

Secure access to Office 365 and all of your resources

Microsoft Enterprise Mobility + Security

Office 365 provides secure, seamless access to its apps from any device and any location. With Enterprise Mobility + Security (EMS), you can expand managed and secure access to all of your resources, enabling uncompromised productivity for your entire workforce.

Manage and secure access with a single, unified identity

Use EMS to connect your current on-premises identity investments to your SaaS and on-premises workloads and establish one identity for each of your users. With one identity, you can anchor security and productivity for your entire application portfolio.

Enable single sign-on to Office 365 and all of your apps

With a unified identity, you can extend single sign-on to Office 365 and all of your apps so that users can connect to all of the resources they need with one username and password. Plus, EMS provides time-saving self-service options such as password reset.

Protect and manage your privileged identities

Safeguard against potential vulnerabilities with more oversight and control over all levels of user privilege. With EMS, you can discover and manage different privileges for users with audit reports and access reviews and on-demand, just-in-time administrative access.

Expand your conditional access capabilities

Office 365 includes conditional access based on device state. With EMS, you can expand your conditional access capabilities for more comprehensive control, including defining conditions for access based on user, location, application, and risk.

Boost self-service capabilities—and reduce helpdesk tickets

Self-service capabilities, such as resetting forgotten passwords, requesting access to an application, or creating and managing groups, help employees work productively and can significantly reduce demands on your IT helpdesk.

Take the next step in your identity management
