

# Extend Office 365 mobile management to protect all your data on any device

## Microsoft Enterprise Mobility + Security

Applications are the most likely point of access to your corporate resources and Office 365 includes management capabilities for its mobile apps. With Enterprise Mobility + Security (EMS), you can expand your control over how data is used once it has been accessed from Office Mobile Apps as well as your line-of-business and third-party apps.

### Flexible solutions for device and app management

Extend your management capabilities beyond Office Mobile apps with EMS. Flexible options for mobile device and application management (MDM and MAM) include full management of corporate and user-owned devices with MDM enrollment, MAM without enrollment, and data protection for non-Microsoft MDM solutions.

### Protect applications without device enrollment

Deploy and manage your app portfolio on iOS, Android, and Windows devices without requiring device enrollment. You can protect your data at the app level with EMS app protection policies and security capabilities including app encryption at rest, secure browsing, edit and save restrictions, and app-level selective wipe.

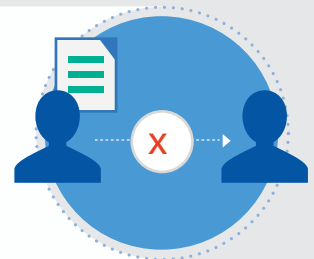

### Extend Office 365 rights management for collaboration

Extend rights management protections available in Office 365 by applying persistent data protection to any file type. EMS includes data classification at the time of creation so that your users can collaborate securely within and outside your organization.

### Manage collaboration with file tracking and revocation

Gain even more visibility and control over internal and external collaboration with EMS. You can manage and monitor access and use of shared files and respond to potential leaks, even revoking access when necessary. Persistent information protection through EMS, can help you secure collaboration for any file, on any device, anywhere.

Decide exactly how your data is used when it's accessed
