

# Windows® phone together with Microsoft® Exchange Server

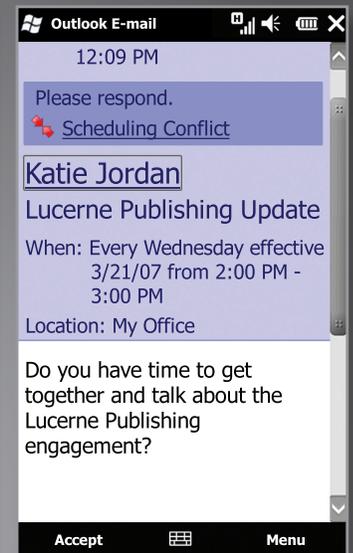

When employees are working in separate locations or on the go, communication fragmentation can occur, which can lead to lost or missed information and reduced efficiency. Catering specific security and IT policies to different mobile device platforms within your organization can decrease the level of control you have over data and assets, and can require additional servers.

Together, Windows® phone and Microsoft Exchange Server allow you to use existing Microsoft IT resources to help increase productivity and usability, manage, protect, and control your organization's mobile messaging infrastructure, and make the most of your investments. This advanced messaging, collaboration, and communication solution, which works with familiar Microsoft technologies, features cutting edge Exchange ActiveSync® implementation and enables a security-enhanced, efficient IT environment at a low total cost of ownership.

As a result, users can have more flexibility in where they do their work, with a variety of mobile device choices that work with the Microsoft Exchange Server management tools already in use, and easy access to the same information they get from Microsoft® Office Outlook.

Inbox

Calendar

With cutting edge Exchange ActiveSync implementation, Windows® phone and Microsoft Exchange Server work easily together to improve your business.

Windows® phone with Microsoft Exchange Server allow your organization to:

- Empower users to stay productive on the go
- Reduce frequency and burden of IT support calls with a compatible, seamless connection
- Enhance security with the power to control users' phones through a centralized location
- Enable users to easily synchronize their mobile devices with their Windows-based PC contacts, calendar, and e-mail, syncing over the air rather than hardwired
- Achieve more with existing infrastructure and tools
- Reduce the need and cost of training, with phones that feature a user experience that is familiar to Windows PC users.

## Empower employees to take action while out of the office or on the go.

*Increase productivity and usability.* When employees are working in multiple locations, communication channels are often fragmented, causing a potential loss of messages and slower follow-up. Windows® phone together with Microsoft Exchange Server empowers employees to work on the go—giving them quick access to the same information from their Microsoft® Outlook on their Windows PC, making it easy to communicate, collaborate, and stay connected, all while using their choice from a variety of devices.

*Manage, protect, and control.* Security is important for your organization and business information, even when employees lose their mobile devices. Windows® phone together with Microsoft Exchange Server can provide you with the control and operational flexibility you need to manage, help protect, and control your organization's mobile messaging infrastructure.

*Make the most of your investments.* Windows® phone and Exchange Server do not automatically require maintenance of extra servers to implement security-enhanced e-mail, which helps keep down the server maintenance and service costs.

*Get Started Today.* Discover how Windows® phone with Microsoft Exchange Server can help your employees stay connected and productive with access to information while on the go.
