

Advanced security for Office 365 and your broader digital ecosystem

Microsoft Enterprise Mobility + Security

Office 365 delivers anywhere, anytime, uncompromised productivity and protection. When you add secure access and mobile management through Enterprise Mobility + Security (EMS), you can build a framework to protect your users, devices, apps, and data across your entire organization.

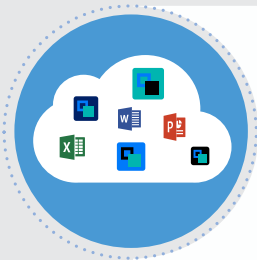

Protect your organization on-premises and in the cloud

Use managed and protected identity as the core of advanced security. EMS works to detect internal threats with cutting-edge behavioral analytics and anomaly detection technologies that help you uncover and pinpoint threats on-premises and in the cloud.

Microsoft Advanced Threat Analytics

Identify advanced persistent threats on-premises and detect known malicious attacks almost as instantly as they occur with EMS. Clear and concise attack timelines help you quickly focus on critical response actions.

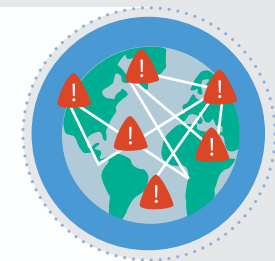

Extend Office 365 Advanced Security Management with Microsoft Cloud App Security

Safeguard all your apps, in addition to your Office Mobile apps, against cloud-based threats. EMS includes comprehensive cloud app security with powerful visibility, threat detection, attack prevention, and deep discovery of shadow IT.

Take a more informed, agile security posture

With EMS, you can monitor, assess, and make security decisions based on sophisticated real-time risk assessment. The Microsoft Intelligent Security Graph applies machine learning and data analytics to massive data sets, identifying anomalous and suspicious activities. The graph informs recommendations and automated actions to prevent and respond to attacks—and it's part of your advanced security strategy.

Build a security strategy that works for your business
