

Migrate in Minutes, not Months

CloudPilot

Migrate to Azure in minutes, not months

CloudPilot® enables migration of applications and data, in a fraction of the time it would take to migrate manually. “No Code Change” migrations enable moving applications and data to Azure at scale.

Unique Advantages

Static code analysis ensures a deep understanding of applications and data to confidently migrate them with ‘No Code Changes’ to Azure Containers, Azure VMs, or Azure App Services (PaaS). CloudPilot checks applications for alignment with Security, Governance & Regulatory Compliance (GRC), and best practices to reduce the risks and costs of moving to Azure. Check your applications against all the possible configuration settings for the Azure services for each application to ensure Security, GRC, and recommended best practices are controlled in Azure.

How it Works

- ☁ Download the CloudPilot scanning application. Point the tool to your code repository, SQL Scripts, and, if necessary, the database. The scan takes minutes; not months.
- ☁ “No Code Change” Migration enables you to move your applications and data to Azure Containers, Azure VMs, or Azure App Services (PaaS).

Migration Options include:

“No Code Change” migrations to Azure:

Docker Containers, VMs, App Services

- ☁ Azure VMs
- ☁ Azure Container Services
- ☁ Azure Managed Container Instances
- ☁ Windows and Linux containers
- ☁ Azure App Services

Modernize applications for Azure

- ☁ Application Modernization makes changes to the application to ensure it can take full advantage of the capabilities of the Azure platform.
- ☁ Detailed recommendations, with recommendations provided down to the line of code, with sample code, links to authoritative guidance.
- ☁ Development effort, resource & time estimates
- ☁ Best practice guidance

"No Code Change" Migration to Azure

User selects the migration strategy

Selects Container Service

Database Migration Options

"No Code Change" migrations enable you to move your applications and data to Azure without changing a line of code.

Options include Migration to Azure Container Services which supports all Azure Orchestration Services (e.g. DC/OS, Swarm, and Kubernetes); or migration to Azure Container Instances as well as Windows and Linux containers.

User can select from any of the database migration options. Migrate databases to SQL Azure or SQL Server VMs. Real time data replication uses Azure SQL Migration services.

Modernize Applications for Azure

Regulation and Controls – Define the certifications your Cloud environment must have in support of your applications

Application Modernization – In minutes, CloudPilot estimates the level of effort for each app to move to the Cloud

Actionable Recommendations – Estimates for Modernizing applications are based on static code analysis. Code recommendations can be used to make the specific changes needed.

UnifyCloud™ developed the CloudAtlas® suite from experience gained by migrating some of the largest and most complex environments to Azure. CloudAtlas accelerates migration to Azure while providing detailed control over Cost, Cybersecurity and Governance & Regulatory Compliance (GRC). CloudAtlas is the only integrated suite of tools to accelerate migration to Azure, using Static Code Analysis, with an underlying knowledgebase to stay current with Compliance (GRC), Cybersecurity, Cost and Best Practices.

CloudRecon

Assess: CloudRecon uses actual customer infrastructure data to develop a Cloud Strategy in minutes, not months.

CloudPilot

Migrate: CloudPilot uses static code analysis to migrate identified apps to the Cloud in minutes not months

CloudSupervisor

Control: CloudSupervisor provides Continuous Cloud Controls for Cost, Performance, Security and Compliance.

CloudOrigin

Configuration Management: CloudOrigin Knowledgebase ensures cybersecurity, compliance (GRC) and cost controls stay current.
