

80%

employees use unapproved apps for work

More than **80 percent** of employees use unapproved SaaS apps, inviting unknown security risks and possible compliance violations that leave the organization liable.

17

cloud apps used by employees

On average, each employee uses **17 cloud apps**, but many organizations have no visibility into what's in use, or whether these apps meet security, privacy, and compliance requirements.

Shadow IT leaves you vulnerable—just look at the numbers

25%

files shared go public

On average, an organization shares 13 percent of its files externally, of which **25 percent are shared publicly**. Unsecure file sharing dramatically increases the likelihood of data loss or leaks and in some cases violates compliance standards or legal regulations.

91%

unauthorized, unmanaged access

In **91 percent** of organizations, employees grant their personal accounts access to the organization's cloud storage increasing the risk of identity breach and putting data privacy at risk.

70%

unsecured admin activity

70 percent of organizations allow cloud admin activity from non-corporate, unsecured networks, creating new, unprotected points of entry for external threats.

75%

idle admin/privileged accounts

75 percent of privileged cloud accounts are not in use. These accounts might be eating up the cost of a license, or worse, increasing the attack surface of the organization.

Gain visibility, data control, and threat protection for your cloud apps.
