Agenda

- The Atlas Framework
 - What is Atlas (and why should I care)?
 - ASP.NET 2.0 AJAX Extensions
 - ASP.NET AJAX Control Toolkit
 - Microsoft AJAX Library

What is “Atlas”?

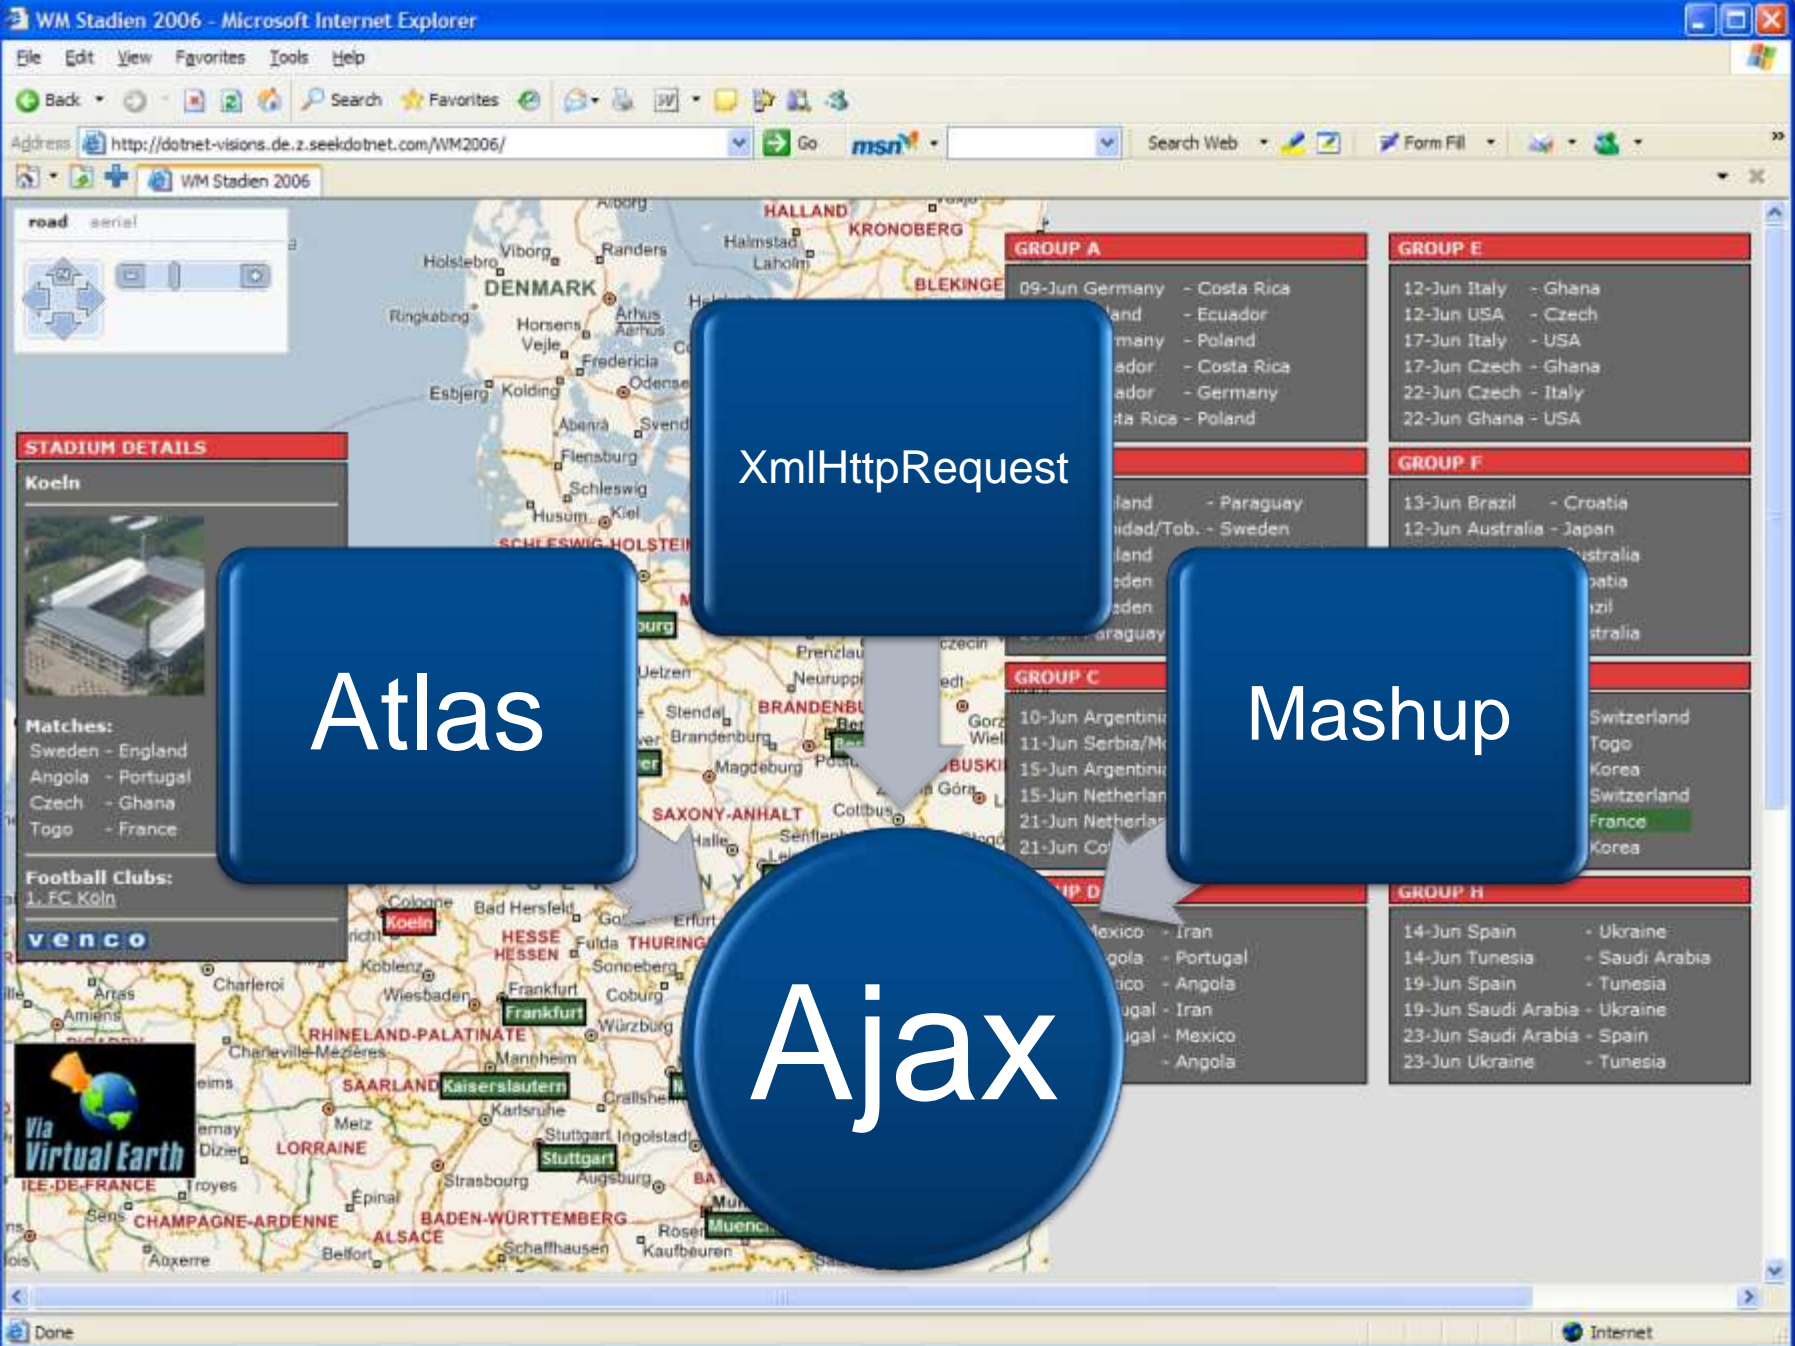

A framework for building...

...a new generation of richer, interactive, personalized standards-based web applications

- High-productivity platform
- Seamless integration
- Ubiquitous reach and easy deployment
- World-class tools

What flavours does Atlas come in?

- Announced Monday 11th September, Atlas becomes:
 - Microsoft AJAX Library
 - ASP.NET 2.0 AJAX Extensions
 - ASP.NET AJAX Control Toolkit
- Current Version
 - ASP.NET AJAX 1.0 Beta 2
- Roadmap
 - 1.0 Release around EOY (core features)
 - “Feature” downloads
 - “Orcas” release

Atlas

XmlHttpRequest

Mashup

Ajax

Example Mash-ups

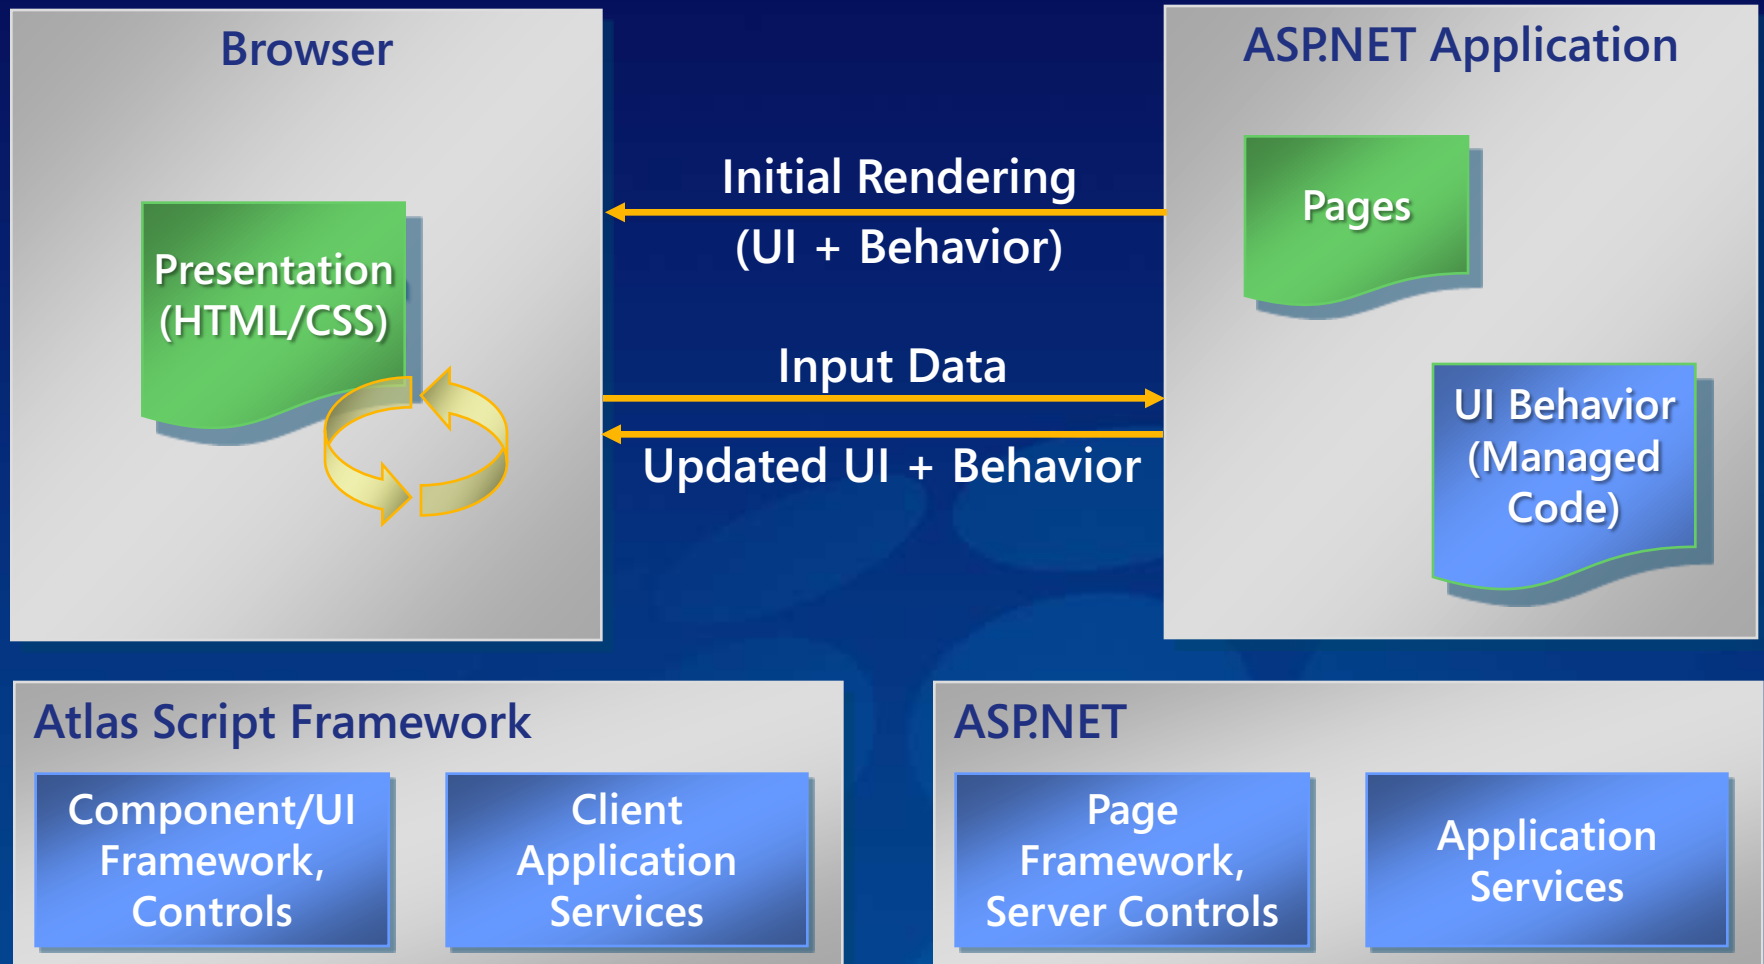

- <http://celeb.local.live.com>
- <http://www.markovic.com/ebay/search>
- <http://www.live.com>
- My BBC Travel Info Demo Mash-Up
 - Virtual Earth Control
 - (<http://dev.live.com/virtualearth/sdk>)
 - BBC Travel Info Service
 - (<http://backstage.bbc.co.uk/data/TravelFeeds>)

“ASP.NET AJAX” Scenarios

- Server-centric Ajax Web Development
 - Incremental Ajax approach to add UI enrichment for key scenarios
 - Enrich applications without lots of Javascript code required
 - Enable you to keep core UI/Application logic on server (VB/C#)
- Client-centric Ajax Web Development
 - Leverage full power of script/DHTML
 - Provide richer and more interactive user experience
 - Build mash-ups, gadgets and other new immersive experiences

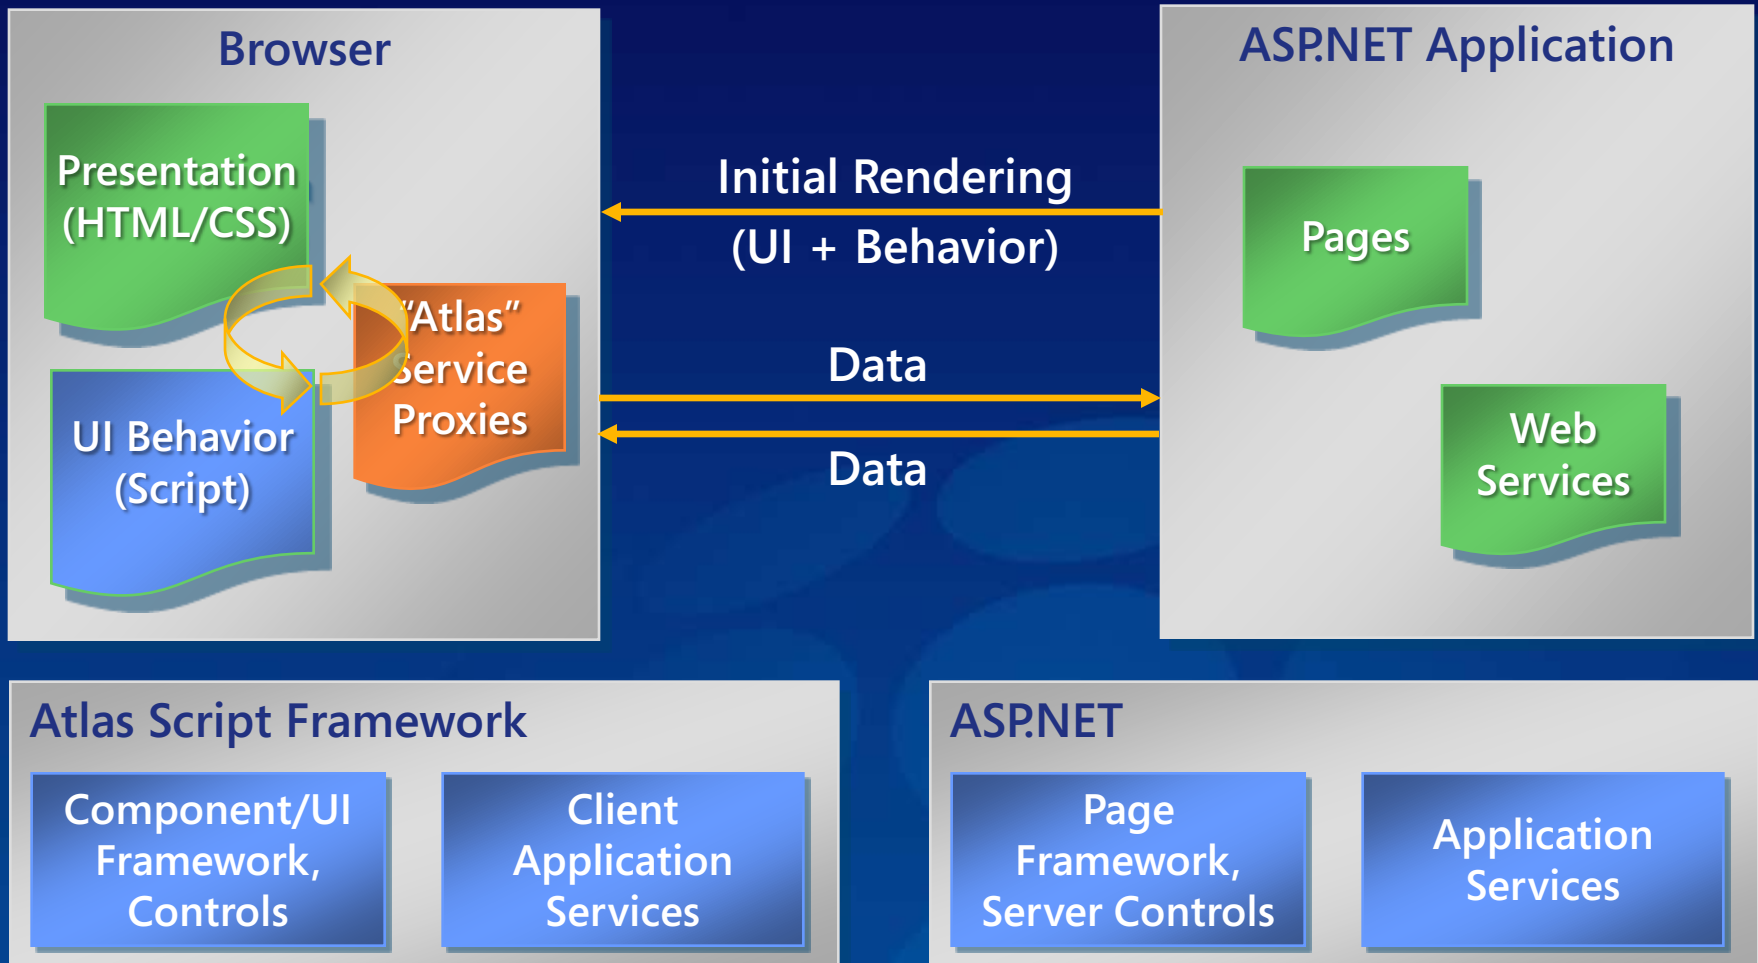

Programming Model

Server-Centric

Programming Model

Client-Centric

Server Components

- Goal: Easily enhance any ASP.NET web application
 - Application UI and core logic still runs on server
 - Avoid need to master JavaScript and asynchronous programming
- Use AJAX techniques to reduce roundtrips
 - Enable incremental page UI updates (avoid full page refreshes)
 - Scenarios: data navigation and editing, form validation, auto refresh
- Enable richer interactivity for existing ASP.NET controls
 - Use the same controls, object model and events you already know
 - Extenders to add Atlas behaviors to any ASP.NET controls
- New, richer ASP.NET server controls
 - Server wrappers for Atlas client controls
 - Examples: DateTimePicker, RichTextBox, Re-Order List

<atlas:updatepanel> control

- Container control that enables “updatable” regions in a page
 - Atlas provides a XmlHttp based postback infrastructure

Some non-updatable content and controls...

```
<atlas:UpdatePanel id="u1" runat="server">
```

```
  <ContentTemplate>
```

```
    This content can be dynamically updated!
```

```
    <asp:label id="Label1" runat="server"/>
```

```
    <asp:button id="button1" text="Push Me!"  
runat="server"/>
```

```
  </ContentTemplate>
```

```
</atlas:UpdatePanel>
```

More non-updatable content and controls...

<atlas:UpdatePanel>

Under the Covers

- Atlas intercepts post-back submit actions on client
- Uses XMLHttpRequest to fire postback action to server
- Postback events fire like normal on server
- Only content of updatepanel regions returned
- Changed updatepanel regions replaced on client

<atlas:UpdatePanel>

Postbacks & Triggers

- Postbacks

- All post-back actions for controls declared within an updatepanel control will cause Ajax-based post-backs with incremental page refresh
- Post-back action for controls outside of an updatepanel control will by default cause normal postbacks

- Triggers

- can be used to associate UpdatePanels on the page with postback controls declared outside of the UpdatePanel
 - `<asp:AsyncPostBackTrigger>`

<atlas:UpdatePanel>

Refresh Modes

- Multiple UpdatePanel Controls can be added to a page
 - Sometimes you only want to update one panel...
- UpdatePanel supports two update modes
 - “Always”
 - “Conditional”
- Conditional refreshes can be done via triggers
 - `<asp:AsyncPostBackTrigger>`
- Conditional refreshes can also be triggered via code
 - `UpdatePanel1.Update()`

<atlas:UpdateProgress> control

- Delivers ability to provide “status” UI while waiting on response from a server
- “Ajax” is inherently Asynchronous
 - Need to provide way for users to understand latency
 - Need to provide way for users to cancel requests
- UpdateProgress control can be placed anywhere on page
 - Templated control allows any content (e.g. animated .gif)
 - Can use CSS to position/style anywhere

<Extender> controls

- Extend existing controls with behaviors
- AutoCompleteExtender
 - Enables textbox auto-complete support
 - Callback to web-service on server for word list
 - Supports both .asmx and WCF based web-services (both using the built-in Atlas JSON bridge)
- DragOverlayExtender
 - Enables dragging a control to a new location
- Other “extender” controls planned
 - Watermark, popup, drag/drop, masked edit, date-time picker, tool tips, etc.

Demo

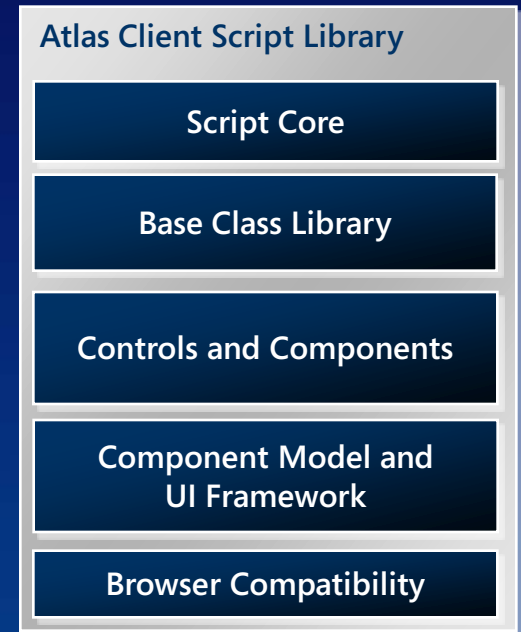

ASP.NET 2.0 AJAX Extensions
ASP.NET AJAX Control Toolkit

Client Components

- Easily develop rich interactive web applications
 - Application UI runs in browser, business logic runs on server
 - HTML/Atlas client accesses data and services from the web
- Scenarios
 - Mash-up applications
 - Composite applications, sites, and gadgets (e.g. Live.com)
- Powerful UI framework and component model for browsers
 - Declarative markup and component model
 - Rich client-side data access and data-binding
- Easily integrated with server application model
 - Easily consume any web service (ASMX, Indigo) from browser
 - Proxy generation, serialization to consume .NET objects in script
 - Script access to ASP.NET application services
 - Server-side bridge to reuse 3rd party services

Atlas Client Script Library

- Script core runtime: a rich type system for JScript
 - Classes, namespaces, inheritance, interfaces
 - Event handlers
 - Object serialization
- Base class library and networking services
 - Helper classes for developers (subset of .NET BCL)
 - Management of asynchronous network operations
- Component model and UI framework
 - Declarative scripting (Atlas XML script definitions)
 - Extensible component and control model
 - Data binding, presentation, and validation
- Atlas components for common scenarios – examples:
 - ListView and DataView for rendering templated data
 - UI behaviors such as drag and drop, tooltips, auto-completion
- Compatibility layer for browsers and platforms
 - Support for IE, Firefox/Mozilla, Safari

Demo

Microsoft AJAX Library

Network Callbacks from Script

- Atlas provides easy mechanism for script callbacks
 - Can call a web-service end-point on server
 - Can call a page-method end-point on server
- Atlas provides JSON network serialization support
 - JSON = JavaScript Object Notation
- JSON support for auto-serialization of .NET types
 - e.g. return an array of “Customer” objects
- Advanced network manager features supported
 - Priorities and queuing on network calls
 - Batch invocation of multiple calls in single network request

Atlas Component and Behaviors

- Components – eg TextBox, Label, Hyperlink...
- Behaviors – PopupBehavior, HoverBehavior, ClickBehavior...
- Atlas provides client JavaScript control + component model
 - Enables control behavior to be associated with html
 - Provides clean OO encapsulation model + control re-use
 - Avoid having to write one-off JavaScript UI repeatedly
- Atlas enables clean developer/designer workflow
 - UI defined using standard XHTML w/ CSS
 - Control behaviors defined and attached separate from html
- Atlas controls can be declared procedurally + declaratively
 - XML declarative markup useful for tool support
- Advanced Atlas Client Control Features:
 - Bi-Directional Databinding, Transformers, Validation

Data Binding and Templates

- Atlas enables declarative databinding and template customization on the client
- Designers can edit the HTML and use CSS to define a html template for an Atlas Control to populate at runtime
- Developers can use the new Atlas ListView client control to bind data (either one or two way) against the html template

Mashup Support

- Atlas provides the ability to define service bridges
 - Allow client script to call to local server
 - Local server then proxies request to service
- Avoids cross-domain script call-back issues
 - No security prompts for the browser
 - Avoids having to publish service keys
- Examples:
 - Amazon, FlickrR, Virtual Earth, Google Maps, etc
- Helps make writing Mashups easy

Gadget Support

- Gadgets are a new Ajax extensibility model
 - Supported by www.live.com
 - Supported by new Windows Side-Bar
- Gadgets enable re-usable functionality to be published and shared at no cost to developer/publisher
- Atlas enables developers to develop Gadgets hosted on their servers, and for end-users to add the Gadgets into their homepage or Windows Sidebar
- Provides more touch with customers and opens up interesting new business model opportunities for developers and web-sites

Summary

- Atlas provides a rich Ajax programming framework
- Rich built-in integration with ASP.NET
 - Server Controls
 - Web and Application Services
- Rich client-side JavaScript framework model
 - Build rich mashups and gadgets
- Rich extensibility model for component developers

IIS7

What's new for developers?

IIS 7 Developer Features

- Structure and Security
- Request Processing Architecture
- Configuration & Management

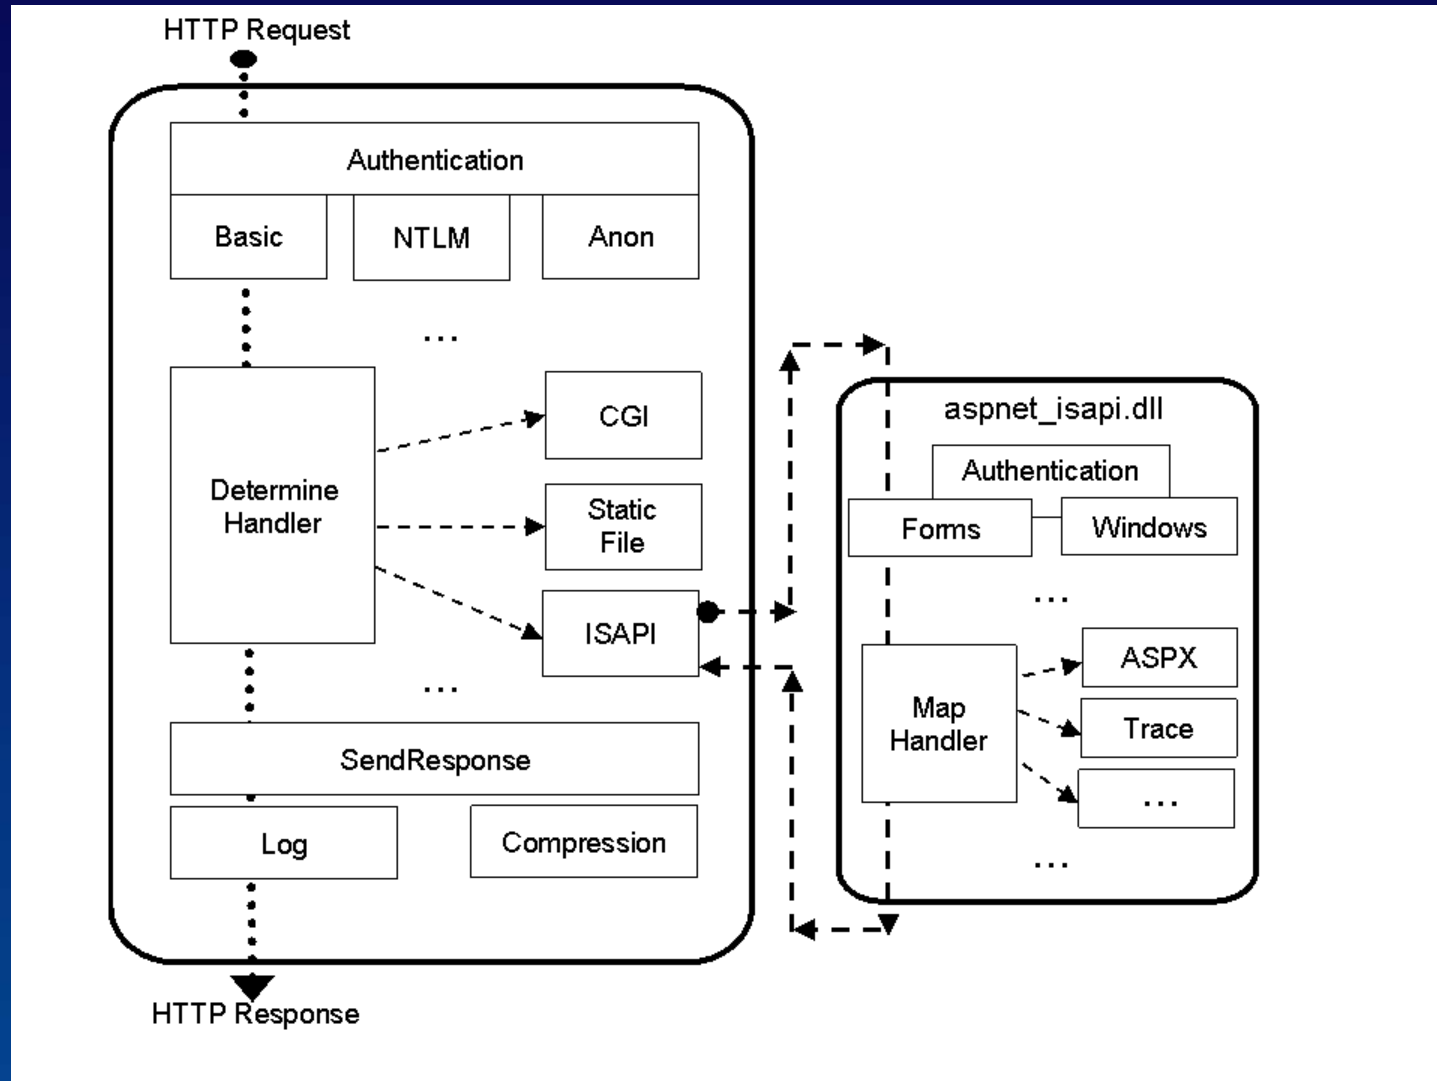

Structure & Security

- IIS 6 - Big step forward
 - Secure by design, default, deployment
- IIS 7 - Next big step
 - Componentised architecture
 - Not required, not installed
 - Security, scalability, patching

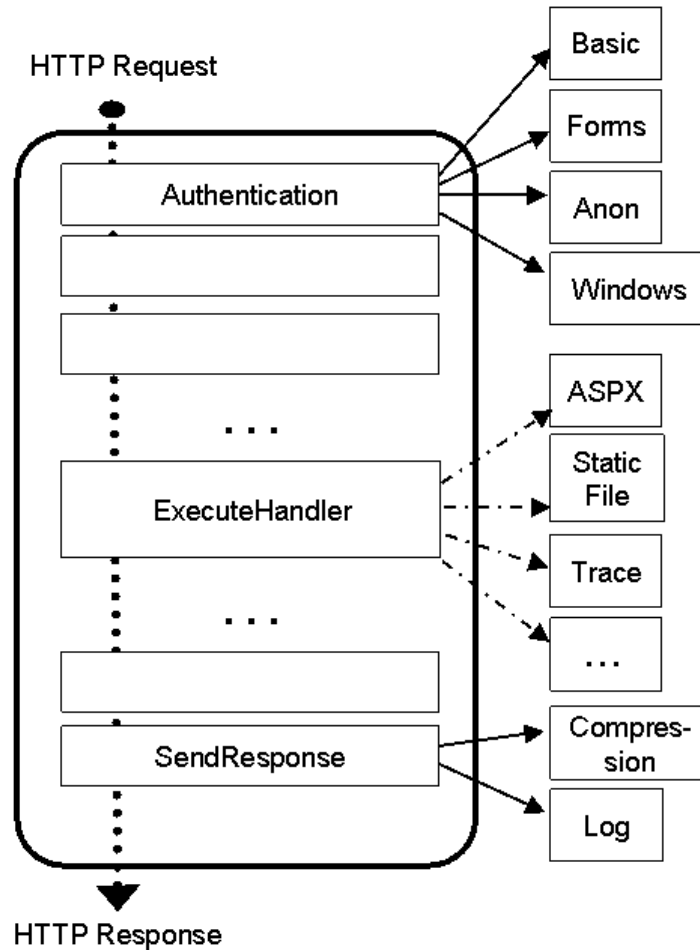

Server Architecture

- HttpModule
 - Fits into HTTP pipeline
 - Can inspect/modify requests on the way in
 - Can inspect/modify responses on the way out
- HttpHandler
 - Executes rendering process
 - Each type of content has exactly one handler
 - Defined in config

IIS6 ASP.NET Integration

IIS7 ASP.NET Integration

IIS7 Managed Modules

- Can use HttpModules at all pipeline stages
- Can be used with all types of content
- Modules listed in IIS admin tool
- Enabled/disabled per-application
- Access to HttpContext in HttpModule
 - Context data that used to be read-only can potentially be written to

Configuration & Management

- New management UI
- Configuration stored in XML config files
- Web.config
 - system.web
 - system.webServer
- Portable format for both ASP.NET and IIS
