

UNLEASH THE POWER OF ASP.NET 2.0
WITH MICROSOFT DEVELOPMENT TOOLS.

ADVANCED TECHNOLOGY FOR CREATING DYNAMIC WEB APPLICATIONS.

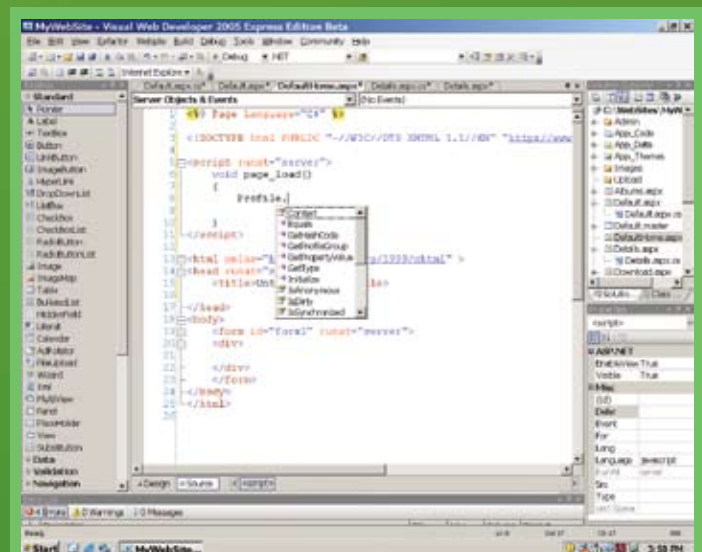

Active Server Pages (ASP) are interactive Web pages that use server-side scripts to dynamically create and modify HTML pages and return those pages to the browser. This kind of interactivity is the mark of an advanced, database-driven Web site.

ASP.NET 2.0 is a technology for creating dynamic Web applications. It provides a programming model and infrastructure that make creating scalable, secure, and stable applications faster and easier than with previous Web technologies. And since ASP.NET 2.0 pages (Web Forms) are compiled—not interpreted—they offer better performance than scripting languages. When building pages, you can use ASP.NET 2.0 server controls to create common user interface elements and program them for common tasks. Server controls allow you to rapidly build an ASP.NET 2.0 page from reusable built-in or custom components. The result: you write fewer lines of code and can create Web applications more quickly.

Microsoft® Visual Web Developer™ 2005 Express Edition is the perfect introduction to the world of Web applications. Microsoft Visual Studio® Standard Edition takes that functionality a step further by providing a complete development environment to build professional-grade Web applications with ASP.NET 2.0.

Visual designers make creating Web applications easy via an easy-to-use drag-and-drop interface.

Built-in ASP.NET 2.0 features make it easy to store site visitor profiles and personalize your sites. Visual Web Developers' powerful code editor preserves HTML and includes rich functionality, such as IntelliSense, that makes writing ASP.NET code and HTML faster.
