

Deployment guide for Microsoft SharePoint 2013 Preview

Microsoft Corporation

Published: July 2012

Author: Microsoft Office System and Servers Team (itspdocs@microsoft.com)

Abstract

This book supports a preliminary release of Microsoft SharePoint Server 2013 Preview and provides deployment instructions for SharePoint Server 2013 Preview. The audiences for this book include application specialists, line-of-business application specialists, and IT administrators who are ready to deploy SharePoint Server 2013 Preview.

The content in this book is a copy of selected content in the [SharePoint 2013 Preview technical library](#) as of the publication date. For the most current content, see the technical library on the web.

Are attachments missing from email messages that are sent to a SharePoint document library?....	110
Configure outgoing email for a SharePoint 2013 Preview farm	112
Before you begin	112
Install and configure the SMTP service.....	113
Install the SMTP service	113
Configure the SMTP service	114
Configure outgoing email for a farm	115
Configure outgoing email for a specific web application	115
Create web applications that use classic mode authentication in SharePoint 2013 Preview	117
Before you begin	117
Create a web application that uses classic mode authentication with Windows PowerShell	118
Create claims-based web applications in SharePoint 2013 Preview	120
Create a claims-based web application by using Central Administration	121
Item	123
Create a claims-based web application by using Windows PowerShell	124
Create a classic-mode web application by using Windows PowerShell	126
Configure authentication infrastructure (SharePoint 2013 Preview)	127
TechNet articles about how to configure authentication infrastructure	127
Configure forms-based authentication for a claims-based web application in SharePoint 2013 Preview	128
Before you begin	128
Process overview	128
Phase 1: Create a new web application that uses forms-based authentication with Central Administration	129
Phase 2: Configure the Web.Config files for an LDAP membership provider	129
Configure the Central Administration Web.Config file	129
Configure the Security Token Service Web.Config file.....	131
Configure the new web application Web.Config file	132
Create a new web application that uses forms-based authentication with Windows PowerShell	134
Configure SAML-based claims authentication with ADFS in SharePoint 2013 Preview	136
Before you begin	136
Process overview	136
Phase 1: Install and configure an AD FS server	137
Phase 2: Configure AD FS with the web application as a relying party	137
Configure AD FS for a relying party	137
Configure the claim rule	138
Export the token signing certificate	139
Phase 3: Configure SharePoint Server 2012 to trust AD FS as an identity provider.....	139
Exporting multiple parent certificates	139
Import a token signing certificate by using Windows PowerShell.....	140

Define a unique identifier for claims mapping by using Windows PowerShell	141
Create a new authentication provider	142
Phase 4: Configure web applications and site collections to use claims-based authentication and AD FS as the trusted identity provider	143
Associate an existing web application with the AD FS identity provider	143
Create a new web application with the AD FS identity provider	144
Create a site collection.....	144
Configure server-to-server authentication in SharePoint 2013 Preview	146
Configure a realm name in SharePoint 2013 Preview for server-to-server authentication.....	146
Copy the SharePoint 2013 Preview realm name to Exchange Server 2013 Preview	147
Export a certificate from SharePoint 2013 Preview for server-to-server authentication	148
Import a certificate to Exchange Server 2013 Preview for server-to-server authentication.....	148
Export a certificate from Exchange Server 2013 Preview for server-to-server authentication	149
Import the Exchange Server 2013 Preview certificate to SharePoint 2013 Preview for server-to-server authentication.....	150
Configure a SharePoint 2013 Preview trust relationship with a Windows Azure Access Control Service (ACS) instance.....	151
Configure a SharePoint 2013 Preview trust relationship with Exchange Server 2013 Preview	152
Configure social computing features in SharePoint 2013 Preview.....	154
TechNet articles about configuring social computing features.....	154
Additional resources about configuring social computing features	155
Configure My Sites in SharePoint 2013 Preview.....	156
Prerequisites.....	156
Web application	156
User Profile service application and profile synchronization	157
Create a My Site host site collection	157
Add a wildcard inclusion managed path to the web application.....	158
Connect the web application to service applications	159
Enable self-service site creation for the web application	159
Configure My Site settings for the User Profile service application	160
Enable the User Profile Service Application - Activity Feed Job.....	162
Next steps.....	163
Configure trusted My Site host locations	164
Configure links to Office client applications	164
Add personalization site links on My Sites.....	164
Start related services	164
Configure microblogging.....	164
Create and configure communities in SharePoint 2013 Preview	165
Before you begin	165
Create a Community Site	165
Create a Community Portal	166

Additional steps	167
Configure microblogging in SharePoint 2013 Preview	168
TechNet articles about microblogging	168
Configure Following settings in SharePoint 2013 Preview	169
Configure Following settings for My Sites	169
Manage Feed Cache and Last Modified Time Cache repopulation in SharePoint 2013 Preview	170
Repopulate the Last Modified Time Cache by using timer jobs in Central Administration	170
Repopulate the Feed Cache and Last Modified Time Cache by using Windows PowerShell cmdlets	171
Manage the Distributed Cache service in SharePoint 2013 Preview	173
Start and stop the Distributed Cache service	173
Change the memory allocation of the Distributed Cache service	174
Change the memory allocation of the Distributed Cache by using Windows PowerShell	175
Add or remove a server in a Distributed Cache cluster	175
Add a server to the cache cluster and starting the Distributed Cache service by using a Windows PowerShell	176
Remove a server from the cache cluster by using a Windows PowerShell	176
Perform a graceful shutdown of the Distributed Cache service	176
Change the service account	177
Enable or disable personal and social features for users or groups in SharePoint 2013 Preview	178
Enable users or groups to use personal and social features	178
Configure eDiscovery in SharePoint 2013 Preview	179
Configure communication between SharePoint Server 2013 Preview and Exchange Server 2013 Preview	179
Configure Search to crawl all discoverable content	180
Grant permissions	180
Create an eDiscovery center	181

Overview of SharePoint 2013 Preview installation and configuration

Although SharePoint products farms vary in complexity and size, a combination of careful planning and a phased deployment that includes ongoing testing and evaluation significantly reduces the risk of unexpected outcomes. This article provides an overview for all types of SharePoint 2013 Preview farm deployment.

Note:

For information about site and solution planning, which is not in scope for this article, see [Sites and site collections overview](#).

For a visual representation of the information in this article, see the SharePoint 2010 Products Deployment model in the [Technical diagrams \(SharePoint 2013 Preview\)](#) topic. Related technical diagrams include "Topologies for SharePoint Server 2010 and Services in SharePoint 2010 Products".

In this article:

- [Concepts](#)
- [Physical architecture](#)
- [Installation and configuration](#)
- [Deployment stages](#)

Important:

This article applies to SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview.

Concepts

The logical result of SharePoint 2013 Preview's flexibility and richness can be a high degree of complexity around installing and configuring SharePoint 2013 Preview correctly. A fundamental understanding of the following key structural elements in a SharePoint 2013 Preview environment is required in order to correctly deploy and support SharePoint 2013 Preview:

- Server farm: The top-level element of a logical architecture design for SharePoint 2013 Preview.
- Web application: An IIS Web site that is created and used by SharePoint 2013 Preview.
- Content database: Provides storage Web application content. You can separate content into multiple content databases at the site collection level.
- Site collection: A set of Web sites that have the same owner and share administration settings.
- Site: One or more related Web pages and other items (such as lists, libraries, and documents) that are hosted inside a site collection.

For more information about these and other architectural components, see [Logical architecture components \(SharePoint Server 2010\)](#).

In addition to understanding the elements of a SharePoint 2013 Preview environment and how they have to be configured for your solution, you must consider the following additional factors: physical architecture, installation and configuration, and the various stages of deployment.

Physical architecture

The physical architecture, which consists of one or more servers and the network infrastructure, enables you to implement the logical architecture for a SharePoint 2013 Preview solution. The physical architecture is typically described in two ways: by its size and by its topology. Size, which can be measured in several ways, such as the number of users or the number of documents, is used to categorize a farm as small, medium, or large. Topology uses the idea of tiers or server groups to define a logical arrangement of farm servers.

Size

Size uses the number of users and number of content items as a fundamental measure to indicate whether a server farm is small, medium, and large, as follows:

- A small server farm typically consists of at least two Web servers and a database server. One of the Web servers hosts the Central Administration site and the other handles additional farm-related tasks, such as serving content to users.
The small farm can be scaled out to three tiers using a dedicated application server in response to the number of users, the number of content items, and the number of services that are required.
- A medium server farm typically consists of two or more Web servers, two application servers, and more than one database servers. We recommend that you start with the preceding configuration and then scale out to accommodate the workload placed on the servers.
In scenarios where services are known to use a disproportionate amount of resources, you can scale out the application tier. Performance data will indicate which services you should consider off-loading to a dedicated server.
- A large server farm can be the logical result of scaling out a medium farm to meet capacity and performance requirements or by design before a SharePoint 2013 Preview solution is implemented. A three-tier topology environment typically uses dedicated servers on all the tiers. Additionally, these servers are often grouped according to their role in the farm. For example, all client-related services can be grouped onto one or two servers and then scaled out by adding servers to this group as needed in response to user demand for these services.

 **Note:**

The recommendation for scaling out a farm is to group services or databases with similar performance characteristics onto dedicated servers and then scale out the servers as a group. In large environments, the specific groups that evolve for a farm depend on the specific demands for each service in a farm.

For specific numbers related to small, medium, and large farms, see [Performance and capacity management for SharePoint 2013 Products Preview](#).

Topology

Topology uses tiers as a model for logically arranging farm servers according to the components that they host or their roles in a server farm. A SharePoint 2013 Preview farm is deployed on one, two, or three tiers, as follows:

- In a single-tier deployment, SharePoint 2013 Preview and the database server are installed on one computer.
- In a two-tier deployment, SharePoint 2013 Preview components and the database are installed on separate servers. This kind of deployment maps to what is called a small farm. The front-end Web servers are on the first tier and the database server is located on the second tier. In the computer industry, the first tier is known as the Web tier. The database server is known as the database tier or database back-end.
- In a three-tier deployment, the front-end Web servers are on the first tier, the application servers are on the second tier, which is known as the application tier, and the database server is located on the third tier. A three-tier deployment is used for medium and large farms.

Installation and configuration

After you finish planning your solution you can create a SharePoint 2013 Preview farm to host the solution. The first step is to install SharePoint 2013 Preview and create the farm that is required for the solution. The process of preparing your environment consists of the following phases:

1. Prepare the servers
2. Create the farm
3. Configure settings, services, solutions, and sites

Note:

The farm that you create and deploy will undergo significant changes in size, topology, and complexity as you move through the different deployment stages illustrated in the SharePoint 2010 Products Deployment model. This is typical and the expected result of a phased deployment. This is why we recommend that you follow all of the stages described in the "Deployment stages" section of this article.

Prepare the servers

In this phase, you get your servers ready to host the product. This includes the supporting servers and the servers that will have SharePoint 2013 Preview installed. The following servers must be configured to support and host a farm:

- Domain controller: The required farm accounts have to be configured for the domain and directory synchronization must be configured.

 **Important:**

SharePoint 2013 Preview does not support single label domain (SLD) names or single label forests, in either the domain of the SharePoint service accounts or the SharePoint end user's domain. Because the use of SLD names is not a recommended practice, SharePoint 2013 Preview are not tested in this scenario. Therefore, there may be incompatibility issues when SharePoint 2013 Preview are implemented in a single label domain environment. For more information, see [Information about configuring Windows for domains with single-label DNS names](#) and the [DNS Namespace Planning Solution Center](#).

For information about required accounts, see:

- [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#)
- [About Directory Synchronization](#) (<http://go.microsoft.com/fwlink/p/?LinkId=193169>)
- Database server: The required version of SQL Server, including service packs and cumulative updates must be installed on the database server. The installation must include any additional features, such as SQL Analysis Services, and the appropriate SharePoint 2013 Preview logins have to be added and configured. The database server must be hardened and, if it is required, databases must be created by the DBA. For more information, see:
 - [Hardware and software requirements \(SharePoint 2013 Preview\)](#)
 - [Configure SQL Server security for SharePoint 2013 Preview environments](#)
 - [Deploy by using DBA-created databases \(SharePoint 2013 Preview\)](#)
- Application servers and front-end Web servers: The farm servers that will have SharePoint 2013 Preview installed must be prepared as follows: verify that they meet the hardware requirements, have the operating system hardened, have the required networking and security protocols configured, have the SharePoint 2013 Preview software prerequisites installed and hardened, and have the required authentication configured. For more information, see:
 - [System requirements \(SharePoint 2013 Preview\)](#)
 - "Installing software prerequisites" in [Hardware and software requirements \(SharePoint 2013 Preview\)](#)
 - [Plan security hardening \(SharePoint Server 2010\)](#)
 - [Plan for authentication \(SharePoint Server 2010\)](#)

Create the farm

In this phase, you install the product and configure each server to support its role in the farm. You also create the configuration database and the SharePoint Central Administration Web site. The following servers are required for a SharePoint 2013 Preview farm:

- Database server: Unless you plan to use DBA-created databases, the configuration database, content database, and other required databases are created when you run the SharePoint Products Configuration Wizard.
- Application server: After you prepare the application server, install any additional components that are required to support functions such as Information Rights Management (IRM) and decision support. Install SharePoint 2013 Preview on the server that will host SharePoint Central

Administration Web site and then run the SharePoint Products Configuration Wizard to create and configure the farm.

- Front-end Web server: Install SharePoint 2013 Preview on each Web server, install language packs, and then run the SharePoint Products Configuration Wizard to add the Web servers to the farm.

 **Note:**

After you add and configure all the front-end Web servers, you can add any additional application servers that are part of your topology design to the farm.

For more information about supported deployment scenarios, see [Install SharePoint 2013 Preview](#).

Configure settings, services, solutions, and sites

In this phase, you prepare the farm to host your site content by completing the following tasks:

- Configure services. For more information, see [Configure services in SharePoint 2013 Preview](#)
- Configure global settings. For more information, see [Configure farm settings in SharePoint 2013 Preview](#)
- Create and populate the sites. For more information, see [Set up Web applications and sites \(SharePoint 2013 Preview\)](#)

 **Note:**

Farm configuration steps are not isolated to a specific tier in the server infrastructure.

Deployment stages

By deploying a SharePoint 2013 Preview solution in stages, you gain the benefits that are provided by a systematic approach, such as collecting performance and usage data that you can use to evaluate your solution. Additional benefits include verifying your capacity management assumptions and identifying issues before the farm is put into production.

We recommend that you deploy your farm in the following stages:

- Planning
- Development
- Proof of concept
- Pilot
- User acceptance test
- Production

Planning

Before you can deploy a farm, you must plan the solution that you want to deploy and determine the infrastructure requirements, such as server resources and farm topology. When you finish the planning stage, you should have documented the following:

-
- An infrastructure design to support your solution
 - A detailed description of how you will implement the farm and the solution
 - A plan for testing and validating the solution
 - A site and solution architecture
 - An understanding of the monitoring and sustained engineering requirements to support the solution
 - A record of how the solution will be governed
 - An understanding of how the solution will be messaged to the user to drive adoption of the solution

We recommend that you use the planning resources and articles described in [Plan for SharePoint 2013 Preview](#).

Important:

Resource and time issues may pressure you to be less rigorous during the planning stage. We recommend that you try to be as diligent as possible because missed or lightly touched planning elements can resurface as significant issues after you are in production. These issues can create much additional work, consume unbudgeted resources, and potentially take away from the success of your SharePoint 2013 Preview.

After the planning stage, you move through the following deployment stages, updating and revising your plans, configurations, and topologies as you test.

Development

During the development stage you will deploy SharePoint 2013 Preview on a single server or on multiple servers to develop, test, evaluate, and refine the solution that you intend to implement. This environment is scaled according to your needs during solution development and can be retained as a scaled down environment for future development and testing. This is not a stable environment and there are no service-level agreements.

Proof of concept

During the proof of concept stage, the objective is two-fold: to understand SharePoint 2013 Preview and to evaluate SharePoint 2013 Preview in the context of how it can address your business needs. The first level of product evaluation can be done by installing all of the product components on a single server. You do a more extensive product evaluation by a proof-of-concept deployment.

A proof-of-concept deployment on a single server or on a small farm enables you to expand the scope of your evaluation. In this deployment, non-IT staff is added to the evaluation team, which provides a broader view of how SharePoint 2013 Preview features might be actually be used in the organization. The benefit of a proof-of-concept deployment is that you can collect data that can be used to refine your original plan. This data—such as page views, user behavior patterns, and server resource consumption—also enables you to start to build a benchmark for sizing your farm. A proof of concept is also good when you evaluate service applications and determining what feature sets that you will offer your end users.

It is important during the proof-of-concept stage that you understand the unique characteristics and functionality of these features because this understanding will help you define your overall topology. Be

aware that a proof-of-concept deployment requires additional resources and extends the time required to put SharePoint 2013 Preview into production.

Tip:

Virtualization provides a good platform for evaluating SharePoint 2013 Preview because a virtual environment provides flexibility, rapid deployment capability, and the ability to roll back virtual machines to previous states.

Pilot

A pilot is used to test your solution on a small scale. There are two approaches to using a pilot deployment. In the first approach, the focus is on functional testing without using real data. By using the second approach you test for production characteristics by using real data and have your pilot users test different kinds of tasks. We recommend the second approach because of the broader scope and real-world data that you can collect and use to refine your solution design.

A pilot deployment provides many benefits. It enables you to collect data that you can use to validate the following aspects of your farm design:

- Infrastructure design
- Capacity management assumptions
- Site and solution architecture
- Solution usage assumptions

The pilot stage also enables you to determine additional data that should be collected to increase the breadth and depth of your benchmarks. This is important if you want to assess the potential effect of additional features or services that you want to add to the farm before the user acceptance test.

At the conclusion of the pilot deployment, you can use the data that you collect to adjust the various components of the solution and its supporting infrastructure.

User acceptance test (UAT)

A user acceptance test deployment—also known as a pre-production environment—is used by organizations as a transitional step from the pilot deployment to a production deployment. An organization's business processes determine the scope, scale, and duration of user accept testing.

The topology of the pre-production environment should be the same as, or very similar to the planned production topology. During user acceptance testing, the SharePoint 2013 Preview solution is tested against a subset or a complete copy of production data. This deployment stage provides a final opportunity for performance tuning and validating operational procedures such as backups and restores.

Production

The final stage is rolling your farm into a production environment. At this stage, you will have incorporated the necessary solution and infrastructure adjustments that were identified during the user acceptance test stage.

Putting the farm into production requires you to complete the following tasks:

-
- Deploy the farm.
 - Deploy the solution.
 - Implement the operations plan.
 - If required, deploy additional environments such as authoring and staging farms, and services farms.

Prepare for installation of SharePoint 2013 Preview

The following downloadable resources, articles on TechNet, video recordings, and related resources provide information about how to prepare for SharePoint 2013 Preview installation and initial configuration.

TechNet articles about how to prepare for SharePoint 2013 Preview installation and initial configuration

The following articles about how to prepare for SharePoint 2013 Preview installation and initial configuration are available to view online. Writers update articles on a continuing basis as new information becomes available and as users provide feedback.

	Content	Description
	Initial deployment administrative and service accounts in SharePoint Server 2013 Preview	Provides information about the administrative and service accounts that are required for an initial SharePoint 2013 Preview deployment.
	Configure SQL Server security for SharePoint 2013 Preview environments	Learn how to harden SQL Server for SharePoint 2013 Preview environments by using SQL Server tools and Windows Firewall.
	Account permissions and security settings (SharePoint Server 2010)	Describes SharePoint 2013 Preview administrative and services account permissions. This article discusses the following areas: Microsoft SQL Server, the file system, file shares, and registry entries.
	Install prerequisites for SharePoint 2013 Preview from a network share	Describes how to install SharePoint 2013 Preview prerequisites from an offline shared network location using the prerequisite installer (PrerequisiteInstaller.exe) tool.

Configure SQL Server security for SharePoint 2013 Preview environments

When you install SQL Server, the default settings help to provide a safe database. In addition, you can use SQL Server tools and Windows Firewall to add additional security to SQL Server for SharePoint 2013 Preview environments.

In this article:

- [Before you begin](#)
- [Configuring a SQL Server instance to listen on a non-default port](#)
 - [To configure a SQL Server instance to listen on a non-default port](#)
- [Blocking default SQL Server listening ports](#)
- [Configuring Windows Firewall to open manually assigned ports](#)
 - [To configure Windows Firewall to open manually assigned ports](#)
- [Configuring SQL Server client aliases](#)
 - [To configure a SQL Server client alias](#)

Before you begin

Before you begin this operation, review the following tasks about how to secure your server farm:

- Block UDP port 1434.
- Configure named instances of SQL Server to listen on a nonstandard port (other than TCP port 1433 or UDP port 1434).
- For additional security, block TCP port 1433 and reassign the port that is used by the default instance to a different port.
- Configure SQL Server client aliases on all front-end web servers and application servers in the server farm. After you block TCP port 1433 or UDP port 1434, SQL Server client aliases are necessary on all computers that communicate with the computer that is running SQL Server.

Note:

Because SharePoint 2013 Preview runs as websites in IIS, administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

Configuring a SQL Server instance to listen on a non-default port

SQL Server provides the ability to reassign the ports that are used by the default instance and any named instances. In SQL Server 2008 R2, and SQL Server 2012, you reassign the TCP port by using SQL Server Configuration Manager. When you change the default ports, you make the environment more secure against hackers who know default assignments and use them to exploit your SharePoint environment.

To configure a SQL Server instance to listen on a non-default port

1. Verify that the user account that is performing this procedure is a member of either the sysadmin or the serveradmin fixed server role.
2. On the computer that is running SQL Server, open SQL Server Configuration Manager.
3. In the navigation pane, expand **SQL Server Network Configuration**.
4. Click the corresponding entry for the instance that you are configuring.
The default instance is listed as **Protocols for MSSQLSERVER**. Named instances will appear as **Protocols for named_instance**.
5. In the main window in the **Protocol Name** column, right-click **TCP/IP**, and then click **Properties**.
6. Click the **IP Addresses** tab.
For every IP address that is assigned to the computer that is running SQL Server, there is a corresponding entry on this tab. By default, SQL Server listens on all IP addresses that are assigned to the computer.
7. To globally change the port that the default instance is listening on, follow these steps:
 - For each IP address except **IPAll**, clear all values for both **TCP dynamic ports** and **TCP Port**.
 - For **IPAll**, clear the value for **TCP dynamic ports**. In the **TCP Port** field, enter the port that you want the instance of SQL Server to listen on. For example, enter 40000.
8. To globally change the port that a named instance is listening on, follow these steps:
 - For each IP address including **IPAll**, clear all values for **TCP dynamic ports**. A value of 0 for this field indicates that SQL Server uses a dynamic TCP port for the IP address. A blank entry for this value means that SQL Server will not use a dynamic TCP port for the IP address.
 - For each IP address except **IPAll**, clear all values for **TCP Port**.
 - For **IPAll**, clear the value for **TCP dynamic ports**. In the **TCP Port** field, enter the port that you want the instance of SQL Server to listen on. For example, enter 40000.
9. Click **OK**.
A message indicates that that the change will not take effect until the SQL Server service is restarted. Click **OK**.
10. Close SQL Server Configuration Manager.
11. Restart the SQL Server service and confirm that the computer that is running SQL Server is listening on the port that you selected.

You can confirm this by looking in the Event Viewer log after you restart the SQL Server service. Look for an information event similar to the following event:

Event Type:Information

Event Source:MSSQL\$MSSQLSERVER

Event Category:(2)

Event ID:26022

Date:3/6/2008

Time:1:46:11 PM

User:N/A

Computer:*computer_name*

Description:

Server is listening on ['any' <ipv4>50000]

12. **Verification:** Optionally, include steps that users should perform to verify that the operation was successful.

Blocking default SQL Server listening ports

Windows Firewall with Advanced Security uses Inbound Rules and Outbound Rules to help secure incoming and outgoing network traffic. Because Windows Firewall blocks all incoming unsolicited network traffic by default, you do not have to explicitly block the default SQL Server listening ports. For more information, see [Windows Firewall with Advanced Security](#) and [Configuring the Windows Firewall to Allow SQL Server Access](#).

Configuring Windows Firewall to open manually assigned ports

To access a SQL Server instance through a firewall, you must configure the firewall on the computer that is running SQL Server to allow access. Any ports that you manually assign must be open in Windows Firewall.

To configure Windows Firewall to open manually assigned ports

1. Verify that the user account that is performing this procedure is a member of either the sysadmin or the serveradmin fixed server role.
2. In **Control Panel**, open **System and Security**.
3. Click **Windows Firewall**, and then click **Advanced Settings** to open the **Windows Firewall with Advanced Security** dialog box.
4. In the navigation pane, click **Inbound Rules** to display the available options in the **Actions** pane.
5. Click **New Rule** to open the **New Inbound Rule Wizard**.
6. Use the wizard to complete the steps that are required to allow access to the port that you defined in [Configuring a SQL Server instance to listen on a non-default port](#).

**Note:**

You can configure the Internet Protocol security (IPsec) to help secure communication to and from your computer that is running SQL Server by configuring the Windows firewall. You do this by selecting **Connection Security Rules** in the navigation pane of the Windows Firewall with Advanced Security dialog box.

Configuring SQL Server client aliases

If you block UDP port 1434 or TCP port 1433 on the computer that is running SQL Server, you must create a SQL Server client alias on all other computers in the server farm. You can use SQL Server client components to create a SQL Server client alias for computers that connect to SQL Server.

To configure a SQL Server client alias

1. Verify that the user account that is performing this procedure is a member of either the sysadmin or the serveradmin fixed server role.
2. Run Setup for SQL Server on the target computer, and install the following client components:
 - **Connectivity Components**
 - **Management Tools**
3. Open SQL Server Configuration Manager.
4. In the navigation pane, click **SQL Native Client Configuration**.
5. In the main window under Items, right-click **Aliases**, and select **New Alias**.
6. In the **Alias - New** dialog box, in the **Alias Name** field, enter a name for the alias. For example, enter SharePoint_*alias*.
7. In the **Port No** field, enter the port number for the database instance. For example, enter 40000. Make sure that the protocol is set to TCP/IP.
8. In the **Server** field, enter the name of the computer that is running SQL Server.
9. Click **Apply**, and then click **OK**.
10. **Verification:** You can test the SQL Server client alias by using SQL Server Management Studio, which is available when you install SQL Server client components.
11. Open SQL ServerManagement Studio.
12. When you are prompted to enter a server name, enter the name of the alias that you created, and then click **Connect**. If the connection is successful, SQL ServerManagement Studio is populated with objects that correspond to the remote database.
13. To check connectivity to additional database instances from SQL ServerManagement Studio, click **Connect**, and then click **Database Engine**.

[How to: Configure a Server to Listen on a Specific TCP Port \(SQL Server Configuration Manager\)](#)

Install prerequisites for SharePoint 2013 Preview from a network share

Installing prerequisites from an offline location is typically required when the servers on which you want to install SharePoint 2013 Preview are isolated from the Internet. Even if this is not the case, installing prerequisites from an offline central location enables you to make sure of farm server consistency by installing a well-known and controlled set of images.

 **Note:**

The Microsoft SharePoint Products Preparation Tool is a user interface built on PrerequisiteInstaller.exe. The Microsoft SharePoint Products Preparation Tool accepts no user input.

In this article:

- [Installer switches and arguments](#)
- [Download and combine the SharePoint 2013 Preview prerequisites on a file share](#)
- [Install the SharePoint 2013 Preview prerequisites at the command prompt](#)
- [Install the SharePoint 2013 Preview prerequisites by using an arguments file](#)
- [Known issues](#)

 **Important:**

The steps in this article apply to SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview.

Installer switches and arguments

By using PrerequisiteInstaller.exe with switches and arguments, you control the versions of the required software that are installed and the location from which they are installed.

PrerequisiteInstaller.exe accepts single or multiple switch and argument pairs. A switch identifies the prerequisite and the argument specifies the action and the location of the prerequisite.

A switch and argument pair uses the following format:

/switch: <path>

Where:

- */switch* is a valid switch to identify a prerequisite. For example, /SQLNCLI is the switch for the Microsoft SQL Server 2008 R2 SP1 Native Client.
- *<path>* is expressed as the path of a local file or the path of a file share, for example, "C:\foldername\sqlncli.msi" or "\\<servername>\<sharename>\sqlncli.msi".

Each switch and its argument are separated by a colon and a space. The argument is enclosed in quotation marks.

The switch and argument pairs can be passed to PrerequisiteInstaller.exe at the command prompt or read from an arguments text file.

Download and combine the SharePoint 2013 Preview prerequisites on a file share

The process for downloading and combining prerequisites consists of the steps that were described in the following procedures.

To identify prerequisites

1. Refer to [Hardware and software requirements \(SharePoint 2013 Preview\)](#), which lists all the required and optional software for SharePoint 2013 Preview. Additionally, this document provides the download location for each prerequisite that is available for download on the Internet.
2. From the command prompt, navigate to the root of the SharePoint 2013 Preview installation media or folder location.
3. At the command prompt, type the following command and then press ENTER:

PrerequisiteInstaller.exe /?

This displays a list of the command-line options and switches and their corresponding arguments for installing a prerequisite from the command-line.

To copy the contents of the active About window to the Clipboard, press CTRL+C.

4. Verify that you have an accurate list of the required software. Compare the output from the prerequisite installer to the list of prerequisites in step 1.
5. Download the prerequisites to a computer that has Internet access.

Next, follow these steps to create a central location that you can use for installing SharePoint 2013 Preview prerequisites on all the farm servers.

To combine prerequisites

1. Create a shared folder on a computer that can be accessed by the servers on which the prerequisites will be installed.
2. Copy the files that you downloaded from the Internet to the shared folder.

After you finish creating an available network location for the prerequisites, use the procedure in the following section to install SharePoint 2013 Preview prerequisites on a server.

Install the SharePoint 2013 Preview prerequisites at the command prompt

You can install one or more of the prerequisites from the command line using the following procedure.

To install from the command line

1. From the **Start** menu, open the Command Prompt window using the **Run as administrator** option.
2. Navigate to the SharePoint 2013 Preview source directory.
3. Type the prerequisite program switch and corresponding argument for the program that you want to install, and then press ENTER, for example:

PrerequisiteInstaller.exe /SQLNCLI: "\\o15-sf-admin\SP_prereqs\sqlncli.msi"

 **Note:**

To install more than one prerequisite, type each switch and argument pair. Be sure to separate each pair by a space, for example:

PrerequisiteInstaller.exe /IDFX: "\\<path>\Windows6.1-KB974405-x64.msu"
/sqlncli:"\\<path>\sqlncli.msi" /Sync:"\\<path>\Synchronization.msi"

Install the SharePoint 2013 Preview prerequisites by using an arguments file

You can install the prerequisites from the file share using an arguments file that consists of switches and corresponding path statements to the programs that have to be installed.

When you run PrerequisiteInstaller.exe with an arguments file, the following happens:

1. PrerequisiteInstaller.exe reads the argument file to verify that each switch is valid and that the program identified in the path statement exists.

 **Note:**

If you specify an argument, PrerequisiteInstaller.exe ignores the arguments file and only processes the command-line argument.

2. PrerequisiteInstaller.exe scans the local system to determine whether any of the prerequisites are already installed.
3. PrerequisiteInstaller.exe installs the programs in the argument file and returns one of the following exit codes:
 - 0 - Success
 - 1 – Another instance of this application is already running
 - 2 – Invalid command line parameter
 - 1001 – A pending restart blocks installation
 - 3010 – A restart is needed
4. If a prerequisite requires a restart, a 3010 code is generated and you are prompted to click **Finish** to restart the system. The behavior of the installer after a 3010 code is different depending on which of the following conditions are true on the computer:

-
- If the component that requires a restart is already installed on the system, the 3010 code is generated and the remaining prerequisites are installed. After the last prerequisite is installed you are prompted to restart the system.
 - If the component that requires a restart is installed on the system by PrerequisiteInstaller.exe, the installer generates the 3010 code, and the installation of the remaining prerequisites is skipped. You are prompted to restart the system.

After the system restarts, PrerequisiteInstaller.exe starts to run again because the startup file that is created before the restart contains a /continue flag.

Multiple components may require a restart. So PrerequisiteInstaller.exe may have to be restarted several times. After a restart, PrerequisiteInstaller.exe ignores the arguments file and attempts to download and install the remaining prerequisites from the Internet. For more information, see [Known issues](#).

Use the following procedure to create an arguments file.

To create an arguments file

1. Using a text editor, create a new text document named PrerequisiteInstaller.Arguments.txt. Save this file to the same location as PrerequisiteInstaller.exe. This file will contain the switches and arguments that are used when you run the Microsoft SharePoint Products Preparation Tool.
2. Using a text editor, edit PrerequisiteInstaller.Arguments.txt and provide file paths to the installation source for each prerequisite switch by using the following syntax:

/switch: <path>

Where */switch* is a valid switch and *<path>* is a path of the installation source.

The following example shows a complete arguments file that uses a file share as a common installation point. Do not include carriage returns in your file.

```
/PowerShell:"<path>\WINDOWS6.1-KB2506143-x64.msu"  
/NETFX:"<path>\dotNetFx45_Full_x86_x64.exe" /IDFX:"<path>\Windows6.1-KB974405-x64.msu"  
/sqlncli:"<path>\sqlncli.msi" /Sync:"<path>\Synchronization.msi"  
/AppFabric:"<path>\setup.exe" /IDFX11:"<path>\Microsoft Identity Extensions.msi"  
/MSIPCCClient:"<path>\msipc.msi" /WCFDataServices:"<path>\WcfDataServices.exe"  
/KB2671763:"<path>\AppFabric1.1-RTM-KB2671763-x64-ENU.exe
```

3. After you finish editing PrerequisiteInstaller.Arguments.txt, save your edits, and verify that this file is in the same directory as PrerequisiteInstaller.exe.

Use the following procedure to install the prerequisites.

To install the prerequisites using an arguments file

1. Run PrerequisiteInstaller.exe at the command prompt to install the prerequisites.

Caution:

If you are prompted to click **Finish** to restart the system, do not do so. Instead, click **Cancel**. For more information, see [Known issues](#) you continue with the next step.

2. Restart the system manually.
3. At the command prompt type the following command and then press Enter:

PrerequisiteInstaller.exe

Known issues

There are two known issues that affect the use of an arguments file:

- Using line breaks in the arguments file
If you create an arguments file and use line breaks to put each switch and argument on a separate line, the prerequisite installer fails. The workaround is to enter all the switch and argument pairs on a single line.
- After a computer restart, the arguments file is not used
After a restart, PrerequisiteInstaller.exe executes the startup command file, which contains a /continue flag. The /continue flag forces the installer to ignore the arguments file.

You must prevent a restart by deleting the startup task in this command file by using one of the following options:

Option 1

1. Run PrerequisiteInstaller.exe by double-clicking it. The program will display the first screen with the list of prerequisites.
2. Click **Cancel**. PrerequisiteInstaller.exe deletes the startup task.

Option 2

1. From the **Start** menu, choose **Run** and then type **regedit** to open the registry.
2. Open the key
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders.
3. Check the value for "Common Startup". This shows the directory where the startup tasks are listed.
4. Close the registry editor without making any changes.
5. Navigate to the startup directory, which is usually
<systemdir>\ProgramData\Microsoft\Windows\Start Menu\Programs\Startup.
6. Delete the startup task by deleting "SharePointServerPreparationToolStartup_0FF1CE15-0000-0000-0000-000000000000.cmd".

Initial deployment administrative and service accounts in SharePoint Server 2013 Preview

This article provides information about the administrative and service accounts that are required for an initial SharePoint 2013 Preview deployment. Additional accounts and permissions are required to fully implement all aspects of a production farm.

Required permissions

To deploy SharePoint 2013 Preview on a server farm, you must provide credentials for several different accounts.

The following table describes the accounts that are used to install and configure SharePoint 2013 Preview.

Account	Purpose	Requirements
SQL Server service account	<p>The SQL Server service account is used to run SQL Server. It is the service account for the following SQL Server services:</p> <ul style="list-style-type: none">• MSSQLSERVER• SQLSERVERAGENT <p>If you do not use the default SQL Server instance, in the Windows Services console, these services will be shown as the following:</p> <ul style="list-style-type: none">• MSSQL<InstanceName>• SQLAgent<InstanceName>	<p>Use either a Local System account or a domain user account.</p> <p>If you plan to back up to or restore from an external resource, permissions to the external resource must be granted to the appropriate account. If you use a domain user account for the SQL Server service account, grant permissions to that domain user account. However, if you use the Network Service or the Local System account, grant permissions to the external resource to the machine account (<domain_name>\<SQL_hostname>). The instance name is arbitrary and was created when SQL Server was installed.</p>
Setup user account	<p>The Setup user account is used to run the following:</p> <ul style="list-style-type: none">• Setup• SharePoint Products Configuration Wizard	<ul style="list-style-type: none">• Domain user account.• Member of the Administrators group on each server on which Setup is run.• SQL Server login on the computer that runs SQL Server.

Account	Purpose	Requirements
		<ul style="list-style-type: none"> Member of the Server admin SQL Server security role: <p>If you run Windows PowerShell cmdlets that affect a database, this account must be a member of the db_owner fixed database role for the database.</p>
Server farm account or database access account	<p>The server farm account is used to perform the following tasks:</p> <ul style="list-style-type: none"> Configure and manage the server farm. Act as the application pool identity for the SharePoint Central Administration Web site. Run the Microsoft SharePoint Foundation Workflow Timer Service. 	<ul style="list-style-type: none"> Domain user account. <p>Additional permissions are automatically granted for the server farm account on Web servers and application servers that are joined to a server farm.</p> <p>The server farm account is automatically added as a SQL Server login on the computer that runs SQL Server. The account is added to the following SQL Server security roles:</p> <ul style="list-style-type: none"> dbcreator fixed server role securityadmin fixed server role db_owner fixed database role for all SharePoint databases in the server farm

Note:

We recommend that you install SharePoint 2013 Preview by using least-privilege administration.

Install SharePoint 2013 Preview

Testing and implementing SharePoint 2013 Preview solutions at different stages of the deployment life cycle requires deployments in various topologies.

The following articles on TechNet provide information about how to deploy SharePoint 2013 Preview on one or more servers to create different topologies that you can use for testing and implementing SharePoint 2013 Preview solutions at different stages of the deployment life cycle.

TechNet articles about how to install and configure SharePoint 2013 Preview

The following articles about how to install and configure SharePoint 2013 Preview are available to view online. Writers update articles on a continuing basis as new information becomes available and as users provide feedback.

	Content	Description
	Prepare the environment (SharePoint 2013 Preview)	Describes information and steps that you have to take that are common to all of the deployment scenarios in this section.
	Install SharePoint 2013 Preview on a single server with SQL Server	Describes how to install SharePoint 2013 Preview on a single server. This deployment uses SQL Server and can easily be scaled out to create two- and three-tier farm topologies.
	Install SharePoint 2013 Preview on a single server with a built-in database	Explains how to install SharePoint 2013 Preview on a single server. This deployment uses SQL Server Express and is typically used for evaluating SharePoint 2013 Preview.
	Install SharePoint 2013 Preview across multiple servers for a three-tier farm	Describes how to install SharePoint 2013 Preview on multiple servers. This deployment uses SQL Server and the resulting three-tier topology provides the foundation for implementing any solution.

	Content	Description
	Deploy by using DBA-created databases (SharePoint Server 2010)	Illustrates how to deploy SharePoint 2013 Preview in a farm environment that uses DBA-created databases.
	Install and configure a virtual environment for SharePoint 2013 Preview	This article describes how to use Windows PowerShell to install SharePoint 2013 Preview in a Hyper-V environment.
	Verify installation (SharePoint 2013 Preview)	Explains how to verify that the installation completed successfully. It also contains next steps for troubleshooting an installation that was not completed successfully.
	Install or uninstall language packs for SharePoint 2013 Preview	Describes language packs and how to download, install, and uninstall them.
	Add web or application servers to farms in SharePoint 2013 Preview	Explains how to add a web or application server to a farm. The procedures in this article apply to a SharePoint 2013 Preview farm that consists of at least two tiers. They should not be used for converting a single server deployment to a multiple server farm.
	Add a database server to an existing farm (SharePoint 2013 Preview)	Provides information about how to add a new database server to an existing SharePoint 2013 Preview farm.
	Remove a server from a farm in SharePoint 2013 Preview	Describes how to remove a web server, application server, or a database server from a SharePoint 2013 Preview farm.
	Uninstall SharePoint 2013 Preview	Describes how to remove SharePoint 2013 Preview from a computer.

Install SharePoint 2013 Preview on a single server with a built-in database

You can quickly publish a SharePoint site by deploying SharePoint 2013 Preview on a single server that has a built-in database. This configuration is useful if you want to evaluate SharePoint 2013 Preview features and capabilities, such as collaboration, document management, and search. This configuration is also useful if you are deploying only a few websites and you want to minimize administrative overhead.

This article contains required information and procedures to install and configure SharePoint 2013 Preview with a built-in database on a single server.

In this article:

- [Overview](#)
- [Before you begin](#)
- [Install SharePoint 2013 Preview](#)
- [Post-installation steps](#)

Important:

The steps in this article apply to SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview. The procedures in this topic install Microsoft SQL Server 2008 R2 SP1 - Express Edition. However, User Profile synchronization does not work with the Express Edition. If you intend to use User Profile synchronization with SharePoint Server 2013 Preview, you must choose a different installation scenario.

Overview

When you deploy SharePoint 2013 Preview on a single server that has a built-in database by using the default settings, Setup installs SQL Server 2008 Express and the SharePoint product. The SharePoint Products Configuration Wizard creates the configuration database and content database for the SharePoint sites. Additionally, the SharePoint Products Configuration Wizard installs the SharePoint Central Administration website and creates your first SharePoint site collection.

Note:

This article does not describe how to install SharePoint 2013 Preview in a farm environment, or how to upgrade from previous releases of SharePoint 2013 Preview. For more information about how to install SharePoint 2013 Preview on a single-server farm, see [Install SharePoint 2013 Preview on a single server with SQL Server](#). For more information about how to install SharePoint 2013 Preview on a multiple server farm, see [Install SharePoint 2013 Preview across multiple servers for a three-tier farm](#). For more information about upgrade, see [Upgrade to SharePoint 2013 Preview](#).

Consider the following restrictions of this method of installation:

-
- You cannot use this method on a domain controller.
 - A SQL Server 2008 Express database cannot be larger than 4 GB.
 - You cannot use user profile synchronization in this type of installation. If you want to use user profile synchronization, you must use a server farm installation of SharePoint 2013 Preview. For more information, see [Install SharePoint 2013 Preview on a single server with SQL Server](#) or [Install SharePoint 2013 Preview across multiple servers for a three-tier farm](#), and [Configure profile synchronization \(SharePoint 2013 Preview\)](#).

Before you begin

Before you begin installation, make sure that you have met all hardware and software requirements. For more information, see [Hardware and software requirements \(SharePoint 2013 Preview\)](#). To make sure that you perform a clean installation of SharePoint 2013 Preview, you must first remove any earlier version of SharePoint 2013 Preview if one is installed.

Install SharePoint 2013 Preview

To install and configure SharePoint 2013 Preview, follow these steps:

1. Run the Microsoft SharePoint Products Preparation Tool.
2. Run Setup, which installs SQL Server 2008 Express and the SharePoint product.
3. Run the SharePoint Products Configuration Wizard, which installs and configures the configuration database, the content database, and installs the SharePoint Central Administration website. This wizard also creates your first SharePoint site collection.
4. Configure browser settings.
5. Perform post-installation steps.

Important:

To complete the following procedures, you must be a member of the Administrators group on the computer on which you are installing SharePoint 2013 Preview.

Run the Microsoft SharePoint Products Preparation Tool

Because the prerequisite installer downloads components from the Microsoft Download Center, you must have Internet access on the computer on which you are running the installer. Use the following procedure to install software prerequisites for SharePoint 2013 Preview.

To run the Microsoft SharePoint Products Preparation Tool

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. In the folder where you downloaded the SharePoint 2013 Preview software, locate and then run **prerequisiteinstaller.exe**.

-
3. On the **Welcome to the Microsoft SharePoint Products Preparation Tool** page, click **Next**.
 4. On the **License Terms for software products** page, review the terms, select the **I accept the terms of the License Agreement(s)** check box, and then click **Next**.
 5. On the **Installation Complete** page, click **Finish**.
 6. After you complete the Microsoft SharePoint Products Preparation Tool, you must also install the following:
 - [KB 2554876](#)
 - [KB 2708075](#)
 - [KB 2472264](#)

Run Setup

The following procedure installs SQL Server 2008 Express and the SharePoint product. At the end of Setup, you can choose to start the SharePoint Products Configuration Wizard, which is described later in this section.

To run Setup

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. On the **SharePoint Server 2013 Preview Start** page, click **Install SharePoint Server**.
3. On the **Enter Your Product Key** page, enter your product key, and then click **Continue**.
4. On the **Read the Microsoft Software License Terms** page, review the terms, select the **I accept the terms of this agreement** check box, and then click **Continue**.
5. On the **Server Type** tab, click **Standalone**.
6. When Setup finishes, a dialog box prompts you to complete the configuration of your server. Ensure that the **Run the SharePoint Products Configuration Wizard now** check box is selected.
7. Click **Close** to start the configuration wizard.

Note:

If Setup fails, check log files in the Temp folder of the user account that you used to run Setup. Ensure that you are logged in using the same user account, and then type **%temp%** in the location bar in Windows Explorer. If the path in Windows Explorer resolves to a location that ends in a "1" or "2", you will have to navigate up one level to view the log files. The log file name is SharePoint Server Setup (<time stamp>).

Run the SharePoint Products Configuration Wizard

Use the following procedure to install and configure the configuration database and the content database, and install the SharePoint Central Administration website.

To run the SharePoint Products Configuration Wizard

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. If you have closed the SharePoint Products Configuration Wizard, you can access it by clicking **Start**, point to **All Programs**, click **SharePoint 2013 Products**, and then click **SharePoint 2013 Products Configuration Wizard**. If the **User Account Control** dialog box appears, click **Continue**.
3. On the **Welcome to SharePoint Products** page, click **Next**.
4. In the dialog box that notifies you that some services might have to be restarted during configuration, click **Yes**.
5. On the **Configuration Successful** page, click **Finish**.

Note:

If the SharePoint Products Configuration Wizard fails, check the PSCDiagnostics log files, which are located on the drive on which SharePoint 2013 Preview is installed, in the %COMMONPROGRAMFILES%\Microsoft Shared\Web Server Extensions\15\LOGS folder.

6. On the **Template Selection** page, select one of the following options, and then click **OK**:
 - In the **Template Selection** section, click a predefined template.
 - In the **Solutions Gallery** section, click **Solutions Gallery**, and customize your own site template.
7. On the **Set Up Groups for this Site** page, specify who should have access to your site, and then either create a new group or use an existing group for these users by doing one of the following:
 - To create a new group, click **Create a new group**, and then type the name of the group and the members that you want to be part of this group.
 - To use an existing group, click **Use an existing group**, and then select the user group in the **Item** list.
8. Click **OK**.

Note:

If you are prompted for your user name and password, you might have to add the SharePoint Central Administration website to the list of trusted sites and configure user authentication settings in Internet Explorer. You might also want to disable the Internet Explorer Enhanced Security settings. If you see a proxy server error message, you might have to configure proxy server settings so that local addresses bypass the proxy server. For more information about how to configure browser and proxy settings, see [Configure browser settings](#).

Configure browser settings

After you run the SharePoint Products Configuration Wizard, you should confirm that SharePoint 2013 Preview works correctly by configuring additional settings in Internet Explorer.

If you are not using Internet Explorer, you might have to configure additional settings for your browser. For information about supported browsers, see [Plan browser support \(SharePoint 2013 Preview\)](#).

To confirm that you have configured browser settings correctly, log on to the server by using an account that has local administrative credentials. Next, connect to the SharePoint Central Administration website. If you are prompted for your user name and password when you connect, perform the following procedures:

- Add the SharePoint Central Administration website to the list of trusted sites
- Disable Internet Explorer Enhanced Security settings

If you receive a proxy server error message, perform the following procedure:

- Configure proxy server settings to bypass the proxy server for local addresses

If you are using Internet Explorer 8, for more information, see [Getting Started with IEAK 8](#).

To add the SharePoint Central Administration website to the list of trusted sites

1. Verify that the user account that completes this procedure has the following credentials:
 - The user account is a member of the Administrators group on the computer on which you are performing the procedure.
2. In Internet Explorer, on the **Tools** menu, click **Internet Options**.
3. On the **Security** tab, in the **Select a zone to view or change security settings** area, click **Trusted Sites**, and then click **Sites**.
4. Clear the **Require server verification (https:) for all sites in this zone** check box.
5. In the **Add this web site to the zone** box, type the URL to your site, and then click **Add**.
6. Click **Close** to close the **Trusted Sites** dialog box.
7. Click **OK** to close the **Internet Options** dialog box.

To disable Internet Explorer Enhanced Security settings

1. Verify that the user account that completes this procedure has the following credentials:
 - The user account is a member of the Administrators group on the computer on which you are performing the procedure.
2. Click **Start**, point to **All Programs**, point to **Administrative Tools**, and then click **Server Manager**.
3. In **Server Manager**, select the root of **Server Manager**.
4. In the **Security Information** section, click **Configure IE ESC**.
The **Internet Explorer Enhanced Security Configuration** dialog box appears.
5. In the **Administrators** section, click **Off** to disable the Internet Explorer Enhanced Security settings, and then click **OK**.

To configure proxy server settings to bypass the proxy server for local addresses

1. Verify that the user account that completes this procedure has the following credentials:
 - The user account is a member of the Administrators group on the computer on which you are performing the procedure.
2. In Internet Explorer, on the **Tools** menu, click **Internet Options**.
3. On the **Connections** tab, in the **Local Area Network (LAN) settings** area, click **LAN Settings**.
4. In the **Automatic configuration** area, clear the **Automatically detect settings** check box.
5. In the **Proxy Server** area, select the **Use a proxy server for your LAN** check box.
6. Type the address of the proxy server in the **Address** box.
7. Type the port number of the proxy server in the **Port** box.
8. Select the **Bypass proxy server for local addresses** check box.
9. Click **OK** to close the **Local Area Network (LAN) Settings** dialog box.
10. Click **OK** to close the **Internet Options** dialog box.

Post-installation steps

After you install SharePoint 2013 Preview, your browser window opens to the SharePoint Central Administration website of your new SharePoint site. Although you can start to add content to the site or customize the site, we recommend that you first perform the following administrative tasks:

- **Configure usage and health data collection** You can configure usage and health data collection in your server farm. The system writes usage and health data to the logging folder and to the logging database. For more information, see [Configure usage and health data collection \(SharePoint 2013 Preview\)](#).
- **Configure diagnostic logging** You can configure diagnostic logging that might be required after initial deployment or upgrade. The default settings are sufficient for most situations, but depending on the business needs and life cycle of the farm, you might want to change these settings. For more information, see [Configure diagnostic logging \(SharePoint 2013 Preview\)](#).
- **Configure incoming e-mail** You can configure incoming e-mail so that SharePoint sites accept and archive incoming e-mail. You can also configure incoming e-mail so that SharePoint sites can archive e-mail discussions as they occur, save e-mailed documents, and show e-mailed meetings on site calendars. In addition, you can configure the SharePoint Directory Management Service to provide support for e-mail distribution list creation and administration. For more information, see [Configure incoming email for a SharePoint 2013 Preview farm](#).
- **Configure outgoing e-mail** You can configure outgoing e-mail so that your Simple Mail Transfer Protocol (SMTP) server sends e-mail alerts to site users and notifications to site administrators. You can configure both the "From" e-mail address and the "Reply" e-mail address that appear in outgoing alerts. For more information, see [Configure outgoing email for a SharePoint 2013 Preview farm](#).

-
- **Configure search settings** You can configure search settings to crawl the content in SharePoint 2013 Preview.

Install SharePoint 2013 Preview on a single server with SQL Server

A single server installation consists of one server that runs both SQL Server and SharePoint 2013 Preview. You can install and configure SharePoint 2013 Preview on a single server if you are hosting only a few sites for a limited number of users or if you want to create a trial or development environment. This configuration is also useful if you want to configure a farm to meet your needs first, and then add servers to the farm at a later stage.

In this article:

- [Overview](#)
- [Before you install SharePoint 2013 Preview on a single server](#)
- [Install SharePoint 2013 Preview on a single server](#)
- [Post-installation steps](#)

Important:

The steps in this article apply to SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview.

Overview

When you install SharePoint 2013 Preview on a single server, you can configure SharePoint 2013 Preview to meet your specific needs. After you have completed setup and the SharePoint Products Configuration Wizard, you will have installed binaries, configured security permissions, configured registry settings, configured the configuration database, configured the content database, and installed the SharePoint Central Administration web site. Next, you can choose to run the Farm Configuration Wizard to configure the farm, select the services that you want to use in the farm, and create the first site collection, or you can manually perform the farm configuration at your own pace.

Before you install SharePoint 2013 Preview on a single server

Before you begin to install and configure SharePoint 2013 Preview, do the following:

- Ensure that you are familiar with the operating-system guidelines described in [Performance Tuning Guidelines for Windows Server 2008](#) and [Performance Tuning Guidelines for Windows Server 2008 R2](#).
- Ensure that you have met all hardware and software requirements. You must have a 64-bit version of Windows Server 2008 R2 SP1. For server farms, you must also have a 64-bit version of SQL Server 2008 R2 SP1. For more information about these requirements, such as specific updates that you must install, see [Hardware and software requirements \(SharePoint 2013 Preview\)](#).

-
- Ensure that you perform a clean installation of SharePoint 2013 Preview.
 - Ensure that you are prepared to set up the required accounts by using appropriate permissions. For detailed information, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).

Security

As a security best practice, we recommend that you install SharePoint 2013 Preview by using least-privilege administration.

Install SharePoint 2013 Preview on a single server

To install and configure SharePoint 2013 Preview on a single server, you will follow these steps:

1. Run the Microsoft SharePoint Products Preparation Tool, which installs all prerequisites to use SharePoint 2013 Preview.
2. Run Setup, which installs binaries, configures security permissions, and edits registry settings for SharePoint 2013 Preview.
3. Run SharePoint Products Configuration Wizard, which installs and configures the configuration database, installs and configures the content database, and installs the SharePoint Central Administration web site.
4. Configure browser settings.
5. Run the Farm Configuration Wizard, which configures the farm, creates the first site collection, and selects the services that you want to use in the farm.
6. Perform post-installation steps.

Important:

To complete the following procedures, the account that you use must be a member of the Administrators group on the computer on which you are installing SharePoint 2013 Preview. For information about user accounts, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).

Run the Microsoft SharePoint Products Preparation Tool

Because the prerequisite installer downloads components from the Microsoft Download Center, you must have Internet access on the computer on which you are running the installer. Use the following procedure to install software prerequisites for SharePoint 2013 Preview.

To run the Microsoft SharePoint Products Preparation Tool

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. In the folder where you downloaded the SharePoint 2013 Preview software, locate and then run **prerequisiteinstaller.exe**.

-
3. On the **Welcome to the Microsoft SharePoint Products Preparation Tool** page, click **Next**.
 4. On the **License Terms for software products** page, review the terms, select the **I accept the terms of the License Agreement(s)** check box, and then click **Next**.
 5. On the **Installation Complete** page, click **Finish**.
 6. After you complete the Microsoft SharePoint Products Preparation Tool, you must also install the following:
 - [KB 2554876](#)
 - [KB 2708075](#)
 - [KB 2472264](#)

Run Setup

The following procedure installs binaries, configures security permissions, and edits registry settings for SharePoint 2013 Preview. At the end of Setup, you can choose to start the SharePoint Products Configuration Wizard, which is described later in this section.

To run Setup

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. On the **SharePoint Server 2013 Preview Start** page, click **Install SharePoint Server**.
3. On the **Enter Your Product Key** page, enter your product key, and then click **Continue**.
4. On the **Read the Microsoft Software License Terms** page, review the terms, select the **I accept the terms of this agreement** check box, and then click **Continue**.
5. On the **Server Type** tab, click **Complete**.
The stand-alone option is used to install a single server that has a built-in database.
6. Optional: To install SharePoint 2013 Preview at a custom location, click the **File Location** tab, and then either type the location or click **Browse** to find the location.
7. Click **Install Now**.
8. When Setup finishes, a dialog box prompts you to complete the configuration of your server. Ensure that the **Run the SharePoint Products and Technologies Configuration Wizard now** check box is selected.
9. Click **Close** to start the configuration wizard.

Note:

If Setup fails, check log files in the Temp folder of the user account you used to run Setup. Ensure that you are logged in using the same user account and then type **%temp%** in the location bar in Windows Explorer. If the path in Windows Explorer resolves to a location that ends in a "1" or "2", you have to navigate up one level to view the log files. The log file name is SharePoint Server Setup (<time stamp>).

Run the SharePoint Products Configuration Wizard

Use the following procedure to install and configure the configuration database and the content database, and to install the SharePoint Central Administration website.

To run the SharePoint Products Configuration Wizard

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. If you have closed the SharePoint Products Configuration Wizard, you can access it by clicking **Start**, point to **All Programs**, click **SharePoint 2013 Products**, and then click **SharePoint 2013 Products Configuration Wizard**. If the **User Account Control** dialog box appears, click **Continue**.
3. On the **Welcome to SharePoint Products** page, click **Next**.
4. In the dialog box that notifies you that some services might have to be restarted during configuration, click **Yes**.
5. On the **Connect to a server farm** page, click **Create a new server farm**, and then click **Next**.
6. On the **Specify Configuration Database Settings** page, do the following:
 - a) In the **Database server** box, type the name of the computer that is running SQL Server.
 - b) In the **Database name** box, type a name for your configuration database or use the default database name. The default name is SharePoint_Config.
 - c) In the **Username** box, type the user name of the server farm account. Ensure that you type the user name in the format DOMAIN\user name.

Security

The server farm account is used to create and access your configuration database. It also acts as the application pool identity account for the SharePoint Central Administration application pool, and it is the account under which the Microsoft SharePoint Foundation Workflow Timer service runs. The SharePoint Products Configuration Wizard adds this account to the SQL Server Login accounts, the SQL Server **dbcreator** server role, and the SQL Server **securityadmin** server role. The user account that you specify as the service account has to be a domain user account. However, it does not have to be a member of any specific security group on your front-end web servers or your database servers. We recommend that you follow the principle of least-privilege and specify a user account that is not a member of the Administrators group on your front-end web servers or your database servers.

- d) In the **Password** box, type the user password.
7. Click **Next**.
 8. On the **Specify Farm Security Settings** page, type a passphrase, and then click **Next**.

Although a passphrase resembles a password, it is usually longer to improve security. It is used to encrypt credentials of accounts that are registered in SharePoint 2013 Preview. For example, the SharePoint 2013 Preview system account that you provide when you run the SharePoint Products Configuration Wizard. Ensure that you remember the passphrase, because you must use it every time that you add a server to the farm.

Ensure that the passphrase meets the following criteria:

- Contains at least eight characters
 - Contains at least three of the following four character groups:
 - English uppercase characters (from A through Z)
 - English lowercase characters (from a through z)
 - Numerals (from 0 through 9)
 - Nonalphabetic characters (such as !, \$, #, %)
9. On the **Configure SharePoint Central Administration Web Application** page, do the following:
- a) Either select the **Specify port number** check box and type the port number that you want the SharePoint Central Administration web application to use, or leave the **Specify port number** check box cleared if you want to use the default port number.
 - b) Click either **NTLM** or **Negotiate (Kerberos)**.
10. Click **Next**.
11. After you complete the **SharePoint Products Configuration Wizard** page, review your configuration settings to verify that they are correct, and then click **Next**.

 **Note:**

The **Advanced Settings** option is not available in SharePoint 2013 Preview.

12. On the **Configuration Successful** page, click **Finish**. When the wizard closes, setup opens the web browser and connects to Central Administration.
- If the SharePoint Products Configuration Wizard fails, check the PSCDiagnostics log files, which are located on the drive on which SharePoint 2013 Preview is installed, in the %COMMONPROGRAMFILES%\Microsoft Shared\Web Server Extensions\15\LOGS folder.
- If you are prompted for your user name and password, you might have to add the SharePoint Central Administration web site to the list of trusted sites and configure user authentication settings in Internet Explorer. You might also want to disable the Internet Explorer Enhanced Security settings. If you see a proxy server error message, you might have to configure proxy server settings so that local addresses bypass the proxy server. Instructions for configuring proxy server settings are provided in the following section. For more information about how to configure browser and proxy settings, see [Configure browser settings](#).

Configure browser settings

After you run the SharePoint Products Configuration Wizard, you should confirm that SharePoint 2013 Preview works correctly by configuring additional settings in Internet Explorer.

If you are not using Internet Explorer, you might have to configure additional settings for your browser. For information about supported browsers, see [Plan browser support \(SharePoint 2013 Preview\)](#).

To confirm that you have configured browser settings correctly, log on to the server by using an account that has local administrative credentials. Next, connect to the SharePoint Central Administration web site. If you are prompted for your user name and password when you connect, perform the following procedures:

- Add the SharePoint Central Administration website to the list of trusted sites

-
- Disable Internet Explorer Enhanced Security settings

If you receive a proxy server error message, perform the following procedure:

- Configure proxy server settings to bypass the proxy server for local addresses

If you are using Internet Explorer 8, for more information, see [Getting Started with IEAK 8](#).

To add the SharePoint Central Administration website to the list of trusted sites

1. Verify that the user account that completes this procedure has the following credentials:
 - The user account is a member of the Administrators group on the computer on which you are performing the procedure.
2. In Internet Explorer, on the **Tools** menu, click **Internet Options**.
3. On the **Security** tab, in the **Select a zone to view or change security settings** area, click **Trusted Sites**, and then click **Sites**.
4. Clear the **Require server verification (https:) for all sites in this zone** check box.
5. In the **Add this web site to the zone** box, type the URL to your site, and then click **Add**.
6. Click **Close** to close the **Trusted Sites** dialog box.
7. Click **OK** to close the **Internet Options** dialog box.

To disable Internet Explorer Enhanced Security settings

1. Verify that the user account that completes this procedure has the following credentials:
 - The user account is a member of the Administrators group on the computer on which you are performing the procedure.
2. Click **Start**, point to **All Programs**, point to **Administrative Tools**, and then click **Server Manager**.
3. In **Server Manager**, select the root of **Server Manager**.
4. In the **Security Information** section, click **Configure IE ESC**.
The **Internet Explorer Enhanced Security Configuration** dialog box appears.
5. In the **Administrators** section, click **Off** to disable the Internet Explorer Enhanced Security settings, and then click **OK**.

To configure proxy server settings to bypass the proxy server for local addresses

1. Verify that the user account that completes this procedure has the following credentials:
 - The user account is a member of the Administrators group on the computer on which you are performing the procedure.
2. In Internet Explorer, on the **Tools** menu, click **Internet Options**.
3. On the **Connections** tab, in the **Local Area Network (LAN) settings** area, click **LAN Settings**.
4. In the **Automatic configuration** area, clear the **Automatically detect settings** check box.
5. In the **Proxy Server** area, select the **Use a proxy server for your LAN** check box.
6. Type the address of the proxy server in the **Address** box.
7. Type the port number of the proxy server in the **Port** box.

-
8. Select the **Bypass proxy server for local addresses** check box.
 9. Click **OK** to close the **Local Area Network (LAN) Settings** dialog box.
 10. Click **OK** to close the **Internet Options** dialog box.

Run the Farm Configuration Wizard

You have now completed setup and the initial configuration of SharePoint 2013 Preview. You have created the SharePoint Central Administration web site. You can now create your farm and sites, and you can select services by using the Farm Configuration Wizard.

To run the Farm Configuration Wizard

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. On the SharePoint Central Administration home page, on the **Quick Launch**, click **Configuration Wizards**, and then click **Launch the Farm Configuration Wizard**.
3. On the **Help Make SharePoint Better** page, click one of the following options, and then click **OK**:
 - **Yes, I am willing to participate (Recommended.)**
 - **No, I don't want to participate.**
4. On the **Configure your SharePoint farm** page, next to **Yes, walk me through the configuration of my farm using this wizard**, click **Start the Wizard**.
5. On the **Configure your SharePoint farm** page, in the **Service Account** section, click the service account option that you want to use to configure your services.

Security

For security reasons, we recommend that you use a different account from the farm administrator account to configure services in the farm.

If you decide to use an existing managed account — that is, an account of which SharePoint 2013 Preview is aware — make sure that you click that option before you continue.

6. In the **Services** section, review the services that you want to use in the farm, and then click **Next**.

Note:

For more information, see [Configure services in SharePoint 2013 Preview](#). If you are using Office Web Apps Preview, see [Office Web Apps Preview \(SharePoint 2013 Preview Products\)](#).

7. On the **Create Site Collection** page, do the following:
 - a) In the **Title and Description** section, in the **Title** box, type the name of your new site.
 - b) Optional: In the **Description** box, type a description of what the site contains.
 - c) In the **Web Site Address** section, select a URL path for the site.

-
- d) In the **Template Selection** section, in the **Select a template** list, select the template that you want to use for the top-level site in the site collection.

Note:

To view a template or a description of a template, click any template in the **Select a template** list.

8. Click **OK**.
9. On the **Configure your SharePoint farm** page, review the summary of the farm configuration, and then click **Finish**.

Post-installation steps

After you install and configure SharePoint 2013 Preview, your browser window opens to the Central Administration web site of your new SharePoint site. Although you can start adding content to the site or customizing the site, we recommend that you first perform the following administrative tasks.

- **Configure usage and health data collection** You can configure usage and health data collection in your server farm. The system writes usage and health data to the logging folder and to the logging database. For more information, see [Configure usage and health data collection \(SharePoint 2013 Products Preview\)](#).
- **Configure diagnostic logging** You can configure diagnostic logging that might be required after initial installation or upgrade. The default settings are sufficient for most situations. Depending upon the business needs and life-cycle of the farm, you might want to change these settings. For more information, see [Configure diagnostic logging \(SharePoint 2013 Preview\)](#).
- **Configure incoming e-mail** You can configure incoming e-mail so that SharePoint sites accept and archive incoming e-mail. You can also configure incoming e-mail so that SharePoint sites can archive e-mail discussions as they occur, save e-mailed documents, and show e-mailed meetings on site calendars. In addition, you can configure the SharePoint Directory Management Service to provide support for e-mail distribution list creation and administration. For more information, see [Configure incoming email for a SharePoint 2013 Preview farm](#).
- **Configure outgoing email** You can configure outgoing email so that your Simple Mail Transfer Protocol (SMTP) server sends email alerts to site users and notifications to site administrators. You can configure both the "From" email address and the "Reply" email address that appear in outgoing alerts. For more information, see [Configure outgoing email for a SharePoint 2013 Preview farm](#).
- **Configure Search settings** You can configure Search settings to crawl the content in SharePoint 2013 Preview.

Install SharePoint 2013 Preview across multiple servers for a three-tier farm

A three-tier farm configuration consists of two front-end web servers, an application server, and a database server. The deployment sequence and configurations that are described in this article are based on recommended best practices. While the farm configuration is not complex, it provides a fundamental infrastructure to implement a SharePoint 2013 Preview solution on similar — or more complex farms.

In this article:

- [Overview](#)
- [Prepare the farm servers](#)
- [Install SharePoint 2013 Preview on the farm servers](#)
- [Create and configure the farm](#)
- [Add web servers to the farm](#)
- [Post-installation steps](#)

Overview

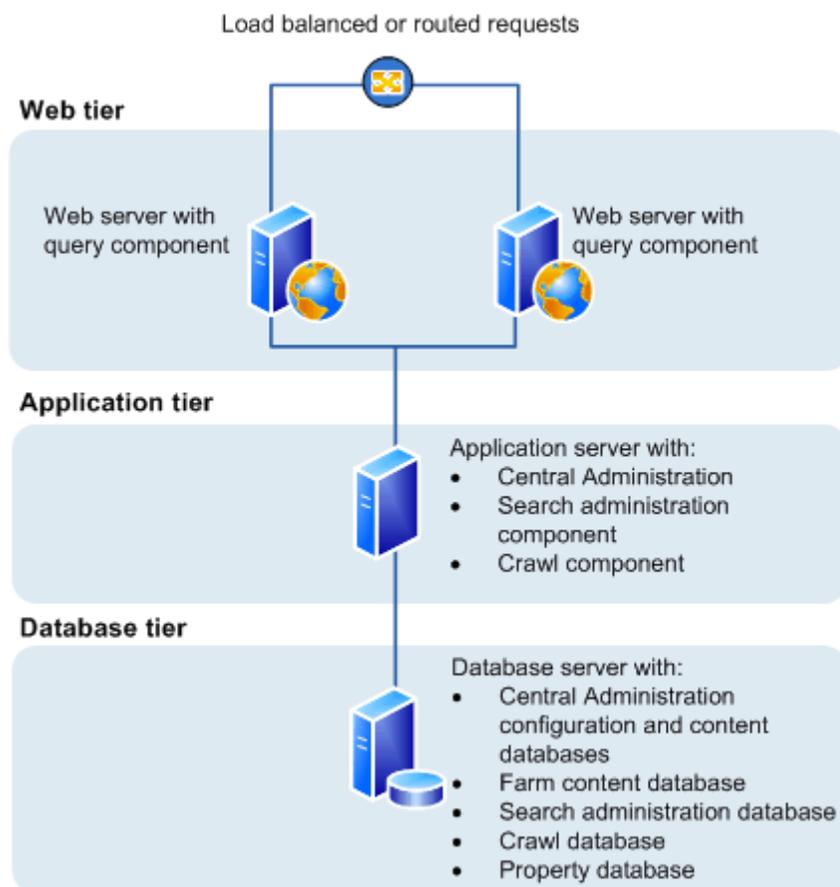

The basic steps in this deployment are as follows:

- Ensure that you are familiar with the concept of a three-tier topology.
- Ensure that you have done all the planning and preparatory work, such as verifying hardware and software requirements.
- Install the required software updates on all servers that will be part of the farm.
- Install the SharePoint 2013 Preview prerequisites on servers in the application and web tiers.
- Install SharePoint 2013 Preview on the application server and the web servers.
- Create and configure the SharePoint farm.
- Provision services.
- Complete post-deployment tasks as required.

Topology overview

This topology is typically used for the medium and large farms described in [Overview of SharePoint 2013 Preview installation and configuration](#). In terms of performance, capacity, and scalability, a three-tier topology is recommended over a two-tier topology. A three-tier topology provides the most efficient physical and logical layout to support scaling out or scaling up, and it provides better distribution of services across the member servers of the farm. The following illustration shows the three-tier deployment that is described in this article.

Three-tier farm configuration

In the previous illustration, note the following:

- You can add web servers to the web tier. These servers can be configured as conventional web servers to handle user requests, or they can be configured to host dedicated query components or other service components.
- You can add farm servers to the application tier and configure them as dedicated servers that will host the SharePoint Central Administration website or other services on the farm that require dedicated resources or isolation from the web tier — for example, crawl components, query components, and profile pages.
- You can add database servers to the database tier to implement a stand-alone instance, database mirroring, or a failover cluster. To configure the farm for high availability, database mirroring or a failover cluster is required on the database tier.

Before you install SharePoint 2013 Preview on multiple servers for a three-tier farm

Before you begin to install and configure SharePoint 2013 Preview, do the following:

-
- Ensure that you are familiar with the operating-system guidelines described in [Performance Tuning Guidelines for Windows Server 2008](#) and [Performance Tuning Guidelines for Windows Server 2008 R2](#).
 - Ensure that you have met all hardware and software requirements. You must have a 64-bit version of Windows Server 2008 R2 SP1. For server farms, you must also have a supported 64-bit version of SQL Server. For more information about these requirements, such as specific updates that you must install, see [Hardware and software requirements \(SharePoint 2013 Preview\)](#).
 - Ensure that you perform a clean installation of SharePoint 2013 Preview.
 - Ensure that you are prepared to set up the required accounts by using appropriate permissions. For detailed information, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).

Using the Microsoft SharePoint Products Preparation Tool

The Microsoft SharePoint Products Preparation Tool checks for the presence of prerequisites, and installs and configures all required programs. The Microsoft SharePoint Products Preparation Tool requires an Internet connection to download and configure SharePoint 2013 Preview prerequisites. The Microsoft SharePoint Products Preparation Tool runs when you start to install SharePoint 2013 Preview.

Database server

Ensure that SQL Server is updated to the required level and the TCP/IP protocol is enabled for the network configuration.

Organizations whose database administrators operate independently from SharePoint administrators will have to make sure that the correct version of SQL Server is available and updated to the required level. In addition, you will have to request a DBA-created database that is configured for your farm.

Note:

The procedures in this article do not use a DBA-created database. These procedures will be different in a DBA-created database deployment. For more information, see [Deploy by using DBA-created databases \(SharePoint 2013 Preview\)](#).

Public updates and hotfix packages

Ensure that public updates and the required hotfix packages are installed for the operating system, SQL Server, and SharePoint 2013 Preview. We recommend that all servers be updated to the same software version before you apply the public updates.

Prepare the farm servers

Before you install SharePoint 2013 Preview, you must check for and install all the prerequisites on the application server and the web servers by using the Microsoft SharePoint Products Preparation Tool.

**Tip:**

If you decide to install prerequisites manually, you can still run the Microsoft SharePoint Products Preparation Tool to verify which prerequisites are required on each server.

Use the following procedure to install prerequisites on each server in the farm.

To run the Microsoft SharePoint Products Preparation Tool

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. In the folder where you downloaded the SharePoint 2013 Preview software, locate and then run **prerequisiteinstaller.exe**.
3. On the **Welcome to the Microsoft SharePoint Products Preparation Tool** page, click **Next**.

**Note:**

The preparation tool may have to restart the local server to complete the installation of some prerequisites. The installer will continue to run after the server is restarted without manual intervention. However, you will have to log on to the server again.

4. On the **License Terms for software products** page, review the terms, select the **I accept the terms of the License Agreement(s)** check box, and then click **Next**.
5. On the Installation Complete page, click **Finish**.
6. After you complete the Microsoft SharePoint Products Preparation Tool, you must also install the following:
 - [KB 2554876](#)
 - [KB 2708075](#)
 - [KB 2472264](#)

Install SharePoint 2013 Preview on the farm servers

After the prerequisites are installed, follow these steps to install SharePoint 2013 Preview on each farm server.

The following procedure installs binaries, configures security permissions, and edits registry settings for SharePoint 2013 Preview. At the end of Setup, you can choose to start the SharePoint Products Configuration Wizard, which is described later in this article.

To run Setup

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. On the **SharePoint Server 2013 Preview Start** page, click **Install SharePoint Server**.
3. On the **Enter Your Product Key** page, enter your product key, and then click **Continue**.

-
4. On the **Read the Microsoft Software License Terms** page, review the terms, select the **I accept the terms of this agreement** check box, and then click **Continue**.
 5. On the **Choose the installation you want** page, click **Server Farm**.
 6. On the **Server Type** tab, click **Complete**.
 7. On the **File Location** tab, accept the default location or change the installation path, and then click **Install Now**.

Note:

As a best practice, we recommend that you install SharePoint 2013 Preview on a non-system drive.

8. When the Setup program is finished, a dialog box prompts you to complete the configuration of your server. Clear the **Run the SharePoint Products and Technologies Configuration Wizard now** check box.

Note:

For consistency of approach, we recommend that you do not run the configuration wizard until you have installed SharePoint 2013 Preview all application and front-end web servers that will participate in the server farm.

9. Click **Close** to finish Setup.

Create and configure the farm

To create and configure the farm, you run the SharePoint Products Configuration Wizard. This wizard automates several configuration tasks, such as creating the configuration database, installing services, and creating the Central Administration website. We recommend that you run the SharePoint Products Configuration Wizard on the server that will host the SharePoint Central Administration website before you run the wizard on the other servers in the farm.

To run the SharePoint Products Configuration Wizard and configure the farm

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. On the server that will host Central Administration (the application server), click **Start**, point to **All Programs**, and then click **SharePoint 2013 Products**, and then click **SharePoint 2013 Products Configuration Wizard**. If the **User Account Control** dialog box appears, click **Continue**.
3. On the **Welcome to SharePoint Products** page, click **Next**.
4. In the dialog box that notifies you that some services might have to be restarted during configuration, click **Yes**.
5. On the **Connect to a server farm** page, click **Create a new server farm**, and then click **Next**.
6. On the **Specify Configuration Database Settings** page, do the following:
 - a) In the **Database server** box, type the name of the computer that is running SQL Server.

-
- b) In the **Database name** box, type a name for your configuration database, or use the default database name. The default name is SharePoint_Config.
 - c) In the **Username** box, type the user name of the server farm account in DOMAIN\user name format.

 **Important:**

The server farm account is used to create and access your configuration database. It also acts as the application pool identity account for the SharePoint Central Administration application pool, and it is the account under which the Windows SharePoint Services Timer service runs. The SharePoint Products Configuration Wizard adds this account to the SQL Server Login accounts, the SQL Server **dbcreator** server role, and the SQL Server **securityadmin** server role. The user account that you specify as the service account has to be a domain user account. However, it does not have to be a member of any specific security group on your web servers or your database servers. We recommend that you follow the principle of least-privilege, and specify a user account that is not a member of the Administrators group on your front-end web servers or your database servers.

- d) In the **Password** box, type the user password.

7. Click **Next**.

8. On the Specify Farm Security Settings page, type a passphrase, and then click **Next**.

Although a passphrase resembles a password, it is usually longer to improve security. It is used to encrypt credentials of accounts that are registered in SharePoint 2013 Preview. For example, the SharePoint 2013 Preview system account that you provide when you run the SharePoint Products Configuration Wizard. Ensure that you remember the passphrase, because you must use it every time that you add a server to the farm.

Ensure that the passphrase meets the following criteria:

- Contains at least eight characters
- Contains at least three of the following four character groups:
 - English uppercase characters (from A through Z)
 - English lowercase characters (from a through z)
 - Numerals (from 0 through 9)
 - Nonalphabetic characters (such as !, \$, #, %)

9. On the **Configure SharePoint Central Administration Web Application** page, do the following:

- a) Either select the **Specify port number** check box and type the port number that you want the SharePoint Central Administration web application to use, or leave the **Specify port number** check box cleared if you want to use the default port number.

 **Note:**

If you want to access the SharePoint Central Administration website from a remote computer, make sure that you allow access to the port number that you configure in this step. You do this by configuring the inbound rule for **SharePoint Central Administration v4** in Windows Firewall with Advanced Security.

- b) Click either **NTLM** or **Negotiate (Kerberos)**.

-
10. Click **Next**.
 11. On the **Completing the SharePoint Products Configuration Wizard** page, click **Next**.
 12. On the **Configuration Successful** page, click **Finish**.

 **Note:**

If the SharePoint Products Configuration Wizard fails, check the log files on the drive on which SharePoint 2013 Preview is installed, which are located in the %COMMONPROGRAMFILES%\Microsoft Shared\Web Server Extensions\15\LOGS folder.

13. The Central Administration website will open in a new browser window.
On the Help Make SharePoint Better page, click one of the following options and then click **OK**.
 - a) **Yes, I am willing to participate (Recommended)**.
 - b) **No, I don't wish to participate**.
14. On the **Initial Farm Configuration Wizard** page, you have the option to use a wizard to configure services or you can decide to configure services manually. For the purpose of this article, we use the manual option. Click **Cancel**.
The choice that you make here is a matter of personal preference. The Farm Configuration Wizard will configure some services automatically when you run it. However, if you configure services manually, you have greater flexibility in designing your logical architecture.
For information about how to use the wizard to configure services, see [Configure services in SharePoint 2013 Preview](#). If you are using Microsoft Office Web Apps Preview, see [Office Web Apps overview \(Installed on SharePoint 2013 Preview Products\)](#).

 **Important:**

If you are using a DBA-created database, you cannot use the Farm Configuration Wizard, you must use SharePoint Products Configuration Wizard.

Add web servers to the farm

After you create the farm on the application server, you can add the servers for the web tier by following the same process described earlier in this topic for installing SharePoint 2013 Preview on the server that hosts Central Administration. The only difference is that during setup, you are prompted to join an existing farm. Follow the wizard steps to join the farm.

For additional information about how to add servers to a farm, see [Add web or application servers to farms in SharePoint 2013 Preview](#). This article also provides detailed information for the steps in the following procedure.

Post-installation steps

After you install and configure SharePoint 2013 Preview, your browser window opens to the Central Administration web site of your new SharePoint site. Although you can start adding content to the site or customizing the site, we recommend that you first perform the following administrative tasks.

-
- **Configure usage and health data collection** You can configure usage and health data collection in your server farm. The system writes usage and health data to the logging folder and to the logging database. For more information, see [Configure usage and health data collection \(SharePoint 2013 Products Preview\)](#).
 - **Configure diagnostic logging** You can configure diagnostic logging that might be required after initial installation or upgrade. The default settings are sufficient for most situations. Depending upon the business needs and life-cycle of the farm, you might want to change these settings. For more information, see [Configure diagnostic logging \(SharePoint 2013 Preview\)](#).
 - **Configure incoming e-mail** You can configure incoming e-mail so that SharePoint sites accept and archive incoming e-mail. You can also configure incoming e-mail so that SharePoint sites can archive e-mail discussions as they occur, save e-mailed documents, and show e-mailed meetings on site calendars. In addition, you can configure the SharePoint Directory Management Service to provide support for e-mail distribution list creation and administration. For more information, see [Configure incoming email for a SharePoint 2013 Preview farm](#).
 - **Configure outgoing email** You can configure outgoing email so that your Simple Mail Transfer Protocol (SMTP) server sends email alerts to site users and notifications to site administrators. You can configure both the "From" email address and the "Reply" email address that appear in outgoing alerts. For more information, see [Configure outgoing email for a SharePoint 2013 Preview farm](#).
 - **Configure Search settings** You can configure Search settings to crawl the content in SharePoint 2013 Preview.

Install or uninstall language packs for SharePoint 2013 Preview

Language packs enable site owners and site collection administrators to create SharePoint sites and site collections in multiple languages without requiring separate installations of SharePoint 2013 Preview. You install language packs, which contain language-specific site templates, on web servers. When an administrator creates a site or a site collection that is based on a language-specific site template, the text that appears on the site or the site collection is displayed in the site template's language. Language packs are typically used in multinational deployments where a single server farm supports users in different locations, or when sites and web pages must be duplicated in one or more languages.

If users are accessing Project Server 2013 Preview in the SharePoint farm and have to view their project data in another language, they will also have to install a corresponding Project Server 2013 Preview language pack. For more information about Project Server 2013 Preview language packs, see [Deploy language packs \(Project Server 2010\)](#)

Word breakers and stemmers enable you to search efficiently and effectively across content on SharePoint sites and site collections in multiple languages without requiring separate installations of SharePoint 2013 Preview. Word breakers and stemmers are automatically installed on web servers by Setup.

Important:

If you are uninstalling SharePoint 2013 Preview, you must uninstall all language packs before you uninstall SharePoint 2013 Preview.

In this article:

- [About language IDs and language packs](#)
- [Downloading language packs](#)
- [Installing language packs on the web servers](#)
- [Uninstalling language packs](#)

About language IDs and language packs

Site owners or site collection administrators who create sites or site collections can select a language for each site or site collection.

The language that they select has a language identifier (ID). The language ID determines the language that is used to display and interpret text that is on the site or site collection. For example, when a site owner creates a site in French, the site's toolbars, navigation bars, lists, and column headings appear in French. Similarly, if a site owner creates a site in Arabic, the site's toolbars, navigation bars, lists, and column headings appear in Arabic. In addition, the default left-to-right orientation of the site changes to a right-to-left orientation to correctly display Arabic text.

The language packs that are installed on the web servers determine the list of available languages that you can use to create a site or site collection. By default, sites and site collections are created in the language in which SharePoint 2013 Preview was installed. For example, if you install the Spanish version of SharePoint 2013 Preview, the default language for sites, site collections, and web pages is Spanish. If someone has to create sites, site collections, or web pages in a language other than the default SharePoint 2013 Preview language, you must install the language pack for that language on the web servers. For example, if you are running the French version of SharePoint 2013 Preview, and a site owner wants to create sites in French, English, and Spanish, you must install the English and Spanish language packs on the web servers.

By default, when a site owner creates a new web page in a site, the site displays text in the language that is specified by the language ID.

Language packs are not bundled into multilingual installation packages. You must install a specific language pack for each language that you want to support. Also, language packs must be installed on each web server to make sure that that each web server can display content in the specified language.

 **Important:**

You cannot change an existing site, site collection, or web page from one language to another by applying different language-specific site templates. After you use a language-specific site template for a site or a site collection, the site or site collection always displays content in the language of the original site template.

For this preview release, only a limited set of language packs are available for SharePoint 2013 Preview.

Although a site owner specifies a language ID for a site, some user interface elements such as error messages, notifications, and dialog boxes do not display in the language that was specified. This is because SharePoint 2013 Preview relies on several supporting technologies — for example, the Microsoft .NET Framework, Microsoft Windows Workflow Foundation, Microsoft ASP.NET, and SQL Server — some of which are localized into only a limited number of languages. If a user interface element is generated by any of the supporting technologies that are not localized into the language that the site owner specified for the site, the user interface element appears in English. For example, if a site owner creates a site in Hebrew, and the .NET Framework component displays a notification message, the notification message will not display in Hebrew because the .NET Framework is not localized into Hebrew. This situation can occur when sites are created in any language except the following: Chinese, French, German, Italian, Japanese, Korean, and Spanish.

Each language pack that you install creates a folder at %COMMONPROGRAMFILES%\Microsoft Shared\Web server extensions\15\LAYOUTS\Locale_ID that contains language-specific data. In each locale_ID folder, you must have only one HTML error file that contains the error information that is used when a file cannot be found. Anytime a file cannot be found for any site in that language, this file will be used. You can specify the file to use by setting the **FileNotFoundPage** for each web application.

In some cases, some text might originate from the original installation language, which can create a mixed-language experience. This kind of mixed-language experience is typically seen only by content creators or site owners and is not seen by site users.

Downloading language packs

Follow these steps for each language that you want to support. If you decide to download more than one language, please be aware that a unique file that has a common name is downloaded for each language. Therefore, make sure that you download each language pack to a separate folder on the hard disk so that you do not overwrite a language pack of a different language.

Important:

By default, the Windows PowerShell Help files are installed in English (en-us). To view these files in the same language as the operating system, install the language pack for the same language in which the operating system was installed.

You can download language packs from the same location where you downloaded SharePoint 2013 Preview.

Installing language packs on the web servers

After you install the necessary language files on the web servers, you can install the language packs. Language packs are available as individual downloads (one download for each supported language). If you have a server farm environment and you are installing language packs to support multiple languages, you must install the language packs on each web server.

Important:

The language pack is installed in its native language. The procedure that follows is for the English language pack.

To install a language pack

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. In the folder where you downloaded the language pack, run setup.exe.
3. On the Read the Microsoft Software License Terms page, review the terms, select the **I accept the terms of this agreement** check box, and then click **Continue**.
4. The Setup wizard runs and installs the language pack.
5. Rerun the SharePoint Products Configuration Wizard by using the default settings. If you do not run the SharePoint Products Configuration Wizard after you install a language pack, the language pack will not be installed correctly.

The SharePoint Products Configuration Wizard runs in the language of the base installation of SharePoint 2013 Preview, not in the language of the language pack that you just installed.

To rerun the SharePoint 2013 Preview Configuration Wizard

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).

-
2. Click **Start**, point to **All Programs**, click **Microsoft SharePoint 2013 Products**, and then click **SharePoint 2013 Products Configuration Wizard**.
 3. On the **Welcome to SharePoint Products** page, click **Next**.
 4. Click **Yes** in the dialog box that alerts you that some services might have to be restarted during configuration.
 5. On the **Modify Server Farm Settings** page, click **Do not disconnect from this server farm**, and then click **Next**.
 6. If the **Modify SharePoint Central Administration Web Administration Settings** page appears, do not change any of the default settings, and then click **Next**.
 7. After you complete the Completing the SharePoint Products and Technologies Configuration Wizard, click **Next**.
 8. On the **Configuration Successful** page, click **Finish**.
 9. After you install a new language pack and rerun the Rerun the SharePoint 2013 Preview Configuration Wizard, you must deactivate and then reactivate any language-specific features before you use the new language pack.

When you install language packs, the language-specific site templates are installed in the %COMMONPROGRAMFILES%\Microsoft Shared\Web server extensions\15\TEMPLATE\LanguageID directory, where *LanguageID* is the Language ID number for the language that you are installing. For example, the United States English language pack installs to the %COMMONPROGRAMFILES%\Microsoft Shared\Web Server Extensions\15\TEMPLATE\1033 directory. After you install a language pack, site owners and site collection administrators can create sites and site collections based on the language-specific site templates by specifying a language when they are creating a new SharePoint site or site collection.

Uninstalling language packs

If you no longer have to support a language for which you have installed a language pack, you can remove the language pack by using the Control Panel. Removing a language pack removes the language-specific site templates from the computer. All sites that were created that have those language-specific site templates will no longer work (the URL will produce a HTTP 500 - Internal server error page). Reinstalling the language pack will make the site functional again.

You cannot remove the language pack for the version of SharePoint 2013 Preview that you have installed on the server. For example, if you are running the Japanese version of SharePoint 2013 Preview, you cannot uninstall the Japanese language support for SharePoint 2013 Preview.

Add web or application servers to farms in SharePoint 2013 Preview

The procedures in this article apply to a SharePoint 2013 Preview farm that consists of at least two tiers. This article does not describe how to convert a single-server deployment to a multiple-server farm.

In this article:

- [Before you add a web or application server to a SharePoint 2013 Preview farm](#)
- [Install prerequisite software](#)
- [Install the SharePoint Products software](#)
- [Add the new SharePoint 2013 Preview server to the farm](#)
- [Configure the new server](#)

Before you add a web or application server to a SharePoint 2013 Preview farm

Note:

Administrators typically use the SharePoint Central Administration website and the SharePoint Management Shell to manage deployments. For information about accessibility for administrators, see [Accessibility for SharePoint Products](#).

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 15 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

Determine server role

To add a new server to the farm, you must know its intended role to plan for additional or specialized configurations and assess the potential effect of adding the server to a production environment.

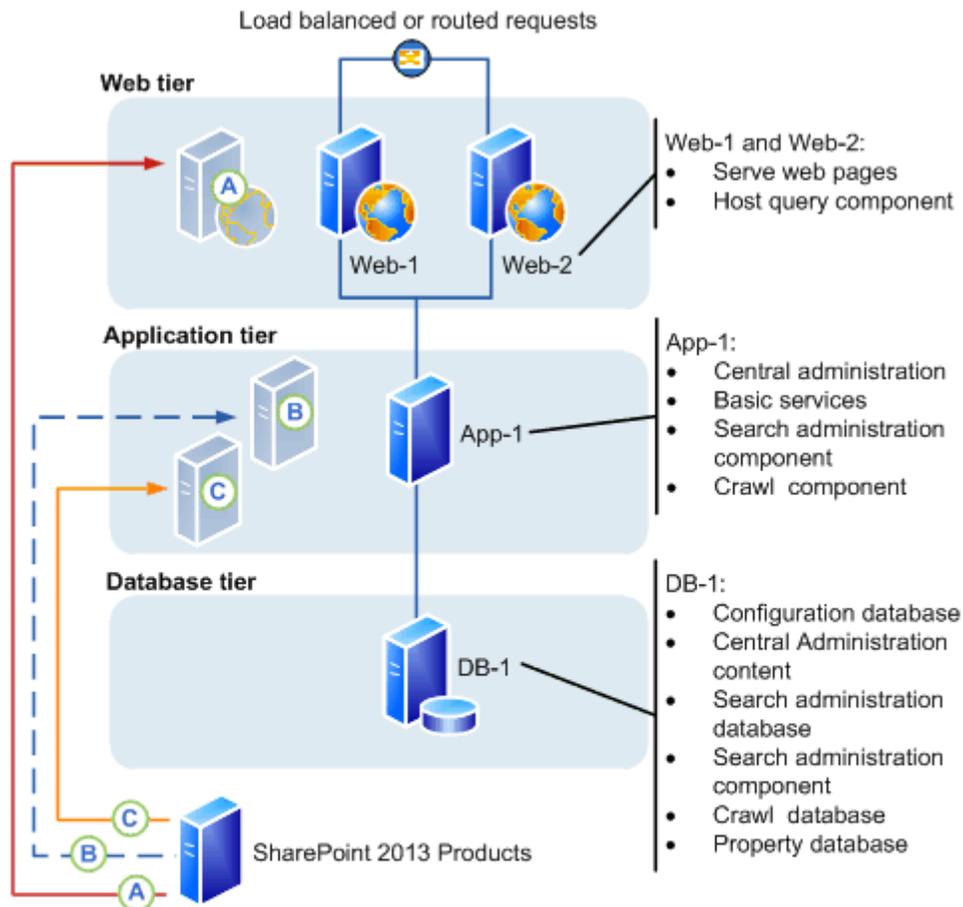

Note:

A typical three-tier farm includes front-end web servers, an application server that also hosts Central Administration, and a database server. The scope of this article is the front-end web server and application server roles.

After you determine the role of the server in your farm topology, you must identify the services and features that must be configured for the server to meet this role. This information will determine how SharePoint 2013 Preview is configured to provision the server for its role in either the web tier or the application tier. For more information, see [Manage service applications and services \(SharePoint Server 2010\)](#).

The following illustration shows a SharePoint 2013 Preview farm with two front-end web servers (Web-1 and Web-2) that serve content and host the search query component. The only application server (App-1) hosts Central Administration and the search crawl component for the farm.

Options for adding a server to a farm

New server options

- A** New server, added to Web server tier and configured with query component
- B** New server, added to application tier and configured with query component
- C** New server, added to application tier and configured with crawl component

The following sections provide information about the general characteristics of the front-end web server and application server roles.

Front-end web server role

The fundamental role of a front-end web server is to host web pages, web services, and the Web Parts that are required to process requests from users. The web server directs these requests to the application server, which returns the results to the front-end web server.

Depending on farm requirements, the front-end web server may also be configured to support search in scenarios where there are no dedicated search servers.

Note:

Distributing search is not an option for SharePoint Foundation 2013 Preview, where only a single search instance is permitted for each content database.

SharePoint Server 2013 Preview provides more flexibility by letting you to install different search components, typically query components, on one or more front-end web servers. This is option A in the previous farm illustration. A third server also improves load balancing and increases front-end web server availability. Three servers on the web-tier is called a *stretched farm*.

Application server role

By default, the server that hosts Central Administration in a three-tier farm is an application server. You can add application servers to host services that can be deployed to a single server and used by all the servers in a farm.

Services with similar usage and performance characteristics can be logically grouped on a server, and if it is necessary, hosted on multiple servers if a scale out is required to respond to performance or capacity requirements. For example, client-related farm services such as Word Services and Word Viewer can be combined into a service group and hosted on a dedicated server. In addition, some services, such as the Managed Metadata service, can be configured as service application that can be used by other farms.

In the farm illustration, there are two options to add an application server.

- In option B an additional server is configured to host all queries for the farm. The query component is removed from the front-end web servers.
- In option C an additional server is configured as a dedicated crawl server, which offloads farm indexing from the server that hosts Central Administration. The front-end web servers continue to host the query component for the farm.

In a three-tier farm that is running enterprise search, dedicated application servers are typically configured to host individual enterprise search components. Servers hosting a query component are known as query servers and servers hosting a crawl component are known as index servers. For more information, see [Manage search topology \(SharePoint Server 2013 Preview\)](#).

Additional tasks

Before you start to install prerequisite software, you have to complete the following:

- Verify that the new server meets the hardware and software requirements described in [Determine hardware and software requirements \(SharePoint Server 2010\)](#).

**Tip:**

As a best practice, we recommend that the operating system on the new server should be at the same service pack level and have the same security updates and other hotfixes as the existing farm servers.

- Verify that you have the minimum level of permissions that are required to install and configure SharePoint 2013 Preview on a new server. You must be a member of the Farm Administrators SharePoint group and the Administrators group on the local server to complete the procedures in this article. For more information, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
- Verify that you know the name of the database server on the farm to which you are connecting, and the name of the configuration database if you are adding the server by using Windows PowerShell commands.
- If you intend to use Windows PowerShell commands to add the server, verify that you meet the following minimum memberships: SharePoint 2013 Preview is installed.
- **Securityadmin** fixed server role on the SQL Server instance.
- **db_owner** fixed database role on all databases that are to be updated.
- Administrators group on the server on which you are running the Windows PowerShell cmdlets.
- An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

**Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

- Document the location of the SharePoint 2013 Preview binary and log files on the existing farm servers. We recommend that the location of these files on the new server map to the locations used on the other servers in the farm. For more information, see [Configure diagnostic logging \(SharePoint Server 2010\)](#).

**Important:**

If you change the location of the trace log to a non-system drive, change the location on all the servers in the farm. Existing or new servers cannot log data if the location does not exist. In addition, you will be unable to add new servers unless the path that you specify exists on the new server. You cannot use a network share for logging purposes.

Install prerequisite software

Before you can install SharePoint 2013 Preview and add a server to the farm, you must check for and install all the prerequisite software on the new server. You do this by using the Microsoft SharePoint Products Preparation Tool, which requires an Internet connection to download and configure SharePoint 2013 Preview prerequisites. If you do not have an Internet connection for the farm servers, you can still use the tool to determine the software that is required. You will have to obtain installable

images for the required software. For download locations, see [Access to applicable software](#) in "Hardware and software requirements (SharePoint 2013 Preview)."

Tip:

After you obtain a copy of the required software, we recommend that you create an installation point that you can use to store the images. You can use this installation point to install future software updates.

For detailed instructions about how to install the prerequisites, see [Prepare the farm servers](#) in the article, [Install SharePoint 2013 Preview across multiple servers for a three-tier farm](#).

Install the SharePoint Products software

After you install the prerequisites, follow these steps to install SharePoint 2013 Preview on the new server. For detailed instructions about how to install SharePoint 2013 Preview, see [Install SharePoint 2013 Preview on a single server with SQL Server](#).

To install SharePoint 2013 Preview

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. From the product media or a file share that contains the SharePoint 2013 Preview Products installation files, run Setup.exe.
3. On the **Start** page, click the link to install SharePoint 2013 Preview.
4. Review and accept the Microsoft License Terms.
5. On the **Server Type** tab, select **Complete**.

Note:

You can choose to install only the components that are required for a front-end web server. However, if you perform a complete installation, you have more flexibility to re-purpose the server role in the farm in the future.

6. Accept the default file location where SharePoint 2013 Preview will be installed or change the installation path in order to suit your requirements.

Tip:

As a best practice, we recommend that you install SharePoint 2013 Preview on a drive that does not contain the operating system.

7. When Setup finishes, a dialog box prompts you to run the SharePoint Products Configuration Wizard. You can start the wizard immediately or from the Windows command prompt later.

Add the new SharePoint 2013 Preview server to the farm

You add the new server to the farm by using one of the following procedures:

- [To add a new SharePoint 2013 Preview server to the farm by using the SharePoint Products Configuration Wizard](#)
- [To add a new SharePoint 2013 Preview server to the farm by using Windows PowerShell](#)

To add a new SharePoint 2013 Preview server to the farm by using the SharePoint Products Configuration Wizard

1. Verify that the user account that is performing this procedure is the Setup user account. For information about the Setup user account, see [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#).
2. On the new server, click **Start**, point to **All Programs**, click **uiName_SharePointAll_1st**, and then click **uiName_ConfigWiz**.
3. On the **Welcome to SharePoint Products** page, click **Next**.
4. On the **Connect to a server farm** page, click **Connect to an existing server farm**.
5. Click **Next**.
6. On the **Specify Configuration Database settings** page, type the name of the instance of SQL Server in the **Database server** box, and then click **Retrieve Database Names**.
7. Select the name of the configuration database in the **Database name** list, and then click **Next**.
8. On the **Specify Farm Security Settings** page, type the name of the farm passphrase in the **Passphrase** box, and then click **Next**.
9. On the **Completing the SharePoint Products Configuration Wizard** page, click **Next**.
10. On the server that hosts Central Administration, click **Manage servers in this farm** to verify that the new server is part of the farm.

Note:

You can also verify a successful server addition or troubleshoot a failed addition by examining the log files. These files are located on the drive on which SharePoint 2013 Preview is installed, in the %COMMONPROGRAMFILES%\Microsoft Shared\Web Server Extensions\15\LOGS folder. For more information, see [Health monitoring for SharePoint 15 products](#).

11. On the **Servers in Farm** page, click the name of the new server. Use the list of available services on the **Services on Server** page to start the services that you want to run on the new server.
12. Configure SharePoint 2013 Preview so that the new server can accommodate the role for which it was intended. For more information, see [Configure the new server](#).

To add a new SharePoint 2013 Preview server to the farm by using Windows PowerShell

1. Verify that you have the following memberships:

- **securityadmin** fixed server role on the SQL Server instance.
- **db_owner** fixed database role on all databases that are to be updated.
- Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command to connect the server to a configuration database:

```
ConnectSPConfigurationDatabase -DatabaseServer "<$DatabaseServer>" -DatabaseName "<$RunSettings.ConfigurationDatabaseName>" -Passphrase "<$Passphrase>"
```

Where:

 - *<\$DatabaseServer>* is the name of the server that hosts the configuration database
 - *<\$RunSettings.ConfigurationDatabaseName>* is the name of the configuration database
 - *<\$Passphrase>* is the passphrase for the farm
6. At the Windows PowerShell command prompt, type the following command to install the Help File Collections:

```
Install-SPHelpCollection -All
```
7. At the Windows PowerShell command prompt, type the following command to install the Security Resource for SharePoint 2013 Preview:

```
Initialize-SPResourceSecurity
```
8. At the Windows PowerShell command prompt, type the following command to install the basic services:

```
Install-SPService
```
9. At the Windows PowerShell command prompt, type the following command to install all the features:

```
Install-SPFeature -AllExistingFeatures
```
10. At the Windows PowerShell command prompt, type the following command to install application content:

```
Install-SPApplicationContent
```

-
11. At the Windows PowerShell command prompt, type the following command to get a list of servers in the farm.

```
Get-SPFarm | select Servers
```

Note:

You can also verify a successful server addition or troubleshoot a failed addition by examining the log files. These files are located on the drive on which SharePoint 2013 Preview is installed, in the %COMMONPROGRAMFILES%\Microsoft Shared\Web Server Extensions\15\LOGS folder. For more information, see [Health monitoring for SharePoint 15 products](#).

12. Configure SharePoint 2013 Preview so that the new server can accommodate the role for which it was intended. For more information, see [Configure the new server](#).

Configure the new server

The new server has no real functionality in the farm until you configure the services that are required to support the role that you planned for the new server. For more information, see [Configure services in SharePoint 2013 Preview](#).

Remove a server from a farm in SharePoint 2013 Preview

There are three types of servers in a server farm running SharePoint 2013 Preview: web servers, application servers, and database servers. The method that you use to remove a server from a SharePoint farm varies depending on the type of server that you are removing from the farm.

In this article:

- [Removing a web server or application server from a SharePoint 2013 Preview farm](#)
- [Removing a database server from a SharePoint 2013 Preview farm](#)
- [Remove a database server, web server, or application server from a SharePoint farm by using Central Administration](#)

Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support \(SharePoint 2013 Preview\)](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

Removing a web server or application server from a SharePoint 2013 Preview farm

For information about uninstallation procedures that SharePoint 2013 Preview supports, see [Uninstall SharePoint 2013 Preview](#).

Removing a server that contains a search topology component can affect future search activities. The extent of that effect depends on the farm search topology. We recommend that you remove or relocate any search topology components from a server before removing the server from the farm.

If you remove a server that hosts a crawl component, no index files are lost. However, you might reduce or remove the capacity to crawl content.

You can lose index files in the following situations:

- The farm has only one query component, and you remove the server that hosts the query component.
- You have configured the index to be partitioned and you delete the last query component in one of the partitions. In this case, you will lose a portion of the index.

In either of these cases, a full crawl will have to be performed to re-create the index files.

You can deploy specific techniques to build fault tolerance into the search topology. If these techniques are followed, the deliberate or unplanned removal of a server from the topology can be absorbed without losing data and without affecting the ability to crawl or serve queries. (However, performance can still be affected.) For more information, see [Technical diagrams \(SharePoint 2013 Preview\)](#).

Make sure that the server that you want to remove is not running any important site components. If important services or components (such as a custom Web Part) are running on the server and are not available on another server in the farm, removing the server can damage sites in the farm. For example, if the server that you want to remove is the only application server in the farm that is running the Business Data Connectivity service, removing the server can make any sites that rely on that service stop working correctly.

Remove a web server or an application server from a farm by using Control Panel

You can remove a web server or an application server from the server farm by uninstalling SharePoint 2013 Preview from the server through Control Panel. When you uninstall SharePoint 2013 Preview by using Control Panel, you remove the program files and other information from the server.

To remove a web server or an application server from a farm by using Control Panel

1. Verify that the user account that completes this procedure has the following credentials:
 - The user account that performs this procedure is a member of the Administrators group on the server.
2. Stop the services that are running on the server. For information about how to determine which services are running on a specific server and stopping services, see [Manage services on the server \(SharePoint Server 2010\)](#).
3. On the server that you want to remove from the farm, click **Start**, click **Control Panel**, and then double-click **Programs and Features**.
4. In the list of currently installed programs, click **SharePoint 2013 Preview**, and then click **Uninstall**.
5. Click **Continue** at the confirmation prompt to uninstall the program.

Removing a database server from a SharePoint 2013 Preview farm

To remove a database server from a farm without uninstalling SharePoint and therefore deleting the data that was stored in the database, you must first move any databases that are hosted by that server to another database server in the farm and then use Central Administration to remove the database server from the farm.

You cannot remove a database server if it is the only database server available in the farm, or if it is the database server that hosts the configuration database.

 **Caution:**

If you uninstall SharePoint 2013 Preview from the server that is running Central Administration, you will be unable to administer the server farm until you configure another server in the farm to host the Central Administration site.

Remove a database server, web server, or application server from a SharePoint farm by using Central Administration

If a web server or application server is no longer available, or if uninstalling SharePoint 2013 Preview from Control Panel is not possible, you can remove the web server or application server from the farm by using the SharePoint Central Administration website. Removing a server from the farm by using Central Administration does not uninstall SharePoint 2013 Preview from the server, nor does it make any sites on that server inaccessible. We recommend that you use the process described in [Remove a web server or an application server from a farm by using Control Panel](#) to uninstall SharePoint 2013 Preview instead of using Central Administration to remove the server.

Removing the server from the farm by using Central Administration does not delete this information from the server. Use the Central Administration procedure for removing database servers only, or for removing a web server or an application server from the farm when the server is no longer available to uninstall through Control Panel.

You can follow these steps to remove a web server, application server, or database server from the farm. However, we recommend that you remove web servers and application servers from a farm by using Control Panel, instead of by using Central Administration. For information, see [To remove a web server or an application server from a farm by using Control Panel](#).

Before you remove a database server from a farm, make sure that you have moved any databases stored on that server to a different database server in your farm.

To remove a database server, web server, or application server from a SharePoint farm by using Central Administration

1. Verify that the user account that completes this procedure has the following credentials:
 - The user account that performs this procedure is a member of the Farm Administrators SharePoint group.
 - The user account that performs this procedure is a member of the Administrators group on the server.
2. Stop the services that are running on the server. For information about how to determine which services are running on a specific server and stopping services, see [Manage services on the server \(SharePoint Server 2010\)](#).
3. On the SharePoint Central Administration website, in the **System Settings** section, click **Manage servers in this farm**.
4. On the **Servers in Farm** page, locate the row that contains the name of the server that you want to remove, and then click **Remove Server**.

-
5. In the warning that appears, click **OK** to remove the server or click **Cancel** to stop the operation. The page updates, and the server that you removed no longer appears in the list of servers.

Uninstall SharePoint 2013 Preview

To uninstall, SharePoint Server 2013 Preview and SharePoint Foundation 2013 Preview support only a complete reformat of the server on which you installed the software.

Install and configure a virtual environment for SharePoint 2013 Preview

The following downloadable resources, articles on TechNet, and related resources provide information about how to prepare Hyper-V to support a SharePoint 2013 Preview virtual farm.

TechNet articles about SharePoint 2013 Preview virtualization with Hyper-V

The following articles about virtualization in SharePoint 2013 Preview are available to view online. Writers update articles on a continuing basis as new information becomes available and as users provide feedback.

	Content	Description
	Use best practice configurations for the SharePoint 2013 virtual machines and Hyper-V environment	Provides best practice guidance to install and configure virtual machines for a SharePoint 2013 Preview farm and the Hyper-V virtualization host computer.

Additional resources about Hyper-V installation and initial configuration

The following resources about Hyper-V are available from other subject matter experts.

	Content	Description
	Getting Business Done With Virtualization	Visit the TechCenter to access videos, community sites, documentation, and more.
	Virtualization: Prepare to Virtualize	This TechNet Magazine article provides an overview of the preparation required to shift applications to a virtual environment.

Use best practice configurations for the SharePoint 2013 virtual machines and Hyper-V environment

After you create a detailed architecture design and system specifications, you are ready to install and configure the virtual environment for the SharePoint 2013 Preview farm. To achieve the performance and capacity goals that you identify in your detailed design and system specifications, you must have a correctly configured virtual environment. One or more badly configured virtual machines or virtualization hosts can significantly reduce performance.

This article discusses Windows Server 2008 Hyper-V technology configuration options and their potential impact on the performance of the virtualization host computer, the virtual machines, and the SharePoint 2013 Preview farm in general. Key decision points and best practice configurations provide guidance when you set up the virtual environment.

Important:

A wide range of features and installation options are available to set up and configure a Hyper-V environment. Measurements focus on testing and guidance on the features and configurations that provide quantifiable benefits and consider the known performance characteristics of server roles in a SharePoint products farm.

In this article:

- [Introduction and scope](#)
- [Review the general best practice guidance for virtualization](#)
- [Configure the Hyper-V host computer](#)
- [Install and configure virtual networking](#)
- [Create and configure the virtual machines](#)
- [Configure the memory for the virtual machines](#)
- [Configure the processors for the virtual machines](#)
- [Configure the controllers and hard disks for the virtual machines](#)
- [Configure services and general settings](#)

Introduction and scope

We recommend that you use a bottom up approach to configure the Hyper-V environment for the SharePoint 2013 Preview farm. Start with the Hyper-V host computer configuration and then work up to the virtual layer to configure the virtual network components and the virtual machines.

Before you install and configure the Hyper-V environment, we recommend that you review the following articles:

- [Hardware Considerations for Hyper-V in Windows Server 2008](#)

-
- [Requirements and Limits for Virtual Machines and Hyper-V in Windows Server 2008 R2](#)
 - [Hyper-V Getting Started Guide](#)

Article scope

Several aspects about how to configure a virtual environment that are not discussed in detail are documented in separate articles. Detailed information about the following subjects is out of scope for this article:

- Business Continuity Management (high availability and disaster recovery) for a virtual environment
- Securing a virtual environment (options and best practices)

Note:

SharePoint 2013 Preview does not support the virtualization changes and features in Windows Server 2012 Release Candidate.

Review the general best practice guidance for virtualization

When you install and configure virtualization for a SharePoint 2013 Preview farm, every configuration choice that you make and implement has an effect on all other parts of the virtual environment. Your primary goal is to create intended consequences and positive effects. To achieve this goal you have to understand the interaction between the virtual and the physical, the inherent constraints. You also have to follow best practice guidance when you set up the virtual farm.

The first thing that you have to do before you install and configure your virtual environment is to make sure that you install the latest version of the Hyper-V Best Practices Analyzer (BPA). You can get this update from [Update for Best Practices Analyzer for HYPER-V for Windows Server 2008 R2 x64 Edition \(KB977238\)](#).

You can use Hyper-V Best Practices Analyzer to scan a server that is running the Hyper-V role and help identify configurations that do not comply with the best practices of Microsoft for this role. BPA scans the configuration of the physical computer, the virtual machines, and other resources, such as virtual networking and virtual storage. No configuration changes are made by running the scan.

The scan results display the following information:

- A list of issues that you can sort by severity
- Recommended fixes for issues
- Links to instructions

The best practices in the following table explain several aspects of virtualization and are not necessarily specific to any virtualization technology.

Note:

Hyper-V partition terminology

Hyper-V provides three types of partitions: the root partition, the parent partition, and the child partition. Each partition has its resources (memory and processor) and policies for device use.

The root partition is the original partition and it starts the hypervisor. The parent partition calls the hypervisor to request the creation of new child partitions—the virtual machines.

Best practice guidance for virtualization

Best practice	Description
Leave adequate memory for the Hyper-V partitions.	Calculate the total memory requirements for all the virtual machines on the host and ensure that there is enough available memory to meet Hyper-V partition requirements.  Important: For SharePoint products virtual machines, we recommend 4 GB of RAM or more for host computer operations.
Do not use the parent partition for services other than Hyper-V.	Do not run additional roles or services on the parent partition. Run them on the virtual machines instead because the parent is differentiated for scheduling.
Do not store host computer system files on drives that are used for Hyper-V storage.	To reduce disk contention, do not store system files (for example, Pagefile.sys) on hard disks that are dedicated to storing virtual machine data.
Use a minimum of two physical network adapters.	For better network management and performance, dedicate one adapter to virtual machine network traffic and use the other adapter for virtualization host network traffic.
Do not oversubscribe the CPU on the virtualization host computer.	Review the supported ratio of virtual processors per logical processor and avoid oversubscribing the host computer CPU. The optimum virtual processor:logical processor ratio is 1:1. For more information, see Configure the processors for the virtual machines .
Do not cross Non-uniform memory access (NUMA) boundaries.	Hyper-V spans NUMA nodes to assign physical memory to a virtual machine; however, this does reduce performance on the virtual machine. For more information, see Configure the memory for the virtual machines
Do not use snapshots in a production environment.	Do not use snapshots for the virtual machines in a SharePoint products production environment. When you create a snapshot, Hyper-V creates a new secondary drive for the virtual machine. Write operations occur on the new drive and read operations

Best practice	Description
	occur on both drives, which has the same net affect as a differencing disk. Every snapshot that you add reduces disk performance further.

Configure the Hyper-V host computer

When you configure the Hyper-V host computer, we recommend that you consider the following configuration options and best practices:

- Close the operating system management windows.
Hyper-V Manager and Virtual Machine Connection sessions consume resources. For example, Hyper-V manager causes Windows Management Instrumentation (WMI) activity in the parent partition. When you close the Virtual Machine Connection Manager, video emulation is disabled, which eliminate this source of resource consumption.
- Avoid running programs such as anti-virus software on the parent partition.
Run them on the child partition if they are required.
- Use hardware that supports Second Level Address Translation (SLAT).
SLAT is hardware that is optimized for virtualization improves virtual machine performance, and reduces processing load on the Windows hypervisor. For more information, see [Hyper-V: List of SLAT-Capable CPUs for Hosts](#).
- If your hardware supports Hyper-Threading, enable it.
Hyper-Threading splits the CPU pipeline in two and makes a single core look like two cores.

Install and configure virtual networking

Hyper-V provides the level of networking robustness and configuration options that you expect to see in a physical networking environment. There are, of course, some limitations because you are dealing with virtual devices.

We recommend that you refer to the following documentation to prepare to install and configure virtual networking.

- [Understanding Networking with Hyper-V](#)
- [How does basic networking work in Hyper-V?](#)
- [Hyper-V: What are the uses for different types of virtual networks?](#)
- [Understanding Hyper-V VLANs](#)
- [Hyper-V VLANs Part II](#)
- [Configuring Virtual Networks](#)

Hyper-V virtual networks

You can create and configure a Hyper-V virtual network before you install and configure virtual machines. In addition, you can create more than one virtual network on a Hyper-V host computer.

 **Note:**

You cannot create more than one virtual network on a Hyper-V host computer if the computer is running a Server Core installation of Windows Server 2008 or Windows Server 2008 R2.

Hyper-V provides three types of virtual networks that you can configure for virtual machines. The following table provides a summary of these virtual networks and their characteristics.

Virtual network types

Type	Description
External	<p>Provides a communication link between virtual machines and a physical network by creating an association to a physical network adapter on the host computer. Dedicate one physical adapter to this type of network.</p> <p>For security purposes you can isolate traffic between virtual machines and other computers on the physical network by clearing the Allow management operating system to share this network adapter setting. However, you will be unable to connect to the management operating system remotely.</p>
Internal	<p>Provides a communications link between the host computer and the virtual machines. This provides a degree of isolation from external network traffic and is typically used in a test environment where you want to connect to the virtual machines by using the management operating system.</p>
Private	<p>Provides a communications link between the virtual machines. They are completely isolated from the host computer and this type of virtual network is often used to set isolated test domains.</p>

 **Important:**

In a scenario where two internal (or private) virtual networks are created in Hyper-V and two virtual machines are created on a separate IP subnet, these virtual machines cannot communicate with one another. Because the virtual switch operates at layer 2 of the ISO/OSI Network Model, you have to have a router to achieve routing at a higher level.

After you create your virtual network, you can specify the range of media access control (MAC) addresses that are automatically assigned to the virtual network adapters. Hyper-V enables you to provide static MAC addresses to a virtual adapter to avoid collisions on the network.

**Tip:**

John Howard's blog post, [Hyper-V: MAC Address allocation and apparent network issues MAC collisions can cause](#) provides a very good explanation about MAC Address allocation and associated network issues.

Windows Server 2008 R2 adds the option to configure MAC address spoofing (Enable Spoofing Of MAC Addresses) in the virtual network adapter settings. For more information, see [Configure MAC Address Spoofing for Virtual Network Adapters](#).

Virtual local area networks (VLANs)

From a performance perspective, the ability to create virtual local area networks (VLANs) can provide significant throughput gains. Because virtual machines on the same VLAN can communicate through the virtual switch, network traffic is faster because it does not have to use the physical network adapter. Another benefit of a VLAN configuration is the fact that, because it is software-based, a virtual machine can easily be moved between hosts and still keeps its network configuration.

When you enable virtual LAN identification for the management operating system, you can assign a VLAN identifier (ID), which is an integer that uniquely identifies a node that belongs to a particular VLAN. If you use virtual LAN feature and a VLAN ID, note the following:

- The physical adapters must support VLAN tagging and this feature has to be enabled.
- Set the VLAN ID on either the virtual switch or on the virtual machine's network adapter instead of the physical adapter.
- You can assign only one VLAN ID on the virtual switch.

Network adapters and virtual network switches

Hyper-V provides two kinds of virtual network adapters that you can configure for a virtual machine: a network adapter and a legacy network adapter.

- A network adapter, also known as a synthetic adapter, is the preferred option for most virtual machine configurations. The driver for this adapter is included with the integration services that are installed with the Windows Server 2008 R2 guest operating system.
- A legacy adapter emulates an Intel 21140-based PCI Fast Ethernet Adapter, which results in a lower data transfer than the network adapter. A legacy network adapter also supports network-based installations because it can boot to the Pre-Boot Execution Environment (PXE).

Unless you have to use a legacy adapter until you can install the virtual machine driver or have to do a network boot, we recommend that you configure a virtual machine with a network adapter. If you do have to use a legacy adapter for a network installation, you can always add a network adapter later, and then delete the legacy adapter.

NIC teaming is the process of grouping several physical NICs into one logical NIC, which can be used for network fault tolerance and transmit load balance. The process of grouping NICs is called *teaming*. Teaming has two purposes:

- **Fault tolerance.** Teaming more than one physical NIC to a logical NIC maximizes high availability. Even if one NIC fails, the network connection does not stop and continues to operate on other NICs.

-
- **Load balancing.** Balancing the network traffic load on a server can enhance the functionality of the server and the network. Load balancing within network interconnect controller (NIC) teams enables distributing traffic among the members of a NIC team so that traffic is routed among all available paths.

 **Note:**

Windows Server 2008 Service Pack 2 (SP2) and Windows Server 2008 R2 have no restrictions that are associated with NIC Teaming and the Failover Clustering feature. In Windows Server 2008, the Microsoft Failover Cluster Virtual Adapter is compatible with NIC Teaming and enables it to be used on any network interface in a Failover Cluster.

Windows Server 2008 R2 adds important new capabilities that you should use in your Hyper-V environment if your servers and network hardware support them. We recommend that you investigate the following networking options:

- Large Send Offload (LSO) and Checksum Offload (CSO). The virtual networks in Hyper-V support LSO and CSO. In addition, if your physical network adapters support these capabilities, the virtual traffic is offloaded to the physical network as necessary. Most network adapters support LSO and CSO.
- Jumbo frames. With Windows Server 2008 R2, jumbo frame improvements converge to support up to 6 times the payload per packet. This increases overall throughput and reduces CPU utilization for large file transfers. Physical networks and virtual networks support jumbo frames. This includes switches and adapters.

 **Note:**

For physical networks, all intervening network hardware such as switches must have jumbo frame support enabled also.

- TCP chimney. This lets virtual NICs in child partitions to offload TCP connections to physical adapters that support it, which reduces CPU utilization and other overhead.
- Virtual machine queue (VMQ). VMQ improves network throughput by distributing network traffic for multiple VMs across multiple processors. This process reduces processor utilization by offloading packet classification to the hardware and avoiding both network data copy and route lookup on transmit paths. VMQ is compatible with most other task offloads and can coexist with large send offload and jumbo frames.

Create and configure the virtual machines

Although Hyper-V supports several guest operating systems, SharePoint 2013 Preview requires the 64-bit edition of Windows Server 2008 R2 Service Pack 1 (SP1) Standard, Enterprise, or Data Center. For more information about supported guest operating systems, see [About Virtual Machines and Guest Operating Systems](#)

Hyper-V provides many configuration options and you can change a configuration, the amount of memory for example, after the virtual machine is running as a SharePoint products farm server. With the exception of adding a virtual hard disk drive for a SCSI controller, you have to shut down a virtual machine before you can change its configuration.

Configure each virtual machine according to the requirements in [Capacity management and high availability in a virtual environment \(SharePoint Server 2010\)](#). Configure the following for each virtual machine:

- The BIOS setting to set the boot sequence (legacy network adapter, CD, IDE, or floppy disk)
- The amount of memory
- The number of virtual processors
- The type and number of controllers
- The type and number of hard disks
- The type and number of network adapters

In addition to the previous configurations, you also have the option to configure a DVD drive, COM ports, and a virtual floppy disk.

From a SharePoint products perspective, the primary configuration considerations are the memory, processor, and hard disks.

Configure the memory for the virtual machines

Configure memory on a virtual machine as you typically do for an application that runs on a physical server. The memory allocation must be sufficient to reasonably handle the load at ordinary and peak times. For SharePoint virtual machines, insufficient memory is the main cause of performance issues.

Before you install and configure the virtual machines on a Hyper-V host computer, calculate how much memory is available for the virtual machines. The root partition must have sufficient memory to provide services such as I/O virtualization and management to support the child partitions. For SharePoint products, we recommend that you allow a minimum of 4 GB of RAM for overhead on a Hyper-V virtualization host computer.

After you factor in the 4 GB RAM reserve for the virtualization host, configure the virtual machines to use the remaining memory.

Dynamic memory

Windows Server 2008 R2 SP1 has the option of configuring dynamic memory (with a minimum value and maximum value) for virtual machines.

We do not support this option for virtual machines that run in a SharePoint 2013 Preview environment. The reason is that this implementation of dynamic memory does not work with every SharePoint feature. For example, Distributed Cache and Search do not resize their caches when the allocated memory for a virtual machine is dynamically changed. This can cause performance degradation, especially when assigned memory is reduced.

Non-uniform memory access (NUMA)

A very important aspect of virtual machine memory configuration is Non-uniform memory access (NUMA). NUMA is a memory design that speeds up memory access by partitioning physical memory so each processor in a multi-CPU has its own memory. For example, in a system with 8 cores and 32 GB of RAM, each core or node has 4 GB of physical memory. If a virtual machine is configured to use 8 GB of RAM, the system has to use memory in another node. Because crossing the NUMA boundary can reduce virtual performance by as much as 8%, it is a best practice to configure a virtual machine to use resources from a single NUMA node. For more information about NUMA, refer to the following articles:

-
- [Understanding Non-uniform Memory Access](#)
 - [Determining NUMA node boundaries for modern CPUs](#)
 - [NUMA Node Balancing](#)

Configure the processors for the virtual machines

You can configure multiple virtual processors for a virtual machine, up to a limit of four processors. You cannot configure more processors per virtual machine than there are logical (cores) processors on the virtualization host. For example, given a dual core physical server, the limit is two virtual processors for a virtual machine. Although Hyper-V supports up to eight virtual processors per core or per thread, a configuration that exceeds this ratio (8:1) is known as being oversubscribed. For any virtual machine that you use in a SharePoint 2013 Preview farm, we recommend a ratio of 1:1. Oversubscribing the CPU on the virtualization host can decrease performance, depending on how much the CPU is oversubscribed. For more information, see [Hyper-V VM Density, VP:LP Ratio, Cores and Threads](#)

Configure the controllers and hard disks for the virtual machines

You can use two controller options and several hard disk configurations for a virtual machine. Before you configure storage for your virtual machines, read the following posts written by Jose Barreto, who is a member of the File Server Team at Microsoft.

- [Storage options for Windows Server 2008 Hyper-V](#)
- [More on Storage Options for Windows Server 2008 Hyper-V](#)

You can select either Integrated Device Electronics or SCSI devices on virtual machines, as follows:

- IDE devices: Hyper-V uses emulated devices with IDE controllers. You can have up to two IDE controllers with two disks on each controller. The startup disk (also known as the boot disk) must be attached to one of the IDE devices. The startup disk can be either a virtual hard disk or a physical disk. Although a virtual machine must use an IDE device as the startup disk to start the guest operating system, you have many options to choose from when you select the physical device that will provide the storage for the IDE device.
- SCSI devices: Each virtual machine supports up to 256 SCSI disks (four SCSI controllers with each controller supporting up to 64 disks). SCSI controllers use a type of device that was developed specifically for use with virtual machines and use the virtual machine bus to communicate. The virtual machine bus must be available when the guest operating system is started. Therefore, virtual hard disks that are attached to SCSI controllers cannot be used as startup disks.

Note:

Physical SCSI devices typically provide better I/O performance than physical IDE devices. However, this is not the case for virtualized SCSI and IDE devices in Hyper-V. Support for hot swappable hard disk drives, which the Hyper-V implementation of SCSI supports, is a better reason for selecting SCSI drives than performance gains.

The version of Hyper-V released with Windows Server 2008 R2 provides significant improvements in virtual hard disk performance. For more information, see [Virtual Hard Disk Performance: Windows Server 2008 / Windows Server 2008 R2 / Windows 7](#). For a summary of virtual machine drive options, see the "How to choose your Hyper-V and VHD Storage Container Format" section of "Virtual Hard Disk Performance: Windows Server 2008 / Windows Server 2008 R2 / Windows 7".

Hyper-V supports many storage options. For more information about the storage options, see [Planning for Disks and Storage](#).

You can use the following types of physical storage with a server that runs Hyper-V:

- **Direct-attached storage:** You can use Serial Advanced Technology Attachment (SATA), external Serial Advanced Technology Attachment (eSATA), Parallel Advanced Technology Attachment (PATA), Serial Attached SCSI (SAS), SCSI, USB, and Firewire.
- **Storage area networks (SANs):** You can use Internet SCSI (iSCSI), Fibre Channel, and SAS technologies.

For more information, see [Configuring Pass-through Disks in Hyper-V](#).

There is no generic storage solution for every virtual environment. Selecting the optimal virtual machine drive option for your SharePoint 2013 Preview servers requires research and extensive testing to implement the best storage solution for your virtual environment. When you pick a storage solution you must consider access performance, storage needs, and how much memory is used for the advanced caching of virtual hard disk images.

Configure services and general settings

In a Hyper-V environment, you can specify the configuration of virtual networking and the configuration for each virtual machine. Additionally, you can configure how each virtual machine interacts with the Hyper-V host computer, and also the stop and restart behavior if the running state of the virtual machine is interrupted.

Integration services

Hyper-V includes a software package for supported guest operating systems that improves integration between the physical computer and the virtual machine. This package is known as integration services. You should verify that the management operating system (which runs the Hyper-V role) and virtual machines are running the same version of integration services. For more information, see [Version Compatibility for Integration Services](#).

For each virtual machine you can configure the following integration items between the virtual machine and the virtualization host computer:

- Operating system shutdown
- Time synchronization
- Data exchange
- Heartbeat
- Backup (volume snapshot)

**Important:**

Disable the time synchronization for each SharePoint virtual machine. SharePoint 2013 Preview implements timer jobs extensively and the latency during time synchronization will cause unpredictable results in the SharePoint environment.

Automatic stop and start

For each virtual machine you can configure automatic stop and start behavior if a physical computer shuts down.

The options for stop are as follows:

- Save the virtual machine state.
The current state of the virtual machine is saved. When the virtual machine is started, Hyper-V attempts to restore the virtual machine to the state it was in.
- Turn off the virtual machine.
This is the equivalent of pulling the power plug on a server.
- Shut down the guest (virtual machine) operating system.
This is the equivalent of shutting down a computer by using the Windows Shut down option.

For a SharePoint products virtual machine, do not configure the virtual machine to save state. Virtual machines that start from saved state will be out of synchronization with the other servers in the farm. We recommend that you configure the virtual machine to use a shutdown because it minimizes that chances that the virtual machine can be corrupted. When a shutdown happens, all timer jobs that are running can finish, and there will be no synchronization issues when the virtual machine restarts.

The opposite of an automatic stop is an automatic start. Hyper-V provides the following startup options when the physical server restarts:

- Do nothing.
You have to start the virtual machine manually regardless of its state when the physical server shut down.
- Automatically start if the virtual machine was running when the service stopped.
- Always start this virtual machine automatically.
Hyper-V starts the virtual machine regardless of its state when the physical server shut down.

We recommend that you select either of the first two options. Both options are acceptable. However, the decision is ultimately up to the IT team that manages and maintains the virtual environment.

In addition to the previous start options, you can configure a startup time delay for a virtual machine. We recommend that you do this to reduce resource contention on a virtualization host. However, if your start option is to do nothing, this is not an issue.

Configure services in SharePoint 2013 Preview

In SharePoint 2013 Preview, you can configure individual services independently, and you can implement only the services that your organization needs.

Deployed services are named *service applications*. A service application provides a resource that you can share across sites in a farm or sometimes across multiple farms, and users can access them through a hosting web application. Service applications are associated to web applications by *service application connections*.

For more information about service applications and services, see [Technical diagrams \(SharePoint 2013 Preview\)](#). If you plan to use Office Web Apps Preview, you must install and configure them to work with SharePoint 2013 Preview. For more information, [Office Web Apps overview \(Used with SharePoint 2013 Preview Products\)](#).

The following articles on TechNet and related resources provide information about how to configure services for SharePoint 2013 Preview.

TechNet articles about how to configure services for SharePoint 2013 Preview

The following articles about how to configure services for SharePoint 2013 Preview are available to view online. Writers update articles on a continuing basis as new information becomes available and as users provide feedback.

	Content	Description
	Configure the Secure Store Service in SharePoint 2013 Preview	This article describes the SharePoint 2013 Preview Secure Store Service operations that solution designers can use to create target applications that map user and group credentials to the credentials of external data sources.
	Create and configure Machine Translation Services	The Machine Translation Service in SharePoint 2013 Preview lets users automatically translate documents. This topic describes how to create a Machine Translation Service Application and configure the Machine Translation Service by using Central Administration, or Windows PowerShell.

Configure the Secure Store Service in SharePoint 2013 Preview

This article describes how to configure the Secure Store Service on a SharePoint Server 2013 Preview farm. Secure Store has important planning considerations associated with it. Be sure to read [Plan the Secure Store service \(SharePoint Server 2010\)](#) before you begin the procedures in this article.

In this article:

- [Configure Secure Store](#)
- [Work with encryption keys](#)
- [Store credentials in Secure Store](#)
- [Create a target application](#)
- [Set credentials for a target application](#)
- [Enable the audit log](#)
- [Video demonstration](#)

Configure Secure Store

To configure Secure Store, you perform the following steps:

1. Register a managed account in SharePoint Server 2013 Preview to run the Secure Store application pool.
2. Start the Secure Store Service on an application server in the farm.
3. Create a Secure Store Service service application.

To run the application pool, you must have a standard domain account. No specific permissions are required for this account. Once the account has been created in Active Directory, follow these steps to register it with SharePoint Server 2013 Preview.

To register a managed account

1. On the SharePoint Central Administration Web site home page, in the left navigation, click **Security**.
2. On the Security page, in the **General Security** section, click **Configure managed accounts**.
3. On the Managed Accounts page, click **Register Managed Account**.
4. In the **User name** box, type the name of the account.
5. In the **Password** box, type the password for the Contoso\ExcelAppPool account.
6. If you want SharePoint Server 2013 Preview to handle changing the password for the account, select the **Enable automatic password change** box and specify the password change parameters that you want to use.
7. Click **OK**.

Once you have configured the registered account, you must start the Secure Store Service on an application server in the farm. Because Secure Store deals with sensitive information, we recommend that you use a separate application server just for the Secure Store Service for better security.

To start the Secure Store Service

1. On the Central Administration home page, in the **System Settings** section, click **Manage services on server**.
2. Above the **Service** list, click the **Server** drop-down list, and then click **Change Server**.
3. Select the application server where you want to run the Secure Store Service.
4. In the **Service** list, click **Start** next to **Secure Store Service**.

Once the service is started, you must create a Secure Store Service service application. Use the following procedure to create the service application.

To create a Secure Store Service service application

1. On the Central Administration home page, in the **Application Management** section, click **Manage service applications**.
2. On the Manage Service Applications page, click **New**, and then click **Secure Store Service**.
3. In the **Service Application Name** box, type a name for the service application (for example, **Secure Store Service**).
4. In the **Database Server** box, type the instance of SQL Server where you want to create the Secure Store database.

Note:

Because the Secure Store database contains sensitive information, we recommend that you deploy the Secure Store database to a different instance of SQL Server from the rest of SharePoint Server 2013 Preview.

5. Select the **Create new application pool** option and type a name for the application pool in the text box.
6. Select the **Configurable** option, and, from the drop-down list, select the account for which you created the managed account earlier.
7. Click **OK**.

The Secure Store Service has now been configured. The next step is to generate an encryption key for encrypting the Secure Store database.

Work with encryption keys

Before using the Secure Store Service, you must generate an encryption key. The key is used to encrypt and decrypt the credentials that are stored in the Secure Store Service database.

Generate an encryption key

The first time that you access the Secure Store service application, your only option is to generate a new encryption key. Once the key has been generated, the rest of the Secure Store functionality becomes available.

To generate a new encryption key

1. On the Central Administration home page, in the **Application Management** section, click **Manage service applications**.
2. Click the Secure Store service application.
3. In the **Key Management** group, click **Generate New Key**.
4. On the Generate New Key page, type a pass phrase string in the **Pass Phrase** box, and type the same string in the **Confirm Pass Phrase** box. This pass phrase is used to encrypt the Secure Store database.

 **Important:**

A pass phrase string must be at least eight characters and must have at least three of the following four elements:

- Uppercase characters
- Lowercase characters
- Numerals
- Any of the following special characters

“! " # \$ % & ' () * + , - . / : ; < = > ? @ [\] ^ _ ` { | } ~

 **Important:**

The pass phrase that you enter is not stored. Make sure that you write this down and store it in a safe place. You must have it to refresh the key, such as when you add a new application server to the server farm.

5. Click **OK**.

For security precautions or as part of regular maintenance you may decide to generate a new encryption key and force the Secure Store Service to be re-encrypted based on the new key. You can use this same procedure to do this.

 **Caution:**

You should back up the database of the Secure Store Service application before generating a new key.

Refresh the encryption key

Refreshing the encryption key propagates the key to all the application servers in the farm. You may be required to refresh the encryption key if any of the following things are true:

- You add a new application server to the server farm.

-
- You restore a previously backed up Secure Store Service database and have since changed the encryption key.
 - You receive an "Unable to get master key" error message.
 - You have upgraded your farm from SharePoint Server 2010.

To refresh the encryption key

1. On the Central Administration home page, in the **Application Management** section, click **Manage service applications**.
2. Click the Secure Store service application.
3. In the **Key Management** group, click **Refresh Key**.
4. In the **Pass Phrase** box, type the pass phrase that you first used to generate the encryption key. This phrase is either the pass phrase that you used when you initialized the Secure Store Service service application or one that you used when you created a new key by using the **Generate a New Key** command.
5. Click **OK**.

Store credentials in Secure Store

Storing credentials in Secure Store is accomplished by using a Secure Store *target application*. A target application maps the credentials of a user, group, or claim to a set of encrypted credentials stored in the Secure Store database. After a target application is created, you can associate it with an external content type or application model, or use it with a business intelligence service application such as Excel Services or Visio Services to provide access to an external data source. When a SharePoint Server 2013 Preview service application calls the target application, Secure Store confirms that the user making the request is an authorized user of the target application and then retrieves the encrypted credentials. The credentials are then used on the user's behalf by the SharePoint Server 2013 Preview service application.

To create a target application, you must do the following:

1. Create the target application itself, specifying the type of credentials that you want to store in the Secure Store database, the administrators for the target application, and the credential owners.
2. Specify the credentials that you want to store.

Create a target application

Target applications are configured on the Secure Store Service Application page in Central Administration. Use the following procedure to create a target application.

To create a target application

1. On the Central Administration home page, in the **Application Management** section, click **Manage service applications**.
2. Click the Secure Store service application.
3. In the **Manage Target Applications** group, click **New**.

-
4. In the **Target Application ID** box, type a text string.
This is the unique string that you will use externally to identify this target application.
 5. In the **Display Name** box, type a text string that will be used to display the identifier of the target application in the user interface.
 6. In the **Contact Email** box, type the e-mail address of the primary contact for this target application.
This can be any legitimate e-mail address and does not have to be the identity of an administrator of the Secure Store Service application.
 7. When you create a target application of type Individual (see below), you can implement a custom Web page that lets users add individual credentials for the destination data source. This requires custom code to pass the credentials to the target application. If you did this, type the full URL of this page in the **Target Application Page URL** field. There are three options:
 - **Use default page:** Any Web sites that use the target application to access external data will have an individual sign-up page that was added automatically. The URL of this page will be `http://<samplesite>/_layouts/SecureStoreSetCredentials.aspx?TargetAppId=<TargetApplicationID>`, where `<TargetApplicationID>` is the string typed in the **Target Application ID** box. By publicizing the location of this page, you can enable users to add their credentials for the external data source.
 - **Use custom page:** You provide a custom Web page that lets users provide individual credentials. Type the URL of the custom page in this field.
 - **None:** There is no sign-up page. Individual credentials are added only by a Secure Store Service administrator who is using the Secure Store Service application.
 8. In the **Target Application Type** drop-down list, choose the target application type: **Group**, for group credentials, or **Individual**, if each user is to be mapped to a unique set of credentials on the external data source.
 **Note:**
There are two primary types for creating a target application:
 - Group, for mapping all the members of one or more groups to a single set of credentials on the external data source.
 - Individual, for mapping each user to a unique set of credentials on the external data source.
 9. Click **Next**.
 10. Use the **Specify the credential fields for your Secure Store Target Application** page to configure the various fields which may be required to provide credentials to the external data source. By default, two fields are listed: **Windows User Name** and **Windows Password**.
To add an additional field for supplying credentials to the external data source, on the **Specify the credential fields for your Secure Store Target Application** page, click **Add Field**.
By default, the type of the new field is **Generic**. The following field types are available:

Field	Description
Generic	Values that do not fit in any of the other categories.
User Name	A user account that identifies the user.
Password	A secret word or phrase.
PIN	A personal identification number.
Key	A parameter that determines the functional output of a cryptographic algorithm or cipher.
Windows User Name	A Windows user account that identifies the user.
Windows Password	A secret word or phrase for a Windows account.
Certificate	A certificate.
Certificate Password	The password for the certificate.

- To change the type of a new or existing field, click the arrow that appears next to the type of the field, and then select the new type of field.

 **Note:**

Every field that you add will be required to have data when you set the credentials for this target application.

- You can change the name that a user sees when interacting with a field. In the **Field Name** column of the **Specify the credential fields for your Secure Store Target Application** page, change a field name by selecting the current text and typing new text.
 - When a field is masked, each character that a user types is not displayed but is replaced with a mask character such as the asterisk "*". To mask a field, click the check box for that field in the **Masked** column of the page.
 - To delete a field, click the delete icon for that field in the **Delete** column of the page. When you have finished editing the credential fields, click **Next**.
11. In the **Specify the membership settings** page, in the **Target Application Administrators Field**, list all users who have access to manage the target application settings.
 12. If the target application type is group, in the **Members** field, list the user groups to map to a set of credentials for this target application.
 13. Click **OK** to complete configuring the target application.

Set credentials for a target application

After creating a target application, an administrator of that target application can set credentials for it. These credentials are used by the calling application to provide access to an external data source. If the target application is of type Individual, you can also enable users to supply their own credentials.

To set credentials for a target application

1. On the Central Administration home page, in the **Application Management** section, click **Manage service applications**.

2. Click the Secure Store service application.

3. In the target application list, point at the target application for which you want to set credentials, click the arrow that appears, and then, in the menu, click **Set credentials**.

If the target application is of type Group, type the credentials for the external data source. Depending on the information that is required by the external data source, the fields for setting credentials will vary.

If the target application is of type Individual, type the user name of the individual who will be mapped to this set of credentials on the external data source, and type the credentials for the external data source. Depending on the information that is required by the external data source, the fields for setting credentials will vary.

4. Click **OK**.

Once you have set the credentials for the target application, it is ready to be used by a SharePoint Server 2013 Preview service such as Business Connectivity Services or Excel Services.

Enable the audit log

Audit entries for the Secure Store service are stored in the Secure Store Service database. By default, the audit log file is disabled.

An audit log entry stores information about a Secure Store Service action, such as when it was performed, whether it succeeded, why it failed if it didn't succeed, the Secure Store Service user who performed it, and optionally the Secure Store Service user on whose behalf it was performed. Therefore, a valid reason to enable an audit log file is to troubleshoot an authentication issue.

To enable the audit log by using Central Administration

1. On the Central Administration home page, in the **Application Management** section, click **Manage service applications**.
2. Select the Secure Store service application. (That is, select the service application, but do not click the link to go to the Secure Store Service application settings page.)
3. On the ribbon, click **Properties**.
4. From the **Enable Audit** section, click to select the **Audit log enabled** box.
5. To change the number of days that entries will be purged from the audit log file, specify a number in days in the **Days Until Purge** field. The default value is 30 days.
6. Click **OK**.

Video demonstration

This video gives an overview of how target applications are used in Secure Store.

Note:

This video uses SharePoint Server 2010. Target applications function in the same way in SharePoint Server 2013 Preview.

Video: How target applications are used in Secure Store

Create and configure a Search service application in SharePoint Server 2013 Preview

Before you begin

If you used the Farm Configuration Wizard after you installed SharePoint Server 2013 Preview, a Search service application might have been created at that time. To verify whether a Search service application exists, you can click **Manage service applications** in the **Application Management** section on the Central Administration home page. For the remainder of this article, it is assumed that a Search service application does not exist yet, and that therefore you must create one.

Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)

- [Touch](#)

How to create and configure a SharePoint Search service application

When you deploy and configure a Search service application, you perform the following main tasks:

1. **Create accounts** — Certain domain user accounts are required specifically for a Search service application.
2. **Create a Search service application** — A Search service application provides enterprise search features and functionality.
3. **Configure the Search service application** — Basic configuration of a Search service application includes configuring a default content access account, an email contact, and content sources.
4. **Configure the Search service application topology** — You can deploy search components on different servers in the farm. You can also specify which instance of SQL Server is used to host the search-related databases.

Step 1: Create accounts that are required for a SharePoint Search service application

The following table lists the accounts that are required when a Search service application is created.

Account	Description	Notes
Search service	Windows user credentials for the SharePoint Server Search service, which is a Windows service	This setting applies to all Search service applications in the farm. You can change this account at any time by clicking Configure service accounts in the Security section on the Central Administration home page.
<ul style="list-style-type: none">• Search Admin Web Service application pool• Search Query and Site Settings Web Service application pool	Windows user credentials	For each of these accounts, you can use the same credentials that you specified for the Search service. Or, you can assign different credentials to each account according to the principle of least-privilege administration.
Default content access	Windows user credentials for the Search service application to use to access content when crawling	We recommend that you specify a separate account for the default content access account according to the principle of least-privilege administration.

The accounts that you use for the Search service, the Search Admin Web Service application pool, and the Search Query and Site Settings Web Service application pool must be registered as managed accounts in SharePoint Server 2013 Preview so that they are available when you create the Search service application. Use the following procedure to register each of these accounts as a managed account.

To register a managed account

1. On the Central Administration home page, in the Quick Launch, click **Security**.
2. On the Security page, in the **General Security** section, click **Configure managed accounts**.
3. On the Managed Accounts page, click **Register Managed Account**.
4. On the Register Managed Account page, in the **Account Registration** section, type the user name and password that you want to use as credentials for the service account.
5. If you want SharePoint Server 2013 Preview to manage password changes for this account, select the **Enable automatic password change** check box and configure the parameters for automatic password change.
6. Click **OK**.

Step 2: Create a SharePoint Search service application

Each Search service application has a separate content index. You can create multiple Search service applications if you want to have different content indexes for different sets of content. For example, if you want to segregate sensitive content (such as employee benefits information) into a separate content index, you can create a separate Search service application to correspond to that set of content.

Use the following procedure to create a Search service application.

To create a Search service application

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators group for the farm for which you want to create the service application.
2. On the Central Administration home page, in the **Application Management** section, click **Manage service applications**.
3. On the Manage Service Applications page, on the ribbon, click **New**, and then click **Search Service Application**.
4. On the Create New Search Service Application page, do the following:
 - a) Accept the default value for **Service Application name**, or type a new name for the Search service application.
 - b) In the **Search Service Account** list, select the managed account that you registered in the previous procedure to run the Search service.
 - c) In the **Application Pool for Search Admin Web Service** section, do the following:
 - i. Select the **Create new application pool** option, and then specify a name for the application pool in the **Application pool name** text box.
 - ii. In the **Select a security account for this application pool** section, select the **Configurable** option, and then from the list select the account that you registered to run the application pool for the Search Admin Web Service.
 - d) In the **Application Pool for Search Query and Site Settings Web Service** section, do the following:
 - i. Choose the **Create new application pool** option, and then specify a name for the application pool in the **Application pool name** text box.
 - ii. In the **Select a security account for this application pool** section, select the **Configurable** option, and then from the list select the account that you registered to run the application pool for the Search Query and Site Settings Web Service.
5. Click **OK**.

Step 3: Configure the SharePoint Search service application

You configure a Search service application on the Search Administration page for that service application. Use the following procedure to go to the Search Administration page for a particular Search service application.

To go to the Search Administration page

1. Verify that the user account that is performing this procedure is an administrator for the Search service application that you want to configure.
2. On the home page of the Central Administration website, in the **Application Management** section, click **Manage service applications**.
3. On the Manage Service Applications page, click the Search service application that you want to configure.

On the Search Administration page, configure the settings as described in the following sections:

- Specify the default content access account
- Specify the contact email address
- Create content sources

Specify the default content access account

When you create a Search service application, the account that you specify for the Search service is automatically configured as the default content access account. The crawler uses this account to crawl content that does not have an associated crawl rule that specifies a different account. For the default content access account, we recommend that you specify a domain user account that has read access to as much of the content that you want to crawl as possible. You can change the default content access account at any time.

If you have to crawl certain content by using a different account, you can create a crawl rule and specify a different account for crawling. For information about how to create a crawl rule, see [Manage crawl rules \(SharePoint Server 2013 Preview\)](#).

Use the following procedure to specify the default content access account.

To specify the default content access account

1. On the Search Administration page, in the **System Status** section, click the link in the **Default content access account** row.
2. In the **Default Content Access Account** dialog box, in the **Account** box, type the account that you created for content access in the form *domain\user name*.
3. Type the password for this account in the **Password** and **Confirm Password** boxes.
4. Click **OK**.

Specify the contact email address

The Search service writes the contact email address to the logs of crawled servers. The default contact email address, `someone@example.com`, is a placeholder. We recommend that you change this to an account that an external administrator can contact when a crawl might be contributing to a problem such as a decrease in performance on a server that the search system is crawling.

Use the following procedure to specify the contact email address.

To specify the contact email address

1. On the Search Administration page, in the **System Status** section, click the link for the **Contact e-mail address**.
2. In the **Search E-mail Setting** dialog box, in the **E-mail Address** box, type the email address that you want to appear in the logs of servers that are crawled by the search system.
3. Click **OK**.

Create content sources in a SharePoint Search service application

Crawling requires at least one *content source*. A content source is a set of options that you use to specify the type of content to crawl, the starting URLs to crawl, and when and how deep to crawl. When a Search service application is created, a content source named "Local SharePoint sites" is automatically created and configured for crawling all SharePoint sites in the local server farm. You can create content sources to specify other content to crawl and how the system will crawl that content. For more information, see [Add, edit, or delete a content source \(SharePoint Server 2013 Preview\)](#). However, you do not have to create other content sources if you do not want to crawl content other than the SharePoint sites in the local farm.

If you choose the **Standalone** installation option when you install SharePoint Server 2013 Preview, a full crawl of all SharePoint sites in the farm is automatically performed after installation and an incremental crawl is scheduled to occur every 20 minutes after that. If you choose the **Server Farm** installation option when you install SharePoint Server 2013 Preview, no crawls are automatically scheduled or performed.

Step 4: Configure the SharePoint Search service application topology

When you create a Search service application, the SharePoint Server Search service is started on the application server that is hosting the Central Administration website, and search components are deployed to that server. If you have more than one application server in your farm, you can deploy additional search components on other application servers, depending on your requirements. You can deploy multiple instances of certain components. For more information, see [Manage search topology \(SharePoint Server 2013 Preview\)](#).

Create a Search Center site in SharePoint 2013 Preview

 **Note:**

The article does not apply to SharePoint Online, because in that environment a Search Center site is automatically available at `<host_name>/search/`.

A Search Center site, or Search Center, provides an interface for users to submit search queries and view search results. A Search Center site is the top-level site of a site collection that a farm administrator creates by using the Enterprise Search Center template or the Basic Search Center template.

Before you begin

Depending on the kind of installation that you performed and the site collection template that you selected at that time, the farm might already have a Search Center site. To check this, browse to the top-level site for the site collection that you created during installation. In either case, you can create a Search Center site and grant users access to it by using the procedures in this article. After you create the Search Center site, the site collection administrator or site owner might want to add features and functionality so that the site provides a richer interface than the search box that appears by default on each SharePoint site.

 **Note:**

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

To create a SharePoint Search Center site

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators group.
2. On the home page of the Central Administration website, in the **Application Management** section, click **Create site collections**.
3. On the Create Site Collection page, do the following:

-
- a) In the **Web Application** section, select a web application to contain the new site collection. To use a web application other than the one that is displayed, click the web application that is displayed, and then click **Change Web Application**.
 - b) In the **Title and Description** section, in the **Title** box, type the name for the new Search Center site. Optionally, type a description in the **Description** box.
 - c) In the **Web Site Address** section, for the part of the URL immediately after the web application address, select **/sites/**, or select a managed path that was previously defined, and then type the final part of the URL.
Note the address of the new Search Center for future reference.
 - d) In the **Template Selection** section, do the following:
 - i. In the **Select the experience version** drop-down list, select **2013** to create a Search Center site that provides the SharePoint 2013 Preview user experience, or select **2010** to create a Search Center site that provides the SharePoint 2010 Products user experience.
 - ii. In the **Select a template** subsection, click the **Enterprise** tab, and then do one of the following:
 - If you are using SharePoint Foundation 2013 Preview, select the **Basic Search Center** template.
 - Otherwise, if you are using SharePoint Server 2013 Preview, select the **Enterprise Search Center** template.
 - e) In the **Primary Site Collection Administrator** section, in the **User name** box, type the user name of the primary site collection administrator for this site collection in the form *domain\user name*.
 - f) (Optional) In the **Secondary Site Collection Administrator** section, type the user name of a secondary site collection administrator in the form *domain\user name*.
 - g) In the **Quota Template** section, select **No Quota**.
A Search Center site is not intended to be a data repository. Therefore, you do not have to select a quota template.
 - h) Click **OK**.
4. On the Top-Level Site Successfully Created page, click the link to the Search Center site that you created.

After you create the Search Center site, you must grant site access to users so that they can perform search queries and view search results. Use the following procedure to grant site access to users.

To grant access to the SharePoint Search Center

1. Verify that the user account that is performing this procedure is a member of the Owners group on the Search Center site.
2. In a web browser, go to the Search Center site.
3. Open the **Site** menu by clicking the gear icon in the upper-right portion of the page, and then click **Site Permissions**.
4. In the **Shared with** dialog box, click **Invite people**.

-
5. In the **Share <SearchCenterName>** dialog box, in the **Enter users separated with semicolons** text box, type the names of the Windows user groups and Windows users to whom you want to grant permissions for submitting queries and viewing search results in the Search Center.
For example, to grant access to the Search Center to all Windows users, type **NT Authority\authenticated users**.
 6. Click **Show options**.
 7. Clear the **Send an email invitation** check box.
 8. In the **Select a group or permission level** drop-down list, select **<SearchCenterName> Visitors [Read]**.
 9. Click **Share**.

Configure farm settings in SharePoint 2013 Preview

After you install SharePoint 2013 Preview, you can configure several additional settings. Some of these settings include configuring usage and health data collection to ensure that you collect relevant data to analyze and configuring several diagnostic logging settings to help with troubleshooting. Configuring additional settings is optional, but many key features are not available unless you configure these settings.

TechNet articles about how to configure additional settings for the server farm

The following articles about how to configure additional settings for the server farm are available to view online. Writers update articles on a continuing basis as new information becomes available and as users provide feedback.

	Content	Description
	Configure usage and health data collection	Describes how to configure usage and health data collection in SharePoint 2013 Preview.
	Configure diagnostic logging	Describes how to configure diagnostic logging that might be required after initial deployment or upgrade and possibly throughout the system's life cycle.
	Configure email integration for a SharePoint 2013 Preview farm	These articles describe how to configure incoming and outgoing e-mail in the server farm.

Additional resources about how to configure additional settings for the server farm

The following resources about how to configure additional settings for the server farm are available from other subject matter experts.

	Content	Description
	Installation and Deployment for SharePoint 2013 Resource Center	Visit the Resource Center to access videos, community sites, documentation, and more.

Configure email integration for a SharePoint 2013 Preview farm

The following articles on TechNet provide information about email integration. After you install SharePoint 2013 Preview, you can configure incoming and outgoing email. These optional settings are useful if you want to work with email in the server farm.

TechNet articles about email integration

The following articles about email integration are available to view online. Writers update articles on a continuing basis as new information becomes available and as users provide feedback.

	Content	Description
	Configure incoming email for a SharePoint 2013 Preview farm	This article describes how to configure incoming email so that SharePoint 2013 Preview sites accept and archive incoming email. It also describes how to configure incoming email so that SharePoint sites can archive email discussions as they happen, save attachments, and show meetings that were sent and received by email on site calendars. In addition, this article describes how to configure the SharePoint Directory Management Service to provide support for email distribution list creation and management.
	Configure outgoing email for a SharePoint 2013 Preview farm	This article describes how to configure outgoing email so that your Simple Mail Transfer Protocol (SMTP) server sends email alerts to site users and notifications to site administrators.

Configure incoming email for a SharePoint 2013 Preview farm

This article describes how to configure incoming email for SharePoint 2013 Preview. This article also describes how to install and configure the SMTP service that you must use to enable incoming email. When incoming email is enabled, SharePoint sites can receive and store email messages and attachments in lists and libraries. This article describes two scenarios, one basic and one advanced. The basic scenario applies to a single-server farm environment and is recommended if you want to use default settings. The advanced scenario applies to a single-server farm or a multiple-server farm and contains several advanced options from which to choose. For more information, see [Plan incoming email \(SharePoint 2013 Preview\)](#).

In this article:

- [Before you begin](#)
- [Install and configure the SMTP service](#)
- [Configure incoming email in a basic scenario](#)
- [Configure incoming email in an advanced scenario](#)
- [Prepare your environment for incoming email in an advanced scenario](#)
- [Are attachments missing from email messages that are sent to a SharePoint document library?](#)

Before you begin

Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

Before you begin this operation, review the following information about prerequisites:

- Your system is running SharePoint 2013 Preview.
- You have read [Plan incoming email \(SharePoint 2013 Preview\)](#).
- For the basic scenario, each SharePoint front-end web server must be running the Simple Mail Transfer Protocol (SMTP) service and the SharePoint Foundation Web Application service.

-
- For the advanced scenario, you can use one or more servers in the server farm to run the SMTP service and to have a valid SMTP server address. Alternatively, you must know the name of a server outside the farm that is running the SMTP service and the location of the email drop folder.

If you have not installed and configured the SMTP service and do not choose to use an email drop folder, you must complete the steps in [Install and configure the SMTP service](#) before you configure incoming email.

Install and configure the SMTP service

Incoming email for SharePoint 2013 Preview uses the SMTP service. You can use the SMTP service in one of two ways. You can install the SMTP service on one or more servers in the farm, or administrators can provide an email drop folder for email that is forwarded from the service on another server. For more information about the email drop folder option, see [Plan incoming email \(SharePoint 2013 Preview\)](#).

Install the SMTP service

If you are not using a drop folder for email, the SMTP service must be installed on every front-end web server in the farm that you want to configure for incoming email. To install the SMTP service, use the Add Features Wizard in Server Manager. After you complete the procedure, the SMTP service is installed on the front-end web server.

To install the SMTP service

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the front-end web server.
2. Click **Start**, point to **Administrative Tools**, and then click **Server Manager**.
3. In Server Manager, click **Features**.
4. In **Features Summary**, click **Add Features** to open the Add Features Wizard.
5. On the Select Features page, select **SMTP Server**.
6. In the **Add Features Wizard** dialog box, click **Add Required Roll Services**, and then click **Next**.
7. On the Confirm Installation Selections page, click **Install**.
8. On the Installation Results page, ensure that the installation finished successfully, and then click **Close**.

Install IIS 6.0 Management tools

To manage the SMTP service on Windows Server 2008 and Windows Server 2008 R2, you must use Internet Information Services (IIS) 6.0 Manager.

To install IIS 6.0 Manager

1. Verify that you have the following administrative credentials:
 - You must be a member of the Administrators group on the front-end web server.
2. Click **Start**, point to **Administrative Tools**, and then click **Server Manager**.

-
3. In Server Manager, click **Roles**.
 4. In **Application Server** section, click **Add Role Services**.
 5. On the Select Role Services page, select **Management Tools** and **IIS 6 Management compatibility**, and then click **Install**.

Configure the SMTP service

After you install the SMTP service, you configure it to accept email from the mail server for the domain. You can decide to accept relayed email from all servers except those that you specifically exclude. Alternatively, you can block email from all servers except those that you specifically include. You can include servers individually, in groups by subnet, or in groups by domain.

After you configure the service, set it to start automatically.

To configure the SMTP service

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the front-end web server.
2. Click **Start**, point to **Administrative Tools**, and then click **Internet Information Services (IIS) 6.0 Manager**.
3. In IIS Manager, expand the server name that contains the SMTP server that you want to configure.
4. Right-click the SMTP virtual server that you want to configure, and then click **Start**.
5. Right-click the SMTP virtual server that you want to configure, and then click **Properties**.
6. On the **Access** tab, in the **Access control** area, click **Authentication**.
7. In the **Authentication** dialog box, verify that **Anonymous access** is selected.
8. Click **OK**.
9. On the **Access** tab, in the **Relay restrictions** area, click **Relay**.
10. To enable relaying from any server, click **All except the list below**.
11. To accept relaying from one or more specific servers, follow these steps:
 - a) Click **Only the list below**.
 - b) Click **Add**, and then add servers one at a time by IP address, or in groups by using a subnet or domain.
 - c) Click **OK** to close the **Computer** dialog box.
12. Click **OK** to close the **Relay Restrictions** dialog box.
13. Click **OK** to close the **Properties** dialog box.

To set the SMTP service to start automatically

1. Click **Start**, point to **Administrative Tools**, and then click **Services**.
2. In Services, right-click **Simple Mail Transfer Protocol (SMTP)**, and then select **Properties**.
3. In the **Simple Mail Transfer Protocol (SMTP) Properties** dialog box, on the **General** tab, in the **Startup type** list, select **Automatic**.
4. Click **OK**.

Configure incoming email in a basic scenario

You can use the following procedure to configure incoming email in a basic scenario by selecting the **Automatic** settings mode and using the default settings. After you complete the procedure, users can send email to lists and libraries.

To configure incoming email in a basic scenario

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the server that is running the SharePoint Central Administration website.
2. In Central Administration, click **System Settings**.
3. On the System Settings page, in the **E-Mail and Text Messages (SMS)** section, click **Configure incoming e-mail settings**.
4. If you want to enable sites on this server to receive email, on the Configure Incoming E-Mail Settings page, in the **Enable Incoming E-Mail** section, click **Yes**.
5. Select the **Automatic** settings mode.
6. In the **Incoming E-Mail Server Display Address** section, in the **E-mail server display address** box, type a display name for the email server, for example, mail.fabrikam.com.
7. Use the default settings for all other sections, and then click **OK**.

After you configure incoming email, users who have Manage Lists permissions can configure email-enabled lists and document libraries.

Configure incoming email in an advanced scenario

You can use the following procedure to configure incoming email in an advanced scenario by selecting the **Advanced** settings mode and additional options that you want to use for your incoming email environment. After you complete the procedure, users can send email to lists and libraries.

You can also use the **Automatic** settings mode in an advanced scenario. In the **Automatic** settings mode, you can select to receive email that has been routed through a safe-email server application. In the **Advanced** settings mode, you can instead specify a drop folder. For more information, see [Plan incoming email \(SharePoint 2013 Preview\)](#).

Several of these steps mention prerequisite procedures that are documented in [Prepare your environment for incoming email in an advanced scenario](#) later in this article.

To configure incoming email in an advanced scenario

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the server that is running the SharePoint Central Administration website.
2. In Central Administration, click **System Settings**.
3. On the System Settings page, in the **E-Mail and Text Messages (SMS)** section, click **Configure incoming e-mail settings**.
4. If you want to enable sites on this server to receive email, on the Configure Incoming E-mail Settings page, in the **Enable Incoming E-Mail** section, click **Yes**.
5. Select the **Advanced** settings mode.

You can specify a drop folder instead of using an SMTP server.

 **Note:**

You can also select the **Automatic** settings mode and select whether to use Directory Management Service and whether to accept email from all email servers or from several specified email servers. For more information, see [Plan incoming email \(SharePoint 2013 Preview\)](#).

6. If you want to connect to Directory Management Service, in the **Directory Management Service** section, click **Yes**.

If you select this option, you must first configure Active Directory Domain Services (AD DS). If you use Exchange Server, you must also configure the DNS Manager and add an SMTP connector. For more information, see [Configure AD DS to be used with Directory Management Service](#), [Configure DNS Manager](#), and [Add an SMTP connector in Microsoft Exchange Server 2010](#) later in this article.

- a) In the **Active Directory container where new distribution groups and contacts will be created** box, type the name of the container in the format **OU=ContainerName, DC=domain, DC=com**, where *ContainerName* is the name of the OU in AD DS, *domain* is the second-level domain, and *com* is the top-level domain.

The application pool identity account for Central Administration must be delegated the **Create, delete, and manage user accounts** task for the container. Access is configured in the properties for the OU in AD DS.

- b) In the **SMTP mail server for incoming mail** box, type the name of the SMTP mail server. The server name must match the FQDN in the A resource record entry for the mail server in DNS Manager.

- c) To accept messages only from authenticated users, click **Yes** for **Accept messages from authenticated users only**. Otherwise, click **No**.

- d) To enable users to create distribution groups from SharePoint sites, click **Yes** for **Allow creation of distribution groups from SharePoint sites**. Otherwise, click **No**.

- e) Under **Distribution group request approval settings**, select the actions that will require approval. Actions include the following:

- **Create new distribution group**
- **Change distribution group e-mail address**
- **Change distribution group title and description**
- **Delete distribution group**

7. If you want to use a remote Directory Management Service, select **Use remote** and complete the remainder of this step. Otherwise, click **No** and proceed to step 8.

If you select this option and you are using Exchange Server, you must configure the DNS Manager and add an SMTP connector. For more information, see [Configure DNS Manager](#) and [Add an SMTP connector in Microsoft Exchange Server 2010](#) later in this article. The AD DS has most likely already been configured, so you do not need to do this.

- a) In the **Directory Management Service URL** box, type the URL of the Directory Management Service that you want to use. The URL is typically in the following format:
`http://server:adminport/_vti_bin/SharePointEmailWS.asmx`.

-
- b) In the **SMTP mail server for incoming mail** box, type the name of the SMTP mail server. The server name must match the FQDN in the A resource record entry for the mail server in DNS Manager on the domain server.
 - c) To accept messages from authenticated users only, click **Yes** for **Accept messages from authenticated users only**. Otherwise, click **No**.
 - d) To allow creation of distribution groups from SharePoint sites, click **Yes** for **Allow creation of distribution groups from SharePoint sites**. Otherwise, click **No**.
8. In the **Incoming E-Mail Server Display Address** section, in the **E-mail server display address** box, type a display name for the email server (for example, mail.fabrikam.com). You typically use this option together with the Directory Management Service.

Tip:

You can specify the email server address that is displayed when users create an incoming email address for a list or group. Use this setting together with Directory Management Service to provide an email server address that is easy to remember.

9. In the **E-Mail Drop Folder** section, in the **E-mail drop folder** box, type the name of the folder from which the Windows SharePoint Services Timer service retrieves incoming email from the SMTP service. This option is available only if you selected **Advanced** settings mode. If you select this option, ensure that you configure the necessary permissions to the email drop folder. For more information, see [Configure permissions to the email drop folder](#) later in this article.
- It is useful to have a dedicated email drop folder if the default email drop folder is full or almost full. Ensure that the logon account for the SharePoint Timer service has Modify permissions on the email drop folder. For more information, see [To configure email drop folder permissions for the logon account for the SharePoint Timer service](#) later in this article.
10. In the **Safe E-Mail Servers** section, select whether you want to accept email from all email servers or from specific email servers.
- This option is available only if you selected **Automatic** settings mode.
11. Click **OK**.

After you configure incoming email, site administrators can configure email-enabled lists and document libraries.

If you selected Directory Management Service, contact addresses that are created for document libraries appear automatically in Active Directory Users and Computers. The addresses are displayed in the OU of AD DS for SharePoint 2013 Preview and must be managed by the administrator of AD DS. The AD DS administrator can add more email addresses for each contact. For more information about AD DS, see [Using Active Directory Service](#) in the TechNet Library.

Alternatively, you can configure the computer running Exchange Server by adding a new Exchange Server Global recipient policy. The policy automatically adds external addresses that use the second-level domain name and not the subdomain or host name for SharePoint 2013 Preview. For more information about how to manage Exchange Server, see [Recipient Configuration Node](#) in the Exchange Server Technical Library.

Prepare your environment for incoming email in an advanced scenario

Before you configure incoming email in an advanced scenario, you need to perform additional procedures depending on how you want your incoming email environment to work.

If you want to use Directory Management Service, you must first configure AD DS, and if you use Exchange Server, you must also configure the DNS Manager and add an SMTP connector.

If you want to use a specific email drop folder, ensure that you configure the necessary permissions to the email drop folder.

In this section:

- [Configure AD DS to be used with Directory Management Service](#)
- [Configure DNS Manager](#)
- [Add an SMTP connector in Microsoft Exchange Server 2010](#)
- [Configure permissions to the email drop folder](#)

Configure AD DS to be used with Directory Management Service

If you plan to use Directory Management Service, you should first create an organizational unit (OU) and make the necessary configurations in AD DS.

To use Directory Management Service on a SharePoint farm, you must configure the application pool identity account for the SharePoint Central Administration website to have the **Create, delete, and manage user accounts** user right to the container that you specify in AD DS. The preferred way to do this is by assigning the right to the application pool identity account for the SharePoint Central Administration website. An AD DS administrator must set up the OU and assign the **Create, delete, and manage user accounts** right to the container. The advantage of using Directory Management Service on a remote server farm is that you do not have to assign rights to the OU for multiple farm service accounts.

The following procedures are performed on a domain controller that runs Windows Server 2008 with DNS Manager. In some deployments, these applications might run on multiple servers in the same domain.

To create an OU in AD DS

1. Verify that the user account that is performing this procedure is a member of the Domain Administrators group or a delegated authority for domain administration on the domain controller that is running DNS Manager.
2. Click **Start**, point to **Administrative Tools**, and then click **Active Directory Users and Computers**.
3. In Active Directory Users and Computers, right-click the folder for the second-level domain that contains your server farm, point to **New**, and then click **Organizational Unit**.
4. Type the name of the OU, and then click **OK**.
After you create the OU, you must delegate the **Create, delete, and manage user accounts** right to the container of the OU to manage the user accounts.

To delegate the right to the application pool identity account for Central Administration

1. Verify that the user account that is performing this procedure is a member of the Domain Administrators group or the Enterprise Administrators group in AD DS, or a delegated authority for domain administration.
2. In Active Directory Users and Computers, find the OU that you created.
3. Right-click the OU, and then click **Delegate control**.
4. On the Welcome page of the Delegation of Control Wizard, click **Next**.
5. On the Users and Groups page, click **Add**, and then type the name of the application pool identity account that the Central Administration uses.
6. In the **Select Users, Computers, and Groups** dialog box, click **OK**.
7. On the Users or Groups page of the Delegation of Control Wizard, click **Next**.
8. On the Tasks to Delegate page of the Delegation of Control Wizard, select the **Create, delete, and manage user accounts** check box, and then click **Next**.
9. On the last page of the Delegation of Control Wizard, click **Finish** to exit the wizard.

To create and delete child objects, you must also delegate **Create all Child Objects** and **Delete all Child Objects** control of the OU to the application pool identity account for Central Administration. After you complete this procedure, the application pool identity account for Central Administration has **Create all Child Objects** and **Delete all Child Objects** control on the OU, and you can enable incoming email.

To delegate Create all Child Objects and Delete all Child Objects control of the OU to the application pool identity account for Central Administration

1. Verify that the user account that is performing this procedure is a member of the Domain Administrators group or the Enterprise Administrators group in AD DS, or a delegated authority for domain administration.
2. Right-click the OU, and then click **Delegate control**.
3. In the Delegation of Control Wizard, click **Next**.
4. Click **Add**, and then type the name of the application pool identity account for Central Administration.
5. Click **OK**.
6. Click **Next**.
7. On the Tasks to Delegate page of the Delegation of Control Wizard, select **Create a custom task to delegate**, and then click **Next**.
8. Click **This folder, existing objects in this folder, and creation of new objects in this folder**, and then click **Next**.
9. In the **Permissions** section, select **Create all Child Objects** and **Delete all Child Objects**.
10. Click **Next**.
11. On the last page of the Delegation of Control Wizard, click **Finish** to exit the wizard.

Delegating **Create all Child Objects** and **Delete all Child Objects** control of the OU to the application pool identity account for Central Administration enables administrators to enable email for a list. After

these controls have been delegated, administrators cannot disable email for the list or document library because the Central Administration account tries to delete the contact from the whole OU instead of from the list.

To avoid this problem, you must add **Delete Subtree** permissions for the application pool identity account for Central Administration. Use the following procedure to add these permissions. After this procedure is complete, you can disable incoming email for a list.

To add Delete Subtree permissions for the application pool identity account for Central Administration

1. Verify that the user account that is performing this procedure is a member of the Domain Administrators group or the Enterprise Administrators group in AD DS, or a delegated authority for domain administration.
2. In Active Directory Users and Computers, click the **View** menu, and then click **Advanced Features**.
3. Right-click the OU, and then click **Properties**.
4. In the **Properties** dialog box, click the **Security** tab, and then click **Advanced**.
5. In the **Permission Entries** area, double-click the application pool identity account for Central Administration.
If the application pool identity account is listed more than once, select the first one.
6. In the **Permissions** area, select **Allow**, for **Delete Subtree**.
7. Click **OK** to close the **Permissions** dialog box.
8. Click **OK** to close the **Properties** dialog box.
9. Click **OK** to close Active Directory Users and Computers.

After you add these permissions, you must restart Internet Information Services (IIS) for the farm.

For more information, see [Active Directory Users, Computers, and Groups](#) in the TechNet Library.

Configure DNS Manager

If you are using Exchange Server and are routing email internally in your organization, you must create a host (A) resource record in DNS Manager to associate DNS domain names of computers (or hosts) to their IP addresses. Your organization might already have a configured DNS Manager and an A resource record. If not, then use the following procedure.

To create an A resource record for a subdomain

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the local computer.
2. In DNS Manager, select the forward lookup zone for the domain that contains the subdomain for SharePoint 2013 Preview.
3. Right-click the zone, and then click **New Host (A or AAAA)**.
4. In the **New Host** dialog box, in the **Name** text box, type the host or subdomain name for SharePoint 2013 Preview.

-
5. In the **Fully qualified domain name (FQDN)** text box, type the FQDN for the server that is running SharePoint 2013 Preview. This is typically in the format *subdomain.domain.com*.
 6. Ensure that the domains that are listed under the SMTP server in IIS match the FQDN of the server that receives email. If they do not match, you must create a local domain. For instructions, see [To create a local domain](#) later in this article.
 7. In the **IP address** text box, type the IP address to which you want the FQDN to resolve.
 8. Click **Add Host**.
 9. In the message that confirms the creation of the host record, click **OK**.
 10. In the **New Host** dialog box, click **Done**.

The A resource record now appears in DNS Manager.

If you use the **E-mail server display address** option and if the email address to which you are sending email messages is not the same as your server name, you must create a local domain.

To create a local domain

1. Click **Start**, point to **Administrative Tools**, and then click **Internet Information Services (IIS) 6.0 Manager**.
2. In IIS Manager, expand the SMTP server.
3. Right-click **Domains**, and on the **Action** menu, point to **New**, and then click **Domain**.
4. In the **New SMTP Domain Wizard** dialog box, select **Alias**, and then click **Next**.
5. In the **Domain Name** area, in the **Name** box, type the address of the mail that is to be received by this domain.
This address must be the same as the one that you specified in step 4 in [To create an A resource record for a subdomain](#), and in step 6b in [To configure incoming email in an advanced scenario](#).
6. Click **Finish**.
7. In the message that confirms the creation of the host record, click **OK**.
8. Restart the SMTP server so that all email messages that are still in the Queue folder move to the Drop folder. The messages are then sent by the Windows SharePoint Services Timer service to their destination list or library.

Note:

If you are routing email from outside your organization to an SMTP server, you must use an MX record. For more information, see [Add a mail exchanger \(MX\) resource record to a zone](#) in the Windows Server Technical Library.

Add an SMTP connector in Microsoft Exchange Server 2010

An SMTP connector gives you more control over the message flow in your organization. Other reasons to use an SMTP connector are to set delivery restrictions or to specify a specific address space. If you use Exchange Server to route incoming email to SharePoint lists and libraries, you must have an SMTP connector so that all mail that is sent to the SharePoint domain uses the servers that are running the SMTP service.

Use the following procedure to add an SMTP connector in Exchange Server. After you complete the procedure, the SMTP connector ensures that incoming email messages are sent to the correct list and library in the farm.

To add an SMTP connector in Exchange Server

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the server that is running Exchange Server.
 2. In Exchange Management Console, expand the Organization Configuration group, right-click **Hub Transport**, point to **New Send Connector**.
The **New Send Connector** wizard appears.
 3. On the Introduction page, do the following and then click **Next**:
 - a) In the **Name** box, type a name for the SMTP connector.
 - b) In the **Select the intended use for this Send connector** box, select the **Custom** usage type for the connector.
 4. On the Address Space page, click **Add**, and then click **SMTP Address Space**.
 5. In the **SMTP Address Space** dialog box, do the following:
 - a) In the **Address** box, type an email domain for the connector.
 - b) In the **Cost** box, assign an appropriate cost. By default, the cost is 1.
 6. Click **OK** to return to the Address Space page, and then click **Next**.
 7. On the Network settings page, select **Use domain name system (DNS) "MX" records to route mail automatically**, and then click **Next**.
 8. On the Source Server page, click **Next**.
The Source server page only appears on Hub Transport servers. By default, the Hub Transport server that you are currently working on is listed as a source server.
 9. On the New Connector page, review your options and then click **New** to create the new send connector.
 10. On the Completion page, ensure that the send connector was created, and then click **Finish**.
In the Hub Transport pane, you can see that the send connector has been enabled automatically.
- For more information, see [Create an SMTP Send Connector](#) in the Exchange Server Technical Library.

Configure permissions to the email drop folder

You can specify a particular email drop folder, which enables SharePoint 2013 Preview to retrieve incoming email from a network share on another server. You can use this option if you do not want to use an SMTP service. However, the drawback of using this option is that SharePoint 2013 Preview cannot detect configuration changes on the remote email server that is delivering email to the drop folder. The result is that SharePoint 2013 Preview cannot retrieve email if the location of the email messages has changed. However, this feature is useful if the default email drop folder is full or almost full.

If you specified an email drop folder, you must ensure that the application pool identity accounts for Central Administration and for the web application have the required permissions to the email drop folder.

Configure email drop folder permissions for the application pool identity account for a web application

If your deployment uses different application pool identity accounts for Central Administration and for one or more web applications, each application pool identity account must have permissions to the email drop folder. If the application pool identity account for the web application does not have the required permissions, email will not be delivered to document libraries on that web application.

In most cases, when you configure incoming email and select an email drop folder, permissions are added for the following worker process groups:

- WSS_Admin_WPG, which includes the application pool identity account for Central Administration and the logon account for the SharePoint Timer service, and has Full Control permissions.
- WSS_WPG, which includes the application pool accounts for web applications, and has Read & Execute, List Folder Contents, and Read permissions.

In some cases, these groups might not be configured automatically for the email drop folder. For example, if Central Administration is running as the Network Service account, the groups or accounts that are needed for incoming email will not be added when the email drop folder is created. Check to determine whether these groups have been added automatically to the email drop folder. If the groups have not been added automatically, you can add them or add the specific accounts that are required.

To configure email drop folder permissions for the application pool identity account for a web application

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the server that contains the email drop folder.
2. In Windows Explorer, right-click the drop folder, click **Properties**, and then click the **Security** tab.
3. On the **Security** tab, under the **Group or user names** box, click **Edit**.
4. In the **Permissions for Windows Explorer** dialog box, click **Add**.
5. In the **Select Users, Computers, or Groups** dialog box, in the **Enter the object names to select** box, type the name of the worker process group or application pool identity account for the web application, and then click **OK**.
This account is listed on the **Identity** tab of the **Properties** dialog box for the application pool in IIS.
6. In the **Permissions for User or Group** box, next to **Modify**, select **Allow**.
7. Click **OK**.

Configure email drop folder permissions for the logon account for the SharePoint Timer service

Ensure that the logon account for the Windows SharePoint Services Timer service has Modify permissions on the email drop folder. If the logon account for the service does not have Modify permissions, email-enabled document libraries will receive duplicate email messages.

To configure email drop folder permissions for the logon account for the SharePoint Timer service

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the server that contains the email drop folder.
2. In Windows Explorer, right-click the drop folder, click **Properties**, and then click the **Security** tab.
3. On the **Security** tab, under the **Group or user names** box, click **Edit**.
4. In the **Permissions for Windows Explorer** dialog box, click **Add**.
5. In the **Select Users, Computers, or Groups** dialog box, in the **Enter the object names to select** box, type the name of the logon account for the SharePoint Timer service, and then click **OK**.
This account is listed on the **Log On** tab of the **Properties** dialog box for the service in the Services snap-in.
6. In the **Permissions for User or Group** box, next to **Modify**, select **Allow**.
7. Click **OK**.

Are attachments missing from email messages that are sent to a SharePoint document library?

If attachments are missing from email messages that are sent to a SharePoint document library, it might be because you associated the document library with an email address. When you do this, Directory Management Service may not add the following two attributes to the user associated with the email address:

- **internet Encoding = 1310720**
- **mAPIRecipient = false**

You must use Active Directory Service Interfaces (ADSI) to manually add these two missing attributes. On servers that are running Windows Server 2008 or Windows Server 2008 R2, ADSI Edit is installed when you configure a server as a domain controller by installing the AD DS role. You can also install Windows Server 2008 Remote Server Administration Tools (RSAT) on domain member servers or stand-alone servers. For more information, see [Installing or Removing the Remote Server Administration Tools Pack](#) in the Windows Server Technical Library.

To add attributes by using ADSI Edit

1. Click **Start**, and then click **Run**.
2. In the **Run** dialog box, type **Adsiedit.msc**, and then click **OK**.

-
3. In the ADSI Edit window, expand **ADSI Edit**, expand **Domain [DomainName]**, expand **DC=DomainName**, **DC=com**, and then expand **CN=Users**.
 4. Right-click the user name to which you want to add the missing attributes, and then click **Properties**.
 5. In the **Properties** dialog box, double-click **Internet Encoding** on the **Attribute Editor** tab.
 6. In the **Integer Attribute Editor** dialog box, type **1310720** in the **Value** box, and then click **OK**.
 7. In the **Properties** dialog box, double-click **mAPIRecipient** on the **Attribute Editor** tab.
 8. In the **Boolean Attribute Editor** dialog box, click **False**, and then click **OK** two times.

Configure outgoing email for a SharePoint 2013 Preview farm

This article describes how to configure outgoing email for a farm or for a specific web application for SharePoint 2013 Preview. This article also describes how to install and configure the SMTP service that you must use to enable outgoing email.

After you have installed SharePoint 2013 Preview and completed the initial configuration of your server farm, you can configure outgoing email. Doing so enables users to create alerts to track such site items as lists, libraries, and documents. In addition, site administrators can receive administrative messages about site administrator issues, such as the information that site owners have exceeded their specified storage space. For more information, see [Plan outgoing email \(SharePoint 2013 Preview\)](#).

To configure outgoing email for a specific web application, first configure the default outgoing email for all web applications in the farm. If you configure the outgoing email for a specific web application, that configuration will override the default configuration for all web applications in the farm.

Important:

You cannot configure outgoing email by using Windows PowerShell.

In this article:

- [Before you begin](#)
- [To install the SMTP service](#)
- [To install IIS 6.0 Management tools](#)
- [To configure the SMTP service](#)
- [To set the SMTP service to start automatically](#)
- [To configure outgoing email for a farm by using Central Administration](#)
- [To configure outgoing email for a specific web application by using Central Administration](#)

Before you begin

Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)

-
- [Touch](#)

Before you begin this operation, review the following information about prerequisites:

- Your computer is running SharePoint 2013 Preview.
- One or more servers in the server farm are running the Simple Mail Transfer Protocol (SMTP) service and have a valid SMTP server address. Alternatively, you must know the name of a server outside the farm that is running the SMTP service.

If you have not installed and configured the SMTP service, before you configure outgoing email you must complete the steps in:

- Install and configure the SMTP service

Install and configure the SMTP service

Before you can enable outgoing email, you must determine which SMTP server to use. This SMTP server must be configured to allow anonymous SMTP email submissions. The SMTP server can be a server in the farm or outside the farm.

Note:

If your organization does not allow anonymous SMTP email messages to be sent by using Exchange Server, you can use a local SMTP server in the SharePoint farm that accepts anonymous email messages. The local SMTP server automatically authenticates the messages and then forwards them to the computer that's running Exchange Server.

Install the SMTP service

To install the SMTP service, use the Add Features Wizard in Server Manager. The wizard creates a default SMTP configuration. You can customize this default SMTP configuration to meet the requirements of your organization.

If you already have the SMTP service installed on a server, skip to [Configure the SMTP service](#) later in this article.

To install the SMTP service

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the front-end web server.
2. Click **Start**, point to **Administrative Tools**, and then click **Server Manager**.
3. In Server Manager, click **Features**.
4. In **Features Summary**, click **Add Features** to open the Add Features Wizard.
5. On the Select Features page, select **SMTP Server**.
6. In the **Add Features Wizard** dialog box, click **Add Required Roll Services**, and then click **Next**.
7. On the Confirm Installation Selections page, click **Install**.
8. On the Installation Results page, ensure that the installation is complete, and then click **Close**.

Configure the SMTP service

After you install the SMTP service, you configure it to send email messages from servers in the farm. You can decide to send relayed email messages to all servers except those that you specifically exclude. Alternatively, you can block messages to all servers except those that you specifically include. You can include servers individually or in groups by subnet or domain.

If you enable anonymous access and relayed email messages, you increase the possibility that the SMTP server will be used to relay unsolicited commercial email messages (spam). It is important to limit this possibility by carefully configuring mail servers to help protect against spam. One way that you can do this is by limiting relayed email messages to a list of specific servers or to a domain, and by preventing relayed email messages from all other servers.

Note:

To manage the SMTP service on Windows Server 2008, you must use Internet Information Services (IIS) 6.0 Manager. Ensure that you install IIS 6.0 Management tools in Server Manager.

To install IIS 6.0 Management tools

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the front-end web server.
2. Click **Start**, point to **Administrative Tools**, and then click **Server Manager**.
3. In Server Manager, click **Roles**.
4. In the **Application Server** section, click **Add Role Services**.
5. On the Select Role Services page, select **Management Tools** and **IIS 6 Management compatibility**, and then click **Install**.

To configure the SMTP service

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the front-end web server.
2. Click **Start**, point to **Administrative Tools**, and then click **Internet Information Services (IIS) 6.0 Manager**.
3. In IIS Manager, expand the server name that contains the SMTP server that you want to configure.
4. Right-click the SMTP virtual server that you want to configure, and then click **Start**.
5. Right-click the SMTP virtual server that you want to configure, and then click **Properties**.
6. On the **Access** tab, in the **Access control** area, click **Authentication**.
7. In the **Authentication** dialog box, verify that **Anonymous access** is selected.
8. Click **OK**.
9. On the **Access** tab, in the **Relay restrictions** area, click **Relay**.
10. To enable relayed email messages to any server, click **All except the list below**.
11. To accept relayed email messages from one or more specific servers, follow these steps:
 - a) Click **Only the list below**.

-
- b) Click **Add**, and then add servers one at a time by IP address, or in groups by using a subnet or domain.
 - c) Click **OK** to close the **Computer** dialog box.

12. Click **OK** to close the **Relay Restrictions** dialog box.

13. Click **OK** to close the **Properties** dialog box.

Ensure that the SMTP service is running and set to start automatically. To do this, use the following procedure.

To set the SMTP service to start automatically

1. Click **Start**, point to **Administrative Tools**, and then click **Services**.
2. In **Services**, right-click **Simple Mail Transfer Protocol (SMTP)**, and then select **Properties**.
3. In the **Simple Mail Transfer Protocol (SMTP) Properties** dialog box, on the **General** tab, in the **Startup type** list, select **Automatic**.
4. Click **OK**.

Configure outgoing email for a farm

You can configure outgoing email for a farm by using the SharePoint Central Administration website. Use the following procedures to configure outgoing email. After you complete the procedures, users can track changes and updates to individual site collections. In addition, site administrators can, for example, receive notices when users request access to a site.

To configure outgoing email for a farm by using Central Administration

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators group on the server that is running the SharePoint Central Administration website.
2. In Central Administration, click **System Settings**.
3. On the System Settings page, in the **E-Mail and Text Messages (SMS)** section, click **Configure outgoing e-mail settings**.
4. On the Outgoing E-Mail Settings page, in the **Mail Settings** section, type the SMTP server name for outgoing email (for example, mail.example.com) in the **Outbound SMTP server** box.
5. In the **From address** box, type the email address as you want it to be displayed to email recipients.
6. In the **Reply-to address** box, type the email address to which you want email recipients to reply.
7. In the **Character set** list, select the character set that is appropriate for your language.
8. Click **OK**.

Configure outgoing email for a specific web application

You can configure outgoing email for a specific web application by using the Central Administration website. Use the following procedures to configure outgoing email.

**Note:**

To configure outgoing email for a specific web application, first configure the default outgoing email for all web applications in the farm. If you configure the outgoing email for a specific web application, that configuration will override the default configuration for all web applications in the farm.

To configure outgoing email for a specific web application by using Central Administration

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators group on the server that is running the SharePoint Central Administration website.
2. In Central Administration, in the **Application Management** section, click **Manage web applications**.
3. On the Web Applications Management page, select a web application, and then in the **General Settings** group on the ribbon, click **Outgoing E-mail**.
4. On the Web Application Outgoing E-Mail Settings page, in the **Mail Settings** section, type the name of the SMTP server for outgoing email (for example, mail.fabrikam.com) in the **Outbound SMTP server** box.
5. In the **From address** box, type the email address (for example, the site administrator alias) as you want it to be displayed to email recipients.
6. In the **Reply-to address** box, type the email address (for example, a help desk alias) to which you want email recipients to reply.
7. In the **Character set** list, click the character set that is appropriate for your language.
8. Click **OK**.

Create web applications that use classic mode authentication in SharePoint 2013 Preview

In SharePoint 2013 Preview, claims-based authentication is the default and preferred method of user authentication and is required to take advantage of server-to-server authentication and app authentication. In Central Administration, you can only configure claims-based authentication when you manage web applications. You can also use Windows PowerShell cmdlets. The use of classic mode authentication, also known as Windows classic authentication, is discouraged in SharePoint 2013 Preview and you can only create or configure web applications for classic mode authentication with Windows PowerShell cmdlets.

To use Windows claims-based authentication instead (recommended), see [Create claims-based web applications in SharePoint 2013 Preview](#). To convert a web application that uses classic mode to use claims-based authentication, see [Migrate from classic-mode to claims-based authentication in SharePoint 2013 Preview](#).

Important:

The steps in this article apply to both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview.

Before you begin

Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](http://go.microsoft.com/fwlink/p/?LinkId=246502) (http://go.microsoft.com/fwlink/p/?LinkId=246502)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 15 Products](http://go.microsoft.com/fwlink/p/?LinkId=246501) (http://go.microsoft.com/fwlink/p/?LinkId=246501)
- [Keyboard shortcuts](http://go.microsoft.com/fwlink/p/?LinkId=246504) (http://go.microsoft.com/fwlink/p/?LinkId=246504)
- [Touch](http://go.microsoft.com/fwlink/p/?LinkId=246506) (http://go.microsoft.com/fwlink/p/?LinkId=246506)

Before you perform this procedure, confirm the following:

- Your system is running SharePoint 2013 Preview.
- You have determined the design of your logical architecture. For more information, see [Logical architecture components](#).
- You have planned authentication for your web application. For more information, see [Plan for user authentication methods](#).

-
- If you use Secure Sockets Layer (SSL), you must associate the SSL certificate with the web application's IIS website after the IIS website is created. For more information about how to set up SSL, see [How to Setup SSL on IIS 7.0](http://go.microsoft.com/fwlink/p/?LinkId=187887) (http://go.microsoft.com/fwlink/p/?LinkId=187887). SSL is required by default for web applications that are used in server-to-server authentication and app authentication scenarios.
 - You understand host-named site collections.
For more information, see [Host-named site collections planning](#).

Create a web application that uses classic mode authentication with Windows PowerShell

Perform the following procedure to use Windows PowerShell to create a web application that uses classic mode authentication.

To create a web application that uses classic mode authentication with Windows PowerShell

1. Verify that you have the following memberships:
 - **securityadmin** fixed server role on the SQL Server instance.
 - **db_owner** fixed database role on all databases that are to be updated.
 - Administrators group on the server on which you are running the Windows PowerShell cmdlets.
 - Add memberships that are required beyond the minimums above.
An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Products cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. Click **Start**, click **All Programs**, click **Microsoft SharePoint 2013 Products**, and then click **SharePoint 2013 Management Shell**.

3. At the Windows PowerShell command prompt, type the following command:

```
New-SPWebApplication -Name <Name> -ApplicationPool <ApplicationPool> -  
AuthenticationMethod <WindowsAuthType> -ApplicationPoolAccount  
<ApplicationPoolAccount> -Port <Port> -URL <URL>
```

Where:

- *<Name>* is the name of the new web application.
- *<ApplicationPool>* is the name of the application pool.
- *<WindowsAuthType >* is either "NTLM" or "Kerberos". Kerberos is recommended.
- *<ApplicationPoolAccount>* is the user account that this application pool will run as.
- *<Port>* is the port on which the web application will be created in IIS.

-
- <URL> is the public URL for the web application.

- **Example**

```
New-SPWebApplication -Name "Contoso Internet Site" -ApplicationPool "ContosoAppPool"  
-AuthenticationMethod "Kerberos" -ApplicationPoolAccount (Get-SPManagedAccount  
"CONTOSO\jdoe") -Port 80 -URL "https://www.contoso.com"
```

For more information, see [New-SPWebApplication](#).

Note:

We recommend that you use Windows PowerShell when performing command-line administrative tasks. The Stsadm command-line tool has been deprecated, but is included to support compatibility with previous product versions.

After this procedure is complete, you can create one or more site collections for this web application.

For more information, see [Create a site collection](#).

After you successfully create the web application, when you open the Central Administration page, you see a health rule warning that indicates that one or more web applications is enabled with classic authentication mode. This is a reflection of our recommendation to use claims-based authentication instead of classic mode authentication.

Create claims-based web applications in SharePoint 2013 Preview

Claims-based authentication is a requirement to enable the advanced functionality of SharePoint 2013 Preview. This article explains how to use either Central Administration or Windows PowerShell to create a SharePoint 2013 Preview web application that uses claims-based authentication. Claims-based authentication is a requirement for web applications that are deployed in scenarios that support server-to-server authentication and app authentication. However, this article also provides guidance for using Windows PowerShell to create classic-mode web applications if you have a specific scenario that cannot support claims-based authentication. Be aware that classic-mode authentication is deprecated in this release, and it will not be available in the next version. For more information, see [Plan for server-to-server authentication in SharePoint 2013 Preview](#)

Important:

Secure Sockets Layer (SSL) is a requirement for web applications that are deployed in scenarios that support server-to-server authentication and app authentication.

You can create a web application by using the SharePoint Central Administration website or Windows PowerShell. You typically use Windows PowerShell to create a web application. If you want to automate the task of creating a web application, which is common in enterprises, use Windows PowerShell. After you complete the procedure, you can create one or several site collections.

In this article:

- [Create a claims-based web application by using Central Administration](#)
- [Create a claims-based web application by using Windows PowerShell](#)
- [Create a classic-mode web application by using Windows PowerShell](#)

Note:

The steps in this article apply to both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview.

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide.

SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

Create a claims-based web application by using Central Administration

Use the procedure described in this section to create a new claims-based SharePoint 2013 Preview web application using the Central Administration.

To create a claims-based web application by using Central Administration

1. Verify that you have the following administrative credentials:
 - a) To create a web application, you must be a member of the Farm Administrators SharePoint group.
2. On the Central Administration Home page, click **Application Management**.
3. On the **Application Management** page, in the **Web Applications** section, click **Manage web applications**.
4. In the **Contribute** group of the ribbon, click **New**.
5. On the **Create New Web Application** page, in the **IIS Web Site** section, you can configure the settings for your new web application by selecting one of the following two options:
 - Click **Use an existing IIS web site**, and then select the web site on which to install your new web application.
 - Click **Create a new IIS web site**, and then type the name of the web site in the **Name** box.
 - In the **Port** box, type the port number you want to use to access the web application. If you are using an existing web site, this field contains the current port number.

 **Note:**

The default port number for HTTP access is 80, and the default port number for HTTPS access is 443.

- Optional: In the **IIS Web Site** section, in the **Host Header** box, type the host name (for example, www.contoso.com) that you want to use to access the web application.

 **Note:**

You do not need to populate this field unless you want to configure two or more IIS web sites that share the same port number on the same server, and DNS has been configured to route requests to the same server.

- In the **Path** box, type the path to the IIS web site home directory on the server. If you are creating a new web site, this field contains a suggested path. If you are using an existing web site, this field contains the current path of that web site.
6. In the **Security Configuration** section, choose whether or not to **Allow Anonymous** access and whether or not to **Use Secure Sockets Layer (SSL)**.

 **Important:**

Secure Sockets Layer (SSL) is a requirement for web applications that are deployed in scenarios that support server-to-server authentication and app authentication. In general, we strongly recommend using SSL for web applications.

- In the **Security Configuration** section, click **Yes** or **No** for the **Allow Anonymous** options. If you choose to **Yes**, visitors can use the computer-specific anonymous access account (that is, IIS_IUSRS) to access the web site.

 **Note:**

If you want users to be able to access any site content anonymously, you must enable anonymous access for the entire web application zone before you enable anonymous access at the SharePoint site level. Later, site owners can configure anonymous access for their sites. If you do not enable anonymous access at the web application level, site owners cannot enable anonymous access at the site level.

- In the **Security Configuration** section, click **Yes** or **No** for the **Use Secure Sockets Layer (SSL)** options. If you choose **Yes**, you must request and install an SSL certificate to configure SSL. For more information about how to set up SSL, see [How to Setup SSL on IIS 7.0](#).
7. In the **Claims Authentication Types** section, select the authentication method that you want to use for the web application.
- To enable Windows authentication, select **Enable Windows Authentication** and, in the drop-down menu, select **NTLM** or **Negotiate (Kerberos)**. We recommend using Negotiate (Kerberos).

If you do not want to use Integrated Windows authentication, clear **Integrated Windows authentication**.

 **Note:**

If you do not select Windows Authentication for at least one zone of this web application, crawling for this web application will be disabled.

- If you want users' credentials to be sent over a network in a nonencrypted form, select **Basic authentication (credentials are sent in clear text)**.

 **Note:**

You can select basic authentication or integrated Windows authentication, or both. If you select both, SharePoint 2013 Preview offers both authentication types to the client web browser. The client web browser then determines which type of authentication to use. If you only select Basic authentication, ensure that SSL is enabled. Otherwise, a malicious user can intercept credentials.

- To enable forms-based authentication, select **Enable Forms Based Authentication (FBA)**, and then enter the **ASP.NET Membership provider name** and the **ASP.NET Role manager name**.

Note:

If you select this option, ensure that SSL is enabled. Otherwise, a malicious user can intercept credentials.

- If you have set up Trusted Identity Provider authentication by using Windows PowerShell, the **Trusted Identity provider** check box is selected.
8. In the **Sign In Page URL** section, choose one of the following options to sign into SharePoint 2013 Preview:
- Select **Default Sign In Page URL** to redirect users to a default sign-in web site for claims-based authentication.
 - Select **Custom Sign In page URL** and then type the sign-in URL to redirect users to a customized sign-in web site for claims-based authentication.
9. In the **Public URL** section, type the URL for the domain name for all sites that users will access in this web application. This URL will be used as the base URL in links that are shown on pages within the web application. The default URL is the current server name and port, and it is automatically updated to reflect the current SSL, host header, and port number settings on the page. If you deploy SharePoint 2013 Preview behind a load balancer or proxy server, then this URL may need to be different than the SSL, host header, and port settings on this page. The **Zone** value is automatically set to **Default** for a new web application. You can change the zone when you extend a web application.
10. In the **Application Pool** section, do one of the following:
- Click **Use existing application pool**, and then select the application pool that you want to use from the drop-down menu.
 - Click **Create a new application pool**, and then type the name of the new application pool, or keep the default name.
 - Click **Predefined** to use a predefined security account for this application pool, and then select the security account from the drop-down menu.
 - Click **Configurable** to specify a new security account to be used for an existing application pool.

Note:

To create a new account, click the **Register new managed account** link.

11. In the **Database Name and Authentication** section, choose the database server, database name, and authentication method for your new web application, as described in the following table.

Item	Action
Database Server	Type the name of the database server and SQL Server instance you want to use in the format <code><SERVERNAME\instance></code> . You can also use the default entry.

Item	Action
Database Name	Type the name of the database, or use the default entry.
Database Authentication	<p>Select the database authentication to use by doing one of the following:</p> <ul style="list-style-type: none"> To use Windows authentication, leave this option selected. We recommend this option because Windows authentication automatically encrypts the password when it connects to SQL Server. To use SQL authentication, click SQL authentication. In the Account box, type the name of the account that you want the web application to use to authenticate to the SQL Server database, and then type the password in the Password box. <p> Note:</p> <p>SQL authentication sends the SQL authentication password to SQL Server in an unencrypted format. We recommend that you only use SQL authentication if you force protocol encryption to SQL Server to encrypt your network traffic by using IPsec.</p>

12. If you use database mirroring, in the **Failover Server** section, in the **Failover Database Server** box, type the name of a specific failover database server that you want to associate with a content database
13. In the **Service Application Connections** section, select the service application connections that will be available to the web application. In the drop-down menu, click **default** or **[custom]**. You use the **[custom]** option to choose the service application connections that you want to use for the web application.
14. In the **Customer Experience Improvement Program** section, click **Yes** or **No**.
15. Click **OK** to create the new web application.

Create a claims-based web application by using Windows PowerShell

Use the procedure in this section to create a new claims-based SharePoint 2013 Preview web application using Windows PowerShell.

To create a claims-based web application by using Windows PowerShell

1. Verify that you have the following memberships:

- **securityadmin** fixed server role on the SQL Server instance.
- **db_owner** fixed database role on all databases that are to be updated.
- Administrators group on the server on which you are running Windows PowerShell cmdlets.
- You must read [about Execution Policies](#).

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 15 Products cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. To create a claims-based authentication provider, from the Windows PowerShell command prompt, type the following:

```
$ap = New-SPAuthenticationProvider
```

3. To create a claims-based web application, from the Windows PowerShell command prompt, type the following:

```
New-SPWebApplication -Name <Name>  
-ApplicationPool <ApplicationPool>  
-ApplicationPoolAccount <ApplicationPoolAccount>  
-URL <URL> -Port <Port> -AuthenticationProvider $ap
```

Where:

- *<Name>* is the name of the new web application that uses claims-based authentication.
- *<ApplicationPool>* is the name of the application pool..
- *<ApplicationPoolAccount>* is the user account that this application pool will run as.
- *<URL>* is the public URL for this web application.
- *<Port>* is the port on which the web application will be created in IIS.

 **Note:**

For more information, see [New-SPWebApplication](#).

The following example creates an https claims-based web application, using the current user credentials and the current machine name:

```
$waUrl = "https://" + $env:ComputerName  
$siteAdmin = $env:userdomain + "\" + $env:username;  
CreateWindowsWebApp -url $waUrl -title "WinClaimsInbound" -site_admin $siteAdmin -  
app_pool_name "WebAppPool1" -app_pool_account $siteAdmin -use_claims -use_ssl;
```

 **Note:**

After you have created the web site, you must configure SSL in IIS for this newly created web site. For more information about how to set up SSL, see [How to Setup SSL on IIS 7.0](#).

If you want your web application to use HTTP, do not use the `-use_ssl` parameter, and use the `http` scheme for the `-url` parameter.

Create a classic-mode web application by using Windows PowerShell

Use the procedure in this section to create a new classic-mode SharePoint 2013 Preview web application using Windows PowerShell.

To create a classic-mode web application by using Windows PowerShell

1. Verify that you have the following memberships:
 - **securityadmin** fixed server role on the SQL Server instance.
 - **db_owner** fixed database role on all databases that are to be updated.
 - Administrators group on the server on which you are running Windows PowerShell cmdlets.
 - You must read [about Execution Policies](#).

2. From the Windows PowerShell command prompt, type the following:

```
New-SPWebApplication -Name <Name>  
-ApplicationPool <ApplicationPool>  
-AuthenticationMethod <WindowsAuthType>  
-ApplicationPoolAccount <ApplicationPoolAccount>  
-Port <Port> -URL <URL>
```

Where:

- *<Name>* is the name of the new web application that uses classic-mode authentication.
- *<ApplicationPool>* is the name of the application pool.
- *<WindowsAuthType>* is either “NTLM” or “Kerberos”. Kerberos is recommended.
- *ApplicationPoolAccount>* is the user account that this application pool will run as.
- *<Port>* is the port on which the web application will be created in IIS.
- *<URL>* is the public URL for the web application.

 **Note:**

For more information, see [New-SPWebApplication](#).

 **Note:**

After you successfully create the web application, when you open the Central Administration page, you see a health rule warning that indicates that one or more web applications is enabled with classic authentication mode. This is a reflection of our recommendation to use claims-based authentication instead of classic mode authentication.

Configure authentication infrastructure (SharePoint 2013 Preview)

The following articles on TechNet and related resources provide information about how to configure authentication infrastructure.

TechNet articles about how to configure authentication infrastructure

The following articles about how to configure authentication infrastructure in SharePoint 2013 Preview are available to view online. Writers update articles on a continuing basis as new information becomes available and as users provide feedback.

	Content	Description
	Configure SAML-based claims authentication with ADFS in SharePoint 2013 Preview	Describes the steps to configure Security Assertion Markup Language (SAML)-based claims authentication using Active Directory Federation Services (AD FS) 2.0.
	Configure forms-based authentication for a claims-based web application in SharePoint 2013 Preview	Describes the steps to configure forms-based authentication using a Lightweight Directory Access Protocol (LDAP) membership provider.
	Configure server-to-server authentication in SharePoint 2013 Preview	Provides steps to configure server-to-server (S2S) authentication with another server that uses the S2S protocol.

Configure forms-based authentication for a claims-based web application in SharePoint 2013 Preview

This article provides guidance for configuring forms-based authentication for a SharePoint 2013 Preview web application that uses a Lightweight Directory Access Protocol (LDAP) membership provider. Forms-based authentication is an identity management system that is based on ASP.NET membership and role provider authentication. Forms-based authentication in SharePoint 2013 Preview is a claims-based authentication method. For more information about the use of forms-based authentication, see the “Implementing forms-based authentication” section of [Plan for user authentication methods](#).

Important:

The steps in this article apply to SharePoint Server 2013 Preview.

Before you begin

Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013](#)
- [Keyboard shortcuts](#)
- [Touch](#)

Before you begin this operation, you should be familiar with the concepts in [Plan for user authentication methods](#).

Process overview

This configuration has the following phases that must be performed in consecutive order:

- [Phase 1: Create a new web application that uses forms-based authentication with Central Administration](#)
- [Phase 2: Configure the Web.Config files for an LDAP membership provider](#)

Within each phase, the set of procedures must also be performed in consecutive order.

For an alternative to creating the new web application by using Central Administration, see [Create a new web application that uses forms-based authentication with Windows PowerShell](#).

Phase 1: Create a new web application that uses forms-based authentication with Central Administration

Perform the steps in the following procedure to create a web application that uses forms-based authentication with Central Administration.

To create a new web application that uses forms-based authentication with Central Administration

1. Verify that the user account that is performing this procedure is a site collection administrator.
2. Click **Start**, click **All Programs**, click **Microsoft SharePoint 2013 Products**, and then click **SharePoint 2013 Central Administration**.
3. In Central Administration, in the **Application Management** section, click **Manage web applications**.
4. In the **Contribute** group of the ribbon, click **New**.
5. In the **Claims Authentication Types** section of the **Create New Web Application** dialog box, select **Enable Forms Based Authentication (FBA)**.
6. Type a membership provider name in **ASP.NET Membership provider name** and a role manager name in **ASP.NET Role manager name**.
In the example Web.Config files depicted in this article, the membership provider is **membership** and the role manager is **rolemanager**.
7. Configure the other settings for this new web application as needed, and then click **OK** to create it.
8. When prompted with the **Application Created** dialog box, click **OK**.

Phase 2: Configure the Web.Config files for an LDAP membership provider

After you successfully create the new web application, modify the following Web.Config files in every web front-end server in the farm:

- [To configure the Central Administration Web.Config file](#)
- [To configure the Security Token Service Web.Config file](#)
- [To configure the new web application Web.Config file](#)

Configure the Central Administration Web.Config file

The following procedure configures the Central Administration web site to recognize and use the new forms-based membership provider and role manager.

To configure the Central Administration Web.Config file

1. Click **Start**, point to **Administrative Tools**, and then click **Internet Information Services (IIS) Manager**.
2. In the console tree, open the server name, and then **Sites**.
3. Right-click the **SharePoint Central Administration v4** site, and then click **Explore**.
4. In the folder window, double-click the Web.Config file.
5. In the <Configuration> section, find the <system.web> section and add the following example entry:

```
<membership defaultProvider="AspNetSqlMembershipProvider">
  <providers>
    <add name="membership"
      type="Microsoft.Office.Server.Security.LdapMembershipProvider,
Microsoft.Office.Server, Version=15.0.0.0, Culture=neutral,
PublicKeyToken=71e9bce111e9429c"
      server="yourserver.com"
      port="389"
      useSSL="false"
      userDNAttribute="distinguishedName"
      userNameAttribute="sAMAccountName"

userContainer="OU=UserAccounts,DC=internal,DC=yourcompany,DC=distinguishedName (of your
userContainer)"
      userObjectClass="person"
      userFilter="(ObjectClass=person)"
      scope="Subtree"
      otherRequiredUserAttributes="sn,givenname,cn" />
  </providers>
</membership>
<roleManager enabled="true" defaultProvider="AspNetWindowsTokenRoleProvider" >
  <providers>
    <add name="roleManager"
      type="Microsoft.Office.Server.Security.LdapRoleProvider,
Microsoft.Office.Server, Version=15.0.0.0, Culture=neutral,
PublicKeyToken=71e9bce111e9429c"
      server="yourserver.com"
      port="389"
      useSSL="false"
      groupContainer="DC=internal,DC=yourcompany,DC= distinguishedName (of your
groupContainer)"
      groupNameAttribute="cn"
      groupNameAlternateSearchAttribute="samAccountName"
      groupMemberAttribute="member"
      userNameAttribute="sAMAccountName"
      dnAttribute="distinguishedName"
      groupFilter="((ObjectClass=group)"
      userFilter="((ObjectClass=person)"
      scope="Subtree" />
  </providers>
</roleManager>
```

In the preceding entry, substitute the following:

- The name of your membership provider in `<add name="membership"`.
- The fully qualified domain name (FQDN) of your domain controller (your LDAP server) in `server="yourserver.com"`.
- The distinguished name of your user container in `userContainer="OU=UserAccounts,DC=internal,DC=yourcompany,DC= distinguishedName (of your userContainer)"`.
- The name of your role manager in `<add name="roleManager"`.
- The distinguished name of your group container in `groupContainer="DC=internal,DC=yourcompany,DC= distinguishedName (of your groupContainer)"`.

After you add this entry, save and close the Web.Config file.

Configure the Security Token Service Web.Config file

The following procedure configures the Security Token Service to recognize and use the new forms-based membership provider and role manager.

To configure the Security Token Service Web.Config file

1. In the console tree of Internet Information Services (IIS) Manager, open the **SharePoint Web Services** site.
2. In the console tree, right-click **SecurityTokenServiceApplication**, and then click **Explore**.
3. In the folder window, double-click the Web.Config file.
4. In the `<Configuration>` section, create a new `<system.web>` section and add the following example entry:

```
<membership>
  <providers>
    <add name="membership"
      type="Microsoft.Office.Server.Security.LdapMembershipProvider,
Microsoft.Office.Server, Version=15.0.0.0, Culture=neutral,
PublicKeyToken=71e9bce111e9429c"
      server="yourserver.com"
      port="389"
      useSSL="false"
      userDNAttribute="distinguishedName"
      userNameAttribute="sAMAccountName"
      userContainer="OU=UserAccounts,DC=internal,DC=yourcompany,DC=com"
      userObjectClass="person"
      userFilter="(&!(ObjectClass=person))"
      scope="Subtree"
      otherRequiredUserAttributes="sn,givenname,cn" />
  </providers>
</membership>
<roleManager enabled="true" >
```

```

    <providers>
      <add name="rolemanager"
        type="Microsoft.Office.Server.Security.LdapRoleProvider,
Microsoft.Office.Server, Version=15.0.0.0, Culture=neutral,
PublicKeyToken=71e9bce111e9429c"
        server="yourserver.com"
        port="389"
        useSSL="false"
        groupContainer="DC=internal,DC=yourcompany,DC=com"
        groupNameAttribute="cn"
        groupNameAlternateSearchAttribute="samAccountName"
        groupMemberAttribute="member"
        userNameAttribute="sAMAccountName"
        dnAttribute="distinguishedName"
        groupFilter="(&(ObjectClass=group))"
        userFilter="(&(ObjectClass=person))"
        scope="Subtree" />
    </providers>
  </roleManager>

```

In the preceding entry, substitute the following:

- The name of your membership provider in <add name="membership".
- The FQDN of your domain controller (your LDAP server) in server="yourserver.com".
- The distinguished name of your user container in
userContainer="OU=UserAccounts,DC=internal,DC=yourcompany,DC=com".
- The name of your role manager in <add name="roleManager".
- The distinguished name of your group container in
groupContainer="DC=internal,DC=yourcompany,DC=com".

After you add this entry, save and close the Web.Config file.

Configure the new web application Web.Config file

The following procedure configures the new web application to recognize and use the new forms-based membership provider and role manager.

To configure the new web application Web.Config file

1. In the console tree of Internet Information Services (IIS) Manager, right-click the site that corresponds to the name of the web applications that you just created, and then click **Explore**.
2. In the folder window, double-click the Web.Config file.
3. In the <Configuration> section, find the <system.web> section.
4. Find the <membership defaultProvider="i"> section and add the following example entry to the <Providers> section:

```

<add name="membership"
  type="Microsoft.Office.Server.Security.LdapMembershipProvider,
Microsoft.Office.Server, Version=15.0.0.0, Culture=neutral,

```

```

PublicKeyToken=71e9bce111e9429c"
    server="yourserver.com"
    port="389"
    useSSL="false"
    userDNAttribute="distinguishedName"
    userNameAttribute="sAMAccountName"
    userContainer="OU=UserAccounts,DC=internal, DC=yourcompany,DC=com"
    userObjectClass="person"
    userFilter="(&(ObjectClass=person))"
    scope="Subtree"
    otherRequiredUserAttributes="sn,givenname,cn" />

```

In the preceding entry, substitute the following:

- The name of your membership provider in <add name="membership".
- The FQDN of your domain controller (your LDAP server) in server="yourserver.com".
- The distinguished name of your user container in userContainer="OU=UserAccounts,DC=internal,DC=yourcompany,DC=com".
 - i. Find the <roleManager defaultProvider="c" enabled="true" cacheRolesInCookie="false"> section and add the following example entry to the <Providers> section:

```

<add name="roleManager"
    type="Microsoft.Office.Server.Security.LdapRoleProvider,
Microsoft.Office.Server, Version=15.0.0.0, Culture=neutral, PublicKeyToken=71e9bce111e9429c"
    server="yourserver.com"
    port="389"
    useSSL="false"
    groupContainer="DC=internal,DC=yourcompany,DC=com"
    groupNameAttribute="cn"
    groupNameAlternateSearchAttribute="samAccountName"
    groupMemberAttribute="member"
    userNameAttribute="sAMAccountName"
    dnAttribute="distinguishedName"
    groupFilter="(&(ObjectClass=group))"
    userFilter="(&(ObjectClass=person))"
    scope="Subtree" />

```

In the preceding entry, substitute the following:

- The name of your role manager in <add name="roleManager".
- The FQDN of your domain controller (your LDAP server) in server="yourserver.com".
- The distinguished name of your group container in groupContainer="DC=internal,DC=yourcompany,DC=com".

After you add the preceding entry, save and close the Web.Config file.

 **Warning:**

Do not overwrite any existing entries in this Web.Config file.

Create a new web application that uses forms-based authentication with Windows PowerShell

Perform the following procedure to create a web application that uses forms-based authentication with Windows PowerShell.

To create a new web application that uses forms-based authentication with Windows PowerShell

1. Verify that you have the following memberships:
 - **securityadmin** fixed server role on the SQL Server instance.
 - **db_owner** fixed database role on all databases that are to be updated.
 - Administrators group on the server on which you are running the Windows PowerShell cmdlets.
 - Add memberships that are required beyond the minimums above.

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Products cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. Click **Start**, click **All Programs**, click **Microsoft SharePoint 2013 Products**, and then click **SharePoint 2013 Management Shell**.
If you have User Account Control (UAC) turned on in Windows, you must right-click SharePoint 2013 Management Shell, and then click **Run as administrator**.

3. From the Windows PowerShell command prompt, type the following:

```
$ap = New-SPAAuthenticationProvider -Name <Name> -ASPNETMembershipProvider <Membership  
Provider Name> -ASPNETRoleProviderName <Role Manager Name>  
$wa = New-SPWebApplication -Name <Name> -ApplicationPool <ApplicationPool> -  
ApplicationPoolAccount <ApplicationPoolAccount> -Url <URL> -Port <Port> -  
AuthenticationProvider $ap
```

Example

```
$ap = New-SPAAuthenticationProvider -Name "ClaimsForms" -ASPNETMembershipProvider  
"membership" -ASPNETRoleProviderName "rolemanager"  
$wa = New-SPWebApplication -Name "FBA Web App" -ApplicationPool "Claims App Pool" -  
ApplicationPoolAccount "internal\appool" -Url http://contoso.com -Port 1234 -  
AuthenticationProvider $ap
```

 **Note:**

The value of the **ApplicationPoolAccount** parameter must be a managed account on the farm.

4. After you successfully create the new web application, modify the following Web.Config files:
 - [To configure the Central Administration Web.Config file](#)

-
- [To configure the Security Token Service Web.Config file](#)
 - [To configure the new web application Web.Config file](#)
5. After you change the Web.Config files, create a **SPClaimsPrincipal** and a site collection, as shown in the following example:
- ```
$cp = New-SPClaimsPrincipal -Identity "membership:SiteOwner" -IdentityType FormsUser
$sp = New-SPSite http://servername:port -OwnerAlias $cp.Encode() -Template "STS#0"
```
- For more information, see [New-SPClaimsPrincipal](#).

**Note:**

We recommend that you use Windows PowerShell when performing command-line administrative tasks. The Stsadm command-line tool has been deprecated, but is included to support compatibility with previous product versions.

---

# Configure SAML-based claims authentication with ADFS in SharePoint 2013 Preview

---

The procedures in this article describe how to configure AD FS to act as an Identity Provider Security Token Service (IP-STTS) for a SharePoint 2013 Preview web application and site collection. In this configuration, AD FS issues SAML-based security tokens consisting of claims so that client computers can access web applications that use claims-based authentication. You can use an alternative identity provider than AD FS, but it must support the WS-Federation standard.

You can use AD FS with the Windows Server 2008 or Windows Server 2008 R2 operating systems to build a federated identity management solution that extends distributed identification, authentication, and authorization services to web-based applications across organization and platform boundaries. By deploying AD FS, you can extend your organization's existing identity management capabilities to the Internet.

## Important:

The steps in this article apply to both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview.

## Before you begin

## Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013](#)
- [Keyboard shortcuts](#)
- [Touch](#)

Before you begin this operation, you should be familiar with the concepts in the following articles:

- [Plan for user authentication methods](#)

## Process overview

This configuration has the following phases that must be performed in consecutive order:

- [Phase 1: Install and configure an AD FS server](#)
- [Phase 2: Configure AD FS with the web application as a relying party](#)

- 
- [Phase 3: Configure SharePoint Server 2012 to trust AD FS as an identity provider](#)
  - [Phase 4: Configure web applications and site collections to use claims-based authentication and AD FS as the trusted identity provider](#)

Within each phase, the set of procedures must also be performed in consecutive order.

## Phase 1: Install and configure an AD FS server

You must install and configure a server that runs AD FS 2.0. For more information, see the [AD FS 2.0 Deployment Guide](#) (<http://go.microsoft.com/fwlink/p/?LinkId=191723>).

## Phase 2: Configure AD FS with the web application as a relying party

This phase has the following procedures:

1. [Configure AD FS for a relying party](#)
2. [Configure the claim rule](#)
3. [Export the token signing certificate](#)

### Configure AD FS for a relying party

Use the procedure in this section to configure a relying party. The relying party defines how the AD FS recognizes the relying party and issues claims to it.

#### To configure AD FS for a relying party

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the local computer. For additional information about accounts and group memberships, see [Local and Domain Default Groups](#)
2. On the AD FS server, open the Active Directory Federation Services (AD FS) 2.0 Management console.
3. In the navigation pane, expand **Trust Relationships**, and then double-click the **Relying Party Trusts** folder.
4. In the right pane, click **Add Relying Party Trust**.  
This opens the Active Directory Federation Services (AD FS) 2.0 configuration wizard.
5. On the Welcome to the Add Relying Party Trust Wizard page, click **Start**.
6. Select **Enter data about the relying party manually**, and then click **next**.
7. Type a relying party name and then click **Next**.
8. Make sure **Active Directory Federation Services (AD FS) 2.0 Profile** is selected, and then click **Next**.
9. Do not use an encryption certificate. Click **Next**.
10. Click to select the **Enable support for the WS-Federation Passive protocol** check box.

- 
11. In the **WS-Federation Passive protocol URL** field, type the name of the web application URL, and append **/\_trust/** (for example, **https://WebAppName/\_trust/**). Click **Next**.

**Note:**

The name of the URL has to use Secure Sockets Layer (SSL).

12. Type the name of the relying party trust identifier (for example, **urn:sharepoint:WebAppName**), and then click **Add**. Click **Next**. Note that this will be the realm value when you configure a new SPTrustedIdentityTokenIssuer in Phase 3.
13. Select **Permit all users to access this relying party**. Click **Next**.
14. On the Ready to Add Trust page, there is no action required, click **Next**.
15. On the Finish page, click **Close**. This opens the Rules Editor Management console. Use this console and the next procedure to configure the mapping of claims from your chosen directory source to SharePoint 2013 Preview.

## Configure the claim rule

Use the procedure in this step to send values of a Lightweight Directory Access Protocol (LDAP) attribute as claims and specify how the attributes will map to the outgoing claim type.

### To configure a claim rule

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the local computer. For additional information about accounts and group memberships, see [Local and Domain Default Groups](#)
2. On the **Issuance Transform Rules** tab, click **Add Rule**.
3. On the Select Rule Template page, select **Send LDAP Attributes as Claims**. Click **Next**.
4. On the Configure Rule page, type the name of the claim rule in the **Claim rule name** field.
5. From the **Attribute Store** drop-down list, select **Active Directory**.
6. In the **Mapping of LDAP attributes to outgoing claim types** section, under **LDAP Attribute**, select **E-Mail Addresses**.
7. Under **Outgoing Claim Type**, select **E-Mail Address**.
8. Under **LDAP Attribute**, select **Token Groups-Unqualified Names**.
9. Under **Outgoing Claim Type**, select **Role**.
10. Under **LDAP Attribute**, select **User-Principal-Name**.
11. Under **Outgoing Claim Type**, select **UPN**.
12. Click **Finish**, and then click **OK**.
13. Click **Add Rule**.
14. On the Choose rule type page, click **Pass Through or Filter an Incoming Claim** in **Claim rule template**, and then click **Next**.
15. On the Configure claim rule page, type **PrimarySID** in **Claim rule name**, click **Primary SID** in **Incoming claim type**, click **Finish**, and then click **OK**.

---

## Export the token signing certificate

Use the procedure in this section to export the token signing certificate of the AD FS server with which you want to establish a trust relationship, and then copy the certificate to a location that SharePoint 2013 Preview can access.

### To export a token signing certificate

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the local computer. For additional information about accounts and group memberships, see [Local and Domain Default Groups](#)
2. On the AD FS server, open the Active Directory Federation Services (AD FS) 2.0 Management console.
3. In the navigation pane, expand **Service**, and then click the **Certificates** folder.
4. Under **Token signing**, click the primary token certificate as indicated in the Primary column.
5. In the right pane, click **View Certificate link**. This displays the properties of the certificate.
6. Click the **Details** tab.
7. Click **Copy to File**. This starts the Certificate Export Wizard.
8. On the Welcome to the Certificate Export Wizard page, click **Next**.
9. On the Export Private Key page, click **No, do not export the private key**, and then click **Next**.
10. On the Export File Format page, select **DER encoded binary X.509 (.CER)**, and then click **Next**.
11. On the File to Export page, type the name and location of the file that you want to export, and then click **Next**. For example, enter **C:\ADFS.cer**.
12. On the Completing the Certificate Export Wizard page, click **Finish**.

## Phase 3: Configure SharePoint Server 2012 to trust AD FS as an identity provider

This phase has the following procedures:

1. [Exporting multiple parent certificates](#)
2. [Import a token signing certificate by using Windows PowerShell](#)
3. [Define a unique identifier for claims mapping by using Windows PowerShell](#)
4. [Create a new authentication provider](#)

### Exporting multiple parent certificates

To complete the configuration of the AD FS server, copy the .CER file to the computer that is running AD FS.

The token signing certificate may have one or more parent certificates in its chain. If it does, every certificate in that chain has to be added to the SharePoint 2013 Preview list of trusted root authorities.

To determine whether one or more parent certificates exist, follow these steps.

**Note:**

These steps should be repeated until all certificates are exported up to the root authority certificate.

### To export multiple parent certificates

1. Verify that the user account that is performing this procedure is a member of the Administrators group on the local computer. For additional information about accounts and group memberships, see [Local and Domain Default Groups](#)
2. Open the Active Directory Federation Services (AD FS) 2.0 Management console.
3. In the navigation pane, expand **Service**, and then click the **Certificates** folder.
4. Under **Token signing**, click the primary token certificate as indicated in the Primary column.
5. In the right pane, click **View Certificate link**. This displays the properties of the certificate.
6. Click the **Certification** tab. This displays any other certificate(s) in the chain.
7. Click the **Details** tab.
8. Click **Copy to File**. This starts the Certificate Export Wizard.
9. On the Welcome to the Certificate Export Wizard page, click **Next**.
10. On the Export Private Key page, click **No, do not export the private key**, and then click **Next**.
11. On the Export File Format page, select **DER encoded binary X.509 (.CER)**, and then click **Next**.
12. On the File to Export page, type the name and location of the file that you want to export, and then click **Next**. For example, enter **C:\adfsParent.cer**.
13. On the Completing the Certificate Export Wizard page, click **Finish**.

### Import a token signing certificate by using Windows PowerShell

Use this section to import the token signing certificates to the trusted root authority list that resides on the SharePoint Server. This step must be repeated for every token signing certificate in the chain until the root certification authority is reached.

#### To import a token signing certificate by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.
  - Add memberships that are required beyond the minimums above.An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Products cmdlets.

**Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. From the Windows PowerShell command prompt, import the parent certificate of the token signing certificate (that is, the root authority certificate), as shown in the following syntax:

```
$root = New-Object
System.Security.Cryptography.X509Certificates.X509Certificate2("C:\adfsParent.cer")
New-SPTrustedRootAuthority -Name "Token Signing Cert Parent" -Certificate $root
```

6. From the Windows PowerShell command prompt, import the token signing certificate that was copied from the AD FS server, as shown in the following syntax:

```
$cert = New-Object
System.Security.Cryptography.X509Certificates.X509Certificate2("C:\adfs.cer")
New-SPTrustedRootAuthority -Name "Token Signing Cert" -Certificate $cert
```

For additional information about the **New-SPTrustedRootAuthority** cmdlet, see [New-SPTrustedRootAuthority](#)

## Define a unique identifier for claims mapping by using Windows PowerShell

Use the procedure in this section to define a unique identifier for claims mapping. Typically, this information is in the form of an e-mail address and the administrator of the trusted STS will have to provide this information because only the owner of the STS knows which claim type will be always unique for each user.

### To define a unique identifier for claims mapping by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.
  - Add memberships that are required beyond the minimums above.

**Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

- 
2. On the **Start** menu, click **All Programs**.
  3. Click **Microsoft SharePoint 2013 Products**.
  4. Click **SharePoint 2013 Management Shell**.
  5. From the Windows PowerShell command prompt, create an identity claim mapping, as shown in the following syntax:

```
$emailClaimMap = New-SPClaimTypeMapping -IncomingClaimType
"http://schemas.xmlsoap.org/ws/2005/05/identity/claims/emailaddress" -
IncomingClaimTypeDisplayName "EmailAddress" -SameAsIncoming
```
  6. From the Windows PowerShell command prompt, create the role claim mapping as shown in the following syntax:

```
$roleClaimMap = New-SPClaimTypeMapping -IncomingClaimType
"http://schemas.microsoft.com/ws/2008/06/identity/claims/role" -
IncomingClaimTypeDisplayName "Role" -SameAsIncoming
```
  7. From the Windows PowerShell command prompt, create the UPN claim mapping as shown in the following syntax:

```
$upnClaimMap = New-SPClaimTypeMapping -IncomingClaimType
"http://schemas.xmlsoap.org/ws/2005/05/identity/claims/upn" -IncomingClaimTypeDisplayName
"UPN" -SameAsIncoming
```

This claim mapping is used for server-to-server authentication scenarios.
  8. From the Windows PowerShell command prompt, create the Primary SID claim mapping as shown in the following syntax:

```
$sidClaimMap = New-SPClaimTypeMapping -IncomingClaimType
"http://schemas.microsoft.com/ws/2008/06/identity/claims/primarysid" -
IncomingClaimTypeDisplayName "PrimarySID" -SameAsIncoming
```

This claim mapping is used for server-to-server authentication scenarios.

For additional information about the **New-SPClaimTypeMapping** cmdlet, see [New-SPClaimTypeMapping](#)

## Create a new authentication provider

Use the procedure in this section to create a new SPTrustedIdentityTokenIssuer.

### To create a new authentication provider by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.
  - Add memberships that are required beyond the minimums above.  
An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Products cmdlets.

**Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. From the Windows PowerShell command prompt, create a new authentication provider, as shown in the following syntax.

**Note:**

The `$realm` variable defines the trusted STS that identifies a specific SharePoint farm and the `$cert` variable is the one that was used from the [Import a token signing certificate by using Windows PowerShell](#) section. The `SignInUrl` parameter is to the AD FS server.

```
$realm = "urn:sharepoint:WebAppName"
$signInURL = "https://YourADFSserverName/adfs/ls"
$ap = New-SPTrustedIdentityTokenIssuer -Name "SAML Provider" -Description "SharePoint
secured by SAML" -realm $realm -ImportTrustCertificate $cert -ClaimsMappings
$emailClaimMap,$roleClaimMap -SignInUrl $signInURL -IdentifierClaim
$emailClaimmap.InputClaimType
```

For additional information about the `New-SPTrustedIdentityTokenIssuer` cmdlet, see [New-SPTrustedIdentityTokenIssuer](#)

## Phase 4: Configure web applications and site collections to use claims-based authentication and AD FS as the trusted identity provider

This phase has the following procedures:

1. [Associate an existing web application with the AD FS identity provider](#)
2. [Create a new web application with the AD FS identity provider](#)
3. [Create a site collection](#)

### Associate an existing web application with the AD FS identity provider

To configure an existing web application to use SAML sign-in, the trusted identity provider in the claims authentication type section must be changed.

---

## To configure an existing web application to use the AD FS identity provider

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. In Central Administration, on the home page, click **Application Management**.
3. On the Application Management page, in the **Web Applications** section, click **Manage web applications**.
4. Click the appropriate web application.
5. From the ribbon, click **Authentication Providers**.
6. Under **Zone**, click the name of the zone. For example, Default.
7. On the **Edit Authentication** page in the **Claims Authentication Types** section, and then select **Trusted Identity provider**. **SAML Provider** should be selected in the list. If not, select **SAML Provider**. Click **OK**.
8. Next, you must enable Secure Sockets Layer (SSL) for this web application. You can do this by adding an alternate access mapping for the "https://" version of the web application's URL and then configuring the web site in the Internet Information Services (IIS) Manager console for an https binding.

## Create a new web application with the AD FS identity provider

When creating a new web application to use SAML sign-in, you must configure claims authentication for the AD FS trusted identity provider.

### To create a new web application with the AD FS identity provider

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. In Central Administration, on the home page, click **Application Management**.
3. On the Application Management page, in the **Web Applications** section, click **Manage web applications**.
4. From the ribbon, click **New**.
5. In the **Security Configuration** section, for **Use Secure Sockets Layer (SSL)**, select **Yes**.
6. In the **Claims Authentication Types** section, select **Trusted Identity provider**.
7. Configure the rest of the new web application settings as needed, and then click **OK**. Note that the URL for the web application must match the URL that you used when you created the relying party in AD FS.

## Create a site collection

As a final step, create a SharePoint site collection and assign an owner. Remember that when you are adding a site collection administrator, you must enter the name in the format of your identity claim. For

---

example, in this article, the identity claim is an e-mail address. For more information, see [Create a site collection](#).

---

# Configure server-to-server authentication in SharePoint 2013 Preview

---

Server-to-server authentication enables you to share resources that live on various servers in a SharePoint farm and access services, such as Exchange Server 2013 Preview and Lync Server 2013 Preview, that are distributed among servers. Server-to-server authentication in SharePoint 2013 Preview also supports resource sharing and access with additional services that are compliant with the server-to-server authentication protocol.

The configuration details in this article are based on configuring server-to-server authentication between SharePoint 2013 Preview and Exchange Server 2013 Preview.

## Important:

Web applications that include server-to-server authentication endpoints for inbound server-to-server requests, or that make outbound server-to-server requests must be configured to use Secure Sockets Layer (SSL). For information about how to configure a web application to use SSL, see [Create claims-based web applications in SharePoint 2013 Preview](#).

## Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013](#)
- [Keyboard shortcuts](#)
- [Touch](#)

Complete the following procedures sequentially to configure server-to-server authentication.

## Configure a realm name in SharePoint 2013 Preview for server-to-server authentication

To enable server-to-server authentication, SharePoint 2013 Preview and Exchange Server 2013 Preview must use the same realm name. Complete the following procedure to configure the realm name in SharePoint 2013 Preview.

### To configure a realm name in SharePoint 2013 Preview

1. Verify that you are a member of the Administrators group on the server on which you are running Windows PowerShell cmdlets.

- 
- **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
- An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. In the SharePoint 2013 Preview environment, on the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```
$farm = Get-SPFarm
$farm.AuthenticationRealm = "<RealmName>"
$farm.Update()
```

Where:

- *<RealmName>* is the name of the realm that you want to use.

## Copy the SharePoint 2013 Preview realm name to Exchange Server 2013 Preview

After you have configured the realm name in SharePoint 2013 Preview, complete the following procedure to copy the realm name to Exchange Server 2013 Preview.

### To copy the SharePoint 2013 Preview realm name to Exchange Server 2013 Preview

1. Verify that you are a member of the Administrators group on the server on which you are running Windows PowerShell cmdlets.
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. In the Exchange Server 2013 Preview environment, on the **Start** menu, click **All Programs**.
3. Click **Microsoft Exchange 2013**.
4. Click **Exchange 2013 Management Shell**.

- 
5. At the Windows PowerShell command prompt, type the following command:

```
Set-PartnerApplication SharePoint -Realm "<RealmName>"
Set-AuthConfig -Realm "<RealmName>"
```

Where:

- *<RealmName>* is the name of the realm that you configured for SharePoint 2013 Preview.

## Export a certificate from SharePoint 2013 Preview for server-to-server authentication

To enable server-to server authentication, you must export a certificate from SharePoint 2013 Preview and then import it to Exchange Server 2013 Preview. Complete the following procedure to export a certificate from SharePoint 2013 Preview.

### To export a certificate from SharePoint 2013 Preview

1. Verify that you are a member of the Administrators group on the server on which you are running Windows PowerShell cmdlets.

- **securityadmin** fixed server role on the SQL Server instance.
- **db\_owner** fixed database role on all databases that are to be updated.

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. In the SharePoint 2013 Preview environment, on the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. Change to the directory where you want to save the file.
6. At the Windows PowerShell command prompt, type the following command:  

```
$spCert = (Get-SPSecurityTokenServiceConfig).LocalLoginProvider.SigningCertificate
$spCert.export("Cert") | Set-Content "" -Encoding Byte
```

## Import a certificate to Exchange Server 2013 Preview for server-to-server authentication

After you export a certificate from SharePoint 2013 Preview, complete the following procedure to import the certificate to Exchange Server 2013 Preview.

### To import a certificate to Exchange Server 2013 Preview

- 
1. Verify that you are a member of the Administrators group on the server on which you are running Windows PowerShell cmdlets.
    - **securityadmin** fixed server role on the SQL Server instance.
    - **db\_owner** fixed database role on all databases that are to be updated.An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. In the Exchange Server 2013 Preview environment, on the **Start** menu, click **All Programs**.
3. Click **Microsoft Exchange 2013**.
4. Click **Exchange 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```
$cert = New-Object System.Security.Cryptography.X509Certificates.X509Certificate2 ""
Set-PartnerApplication SharePoint -CertificateRawString
([Convert]::ToBase64String($cert.GetRawCertData()))
```

## Export a certificate from Exchange Server 2013 Preview for server-to-server authentication

To enable server-to-server authentication, you must export a certificate from Exchange Server 2013 Preview and then import it to SharePoint 2013 Preview. Complete the following procedure to export a certificate from Exchange Server 2013 Preview.

### To export a certificate from Exchange Server 2013 Preview

1. Verify that you are a member of the Administrators group on the server on which you are running Windows PowerShell cmdlets.
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. Open Microsoft Internet Explorer and navigate to **https://owa**, using the name of the computer that is running Exchange Server 2013 Preview.

- 
3. On the **Certificate Error: Navigation Blocked** page, click **Continue to this website (not recommended)**.
  4. In the **Security Status** bar, click **Certificate Error**.
  5. In the **Untrusted Certificate** box, click **View certificates**.
  6. On the **Details** tab of the **Certificate** dialog box, click **Copy to File**.
  7. In the **Certificate Export Wizard** dialog box, on the **Welcome to the Certificate Export Wizard** page, click **Next**.
  8. On the **Export File Format** page, select **Base-64 encoded X.509 (.CER)**, and then click **Next**.
  9. On the **File to Export** page, select a location to store the certificate, type a name for the file, and then click **Next**.
  10. On the **Completing the Certificate Export Wizard** page, click **Finish**.
  11. In the **Certificate Export Wizard** dialog box, click **OK**.
  12. In the **Certificate** dialog box, click **OK**.
  13. Copy the certificate that you exported to a location that is accessible to the computer that is running SharePoint 2013 Preview.

## Import the Exchange Server 2013 Preview certificate to SharePoint 2013 Preview for server-to-server authentication

After you export a certificate from Exchange Server 2013 Preview, complete the following procedure to import the certificate to SharePoint 2013 Preview.

### To import the Exchange Server 2013 Preview certificate to SharePoint 2013 Preview

1. Verify that you are a member of the Administrators group on the server on which you are running Windows PowerShell cmdlets.
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. In the SharePoint 2013 Preview environment, on the **Start** menu, click **All Programs**.
3. Click **SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.

- 
5. Change to the directory where you want to save the file.
  6. At the Windows PowerShell command prompt, type the following command:  

```
$exCert = New-Object System.Security.Cryptography.X509Certificates.X509Certificate2
$exCert.Import(("<ExchangeCertificateLocation>.cer")
New-SPTrustedRootAuthority -Name "<ExchangeRootAuthority>" -Certificate $exCert
```

Where:
    - *<ExchangeCertificateLocation>* is the location to which you copied the certificate.
    - *<ExchangeRootAuthority>* is the name of the Exchange Server 2013 Preview trusted root authority.

## Configure a SharePoint 2013 Preview trust relationship with a Windows Azure Access Control Service (ACS) instance

You must configure SharePoint 2013 Preview to trust the ACS instance. The ACS instance acts as the online security token service (STS). Use the Windows PowerShell **New-SPTrustedSecurityTokenIssuer** cmdlet in SharePoint 2013 Preview to configure the trust relationships. You must configure the server running SharePoint 2013 Preview with the JavaScript Object Notation (JSON) metadata endpoint of the ACS instance.

### To configure a SharePoint 2013 Preview trust relationship with an ACS instance

1. Verify that you are a member of the Administrators group on the server on which you are running Windows PowerShell cmdlets.
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. In the SharePoint 2013 Preview environment, on the **Start** menu, click **All Programs**.
3. Click **SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:  

```
New-SPTrustedSecurityTokenIssuer -MetadataEndpoint "<Metadata endpoint URL of ACS>"
-IsTrustBroker -Name "ACS"
```

Where:

- 
- *<Metadata endpoint URL of ACS>* for SharePoint 2013 Preview is <https://accounts.accesscontrol.windows.net/metadata/json/1>.

 **Note:**

For more information, see [New-SPTtrustedSecurityTokenIssuer](#).

## Configure a SharePoint 2013 Preview trust relationship with Exchange Server 2013 Preview

You must configure SharePoint 2013 Preview to trust Exchange Server 2013 Preview. Use the Windows PowerShell **New-SPTtrustedSecurityTokenIssuer** cmdlet in SharePoint 2013 Preview to configure the trust relationships. You must configure the server running SharePoint 2013 Preview with the JavaScript Object Notation (JSON) metadata endpoint of the server that is running Exchange Server 2013 Preview.

### To configure a SharePoint 2013 Preview trust relationship with Exchange Server 2013 Preview

1. Verify that you are a member of the Administrators group on the server on which you are running Windows PowerShell cmdlets.
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.  
An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. In the SharePoint 2013 Preview environment, on the **Start** menu, click **All Programs**.
3. Click **SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:  
`New-SPTtrustedSecurityTokenIssuer -Name "<FriendlyName>" -MetadataEndpoint "https://<AuthorityComponent>/_layouts/15/metadata/json/1"`

Where:

- *<FriendlyName>* is the friendly name of the other farm.
- *<AuthorityComponent>* is the fully qualified domain name (FQDN) and port of any SSL-enabled web application of the other farm that will be making incoming requests. You can view the server name and port number from the URL column of the list of web applications in Central Administration, for example: **hrweb.corp.contoso.com:28221**.

For more information, see [New-SPTrustedSecurityTokenIssuer](#).

---

# Configure social computing features in SharePoint 2013 Preview

---

SharePoint Server 2013 Preview implements features that make enterprise social computing and collaboration easier. Social networking tools, such as My Sites, and social content technologies, such as microblogs, are examples of social computing features. These features enable users to easily capture and share the knowledge and expertise that is needed to do their work. This sharing of information encourages collaboration, improves innovation, and targets relevant content to the people who have to see it. You can adapt content to each user while enabling administrators to set policies to protect privacy.

## TechNet articles about configuring social computing features

The following articles about how to configure social computing features in SharePoint Server 2013 Preview are available to view online. Writers update articles on a continuing basis as new information becomes available and as users provide feedback.

|                                                                                     | Content                                                                                       | Description                                                                                         |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
|  |                                                                                               |                                                                                                     |
|                                                                                     | <a href="#">Configure My Sites in SharePoint 2013 Preview</a>                                 | Learn how to set up My Sites in SharePoint Server 2013 Preview.                                     |
|                                                                                     | <a href="#">Create and configure communities in SharePoint 2013 Preview</a>                   | Learn how to set up Community Sites in SharePoint Server 2013 Preview.                              |
|                                                                                     | <a href="#">Configure microblogging in SharePoint 2013 Preview</a>                            | Learn how to configure microblogging in SharePoint Server 2013 Preview.                             |
|                                                                                     | <a href="#">Configure personal and social features for My Sites (SharePoint 2013 Preview)</a> | Learn how to configure personal and social features for My Sites in SharePoint Server 2013 Preview. |

# Configure My Sites in SharePoint 2013 Preview

---

This article describes how to set up My Sites in SharePoint Server 2013 Preview. Like other tasks in SharePoint Server, there are multiple ways to complete a task. This article provides ordered tasks with prerequisites and procedures to help you set up My Sites in your enterprise.

Before you set up My Sites, ensure that you understand the concepts and terminology in [My Sites overview \(SharePoint Server 2010\)](#) and [Plan for My Sites \(SharePoint Server 2010\)](#).

We recommend that you perform all of the procedures in the order listed for best results, although not all of them are required.

In this article:

- [Prerequisites](#)
- [Create a My Site host site collection](#)
- [Add a wildcard inclusion managed path to the web application](#)
- [Connect the web application to service applications](#)
- [Enable self-service site creation for the web application](#)
- [Configure My Site settings for the User Profile service application](#)
- [Enable the User Profile Service Application - Activity Feed Job](#)
- [Next steps](#)

## Prerequisites

Because My Sites have dependencies on other service applications and features in SharePoint Server 2013 Preview, ensure that you meet the prerequisites in this section before you perform the procedures in this task.

### Note:

My Sites are hosted by a web application and rely on a User Profile service application. Both are described in this section. My Sites also requires a managed metadata service application. We recommend that you also have a Search service application to use with My Sites, but this is not required. Without the Search service application, some My Sites functionality is affected. For more information, see [Related service applications](#) in [Plan for My Sites \(SharePoint 2013 Preview\)](#).

## Web application

Although you can use an existing web application, for optimal performance and security, we recommend that you create the My Site host site collection in a dedicated web application. For more information, see [Create a Web application \(SharePoint Server 2010\)](#).

---

 **Important:**

If a My Site host site collection was created during initial deployment and configuration, we recommend that you do not use it because it was created in the default web application. Delete this site collection, and create a new web application that is dedicated to hosting My Sites. Then create a new My Site host site collection in the dedicated web application.

## User Profile service application and profile synchronization

Ensure you have a User Profile service application that you want to use for My Sites. If you do not, follow the steps in [Create, edit, or delete a User Profile service application \(SharePoint 2013 Preview\)](#) to create one.

 **Important:**

Although the **Create New User Profile service application** dialog box requests information in the **My Site Host URL** and **Personal Site Location** sections, for this task, remove any default values and leave those fields blank when you create the User Profile service application. Additionally, you can select any of the options in **Site Naming Format**. These settings will be configured separately later in this task.

Optionally, configure profile synchronization if you want to synchronize user and group profile information that is stored in the SharePoint Server 2013 Preview profile database with profile information that is stored in a directory service or business system. For more information, see [Plan for profile synchronization \(SharePoint 2013 Preview\)](#).

## Create a My Site host site collection

The My Site host site collection is a site collection that uses the Enterprise site template named **My Site Host**. This site collection must be created in the web application that you want to host My Sites. Generally, this site collection can be created at the root path of the web application, although it can be created as an explicit inclusion managed path deeper in the URL as long as there is a site collection created at the web application root. For more information about how to select the path for the My Site host collection, see [My Sites architecture](#) in [Plan for My Sites \(SharePoint 2013 Preview\)](#).

### To create a My Site host site collection

1. Verify that you have the following administrative credentials:
  - To create a My Site host site collection, you must be a member of the Farm Administrators group on the computer running the SharePoint Central Administration website or a service application administrator for the services related to My Sites. If you are a service application administrator, you must also have permission to create site collections in the web application that you dedicate to host My Sites.
2. In Central Administration, click **Application Management**, and then click **Create site collections**.
3. On the **Create Site Collection** page, in the **Web Application** section, ensure that the selected web application is the web application that you want to host My Sites. If it is not, expand the list, and then click **Change Web Application**. In the **Select Web Application** dialog box, select a different web application.

- 
4. In the **Title and Description** section, type a title and description for the site collection.
  5. In the **Web Site Address** section, select the URL where you want this site collection created. Generally, you should use the default path (which is displayed as / in the user interface), which is the root of the web application. For more information about this path, see [My Sites architecture in Plan for My Sites \(SharePoint 2013 Preview\)](#).
  6. In the **Template Selection** section, in the **Select experience version** list, select **2013**. Then, on the **Enterprise** tab, click **My Site Host**.
  7. In the **Primary Site Collection Administrator** section, and optionally in the **Secondary Site Collection Administrator** section, type an account in the format *domain\username* to specify an administrator for the site collection.
  8. Optionally, in the **Quota Template** section, select a quota template for the My Site host site collection. This quota template does not affect the individual site collections that users create for their My Sites. For more information, see [Planning for storage requirements](#) in [Plan for My Sites \(SharePoint 2013 Preview\)](#).
  9. Click **OK**. Copy this site collection URL for later reference.

## Add a wildcard inclusion managed path to the web application

The wildcard inclusion managed path is the path under which separate site collections are created for a user's My Site. Creation of the site collection occurs the first time that a user views the user's My Site. This functionality is available only when self-service site creation is also enabled. Enabling self-service site creation is discussed later in this article. For more information about managed paths, see [Define managed paths \(SharePoint Server 2010\)](#).

### To add a wildcard inclusion managed path to the web application

1. Verify that you have the following administrative credentials:
  - To add managed paths, you must be a member of the Farm Administrators group on the computer running the SharePoint Central Administration website.
2. In Central Administration, click **Application Management**, and then click **Manage Web applications**.
3. On the **Web Applications Management** page, select the web application that you created to host My Sites.
4. On the **Web Applications** tab, in the **Manage** group, click **Managed Paths**.
5. In the **Define Managed Paths** dialog box, in the **Add a New Path** section, in the **Path** box, type the path that you want to append to the URL namespace, and then select **Wildcard inclusion**. For example, if your web application URL is `http://mysites.contoso.com/` and you want users' individual site collections created under a path named "personal", type **personal** in the **Path** box. Separate My Sites site collections will be created for each user under `http://mysites.contoso.com/personal/`.
6. Click **Add Path**, and then click **OK**.
7. Copy this managed path for later reference.

---

## Connect the web application to service applications

The web application that hosts My Sites must be connected to service applications in SharePoint Server 2013 Preview. The User Profile service application is required for My Sites. The managed metadata service application and Search service application are highly recommended. For more information, see [My Sites architecture](#) in [Plan for My Sites \(SharePoint 2013 Preview\)](#).

Additionally, if you have other SharePoint sites from which you want users to be able to access their My Site and **About Me** links from the upper-right corner menu, connect the web applications of those sites to the User Profile service application.

### To connect the web application to service applications

1. Verify that you have the following administrative credentials:
  - To connect a web application to a service application, you must be a member of the Farm Administrators group on the computer running the SharePoint Central Administration website.
2. In Central Administration, in the **Application Management** section, click **Manage Web applications**.
3. On the **Web Applications Management** page, select the web application that you created to host My Sites.
4. On the **Web Applications** tab, in the **Manage** group, click **Service Connections**.
5. In the **Configure Service Application Associations** dialog box, in the **Edit the following group of connections** list, select **default** if the default group contains the service applications that you want to connect to the web application.
  - If you choose **[Custom]**, select any service applications to which you want to connect the web application, including the User Profile service application, the managed metadata service application, and the Search service application.
6. Click **OK**.

## Enable self-service site creation for the web application

Self-service site creation enables the automatic creation of a separate site collection for users when they first view their My Site.

### To enable self-service site creation for the web application

1. Verify that you have the following administrative credentials:
  - To enable self-service site creation, you must be a member of the Farm Administrators group on the computer running the SharePoint Central Administration website.
2. In Central Administration, in the **Application Management** section, click **Manage Web applications**.
3. On the **Web Applications** page, select the web application that you created to host My Sites.
4. On the **Web Applications** tab, in the **Security** group, click **Self-Service Site Creation**.

- 
5. In the **Self-Service Site Creation Management** dialog box, in **Site Collections**, select **On**. Optionally, in **Quota template to apply**, select a quota template.
  6. In **Start a Site**, choose one of the following options:
    - a) **Prompt users to create a team site under** so users can create team sites from their My Site to use site feeds.
    - b) **Be hidden from users** if you do not want users to create team sites from their My Sites to use site feeds.
  7. Click **OK** to finish.

Perform these additional steps to configure permissions for users to create team sites from their My Sites to use site feeds.

1. In the **Policy** group, click **Permission Policy**.
2. On **Manage Permission Policy Levels** dialog box, click **Add Permission Policy Level**.
3. Type a name for the permission policy.
4. Under **Permissions**, in **Site Permissions**, select the **Grant** option for **Create Subsites - Create subsites such as team sites, Meeting Workspace sites, and Document Workspace sites**.
5. Click **Save**.
6. In the **Policy** group, click **User Policy**.
7. On **Policy for Web Application** dialog box, click **Add Users**.
8. On **Add Users**, in **Zones** select **(All Zones)**, then click **Next**.
9. In **Choose Users**, enter the user names of the users that you want to create team sites from their My Site to use site feeds. If all users can create team sites from their My Site to use site feeds, click the **Browse** icon. In **Select People and Groups**, click **All Users**, then click **Everyone**. Click **Add**, and then click **OK**.
10. In the **Choose Permissions** section, select the name of the **Permission Policy** created previously.
11. Click **Finish**, and then click **OK**.

## Configure My Site settings for the User Profile service application

After you have a My Site host site collection and wildcard inclusion managed path configured for My Sites, you can update the My Sites settings in the User Profile service application. Most of these settings are configured during initial deployment and only change infrequently during maintenance operations afterward.

### To configure My Site settings for the User Profile service application

1. Verify that you have the following administrative credentials:
  - To configure My Site settings for the User Profile service application, you must be a member of the Farm Administrators group on the computer running the SharePoint Central Administration website or a service application administrator for the User Profile service application.

- 
2. In Central Administration, in the **Application Management** section, click **Manage service applications**.
  3. Click the User Profile service application that you connected to the web application hosting My Sites earlier in this task.
  4. On the **Manage Profile Service** page, in the **My Site Settings** section, click **Setup My Sites**.
  5. On the **My Sites Settings** page, in the **Preferred Search Center** section, specify settings for the search center to direct users to when they search for people or documents from their **About Me** profile page. If you do not have a search center set up yet, you can skip this step and complete it later. For more information, see [Search service application](#) in [Plan for My Sites \(SharePoint 2013 Preview\)](#).
  6. In the **My Site Host** section, type the URL of the My Site host site collection that you created earlier in this task.
  7. Optionally, in the **My Site Host URL in Active Directory** section, type the URL of the My Site host site collection that is returned to client and mobile phone applications that uses Exchange Auto Discovery. When a user is using a client or mobile phone application, credentials are passed in the form of an email address and password. Exchange Auto Discover then finds other required settings, such as SMTP server name, and sends this to the client or mobile phone application. Client and mobile phone applications use Exchange Auto Discovery to find a user's SharePoint Server 2013 Preview My Site based on the My Site host URL stored in Active Directory Domain Services (AD DS).
  8. In the **Personal Site Location** section, type the wildcard inclusion managed path you configured earlier in this task. By default, **personal** is prepopulated in the box. However, if you chose a different path for your wildcard inclusion managed path, replace **personal** with your path.
  9. In the **Site Naming Format** section, select a naming format for the My Sites site collections that will be created when users view their My Sites for the first time. For more information about these formats, see [My Sites architecture](#) in [Plan for My Sites \(SharePoint 2013 Preview\)](#).
  10. In the **Language Options** section, specify whether users can select a preferred language for their My Site. The available languages correspond to the language packs installed in the farm. All servers in a farm must have the same language packs. For more information about multilingual sites, see [Plan for multilingual sites \(SharePoint Server 2010\)](#). For more information about language packs, see [About language IDs and language packs](#) in [Install or uninstall language packs for SharePoint 2013 Preview](#).
  11. In the **Read Permission Level** section, specify the users or groups that can view other users' My Sites when they are created. By default, this includes all authenticated users. However, you can select a more specific group or users depending on the needs of your deployment.
  12. In the **Security Trimming Options** section, specify how system generated posts are checked for permissions before they are displayed in feeds and on the **Tags and Notes** page.
  13. In the **Newsfeed** section, enable system generated posts to the feed on My Sites by selecting **Enable activities in My Site newsfeeds**. This option is selected by default. This is important in hosted environments where tenants can share the same User Profile service but have different requirements on whether they can enable newsfeeds for their users.

---

When upgrading from a SharePoint Server 2010 server farm that uses the newsfeed and tags and notes, you enable these legacy features on your SharePoint Server 2013 Preview server farm by selecting **Enable SharePoint 2010 activity migration**.

14. In the **E-mail Notifications** section, specify an email address to use as the sender email address for My Site email notifications. This account does not have to be a real monitored email address. If you want to receive notifications for newsfeed activities, such as replies to your posts or when someone follows you, select **Enable newsfeed email notifications**.

 **Important:**

You must add the IP address of the farm's outbound SMTP server to the safe list in Exchange Server 2013 Preview to prevent My Site email notifications from being sent to the Junk folder. For more information about safe lists in Exchange Server 2013 Preview, see [Understanding Connection Filtering](#) in the Exchange Server Technical Library.

15. In the **My Site Cleanup** section, specify a new owner of a My Site if the existing My Site user is removed from the profile database. For example, if a user leaves the company and is no longer in the profile database, the user's My Site will be deleted together with any content. However, before it is deleted, a new owner can recover any important content. Select **Enable access delegation** for the My Site cleanup job to first attempt to assign ownership of the My Site to the user's manager. If no manager is found, the My Site is assigned to the user specified in **Secondary Owner**. The new owner has two weeks to retrieve content from the My Site before it is deleted.
16. In the **Privacy Settings** section, select **Make My Sites Public** to make all users' My Sites public. This option is not selected by default.

 **Note:**

When a user's My Site is public, the user's list of followers, the user's list of people they are following, and all activities (including new follow notifications, social tagging and rating of content, birthdays, job title changes, workplace anniversary, updating Ask Me About, posting on a note board, and new blog posts) will be public. Any policies set within **People and Privacy** on the **Manage Policies** page is overridden.

17. Click **OK**.

For more information about additional timer jobs for My Sites, see [Planning for jobs and schedules in Plan for My Sites \(SharePoint 2013 Preview\)](#).

## Enable the User Profile Service Application - Activity Feed Job

The **User Profile Service Application - Activity Feed Job** creates system generated posts in the feeds for the following events:

- Following a tag
- Tagging an item
- Birthday celebration
- Job title change

- 
- Workplace anniversary
  - Updates to Ask Me About
  - Posting on a note board

After you configure My Sites, enable the **User Profile Service Application - Activity Feed Job** so that users receive system generated posts in the **Newsfeed** on their My Sites.

There are other timer jobs related to My Sites that you might want to review and change default settings for. For more information about jobs related to My Sites functionality, see [Planning for jobs and schedules](#) in [Plan for My Sites \(SharePoint 2013 Preview\)](#).

## To enable the User Profile Service Application - Activity Feed Job

1. Verify that you have the following administrative credentials:
  - To configure timer jobs, you must be a member of the Farm Administrators group on the computer running the SharePoint Central Administration website.
2. In Central Administration, click **Monitoring**, and then click **Review job definitions**.
3. On the **Job Definitions** page, in the **View** list, select **Service**. The **Service** list appears.
  - If the **Service** list does not display **User Profile Service**, in **Service**, click **No selection**, then click **Change Service**. On the **Select Service** page, use the arrows in the upper-right corner to locate **User Profile Service**, and then click it. The **Job Definitions** page updates with the User Profile service jobs.
4. Click the activity feed job for the User Profile service application that you created in [Prerequisites](#) earlier in this article. The job name is in the format *User\_Profile\_service\_name* - **Activity Feed Job**, where *User\_Profile\_service\_name* is the name that you specified for your User Profile service application.
5. On the **Edit Timer Job** page, in the **Recurring Schedule** section, select the interval that you want the job to run. Available intervals are **Minutes**, **Hourly**, **Daily**, **Weekly**, and **Monthly**. Selecting a shorter interval, such as **Minutes** or **Hourly**, ensures that activities appear on users' My Site newsfeeds more frequently. However, it increases load on the system depending on how many activities are available. Selecting a longer interval, such as **Daily**, **Weekly**, or **Monthly**, reduces the number of times the job runs and processes feeds. However, it also means that users receive less frequent updates to activities in their newsfeeds.
6. Click **Enable**.
7. Optionally, click **Run Now** to run the job immediately without waiting for the next scheduled interval.

## Next steps

After you configure My Sites by using the procedures in this article, consider whether you require the following optional procedures:

- [Configure trusted My Site host locations](#)
- [Configure links to Office client applications](#)
- [Add personalization site links on My Sites](#)
- [Start related services](#)

- 
- [Configure microblogging](#)

## Configure trusted My Site host locations

**Trusted My Site Host Locations** is an optional feature that prevents a user from creating more than one My Site in an organization with multiple User Profile service applications. For more information, see [Add or delete a trusted My Site host location \(SharePoint Server 2010\)](#).

## Configure links to Office client applications

Users' My Sites are convenient locations for users to save files that they work on in Office client applications, such as Word, Excel, and PowerPoint. After you configure an environment for My Sites, you can add a link to the **Favorite Links** section that users see when they save documents in the **Save As** dialog box in Office client applications. Users can then select their My Site and save files to the **Documents** library available on their My Site. For more information, see [Add or delete links to Office client applications \(SharePoint Server 2010\)](#).

## Add personalization site links on My Sites

If your organization wants to provide important information to users, it can do so by adding personalization site links to a user's My Site. For more information, see [Add or delete personalization site links on My Sites](#).

## Start related services

If the related services for My Sites have not been started yet, start them so that My Sites functionality is available in your environment. For more information, see [Manage services on the server \(SharePoint Server 2010\)](#).

## Configure microblogging

Setting up My Sites is the first step in configuring microblog features in SharePoint Server 2013 Preview. For more information about how to configure microblogging features in SharePoint Server 2013 Preview, see [Configure microblogging in SharePoint 2013 Preview](#).

---

# Create and configure communities in SharePoint 2013 Preview

---

You can create Community Sites and Community Portals in SharePoint Server 2013 Preview. Community Sites provide a discussion forum experience in the SharePoint environment. The Community Portal provides a directory of Community Sites for users to browse and search for communities of interest. Before you create Community Sites and Community Portals, understand the concepts and planning process in [Communities overview \(SharePoint 2013 Preview\)](#) and [Plan for Communities \(SharePoint 2013 Preview\)](#).

## Important:

The steps in this article apply to SharePoint Server 2013 Preview.

In this article:

- [Before you begin](#)
- [Create a Community Site](#)
- [Create a Community Portal](#)
- [Additional steps](#)

## Before you begin

### Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 15 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

Before you begin this operation, review the following information about prerequisites:

- Verify that you have met the requirements in [Phase 3: Plan the solution](#) in [Plan for Communities \(SharePoint 2013 Preview\)](#).

## Create a Community Site

Use the following procedure to create a Community Site at the site collection level in SharePoint Server 2013 Preview.

---

## To create a Community Site

1. Verify that you have the following administrative credentials:
  - To create a site collection by using the Community Site template, you must be a member of the Farm Administrators group on the computer running the SharePoint Central Administration website or a service application administrator. If you are a service application administrator, you must also have permission to create site collections in the web application in which you create the Community Site.
2. In Central Administration, click **Application Management**, and then click **Create site collections**.
3. On the **Create Site Collection** page, in the **Web Application** section, ensure that the selected web application is the web application in which you want to create the Community Site. If it is not, expand the list, and then click **Change Web Application**. In the **Select Web Application** dialog box, select a different web application.
4. In the **Title and Description** section, type a title and description for the site collection.
5. In the **Web Site Address** section, select the URL where you want this site collection created.
6. In the **Template Selection** section, in the **Select experience version** list, select **2013**. Then, on the **Collaboration** tab, click **Community Site**.
7. In the **Primary Site Collection Administrator** section, and optionally in the **Secondary Site Collection Administrator** section, type an account in the format *domain\username* to specify an administrator for the site collection.
8. Optionally, in the **Quota Template** section, select a quota template.
9. Click **OK**.
10. **Verification:** After the site collection is created successfully, click the link to open the Community Site.

## Create a Community Portal

Use the following procedure to create a Community Portal in SharePoint Server 2013 Preview. Community Portals can be created at only the site collection level.

### To create a Community Portal

1. Verify that you have the following administrative credentials:
  - To create a site collection by using the Community Portal template, you must be a member of the Farm Administrators group on the computer running the SharePoint Central Administration website or a service application administrator. If you are a service application administrator, you must also have permission to create site collections in the web application in which you create the Community Portal.
2. In Central Administration, click **Application Management**, and then click **Create site collections**.
3. On the **Create Site Collection** page, in the **Web Application** section, ensure that the selected web application is the web application in which you want to create the Community Portal. If it is not, expand the list, and then click **Change Web Application**. In the **Select Web Application** dialog box, select a different web application.

- 
4. In the **Title and Description** section, type a title and description for the site collection.
  5. In the **Web Site Address** section, select the URL where you want this site collection created.
  6. In the **Template Selection** section, in the **Select experience version** list, select **2013**. Then, on the **Enterprise** tab, click **Community Portal**.
  7. In the **Primary Site Collection Administrator** section, and optionally in the **Secondary Site Collection Administrator** section, type an account in the format *domain\username* to specify an administrator for the site collection.
  8. Optionally, in the **Quota Template** section, select a quota template.
  9. Click **OK**.
  10. **Verification:** After the site collection is created successfully, click the link to open the Community Portal.

## Additional steps

After you have created a Community Site or a Community Portal, consider the following additional steps to complete the configuration:

- Create additional Community Sites as needed. You might create them at the site collection level, as in this procedure, or create them at the site level depending on what you determined during the planning phase.
- Configure permissions for your Community Sites to make them private, closed, or open. For more information, see [Community types](#) in [Plan for Communities \(SharePoint 2013 Preview\)](#).
- Customize the Community Site. In particular, update the icon, title, and description of the site so that the Community Portal displays distinct information for each Community Site.
- Run a search crawl so that it indexes the new site or sites, and populates the Community Portal with Community Sites. No communities appear on the portal until you run a crawl. Configure the incremental crawl schedule so that the Community Portal continues to display any new Community Sites, and so that members can search within communities and the portal.

---

# Configure microblogging in SharePoint 2013 Preview

---

The following articles on TechNet provide information about microblogging in SharePoint 2013 Preview. Before you configure microblogging, make sure that you have completed the steps in [Configure My Sites in SharePoint 2013 Preview](#).

## TechNet articles about microblogging

The following articles about microblogging are available to view online. Writers update articles on a continuing basis as new information becomes available and as users provide feedback.

|                                                                                   | Content                                                                                                | Description                                                                                                 |

# Configure Following settings in SharePoint 2013 Preview

---

In SharePoint Server 2013 Preview, *following* is a user-initiated action that indicates the user's interest in a specific document, person, site, or tag. When users follow an item, new activities about that item appear in the users' newsfeeds on their My Sites. Users view all their followed items from their My Sites.

## Configure Following settings for My Sites

Use this procedure to configure Following settings for My Sites.

 **Note:**

Using lower limits can slightly improve performance. Also, by using lower limits, users will follow higher priority documents, people, or sites.

### To configure Following settings for My Sites

1. Verify that you have the following administrative credentials:
  - To configure Following settings for the User Profile service application, you must be a member of the Farm Administrators group on the computer running the SharePoint Central Administration website or a service application administrator for the User Profile service application.
2. In Central Administration, in the **Application Management** section, in the **Service Applications** group, click **Manage service applications**.
3. In the list of service applications, select the User Profile service application.
4. In the **Operations** group, click **Manage**.
5. On the **Manage Profile Service** page, in the **My Sites Settings** section, click **Manage Following**.
6. In the **Maximum number of followed people** box, type the maximum number of people that a user can follow from the user's My Site.
7. In the **Maximum number of followed documents** box, type the maximum number of documents that a user can follow from the user's My Site.
8. In the **Maximum number of followed sites** box, type the maximum number of sites that a user can follow from the user's My Site.
9. Click **OK**.

---

# Manage Feed Cache and Last Modified Time Cache repopulation in SharePoint 2013 Preview

---

SharePoint Server 2013 Preview feeds require the Feed Cache and Last Modified Time Cache. The Feed Cache maintains recent conversations and activities of entities. The Last Modified Time Cache maintains the last modified time for all items in the Feed Cache. The Distributed Cache service manages both the Feed Cache and the Last Modified Time Cache.

System events, such as a server shutting down unexpectedly or a variation in electrical supply to the server, can affect the Distributed Cache service. Additionally, an administrator who performs maintenance and operational tasks can take an application server that runs the Distributed Cache service offline. This results in the resetting and emptying of the Feed Cache and the Last Modified Time Cache. In this situation, repopulation of the recent conversations and activities of entities occurs. Repopulation occurs in two stages:

1. Load last modified time information for recent conversations and activities.
2. Load recent conversations and activities.

## Note:

In the case of planned maintenance and operations, an administrator can preserve cache data by using the graceful shutdown procedure. For more information, see [Perform a graceful shutdown of the Distributed Cache service](#) in [Manage the Distributed Cache service in SharePoint 2013 Preview](#).

To manage the repopulation process, SharePoint Server 2013 Preview includes the **Feed Cache Repopulation Job** timer job. When the **Feed Cache Repopulation Job** timer job runs, it first checks whether the Feed Cache and Last Modified Time Cache are empty. If they are empty, it starts repopulating the last modified time information for recent conversations and activities in the Last Modified Time Cache. After the timer job finishes the Last Modified Time Cache repopulation, the Feed Cache is populated with recent conversations and activities the next time any user accesses a feed in SharePoint Server 2013 Preview.

In this article:

- [Repopulate the Last Modified Time Cache by using timer jobs in Central Administration](#)
- [Repopulate the Feed Cache and Last Modified Time Cache by using Windows PowerShell cmdlets](#)

## Repopulate the Last Modified Time Cache by using timer jobs in Central Administration

The **User Profile Service Application - Feed Cache Repopulation Job** repopulates the Last Modified Time Cache if the Distributed Cache service resets and becomes empty. Also, after you configure My Sites, users will not see posts appearing in their consolidated newsfeed if the **User Profile Service Application - Feed Cache Repopulation Job** timer job is not configured to run. By default, the **User**

---

**Profile Service Application - Feed Cache Repopulation Job** timer job is configured to run every 5 minutes.

Use this procedure to configure the **User Profile Service Application - Feed Cache Repopulation Job** timer job to monitor the Feed Cache and Last Modified Time Cache for repopulation.

 **Important:**

Do not change the default settings of this timer job if you plan to use social features in SharePoint Server 2013 Preview. Do not disable this timer job. If this timer job is disabled and a repopulation is required, it will re-enable itself and run.

## To configure the User Profile Service Application - Feed Cache Repopulation Job

1. Verify that you have the following administrative credentials:
  - To configure timer jobs, you must be a member of the Farm Administrators group on the computer running the SharePoint Central Administration website.
2. In Central Administration, on the **Monitoring** page, click **Review job definitions**.
3. On the **Job Definitions** page, in the **View** list, select **All**.
4. Use the arrows at the bottom of the page to locate the feed cache repopulation job for the User Profile service application on your server farm. The job name is in the format *User\_Profile\_service\_name - Feed Cache Repopulation Job*, where *User\_Profile\_service\_name* is the name that you specified for the User Profile service application.
5. On the **Edit Timer Job** page, in the **Recurring Schedule** section, select the interval that you want the job to run. Available intervals are **Minutes**, **Hourly**, **Daily**, **Weekly**, and **Monthly**. Selecting a shorter interval, such as **Minutes** or **Hourly**, ensures that checks for an empty cache is performed more frequently. Selecting a longer interval, such as **Daily**, **Weekly**, or **Monthly**, reduces the number of times the job runs. However, it also means that performing cache repopulation checks are done fewer times. We recommend that this timer job runs on shorter intervals.
6. Click **Enable**.
7. Optionally, click **Run Now** to run the job immediately without waiting for the next scheduled interval.

## Repopulate the Feed Cache and Last Modified Time Cache by using Windows PowerShell cmdlets

You can use Windows PowerShell cmdlets to perform the repopulation of the Feed Cache and the Last Modified Time Cache. To perform repopulation, we recommend that you configure the **User Profile Service Application - Feed Cache Repopulation Job** timer job as described above. This is because the timer job first checks to see whether the cache is empty and then repopulates the cache as necessary, whereas the Windows PowerShell cmdlets force a repopulation of the cache. However, in some instances, using the Windows PowerShell cmdlets is the only way to repopulate the cache. These instances include the following:

- After attaching a new content database and the cache is not repopulating.
- After restoring a content database.

---

The following cmdlets are available to force repopulation of the Feed Cache and the Last Modified Time Cache:

- [Update-SPRepopulateMicroblogLMTCache](#). This cmdlet must be run first.
- [Update-SPRepopulateMicroblogFeedCache](#).

---

# Manage the Distributed Cache service in SharePoint 2013 Preview

---

To perform management and operational tasks on the Distributed Cache service in SharePoint Server 2013 Preview, an administrator must perform specific, ordered procedures. This article describes how to conduct several management and operational tasks on the Distributed Cache service.

In this article:

- [Start and stop the Distributed Cache service](#)
- [Change the memory allocation of the Distributed Cache service](#)
- [Add or remove a server in a Distributed Cache cluster](#)
- [Perform a graceful shutdown of the Distributed Cache service](#)
- [Change the service account](#)

## Important:

The Distributed Cache service can end up in a nonfunctioning or unrecoverable state if you do not follow the procedures that are listed in this article. In extreme scenarios, you might have to rebuild the server farm. The Distributed Cache depends on Windows Server AppFabric as a prerequisite. Do not administer the **AppFabric Caching Service** from the **Services** window in **Administrative Tools in Control Panel**. Do not use the applications in the folder named **AppFabric for Windows Server** on the **Start** menu.

## Start and stop the Distributed Cache service

An administrator that performs maintenance and operational tasks might need to start and stop the Distributed Cache service. Some of these tasks include the following:

- Changing the default configuration of the server farm at installation time. The Distributed Cache service is started on all SharePoint servers at installation time. An administrator might want to stop the Distributed Cache service on some servers in the farm.
- Updating the server and there is only one Distributed Cache server in the SharePoint Server 2013 Preview farm.

Stopping the cache results in partial data loss. The Feed Cache depends on the Distributed Cache service. Tags and document activities are saved only to the Feed Cache. Tags and document activities are not persisted to content databases. When the Distributed Cache service is stopped, tags and document activities are lost. When the Distributed Cache service is started, repopulation occurs when the feed cache repopulation timer job runs. For more information, see [Manage Feed Cache and Last Modified Time Cache repopulation in SharePoint 2013 Preview](#). One way to maintain the tags and document activities is to use the method described in [Perform a graceful shutdown of the Distributed Cache service](#) later in this article. When the graceful shutdown of the Distributed Cache service method is used, all cache data is moved from one server to another server before the Distributed Cache service is stopped.

**Note:**

If your cache hosts are part of a cache cluster, do not start or stop the Distributed Cache service as described here. Instead, see [Add or remove a server in a Distributed Cache cluster](#) later in this article.

## To start and stop the Distributed Cache service by using Central Administration

1. In Central Administration, click **Application Management**.
2. In **Service Applications**, click **Manage Services on Server**.
3. On the **Services on Server** page, locate the **Distributed Cache** service.
4. If the Distributed Cache service is started and you want to stop the service, under **Action**, click **Stop**. If the Distributed Cache service is stopped and you want to start the service, under **Action**, click **Start**.

## To start the Distributed Cache service by using Windows PowerShell

At the Windows PowerShell command prompt, run the following command:

```
$instanceName = "SPDistributedCacheService Name=AppFabricCachingService"
$serviceInstance = Get-SPServiceInstance | ? {($_.service.toString()) -eq $instanceName -and
($_.server.name) -eq $env:computername}
$serviceInstance.Provision()
```

## To stop the Distributed Cache service by using Windows PowerShell

At the Windows PowerShell command prompt, run the following command:

```
$instanceName = "SPDistributedCacheService Name=AppFabricCachingService"
$serviceInstance = Get-SPServiceInstance | ? {($_.service.toString()) -eq $instanceName -and
($_.server.name) -eq $env:computername}
$serviceInstance.Unprovision()
```

# Change the memory allocation of the Distributed Cache service

When SharePoint Server 2013 Preview is installed, it assigns the Distributed Cache service 10 percent of the total physical memory on the server. The Distributed Cache service uses half of the memory allocation for data storage (also known as cache size), and the other half of the memory allocation is used for memory management overhead. When the cached data grows, the Distributed Cache service uses the entire 10 percent of the allocated memory.

The following scenarios describe when an administrator should increase the memory allocation for the Distributed Cache:

- When you add physical memory to a server. In this case, the Distributed Cache does not recalculate the 10 percent memory allocation to include the new total physical memory.
- When you have a dedicated Distributed Cache server. Use the following method to calculate how much memory can be assigned to the Distributed Cache service:

- 
1. Determine the total physical memory on the server. For this example, we will use 16 GB as the total physical memory available on the server.
  2. Reserve 2 GB of memory for other processes and services that are running on the cache host. For example, 16 GB – 2 GB = 14 GB. This remaining memory is allocated to the Distributed Cache service.
  3. Take half of the remaining memory, and convert it to MB. For example, 14 GB/2 = 7 GB or 7000 MB. This is the cache size of the Distributed Cache service.
  4. Use the following procedure to update the memory allocation accordingly.

## Change the memory allocation of the Distributed Cache by using Windows PowerShell

Use this procedure to reconfigure the memory allocation for the Distributed Cache service.

1. Stop the Distributed Cache service on all cache hosts that are part of the cache cluster. To stop the Distributed Cache service, on all cache hosts, at the Windows PowerShell command prompt, run the following command:

```
$instanceName = "SPDistributedCacheService Name=AppFabricCachingService"
$serviceInstance = Get-SPServiceInstance | ? {($_.service.toString()) -eq $instanceName -
and ($_.server.name) -eq $env:computername}
$serviceInstance.Unprovision()
```

2. Reconfigure the cache size of the Distributed Cache service on the server that is being added or upgraded. On that server only, at the Windows PowerShell command prompt, run the following command:

```
Set-CacheHostConfig -Hostname Hostname -cacheport Cacheport -cachesize Cachesize
```

Where:

- *Hostname* is the FQDN of the application server being reconfigured that runs the Distributed Cache service.
  - *Cacheport* is equal to the port number of the Distributed Cache (22233).
  - *Cachesize* is the cache size's memory allocation assignment in MB. In the previous example, the cache size was calculated at 7000 MB for a server with 16 GB of total physical memory.
3. Restart the Distributed Cache service. On all servers, at the Windows PowerShell command prompt, run the following command:

```
$serviceInstance.Provision()
```

## Add or remove a server in a Distributed Cache cluster

An administrator can add or remove a server to a cache cluster, or might want to remove a server from the cache cluster, perform some operational or maintenance tasks on the server, and then rejoin or add the server to the cache cluster. When removing the server, the Distributed Cache service is stopped,

---

then unregistered from the server. Unregistering the Distributed Cache service means that an administrator will not see the Distributed Cache service listed on the **Services on Server** page in Central Administration. Similarly, when a server is added, the Distributed Cache service is registered and then is started on the server. Registering the Distributed Cache service means that an administrator will see the Distributed Cache service listed on the **Services on Server** page in Central Administration.

Use the following procedures to add and remove a server from a cache cluster. These Windows PowerShell cmdlets are run on the server being added or removed.

## Add a server to the cache cluster and starting the Distributed Cache service by using a Windows PowerShell

At the Windows PowerShell command prompt, run the following command:

```
Add-SPDistributedCacheServiceInstanceOnLocalServer
```

## Remove a server from the cache cluster by using a Windows PowerShell

At the Windows PowerShell command prompt, run the following command:

```
Remove-SPDistributedCacheServiceInstanceOnLocalServer
```

### Important:

This procedure will stop the cache service and nonpersisted cached data will be lost. If you want to keep the cached data, use the graceful shutdown procedure that is described in the next section, and then run the **Remove-SPDistributedCacheServiceInstanceOnLocalServer** cmdlet. The **Remove-SPDistributedCacheServiceInstanceOnLocalServer** cmdlet involves stopping and disabling the underlying AppFabric Caching service. Do not restart the AppFabric Caching service other than by running the **Add-SPDistributedCacheServiceInstanceOnLocalServer** cmdlet.

## Perform a graceful shutdown of the Distributed Cache service

In a SharePoint Server 2013 Preview farm, a cache cluster exists when several cache hosts run the Distributed Cache service. In a SharePoint Server 2013 Preview farm, one cache exists, and the cache spans the cache cluster. An administrator can take a cache host out of the cluster to perform operational or maintenance tasks on the server, such as applying updates to the server. To prevent data loss associated with the removal of the cache host from the cache cluster, an administrator must first run the graceful shutdown procedure before removing the cache host from the cache cluster. The graceful shutdown procedure is run on the cache host being removed from the cache cluster. This cache host stores a portion of the cached data. The graceful shutdown procedure transfers all cached data from the cache host on which the graceful shutdown procedure is being run on to another cache

---

host in the farm. The transfer process takes 15 minutes or more to run depending on how many items exist in the cache. When the transfer process is complete, removing the cache host by using the **Remove-SPDistributedCacheServiceInstanceOnLocalServer** cmdlet does not result in any data loss.

## To perform a graceful shutdown of the Distributed Cache by using Windows PowerShell

At the Windows PowerShell command prompt, run the following command:

```
Stop-SPDistributedCacheServiceInstanceGracefullyOnLocalServer
Remove-SPDistributedCacheServiceInstanceOnLocalServer
```

### Note:

To rejoin or add the server to the cache cluster, run the **Add-SPDistributedCacheServiceInstanceOnLocalServer** cmdlet.

## Change the service account

When the server farm is first configured, the server farm account is set as the service account of the AppFabric Caching service. The Distributed Cache service depends on the AppFabric Caching service. To change the service account of the AppFabric Caching service to a managed account:

1. Create a managed account. For more information, see [Configure automatic password change \(SharePoint Server 2010\)](#).
2. Set the Managed account as the service account on the AppFabric Caching service. At the Windows PowerShell command prompt, run the following command:

```
$farm = Get-SPFarm
$cacheService = $farm.Services | where {$_.Name -eq "AppFabricCachingService"}
$acct = Get-SPManagedAccount -Identity domain_name\user_name
$cacheService.ProcessIdentity.CurrentIdentityType = "SpecificUser"
$cacheService.ProcessIdentity.ManagedAccount = $acct
$cacheService.ProcessIdentity.Update()
$cacheService.ProcessIdentity.Deploy()
```

Where *Domain\_name\user\_name* is the domain name and user name of the managed account.

---

# Enable or disable personal and social features for users or groups in SharePoint 2013 Preview

---

Farm Administrators or service administrators of a User Profile service application control who can create My Sites, and use personal and social features. For example, you might want a subset of users in an organization to be able to create My Sites, so you enable the **Create Personal Site** permission for those users. For more information, see [User Profile service application overview \(SharePoint 2013 Preview\)](#).

## Important:

Before you decide which permission to grant users or groups of users, first review the permission descriptions and how the combination of these permissions affects the My Site user experience. For more information, see [Plan users and user permissions](#) in [Plan for My Sites \(SharePoint 2013 Preview\)](#).

Before you perform this procedure, confirm the following:

- A User Profile service application is running in the farm. For more information, see [Create, edit, or delete a User Profile service application \(SharePoint 2013 Preview\)](#).

## Enable users or groups to use personal and social features

Use this procedure to configure the user permissions for personal and social features.

### To enable users or groups to use personal and social features

1. Verify that you have the following administrative credentials:
  - To use the SharePoint Central Administration website to enable users or groups to use personal and social features, you must be a member of the Farm Administrators group, or you must have been delegated permission to administer the User Profile service application that is running in the farm. For more information, see [Assign administration of a User Profile service application \(SharePoint 2013 Preview\)](#).
2. In Central Administration, in the **Application Management** section, click **Manage service applications**.
3. In the list of service applications, click **User Profile Service Application**.
4. On the **Manage Profile Service: User Profile Service Application** page, in the **People** group, click **Manage User Permissions**.
5. On the **Permissions for User Profile Service Application** page, type or select a user or group account, and then click **Add**.
6. In the **Permissions for** box, check the feature or features that you want the user or group to be able to use, and then click **OK**.

---

# Configure eDiscovery in SharePoint 2013 Preview

---

This article identifies the steps that are required to configure eDiscovery in SharePoint Server 2013 Preview. When you complete the steps that are listed in this article, users will be able to create and work with eDiscovery cases.

Before you configure eDiscovery, you should understand the concepts that are presented in the article [Overview of eDiscovery and In-Place Holds \(SharePoint 2013 Preview\)](#), and you should have completed the planning process that is described in the article [Plan for eDiscovery](#).

The tasks that you must perform to configure eDiscovery are the following:

- Configure communication between SharePoint Server 2013 Preview and Exchange Server 2013 Preview.
- Configure Search to crawl all discoverable content.
- Grant permissions.
- Create an eDiscovery Center.

## Configure communication between SharePoint Server 2013 Preview and Exchange Server 2013 Preview

If you will use a SharePoint eDiscovery Center to discover content in Exchange Server, you must configure SharePoint Server 2013 Preview and Exchange Server to interact.

 **Important:**

To discover content in Exchange Server from a SharePoint eDiscovery Center, you must be running Exchange Server 2013 Preview.

Perform the following steps:

1. Ensure that the Exchange Web Service managed API is installed on every front-end server that is running SharePoint Server 2013 Preview. For more information about the Exchange Web Service managed API, see [Hardware and software requirements \(SharePoint 2013 Preview\)](#).
2. Configure a trust relationship between SharePoint Server 2013 Preview and Exchange Server. For information about how to configure the trust relationship, see [Configure server-to-server authentication in SharePoint 2013 Preview](#).
3. If you want content from Lync Server 2013 Preview to be discoverable, configure Lync Server 2013 Preview to archive to Exchange Server 2013 Preview. For information about how to configure Lync Server 2013 Preview archiving, see [Microsoft Lync Server 2013 Archiving Deployment Guide](#).

- 
4. Perform the eDiscovery configuration steps for Exchange. For information about how to configure Exchange Server 2013 Preview for eDiscovery, see [Configure Exchange for SharePoint eDiscovery Center](#).

## Configure Search to crawl all discoverable content

Content is only discoverable if it is crawled and indexed by the Search service application that is associated with the web application that the eDiscovery Center is in. You should have identified this Search service application when you planned for eDiscovery. To configure the Search service application to crawl the appropriate content, follow these steps:

1. If content in Exchange Server 2013 Preview must be discoverable, add Exchange Server 2013 Preview as a result source. For information about how to configure a result source, see [Manage result sources \(SharePoint Server 2013\)](#).
2. Ensure that all websites that contain discoverable content are being crawled. For information about how to configure a location to be crawled, see [Add, edit, or delete a content source \(SharePoint Server 2010\)](#).
3. Ensure that all file shares that contain discoverable content are being crawled. For information about how to configure a location to be crawled, see [Add, edit, or delete a content source \(SharePoint Server 2010\)](#).

## Grant permissions

The article [Plan for eDiscovery](#) recommends that you create a security group to contain all users of the eDiscovery Center. After you create the security group, grant the security group permissions to access all discoverable content.

### Note:

The article [Plan for eDiscovery](#) explains the different ways of granting permissions to discoverable content. You should have chosen to grant permissions at the web application level or at the site collection level.

1. If you will grant permissions at the web application level, create a user policy that gives the security group full read permissions for each web application that contains discoverable content. For information about how to create a policy for a web application, see [Manage permission policies for a Web application \(SharePoint Server 2010\)](#).

### Note:

When you change permissions at the web application level, Search re-crawls all of the content in the web application.

2. If you will grant permissions at the site collection level, make the security group a site collection administrator for each site collection that contains discoverable content. For information about how to add a site collection administrator, see [Add or change a site collection administrator](#).

**Important:**

A site collection administrator must add the security group as an additional site collection administrator by using the **Site Settings** menu. You cannot use Central Administration to make a security group a site collection administrator

3. Ensure that the security group has permissions to access all file shares and other websites that contain discoverable content.
4. If you will use a SharePoint eDiscovery Center to discover content in Exchange Server, grant the security group permissions to access Exchange Server mailboxes. For information about how to grant permissions in Exchange, see [Configure Exchange for SharePoint eDiscovery Center](#).
5. Grant the security group permissions to view the crawl log. For information about how to grant permissions to access the crawl log, see [Set-SPEnterpriseSearchCrawlLogReadPermission](#).

## Create an eDiscovery center

An eDiscovery Center is a site collection from which users can create and manage eDiscovery cases. To create an eDiscovery Center, follow the procedure in the article [Create a site collection \(SharePoint 2013 Preview\)](#), and choose the **eDiscovery Center** site collection type from the **Enterprise** tab. Be aware that an eDiscovery Center must be in a web application that supports claims authentication.

---

# Install Business Connectivity Services solutions for SharePoint 2013 Preview

---

This article is your starting place for the procedures to install common Microsoft Business Connectivity Services scenarios for SharePoint Server 2013 Preview. The Business Connectivity Services solution that you deploy will most likely look different from the solutions presented here, but you can model your installation on these examples. Also, you can select the individual procedures from here to build your own procedural documents for your Business Connectivity Services solution scenario.

## About Business Connectivity Services installation scenarios

Every Business Connectivity Services solution is unique because each business has unique data integration problems that it is solving by using Business Connectivity Services. The solutions can range from something simple and straightforward that a power user or IT professional (who has the appropriate permissions) can perform by themselves, to complex solutions that require developer, IT professional, and end-user solution development involvement. This guide presents the configuration procedures in common scenarios.

- On-premises: All the Business Connectivity Services components are under your organizations control behind your firewall.

## Prerequisites

Before you begin with any Business Connectivity Services scenario configuration, make sure that you have read [Business Connectivity Services Overview \(SharePoint 2013 Preview\)](#) and completed the steps in [Plan a Business Connectivity Services solution \(SharePoint 2013 Preview\)](#).

## On-premises deployment

The procedures in [Deploy an on-premises Business Connectivity Services solution in SharePoint 2013 Preview](#) show you how to deploy a solution that involves the following:

- A Business Connectivity Services infrastructure that is on your corporate network.
- Information workers who access the Business Connectivity Services solution are on your corporate network.
- External content that is surfaced in SharePoint as an external list.
- External content that is synchronized into Outlook for offline use.
- Accessing external data that is in SQL Server database on your corporate network.
- SharePoint Designer 2013 Preview to create the external content type for the SQL Server data source.

- 
- The Secure Store Service to manage mapping of user credentials to group credentials for accessing the external systems.

---

# Deploy an on-premises Business Connectivity Services solution in SharePoint 2013 Preview

---

The following scenario shows you how to create a no-code business solution by using the SQL Server AdventureWorks sample database. You learn how to do the following:

- Access a customer view in the SQL Server AdventureWorks sample database as your external data source.
- Configure various SharePoint services and accounts.
- Choose and implement an authentication mode.
- Define an external content type.
- Create and authorize access to an external list.
- Connect the external list to Outlook.

# Overview of apps for SharePoint

---

The apps for SharePoint provide a new method to deliver specific information or functionality to a SharePoint site. An app for SharePoint is a small, easy-to-use, stand-alone app that solves a specific end-user or business need. Site owners can discover and download apps for SharePoint from a public SharePoint Store or from their organization's internal App Catalog and install them on their SharePoint sites. These apps for SharePoint integrate the best of the web with SharePoint 2013 Preview. They do not replace SharePoint features and solution packages, which customize or enhance SharePoint sites. Unlike features and solutions, which farm or site collection administrators have to install, apps for SharePoint are stand-alone applications that owners of sites can add to their SharePoint sites. The apps for SharePoint have a simple lifecycle - they can be installed, upgraded, and uninstalled by site owners.

The following are examples of apps for SharePoint that site owners could add to their sites:

- An app that provides event planning tools.
- An app that provides a shopping cart experience for a site.
- An app that sends a note of recognition for good work (kudos) to someone in the organization.

Microsoft will host and control a public SharePoint Store, where developers will be able to publish and sell their custom apps for SharePoint. End users and IT professionals will be able to obtain these custom apps for personal or corporate use. This SharePoint Store will handle the end-to-end acquisition experience from discovery to purchase, upgrades, and updates.

Company-developed and approved apps can also be deployed to an organization's internal App Catalog hosted on SharePoint 2013 Preview or SharePoint Online. This controls the visibility of apps within organizations.

 **Important:**

This article applies to both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview.

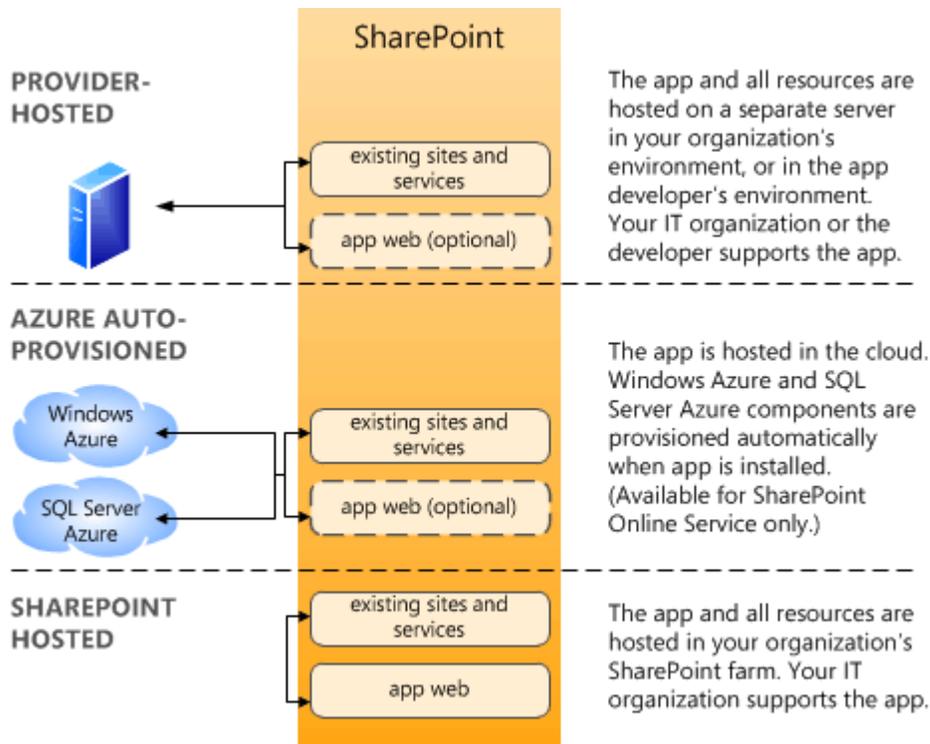

## Where are apps for SharePoint hosted?

There are several options for hosting apps for SharePoint.

- Provider-hosted
- Hosted in the cloud (Azure auto-provisioned)
- Hosted in a SharePoint environment
- Several combinations of these options.

Depending on the hosting option, the app can contain different elements and take advantage of different components.

The following illustration shows the hosting options:

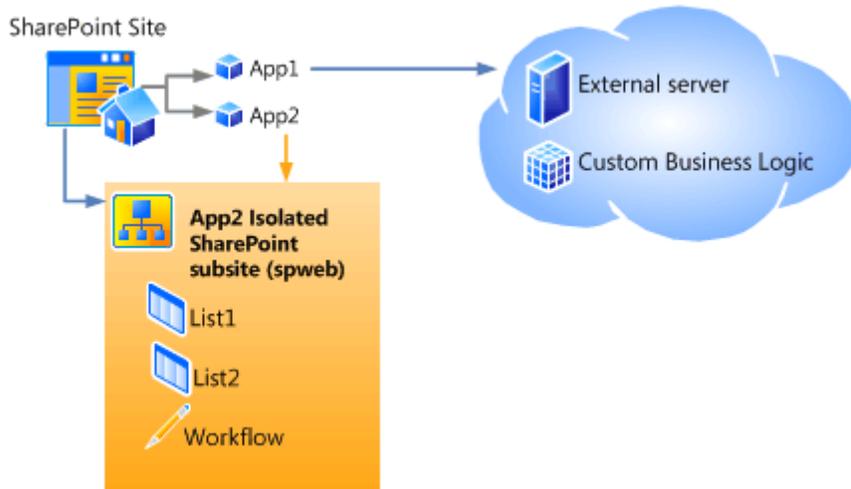

No matter the hosting option for the app, if you want users to be able to install and use apps for SharePoint in your environment, you will have to configure your environment to support them.

For more information about hosting options, see the SharePoint 2013 Preview developer documentation.

## How are apps for SharePoint and SharePoint sites related?

Site owners can add apps for SharePoint to their sites. If an app contains SharePoint components, those components are stored in a subweb of the site that is automatically created when you install the app. Apps have their own, isolated URLs, which are separate from the URL for the site that contains the app. If the app is a Provider-hosted or Azure auto-provisioned app, the app components are stored in those locations. For example, in the following diagram, App1 contains custom business logic and is stored on an external server - it is an Azure auto-provisioned app and does not store content in a subweb of the site. App2 is a SharePoint hosted app with only SharePoint components. App2's content is stored in a subweb of the site on which it is installed.

## What is the URL for an app for SharePoint?

By default, apps are deployed to their own web site in a special, isolated domain name, instead of in the same domain name as your farm. Processes run under that domain name and do not affect the SharePoint sites. This difference in domain names provides a layer of isolation for the apps. The use of a different domain name from the SharePoint sites prevents cross-site scripting between the apps and sites and unauthorized access to users' data.

Each installation of an app has a unique URL in your environment. You determine the template for that URL (by specifying a domain name and an app prefix), and then app URLs are automatically generated based on that template. Paths for the apps are based on the URL for the site where they are installed. When you install an app to a site, a subweb of that site is created to host the app content. The subweb for the app is hierarchically below the site collection, but has an isolated unique host header instead of being under the site's URL. The following diagram shows the relationship between the site's URL and the app's URL:

### Main SharePoint site

`http://contoso.com/sites/web1`

### App1 SharePoint site

`http://prefix-apphash.contosoapps.com /sites/web1/appname`

In this diagram, the Main SharePoint Site is the site on which the user installed the app. The App1 SharePoint Site is a subweb of the Main site that contains the app and its components. The URL for the App1 SharePoint site is based on that of the Main SharePoint site. However, it is in a different domain, has a prefix-apphash at the beginning, and has an app name at the end for the subweb name. The prefix-apphash part of the URL is designed to support multi-tenant environments. In a multi-tenant environment, each tenant has its name that is combined with the apphash to provide a unique domain name for the app. If you are not in a multi-tenant environment, you can use the same app prefix for all URLs.

---

## Use and benefits of apps for SharePoint

The apps for SharePoint allow users to add quick functionality to their site without your intervention. Unlike templates, features, and solutions, which an IT administrator must deploy, site owners can add apps for SharePoint to their sites or remove them. Because apps for SharePoint are limited in scope to a subweb and have an isolated URL, they do not interact with the rest of your farm or open your environment to cross-site scripting risks.

Your organization can develop its own apps for SharePoint. You can make apps for SharePoint available from the SharePoint Store, and you can make these apps available in the App Catalog so that users know which apps for SharePoint are approved for use in your environment. Users can easily update apps for SharePoint with new versions when they become available.

## Impacts of apps for SharePoint

Supporting apps for SharePoint in your environment does require a configuration change to your environment. There are two main considerations:

- **Requirements for supporting apps for SharePoint** You must be running the Subscription Settings and App Management service applications to use apps for SharePoint. You must create the DNS domain to contain the URLs for apps for SharePoint in your environment.
- **Plan for capacity** Each app for SharePoint that is installed creates a subweb under the site on which it is installed with its own URL. This means that environments that contain many apps for SharePoint will have many additional subwebs. Be sure to consider this when planning for capacity for your farm.

For more information about these and other considerations, see [Plan for apps for SharePoint](#) and [Configure an environment for apps for SharePoint](#).

---

# Plan for apps for SharePoint

---

The apps for SharePoint provide a new method to deliver specific information or functionality to a SharePoint site. An app for SharePoint is a small, easy-to-use, stand-alone productivity app that solves a specific end-user need. Before you allow users to install apps in a SharePoint environment, you must plan how you want to support them. You have to determine your organization's policy around apps for SharePoint, plan your configuration settings, and determine how to manage and monitor the apps. This article explains key decisions and helps you understand the choices to make as you plan to support apps for SharePoint.

In this article:

- [Governance: determine the app for SharePoint policy for your organization](#)
- [Plan app configuration settings](#)
- [Plan App Catalog](#)
- [Plan to monitor apps](#)
- [Plan for app licenses](#)

For more conceptual information about apps for SharePoint, see [Overview of apps for SharePoint](#).

## Governance: determine the app for SharePoint policy for your organization

The first decision about apps for SharePoint is the extent to which you want to use them in your organization and the policy for using them. The following questions can help you frame your discussion about your policy:

- Do you want users to be able to install and use apps for SharePoint?
  - If so, keep reading and shaping your policy.
  - If not, then you can use settings in the SharePoint Store to control whether users can get apps from the SharePoint Store. You cannot block users from viewing the SharePoint Store. However, you can prevent them from purchasing or downloading apps for SharePoint. If you choose to prevent users from getting apps for SharePoint from the SharePoint Store, you should create a policy statement and notify users to advise users that you have chosen not to support apps for SharePoint. Otherwise, the only notification to users will be an error when they try to install an app for SharePoint.
- Do you want to restrict or control the apps for SharePoint that users can install and use?

If so, you can do one or both of the following:

  - Set up an App Catalog to provide a set of apps for SharePoint that users can install and use.
  - Use the App Request feature to control the purchasing and licensing of apps for SharePoint.
- In which environments do you want apps for SharePoint to be available? For example, intranet, extranet, or Internet environments?

---

You should decide which environments are appropriate for using apps for SharePoint and configure the settings for apps for SharePoint only in those farms or for those web applications.

- Do you want to control who can purchase apps for SharePoint?  
No explicit setting prevents a user from purchasing an app for SharePoint. However, you can create a request process that requires users to submit a request that your organization reviews to ensure that appropriate persons make purchases.
- Do you want to control who can install apps for SharePoint?  
A user must have the Manage Web site and Create Subsites permissions to install an app for SharePoint. By default, these permissions are available only to users who have the Full Control permission level or who are in the Site Owners group.
- Do you want to control which hosting options can be used for apps for SharePoint in your environment?  
You cannot explicitly specify the hosting options (Provider-hosted, Azure auto-provisioned, or SharePoint hosted) that are available. The creator of an app determines how it is hosted based on what the app contains or does. However, you can choose a specific hosting option for apps for SharePoint that you provide for your own organization in the App Catalog.
- How many and which apps for SharePoint do you want to monitor?  
You must explicitly select the apps for SharePoint to monitor for a farm.

 **Note:**

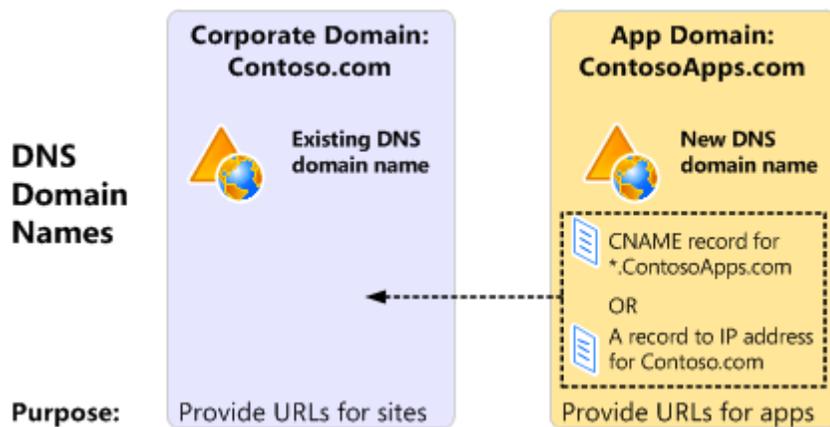

The ability to monitor apps for SharePoint is not available for SharePoint Foundation 2013 Preview.

## Plan app configuration settings

Before you use apps for SharePoint in your environment, you have to configure your environment to support them. If you don't configure your environment, users who try to install and use apps for SharePoint receive error messages. For all apps for SharePoint, you must set up a Domain Name Services (DNS) domain name to provide a host name for the installed apps. By using a separate domain name, apps for SharePoint are separated from SharePoint sites to prevent unauthorized access to user data and to reduce the likelihood of cross-site scripting attacks. Using separate URLs for apps for SharePoint and SharePoint sites is called *app isolation*. You also need a DNS record so that the domain name can get correctly resolved. You can create one of two of the following types of DNS records for app for SharePoint URLs:

- A wildcard Canonical Name (CNAME) record that points to the host domain assigned to the SharePoint farm.
- An A record to point to the IP address for the SharePoint farm.

Choose the type of record to point from the app domain to the SharePoint farm domain.

In addition to setting up the DNS domain to support apps in your environment, you also have to configure the following:

- SSL Certificates (if they are required)  
If you are using SSL to help secure traffic, you must create a wildcard certificate to use for all app URLs. Wildcard certificates cost about the same as five individual certificates. So, you can quickly justify the cost of a wildcard if you expect to use more than five instances of apps for SharePoint in your environment.

**! Important:**

Each instance of an app for SharePoint that is installed has its own URL. Therefore, if you only have one app for SharePoint in your environment, but the app is installed on six different sites, then you will have six different app URLs.

- The Subscription Settings and App Management service applications  
These services support apps in your environment by storing the data needed to run apps in the farm. The Subscription Settings service stores the tenant name and the App Management Service stores app licenses, app principals, app users, app registrations, and so on.
- The app URLs to use  
Each app has a unique URL in your environment. You determine the template for that URL, and then app URLs are automatically generated by using the prefix and domain that you specify. For example, *prefix-Apphash.ContosoApps.com/sites/web1/appname*.

The [Configure an environment for apps for SharePoint](#) article explains how to configure these settings.

## Determine the domain name to use

Each app for SharePoint has a unique URL, which is made up of the app domain and a prefix for that domain that consists of a tenant name and an Apphash. The format is as follows: *prefix-Apphash.domain.com*. The *Apphash* is an arbitrarily-assigned unique identifier for each app for SharePoint.

**i Note:**

The examples in this section use an Internet-style domain name for clarity. This does not imply that you must expose your apps to the Internet or that your URLs must use this format. Note

---

that for actual hosting environments you must still organize a DNS routing strategy within your intranet and optionally configure your firewall.

When you choose the domain name and prefixes to use for your environment, consider the following:

- **Consider using a unique domain name, not a subdomain**

To help improve security, the domain name that you choose should not be a subdomain of the root domain name that hosts other applications (other than SharePoint sites). This is because other applications that run under that host name might contain sensitive information stored in cookies that might not be protected. Code can set or read cookies across different domains that are under the same domain. A malicious developer could use code in an app for SharePoint to set or read information in a cookie on the root domain from the app for SharePoint subdomain. If a malicious app accessed that cookie information, then you could have an information leak. SharePoint sites have protections against this issue. However, it is still a good idea to use a domain for apps that is separate from your other domains. For example, if the SharePoint sites are at Contoso.com, do not use Apps.Contoso.com. Instead use a unique name such as Contoso-Apps.com. This is not to say that you should never use a subdomain if you have business reasons to do this. However, consider all potential security risks.

- **For single tenant environments, use the same prefix for all apps**

If your environment is only used for your own organization and does not host SharePoint sites for other organizations, you configure a prefix that all app for SharePoint URLs in your environment use. For example, you can set the prefix to a word like *default* so that each app for SharePoint has a URL such as *default-Apphash.Contoso-Apps.com*.

- **For multi-tenancy environments, use unique prefixes for each tenant's apps**

If your environment has multiple tenants (in other words, you host SharePoint sites for multiple clients), you must be able to identify the URLs that each tenant or client in your environment uses. So, you set the URL prefix to indicate the client's name or the client's site's name. For example, suppose that A. Datum Corporation hosts SharePoint sites for Fabrikam and Fourth Coffee under the *adatum.com* hosting domain (for example, *Fabrikam.Adatum.com* and *FourthCoffee.Adatum.com*). You should set the prefix for your hosted sites so that they are created as *Fabrikam-Apphash.AdatamApps.com* and *FourthCoffee-Apphash.AdatamApps.com*.

 **Important:**

If you are in a multi-tenancy environment, you must use Windows PowerShell to configure the URL and prefix.

- **Keep prefixes short and simple**

Prefixes must be less than 48 characters and cannot contain special characters or dashes.

- **All URLs will be in the default zone**

You cannot use multiple zones in alternate access mapping for apps for SharePoint. By default, all apps for SharePoint are in the intranet zone.

## Plan App Catalog

If you decide to provide trusted apps for SharePoint for users to install, you can configure the App Catalog to contain those apps for SharePoint. The App Catalog is a special site that contains the apps

---

for SharePoint that users can install. You can have multiple App Catalogs in your farm, one for each Web application in your farm. To configure the App Catalog for a Web application, you just have to supply the names of the site collection administrators who you want to use for the App Catalog site. After you create the App Catalog, the site collection administrators can upload apps for SharePoint to it. To plan App Catalog settings, determine the following:

- Which web applications will need an App Catalog.  
This goes together with your decisions about your policy for supporting apps for SharePoint in the SharePoint environment. If you have different types of sites (intranet, extranet, Internet) on different web applications in your farm, you can determine whether you want an App Catalog for each of those web applications.  
You can also share an App Catalog site across web applications in a farm. To do this, you configure the App Catalog for one web application, and then configure the App Catalog settings for another web application to use the same URL.
- Who to add as the site collection administrators for the App Catalog.  
The App Catalog is a site inside a web application that can only be accessed from a link in Central Administration or directly by using the URL.

## Plan to monitor apps

The Monitor Apps page in SharePoint on-premises only lists apps that the Farm administrator adds. The maximum number of apps that can be monitored is limited to 100. Apps that exceed the threshold require a farm administrator to remove existing apps from the list. The first 50 apps appear in the monitoring apps list so the administrator must filter the apps to monitor the rest of the apps.

The apps for SharePoint monitoring data is stored in the SQL Server Usage database as WSS\_Logging.

## Plan for app licenses

SharePoint 2013 Preview does not enforce app licenses. Developers who build apps must add code that retrieves license information and then addresses users. SharePoint 2013 Preview provides the storage and together with SharePoint Store web services the app license renewal. SharePoint Store handles payments for the licenses, issues the correct licenses, and provides the process to verify license integrity. Note that licensing only works for apps that are distributed through the SharePoint Store. Apps that you purchase from another source and apps that you develop internally must implement their own licensing mechanisms. SharePoint 2013 Preview supports the following app licenses formats:

| License Type  | Duration                       | User Limit                   |
|---------------|--------------------------------|------------------------------|
| Free          | Perpetual                      | Unlimited                    |
| Trial         | 30, 60, 120 Days, or Unlimited | Number per user or Unlimited |

# Plan app permissions management in SharePoint 2013 Preview

---

The purpose of app permissions management is to manage the ability of apps to access and use internal SharePoint 2013 Preview resources and perform tasks on behalf of users. For app authentication, SharePoint 2013 Preview relies on a trusted token service named the Windows Azure Access Control Service (ACS) to issue time- and scope-limited access tokens for apps. In SharePoint 2013 Preview, the ACS acts as the app identity provider. The app authentication process verifies a claim that an app makes and asserts that the app can act on behalf of an authenticated SharePoint 2013 Preview user. The authorization process verifies that an authenticated app has permission to access a specified resource and perform a defined function. You can configure SharePoint 2013 Preview to process app permissions and enable anyone who enters an anonymous web site, for example, to view and fill out a form that requests additional information about a product or service. You can also allow a SharePoint 2013 Preview site owner, or a user with elevated permissions, to purchase and install an app that a defined set of internal SharePoint 2013 Preview users can access. For example, a site owner can purchase and install an expense report app for a workgroup, and the members of the workgroup can use the app to access data in SharePoint 2013 Preview document libraries and generate expense reports. For more information about apps, see [Overview of apps for SharePoint](#).

In this article:

- App permission request scopes
- App permission requests
- App authorization policies

To plan the management of SharePoint 2013 Preview app permissions, you have to determine the specific SharePoint 2013 Preview resources that the app will need to access, and where those resources reside. You also have to determine the minimum permission level that will be required to enable the app to function correctly. In addition, you have to determine the appropriate app authorization policy to ensure that the app functions correctly and complies with specified authorization requirements.

## Introduction

SharePoint 2013 Preview apps provide a wide variety of powerful tools and enhanced functionality that can increase the usefulness of your SharePoint 2013 Preview deployment. When you decide to support the implementation of SharePoint 2013 Preview apps within your deployment, you need to determine who will be installing the apps and who will be using them. You also need to determine the appropriate scope and permission levels for each app, based on how the app is intended to be used.

This article explains how to decide which scope, permission level, and authorization policy to use for the various types of SharePoint 2013 Preview apps you plan to deploy, depending on how the app is going to be used and who is going to use the app. This article does not explain how to create or configure SharePoint 2013 Preview apps.

---

## App permission request scopes

SharePoint 2013 Preview apps use app permission request scopes and permission requests to specify the level at which the app is intended to run, and the permission level that is assigned to the app. The app permission request scope indicates the location within the SharePoint 2013 Preview hierarchy where a permission request will apply. SharePoint 2013 Preview supports the following permission request scopes:

- **SPSite** Defines the app permission request scope as a SharePoint 2013 Preview site collection.
- **SPWeb** Defines the app permission request scope as a SharePoint 2013 Preview web site.
- **SPList** Defines the app permission request scope as a SharePoint 2013 Preview list.
- **Tenancy** Defines the app permission request scope as a SharePoint 2013 Preview tenancy.

If an app is granted permission to one scope, the permission also applies to the children of that scope. For example, if an app is granted permission to a web site by using the SPWeb scope, the app is also granted permission to each list (SPList scope) that is contained within the SPWeb scope and all list items within each list. Because permission requests are made without information about the topology of the site collection where the app is installed, the scope is expressed as a type rather than as the URL of a specific instance. These scope types are expressed as URIs. Content database related permissions are organized under this URI: **http://sharepoint/content**. The following table provides an URI example for each app permission request scope.

| Scope   | URI                                               |
|---------|---------------------------------------------------|
| SPSite  | http://sharepoint/content/sitecollection/         |
| SPWeb   | http://sharepoint/content/sitecollection/web      |
| SPList  | http://sharepoint/content/sitecollection/web/list |
| Tenancy | http://<sharepointserver>/<content>/<tenant>/     |

## App permission requests

App permission requests are collections of permissions that enable apps to perform specific tasks. SharePoint 2013 Preview includes four app permission request levels.

The following table lists the four app permission requests that you can assign to a SharePoint 2013 Preview app.

| Permission request | Description                                                     | Permissions included                                                                                                              |
|--------------------|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Read-Only          | Enables apps to view pages, list items, and download documents. | <ul style="list-style-type: none"><li>• View Items</li><li>• Open Items</li><li>• View Versions</li><li>• Create Alerts</li></ul> |

| Permission request | Description                                                                                         | Permissions included                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|-----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    |                                                                                                     | <ul style="list-style-type: none"> <li>• Use Self-Service Site Creation</li> <li>• View Pages</li> </ul>                                                                                                                                                                                                                                                              |
| Write              | Enables apps to view, add, update, and delete items in existing lists and document libraries.       | <ul style="list-style-type: none"> <li>• Read-Only permissions, plus:</li> <li>• Add Items</li> <li>• Edit Items</li> <li>• Delete Items</li> <li>• Delete Versions</li> <li>• Browse Directories</li> <li>• Edit Personal User Information</li> <li>• Manage Personal Views</li> <li>• Add/Remove Personal Web Parts</li> <li>• Update Personal Web Parts</li> </ul> |
| Manage             | Enables apps to view, add, update, delete, approve, and customize items or pages within a web site. | <ul style="list-style-type: none"> <li>• Write permissions, plus:</li> <li>• Manage Lists</li> <li>• Add and Customize Pages</li> <li>• Apply Themes and Borders</li> <li>• Apply Style Sheets</li> </ul>                                                                                                                                                             |
| Full Control       | Enables apps to have full control within the specified scope.                                       | All permissions                                                                                                                                                                                                                                                                                                                                                       |

There are important security implications when you assign a permission request level to a SharePoint 2013 Preview app. The permission request level must be adequate to allow the app to function correctly and complete every aspect of the task it is designed to perform. However, it is also important to make sure that the assigned permission request level does not exceed the minimum requirements to complete the task. For example, the Read-Only app permission request level is adequate for a SharePoint 2013 Preview app that is gathering and rendering data in response to a query. However, the Write app permission request level will be required for a SharePoint 2013 Preview app that is intended to add new data or update existing data in a SharePoint 2013 Preview library.

## App authorization policies

In addition to determining the app permission request scope and the app permission request level for each app you deploy, you must also determine which app authorization policy is appropriate. SharePoint 2013 Preview provides the following app authorization policies:

- **User and app policy** When you assign the **user and app** policy to a SharePoint 2013 Preview app, the content database authorization checks succeed only if both the current user and the app have sufficient permissions to perform the actions that the app is designed to perform. The **user**

---

**and app** policy is required when a SharePoint 2013 Preview site has an embedded IFRAME that links to a SharePoint Store app, and the app calls back to SharePoint 2013 Preview to access SharePoint 2013 Preview resources on behalf of the user. For example, this is a requirement when a SharePoint Store app that does not run within SharePoint 2013 Preview needs to act on behalf of a user to access the user's resources.

- **App-only policy** When you assign the **app-only** policy to a SharePoint 2013 Preview app, the content database authorization checks succeed if the app has sufficient permissions to perform the actions that the app is designed to perform, whether or not the current user (if there is a current user) has the same permissions. The **app-only** policy is required when the app is not acting on behalf of a user.
- **User-only policy** When you assign the **user-only** policy, the content database authorization checks succeed if the user has sufficient permissions to perform the action that the app is designed to perform. The **user-only** policy is required when a user is accessing their own resources.

---

# Configure an environment for apps for SharePoint

---

To enable users to install and use apps for SharePoint in their sites, you must configure your environment to support them. This article explains how to configure your environment to support apps. Use the [Plan for apps for SharePoint](#) article to review options and determine the values to use for configuration settings in this article.

In this article:

- [Before you begin](#)
- [Create a DNS domain name \(all hosting options\)](#)
- [Create a new SSL certificate or add the new app domain URL to your SSL certificate](#)
- [Configure the Subscription Settings and App Management service applications](#)
- [Configure the app URLs to use](#)

## Important:

The steps in this article apply to both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview.

## Before you begin

- You must be a member of the Farm Administrators group to perform the steps in this article. For some steps, you must also be a local administrator on the domain controller.
- Confirm that the SharePoint Administration (spadmin) and SharePoint Timer (sptimer) services are running.

To verify this, click **Start**, point to **Administrative Tools**, and then click **Services**. In the Services list, verify that the **SharePoint Administration** and **SharePoint Timer** services are running.

## Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](http://go.microsoft.com/fwlink/p/?LinkId=246502) (http://go.microsoft.com/fwlink/p/?LinkId=246502)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 15 Products](http://go.microsoft.com/fwlink/p/?LinkId=246501) (http://go.microsoft.com/fwlink/p/?LinkId=246501)
- [Keyboard shortcuts](http://go.microsoft.com/fwlink/p/?LinkId=246504) (http://go.microsoft.com/fwlink/p/?LinkId=246504)
- [Touch](http://go.microsoft.com/fwlink/p/?LinkId=246506) (http://go.microsoft.com/fwlink/p/?LinkId=246506)

---

## Create a DNS domain name (all hosting options)

You must create a new domain name in Domain Name Services (DNS) to host the apps. To help improve security, the new domain name should not be a subdomain of the domain that hosts the SharePoint sites. For example, if the SharePoint sites are at Contoso.com, consider ContosoApps.com instead of App.Contoso.com as the domain name. For more information, see [Plan for apps for SharePoint](#). When an app is provisioned, it needs a unique DNS domain name (for example, *hr-12345678ABCDEF.ContosoApps.com*, where *hr-12345678ABCDEF* is a unique identifier for the app). You need a wildcard Canonical Name (CNAME) entry for your DNS domain to support these unique names.

Depending on your configuration, you might have to create a new forward lookup zone first, or you can start with a wildcard CNAME entry in the same zone as the SharePoint site domain. The following instructions start with creating a wildcard CNAME entry. For information about how to create a new forward lookup zone, see [Add a Forward Lookup Zone](#).

In the following procedure, you create a wildcard alias record for the DNS domain name that allows for individual apps to create unique domain names within your app domain. In these procedures, we use DNS Manager for Windows Server 2008 R2. If you have a different type of DNS server, follow the procedures in the documentation for that server type.

### To create a wildcard Alias (CNAME) record for the new domain name

1. Verify that the user account that performs this procedure is a local administrator on the domain controller.
2. In DNS Manager, right-click the name of domain that hosts the SharePoint sites, and then click **New Alias (CNAME)**.
3. In the New Resource Record dialog box, in the **Alias name (uses parent domain if left blank)** box, type \*. followed by the domain name that you want to use for apps.  
For example, \*.ContosoApps.com or \*.Contoso-Apps.com.
4. Next to the **Fully qualified domain name (FQDN) for target host** box, click **Browse** and navigate to the Forward Lookup Zone for the domain that hosts the SharePoint sites.  
For example, Contoso.com.
5. Next to the **Fully qualified domain name (FQDN) for target host** box, click **Browse** and navigate to the domain that you just created.
6. Select the host name that is labeled **(same as parent folder)** and then click **OK**.

For more information about how to create a wildcard alias record in DNS Manager, see [Add an Alias \(CNAME\) Resource Record to a Zone](#).

You can verify the new domain name and alias by pinging them.

### To verify the new domain name

1. Verify that the user account that is performing this procedure is a local administrator on the domain controller.
2. Click **Start**, and then click **Command Prompt**.

- 
3. At the command prompt, type **ping** followed by a subdomain of the domain that you created, and then press **ENTER**.

For example, **ping hr-12345678ABCDEF.contosoapps.com**

If the ping command returns the correct IP address, then your wildcard for the domain name was configured successfully.

## Create a new SSL certificate or add the new app domain URL to your SSL certificate

If you are using Secure Sockets Layer (SSL), you must either create an SSL certificate or add the new domain to your existing SSL certificate.

- Create an SSL certificate if you are using a different root domain (for example, ContosoApps.com).
- Add the new app domain to an existing SSL certificate if you are using the same root domain (for example, Apps.Contoso.com).

Either way, the domain should be added in the form of a wildcard (for example, \*.contosoapps.com).

You need a wildcard certificate instead of individual certificates because each installed app has its own subdomain.

## Configure the Subscription Settings and App Management service applications

Apps rely on the App Management and Microsoft SharePoint Foundation Subscription Settings service applications. The Microsoft SharePoint Foundation Subscription Settings service application is used to establish the subdomain that hosts the subweb for the app. This process uses the multi-tenancy features to create the subdomains. Therefore, even if you are not hosting multiple tenants, you must still establish a name for the default tenant for your environment (any SharePoint site that is not associated with a tenant will be in the default tenant). The App Management service application provides app permissions, among other things.

### **Note:**

You can use the SharePoint Central Administration website to set the default tenant name (also known as the app prefix) for non-hosting environments. You must use Windows PowerShell to configure tenant names for hosting environments. You perform the steps to set the app prefix in the next section, [Configure the app URLs to use](#).

### To configure the Subscription Settings and App Management service applications

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.

---

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 15 Products cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:  

```
Get-SPServiceInstance | where{$_ .GetType().Name -eq "AppManagementServiceInstance" -or
$_ .GetType().Name -eq "SPSubscriptionSettingsServiceInstance"} | Start-SPServiceInstance
```

This command gets and starts the App Management and Subscription Settings service applications.

Now you must establish the application pool, run as account, and database settings for the services. Use a farm account for the SPManagedAccount (which will be used for the application pool runas account).

6. At the Windows PowerShell command prompt, type the following commands, and press **ENTER** after each one to create the application pool:  

```
$account = Get-SPManagedAccount "<farm account>"
Gets the name of the Farm administrators account and sets it to the variable $account
for later use.

$appPoolSubSvc = New-SPServiceApplicationPool -Name SettingsServiceAppPool -Account
$account
Creates an application pool for the Subscription Settings service application.
Uses the Farm administrators account as the security account for the application pool.
Stores the application pool as a variable for later use.

$appPoolAppSvc = New-SPServiceApplicationPool -Name AppServiceAppPool -Account $account
Creates an application pool for the Application Management service application.
Uses the Farm administrators account as the security account for the application pool.
Stores the application pool as a variable for later use.
```

Where:

- *<farm account>* is the name of the Farm administrators account in the SharePoint farm.

7. At the Windows PowerShell command prompt, type the following commands, and press **ENTER** after each one to create the new service applications and proxies:  

```
$appSubSvc = New-SPSubscriptionSettingsServiceApplication -ApplicationPool
$appPoolSubSvc -Name SettingsServiceApp -DatabaseName <SettingsServiceDB>
Creates the Subscription Settings service application, using the variable to associate
it with the application pool that was created earlier.
Stores the new service application as a variable for later use.

$proxySubSvc = New-SPSubscriptionSettingsServiceApplicationProxy -ServiceApplication
$appSubSvc
Creates a proxy for the Subscription Settings service application.
```

---

```
$appAppSvc = New-SPAppManagementServiceApplication -ApplicationPool $appPoolAppSvc -Name
AppServiceApp -DatabaseName <AppServiceDB>
Creates the Application Management service application, using the variable to associate
it with the application pool that was created earlier.
Stores the new service application as a variable for later use.
$proxyAppSvc = New-SPAppManagementServiceApplicationProxy -ServiceApplication $appAppSvc
Creates a proxy for the Application Management service application.
```

Where:

- <SettingsServiceDB> is the name of the Subscription Settings service database.
- <AppServiceDB> is the name of the App Management service database.

For more information, see [Get-SPManagedAccount](#), [New-SPServiceApplicationPool](#), [New-SPSubscriptionSettingsServiceApplication](#), [New-SPSubscriptionSettingsServiceApplicationProxy](#), [New-SPAppManagementServiceApplication](#) and [New-SPAppManagementServiceApplicationProxy](#).

## Configure the app URLs to use

In this section, you create the app domain prefix and the tenant name to use for apps in your environment. The app URL points to your app domain and a prefix that determines how each app is named. If you host multiple tenants in your environment, you must use Windows PowerShell to configure the app URLs.

Use the following procedure to configure app URLs for non-hosting (single tenant) environments by using Central Administration.

### To configure app URLs

1. In Central Administration, click **Apps**.
2. On the Apps page, click **Configure App URLs**.
3. In the **App domain** box, type the isolated domain that you created for hosting apps.  
For example, ContosoApps.com or Contoso-Apps.com.
4. In the **App prefix** box, type a name to use for the URL prefix for apps.  
For example, you could use “apps” as the prefix so that you would see a URL for each app such as “apps-hr-12345678ABCDEF.ContosoApps.com”.
5. Click **OK**.

Use the following procedure to configure app URLs for multi-tenant hosting environments.

### To configure app URLs by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.  
An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 15 Products cmdlets.

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following commands and press **ENTER** after each one:

```
Set-SPAppDomain <appDomain>
$sub = Get-SPSiteSubscription -Default
Creates a variable to store the default tenant name.
$mgr = [Microsoft.SharePoint.SPSiteSubscriptionSettingsManager]::Local
Indicates that the local option should be used for subscriptions.
$metadata = $mgr.GetMetadata($sub)
Sets up the metadata variable for later use.
$metadata.Name = "<tenant name>"
Specifies the name to use for a specific tenant's app URLs.
$metadata.Update()
Updates the app URLs to the values you specified.
```

Where:

- *<appDomain>* is the domain name that you created.
- *<tenant name>* is the name of a tenant in your hosting environment.

For more information, see [Get-SPSiteSubscription](#) and [Set-SPAppDomain](#).

---

# Manage the App Catalog in SharePoint 2013 Preview

---

You can store apps for SharePoint and Office apps for your organization's internal use in an App Catalog site. This article contains an overview of the App Catalog site and shows how to configure the App Catalog for a web application.

In this article:

- [Before you begin](#)
- [Configure the App Catalog site for a web application](#)
- [Configure app requests and SharePoint Store settings](#)
- [Add apps to the App Catalog](#)
- [Remove apps from the App Catalog](#)

## Before you begin

Before you begin:

- You must be a member of the Farm Administrators group to perform the steps in this article.

### Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

## Configure the App Catalog site for a web application

The App Catalog site is a special site collection on a web application. Because each web application can have an App Catalog site, a farm can have more than one App Catalog site.

When you create an App Catalog site, you get two libraries for apps:

- Apps for SharePoint
- Apps for Office

---

Because an App Catalog is scoped to a web application, all apps that you want to make available for a web application have to be in the App Catalog site collection for that web application. You create the App Catalog site collection from SharePoint Central Administration.

### **To create an App Catalog site collection for a web application**

1. Verify that the user account that is performing this procedure is a member of the Farm administrators group.
2. In Central Administration, on the Apps page, in the **App Management** section, click **Manage App Catalog**.  
If no App Catalog exists for the farm, the **Web Application** page opens, so you can select a web application.
3. On the **Web Application** page, select the web application for which you want to create a catalog.
4. In the App Catalog Site section, select **Create a new app catalog site**, and then click **OK**.
5. On the Create App Catalog page, in the **Title** box, type a title for the App Catalog site.
6. In the **Description** box, type the description for the site.
7. In the **URL** box, fill in the URL to use for the site.
8. In the Primary Site Collection Administrator section, in the **User Name** box, type the user who will manage the catalog.  
Only one user name can be entered. Security groups are not allowed.
9. In the End Users section, in the **Users/Groups** box, type the names of the users or groups that you want to be able to browse the catalog.  
Added users or groups have read access to the App Catalog site. You can add multiple user names and security groups. Users must be added as End Users to be able to browse the App Catalog from their site collections.
10. In the **Select a quota template** list box, select the quota template to use for the site.
11. Click **OK**.

### **To use an existing App Catalog site collection for a different web application**

1. Verify that the user account that is performing this procedure is a member of the Farm administrators group.
2. In Central Administration, on the Apps page, in the **App Management** section, click **Manage App Catalog**.
3. On the Manage App Catalog page, next to Web Application, click the down arrow and click **Change Web Application**.
4. In the **Select Web Application** box, select the web application for which you want to create a catalog.
5. In the App Catalog section, select **Enter a URL for an existing app catalog site**.
6. In the URL box, type the URL to the App Catalog site, and then click **OK**.

---

## To view an App Catalog site collection from Central Administration

1. Verify that the user account that is performing this procedure is a member of the Farm administrators group and has Read permission to the App Catalog site.
2. In Central Administration, on the Apps page, in the **App Management** section, click **Manage App Catalog**.
3. On the Manage App Catalog page, verify that the web application that is selected is the web application you want to manage.  
If you want to switch to a different web application, click the down arrow next to the Web application URL to change to a different web application.
4. Under **Site URL** click the link to open the App Catalog for that web application.

## Configure app requests and SharePoint Store settings

Farm administrators can determine whether users can purchase apps from the SharePoint Store. This setting is at the web application scope. If users cannot purchase apps, they can still browse the SharePoint Store, and request an app. Farm administrators and the App Catalog site owner can view and respond to app requests.

### To configure SharePoint Store settings

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators group.
2. In Central Administration, on the Apps page, in the **SharePoint and Office Store** section, click **Configure Store Settings**.
3. On the SharePoint Store Settings page, verify that the selected web application is the web application that you want to configure.  
If you want to switch to a different web application, click the down arrow next to the web application URL to change to a different web application.
4. To allow or prevent purchases, select an option for **Should end users be able to get apps from the SharePoint Store?**
  - Select **Yes** to allow users to purchase apps.
  - Select **No** to prevent purchases but allow users to request apps.
5. To allow or prevent apps for Office from the Office Store to be started when a user opens a document in the browser, select an option for **Should apps for Office from the store be able to start when documents are opened in the browser?**
  - Select **Yes** to allow apps for Office from the Office Store to start.
  - Select **No** to prevent apps for Office from the Office Store from starting.
6. Click **OK**.

---

When users request an app for SharePoint from the SharePoint Store, users can request a specific number of licenses and provide a justification for the purchase of the app for SharePoint. Submitted requests are added to the **App Requests** list in the App Catalog of the web application that contains a user's site collection. The app request includes the following fields:

- **Requested by** The user name of the person requesting the app for SharePoint.
- **Title** The title of the app for SharePoint.
- **Seats and Site License** The number of licenses the user requested for that app for SharePoint.
- **Justification** The reason why the app for SharePoint would be useful for the organization.
- **Status** By default, the status is set to New for new requests. The person who reviews the request can change the status to Pending, Approved, Declined, Withdrawn, Closed as Approved, or Closed as Declined.
- **View App Details** A link to the app details page in the SharePoint Store.
- **Approver Comments** The person who reviews the request can add comments for the requestor.

### To view and manage app requests from the SharePoint Store Settings page

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators group and is a member of the site Owners or Designers group for the App Catalog.
2. In Central Administration, on the Apps page, in the **SharePoint and Office Store** section, click **Configure Store Settings**.
3. On the SharePoint Store Settings page, verify that the selected web application is the web application that you want to configure.  
If you want to switch to a different web application, click the down arrow next to the web application URL to change to a different web application.
4. In the **App Requests** section, click **Click here to view app requests**.  
The App Requests list in the App Catalog site opens.
5. Select a request in the list, and then click the **Edit** button.
6. Review the details of the request.

#### Note:

At this time, the **View app details** link in the request details opens the SharePoint Store home page, instead of the details page for the app. Search for the app in the SharePoint Store to find more information about the app.

7. Change the Status to the appropriate value - **Approved** if you want to user to be able to purchase the app, or **Declined** if you do not want to allow the purchase.
8. Add comments in the **Approver Comments** box, and then click **Save**.  
To view a request, requestors can go to the Add an App page in their site collection, and then click **Your Requests**.

### To view and manage app requests from the App Catalog site

1. Verify that the user account that is performing this procedure is a member of the site Owners or Designers group for the App Catalog.

- 
2. On the App Catalog site, click the **App Requests** list.
  3. Select a request in the list, and then click the **Edit** button.
  4. Review the details of the request.

 **Note:**

At this time, the **View app details** link in the request details opens the SharePoint Store home page, instead of the details page for the app. Search for the app in the SharePoint Store to find more information about the app.

5. Change the Status to the appropriate value - **Approved** if you want to user to be able to purchase the app, or **Declined** if you do not want to allow the app to be purchased.
6. Add any comments in the **Approver Comments** box, and then click **Save**.  
To view a request, requestors can go to the Add an App page in their site collection, and then click **Your Requests**.

## Add apps to the App Catalog

After you have configured the App Catalog, you can add apps that users can then install to their SharePoint sites or use in their Office documents.

### To add an app to the App Catalog

1. Verify that the user account that is performing this procedure is a member of the site Owners or Designers group for the App Catalog.
2. On the App Catalog site, click the **Apps for SharePoint** list.  
On the **Apps for SharePoint** page, click **new item**.
3. In the **Choose a file** box, click **Browse**, and then locate the folder that contains the app that you want to upload.

 **Tip:**

You can also click **Upload files using Windows Explorer instead** to drag and drop an app for SharePoint into the App Catalog.

4. Select the app, and then click **Open**.
5. Click **OK** to upload the app.
6. In the Item details box, verify the Name, Title, Short Description, Icon URL, and other settings for the app.

Be sure that the **Enabled** check box is selected so that users can see the app in their sites.

You can select the **Featured** check box to list the app in the Featured content view of the App Catalog.

7. Click **Save**.

You can also categorize apps in the App Catalog. To add categories, edit the Category field for the App Catalog list and add the category names you want to use.

You can preview how the app will appear to users.

---

## Remove apps from the App Catalog

If you no longer want to offer a particular app to your users, you can remove it from the App Catalog. Removal does not uninstall or remove the app from sites to which it has been added. It merely removes the app from the App Catalog, and users cannot add the app to other sites.

### To remove an app from the App Catalog

1. Verify that the user account that is performing this procedure is a member of the site Owners or Designers group for the App Catalog.
2. On the App Catalog site, click the **Apps for SharePoint** list.
3. On the **Apps for SharePoint** page, select the app that you want to remove.
4. In the ribbon, on the **Files** tab, click **Delete Document** to remove the app.
5. In the dialog box, click **OK** to confirm that you want to send the item to the site Recycle Bin.  
The app is removed.

---

# Add apps for SharePoint to a SharePoint 2013 Preview site

---

Site owners can add apps for SharePoint from the SharePoint Store or an App Catalog to their sites. Adding an app installs an instance of that app to the site. In addition, several lists, libraries, and other SharePoint components, which are also called apps in SharePoint 2013 Preview, are available to add to a site.

## Before you begin

Before you begin this operation, review the following information about prerequisites and permissions:

- Before a user can add an app for SharePoint, a member of the Farm Administrators group must configure the environment to support apps for SharePoint. For more information, see [Configure an environment for apps for SharePoint](#).
- A user must have the Manage Web site and Create Subsites permissions to add an app for SharePoint. By default, these permissions are available only to users who have the Full Control permission level or who are in the site Owners group.
- When a user adds an app for SharePoint, the app requests permissions that it needs to function (for example, access to Search, or to create a list). Users who do not have those permissions are informed that they do not have sufficient permissions and the app cannot be added.

### Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](http://go.microsoft.com/fwlink/p/?LinkId=246502) (http://go.microsoft.com/fwlink/p/?LinkId=246502)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 15 Products](http://go.microsoft.com/fwlink/p/?LinkId=246501) (http://go.microsoft.com/fwlink/p/?LinkId=246501)
- [Keyboard shortcuts](http://go.microsoft.com/fwlink/p/?LinkId=246504) (http://go.microsoft.com/fwlink/p/?LinkId=246504)
- [Touch](http://go.microsoft.com/fwlink/p/?LinkId=246506) (http://go.microsoft.com/fwlink/p/?LinkId=246506)

## Add apps for SharePoint to SharePoint sites

Site owners can add apps for SharePoint from the following sources to their sites:

- from the list of apps already available for a site (default apps, such as standard lists and libraries, and apps that have been purchased already).
- from the App Catalog.

- 
- from the SharePoint Store.

The following procedures provide steps for adding apps from these sources.

### To add an app from the list of available apps in a site

1. Verify that the user account that is performing this procedure is a member of the site Owners group.
2. On the home page, under **Get started with your site**, click **Add lists, libraries, and other apps**.  
If the Get started with your site control does not appear on the home page, click the **Settings** icon, and click **View Site Contents**, and then on the **Site Contents** page, click **Add an App**.
3. In the Your Apps list, click the app you want to add.
4. Follow the instructions to Trust the app (if it is a custom component) or Name the app (if it is a SharePoint component).

The app for SharePoint is added and appears in the **Apps** section of your Site Contents list.

### To add an app from an App Catalog

1. Verify that the user account that is performing this procedure is a member of the site Owners group.
2. On the home page, under **Get started with your site**, click **Add lists, libraries, and other apps**.  
If the Get started with your site control does not appear on the home page, click the Settings icon, and click **View Site Contents**, and then on the Site Contents page, click **Add an App**.
3. Click **FromName**.

Where *Name* is the name of your organization's App Catalog. For example, "From Contoso".

#### Tip:

Apps marked as Featured in the App Catalog will also appear in the main list of Apps.

4. Click the app you want to add.
5. In the Grant Permission to an App dialog box, if you trust the app, click **Allow Access**.  
The app for SharePoint is added and appears in Apps section of your Site Contents list.

### To add an app from the SharePoint Store

1. Verify that the user account that is performing this procedure is a member of the site Owners group.
2. On the home page, under **Get started with your site**, click **Add lists, libraries, and other apps**.  
If the Get started with your site control does not appear on the home page, click the Settings icon, and click **View Site Contents**, and then on the Site Contents page, click **Add an App**.
3. Click **SharePoint Store**.
4. Browse the SharePoint Store to find an app that you want.
5. Click the app you want to add.
6. Click Details, and then click **Buy It**.
7. Follow the steps to log in and purchase the app, if required.
8. In the **Grant Permission to an App** dialog box, if you trust the app, click **Allow Access**.  
The app for SharePoint is added and appears in the Apps section of your Site Contents list.

---

You can also install an app by using Windows PowerShell. First, you import the app package from the file system, and then install it to the site collection. The following procedure contains a script to perform these steps.

## To install an app by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.
  - Site Owners group on the site collection to which you want to install the app.An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 15 Products cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command to import the app and then press **ENTER**:

```
$spapp = Import-SPAppPackage -Path Path to app -Site URL -Source Source
Imports the app and sets a variable that you can use to identify the app when you
install it in the next step.
```

Where:

- *Path to app* is the path to the app you want to import on the file system.
  - *URL* is URL for the site collection to which you want to import the app.
  - *Source* is one of the following: Marketplace, CorporateCatalog, DeveloperSite, ObjectModel, RemoteObjectModel, or InvalidSource.
6. At the question **Are you sure you want to perform this action?**, type **Y** to import the app. The app is imported and information about the app, including the Asset ID, version string, and Product ID is displayed.
  7. At the Windows PowerShell command prompt, type the following command to add the app to a site and then press **ENTER**:

```
Install-SPApp -Web URL -Identity $spapp
Installs the app to the subweb you specify.
Uses the $spapp variable you set previously to identify that app you want to install.
```

Where:

- *URL* is URL for the site or subweb to which you want to install the app.

For more information, see [Import-SPAppPackage](#) and [Install-SPApp](#).

---

# Remove an app for SharePoint from a SharePoint 2013 Preview site

---

In this article:

- [Before you begin](#)
- [Remove an app from a SharePoint site](#)

## Before you begin

Before you begin this operation, review the following information about permissions:

- A user must have the Manage Web site permission to remove an app for SharePoint. By default, this permission is only available to users with the Full Control permission level or who are in the site Owners group.

### Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](http://go.microsoft.com/fwlink/p/?LinkId=246502) (http://go.microsoft.com/fwlink/p/?LinkId=246502)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 15 Products](http://go.microsoft.com/fwlink/p/?LinkId=246501) (http://go.microsoft.com/fwlink/p/?LinkId=246501)
- [Keyboard shortcuts](http://go.microsoft.com/fwlink/p/?LinkId=246504) (http://go.microsoft.com/fwlink/p/?LinkId=246504)
- [Touch](http://go.microsoft.com/fwlink/p/?LinkId=246506) (http://go.microsoft.com/fwlink/p/?LinkId=246506)

## Remove an app from a SharePoint site

Site owners can remove apps for SharePoint from their sites. The following procedures provide steps for removing (or uninstalling) an app. When you remove an app, the data for that app will no longer be available.

### To remove an app from a SharePoint site

1. Verify that the user account that is performing this procedure is a member of the Site owners group.
2. On the site, on the **Settings** menu, click **View Site Contents**.
3. In the **Apps** section, point to the app that you want to remove, click ..., and then click **Remove**.
4. Click **OK** to confirm that you want to remove the app.

Before you use the following procedure, be sure to get the title for the app that you want to remove.

---

## To remove an app by using Windows PowerShell

1. Verify that you have the following memberships:

- **securityadmin** fixed server role on the SQL Server instance.
- **db\_owner** fixed database role on all databases that are to be updated.
- Administrators group on the server on which you are running the Windows PowerShell cmdlets.
- Site Owners group on the site collection to which you want to install the app.

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 15 Products cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.

3. Click **Microsoft SharePoint 2013 Products**.

4. Click **SharePoint 2013 Management Shell**.

5. At the Windows PowerShell command prompt, type the following commands, and press **ENTER** after each one:

```
$instances = Get-SPAppInstance -Web <URL>
Gets all apps installed to the subsite you specify.
$instance = $instances | where {$_.Title -eq '<App_Title>'}
Sets the $instance variable to the app with the title you supply.
Uninstall-SPAppInstance -Identity $instance
Uninstalls the app from the subsite.
```

Where:

- **<URL>** is the path site collection or subsite that contains the app.
- **<App\_Title>** is the title of the app you want to remove.

6. At the question **Are you sure you want to perform this action?**, type **Y** to uninstall the app.

For more information, see [Get-SPAppInstance](#), [Uninstall-SPAppInstance](#).

---

# Monitor and manage app licenses in SharePoint Server 2013 Preview

---

You can use the SharePoint Central Administration website to monitor and manage licenses for the apps for SharePoint. Licenses for apps for SharePoint are digital sets of verifiable information that state the user rights for a app for SharePoint. All apps that are distributed through the SharePoint Store are the only apps that have built-in licenses that SharePoint Server 2013 Preview recognizes.

Members of the Farm Administrators group manage licenses for apps and can also assign license managers for others to manage app for SharePoint licenses.

 **Important:**

The steps in this article apply to SharePoint Server 2013 Preview only.

## Before you begin

 **Note:**

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

Before you begin this operation, review the following information about what SharePoint Server 2013 Preview does and does not provide for apps for SharePoint licensing:

- SharePoint Server 2013 Preview provides:
  - Storefront to obtain apps
  - Storage and renewal of app for SharePoint licenses
  - User Interface (UI) to assign users to specific app for SharePoint licenses
  - APIs for developers to query for license information
- SharePoint Server 2013 Preview does not enforce app for SharePoint licenses.
- Developers must add code in their apps for SharePoint to retrieve license information and react accordingly.

- 
- All app for SharePoint licenses are bound to a specific SharePoint Server 2013 Preview deployment but can be transferred to a different SharePoint Server 2013 Preview deployment three times.

## Monitoring and managing app licenses

A farm administrator or a license manager can check the licenses for all apps for SharePoint on the App Licenses page. It is important to track the number of licenses that are available for each app for SharePoint so that users do not exceed this number. An administrator can assign additional users to a app for SharePoint license, purchase additional licenses for an app, and also add managers to a license. For more information about how to monitor apps for SharePoint see, [Monitor apps for SharePoint](#).

### To view app license details

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group or a license manager.
2. In Central Administration, click **Apps**.
3. On the Apps page, in the **Store** section, click **Manage App Licenses**.
4. On the Manage App Licenses page, click an app for SharePoint in the list to view the license details.

The Manage App License page shows detailed licensing information. This includes the name of the app, the developer, and current license details.

5. In the top section, click the drop-down arrow in the dialog box to see purchase details for the selected app for SharePoint.

The app details include the following information:

- Number of licenses available for users
  - License type
  - App purchaser name
6. At the end of the dialog box, a farm administrator can view the app details.
    - Click **View in Store** to see the app details.
      - In the **People with a License (number of licenses available)** section, the number of available licenses and a list of the people who currently have licenses for this App are shown.
      - In the **License Managers** section, all app managers are listed.

### To add users to the app license

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. On the **Manage App Licenses** page, click an app for SharePoint for which you want to add users.
3. In the **People with a License** section, click **assign people**.

- 
4. In the dialog box that appears below, enter the user name that you want to add and then, click **Add User**.

The user name is added to the list at the bottom of this section and the number of available licenses for this app is refreshed for the selected app for SharePoint.

### **To purchase more app licenses**

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. On the **Manage App Licenses** page, click an app for SharePoint for which you want to purchase more licenses.
3. In the **People with a License** section, click **buy more licenses**.
4. The SharePoint Store opens with the specific app showing the details with links to purchase additional licenses. Choose the number of Apps you want to purchase and then click **OK**.

### **To remove app licenses**

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. On the **Manage App Licenses** page, click an app for SharePoint for which you want to remove licenses.
3. In the top section, under the app for SharePoint name, at the end of the dialog box, click **Remove this License**.
4. **Verification:** Optionally, include steps that users should perform to verify that the operation was successful.

### **To recover app licenses**

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. On the **Manage App Licenses** page, click an app for SharePoint for which you want to recover licenses.
3. In the top section, under the app name, at the end of the dialog box, click **Recover License**. The app for SharePoint details show any changes the administrator has made.

### **To add a license manager**

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. On the Manage App License page, in the **License Managers** section, click **add manager**. Below the License Managers section, the new App manager appears in the list.

---

# Monitor apps for SharePoint

---

You can use the SharePoint Central Administration website to add and remove apps for SharePoint and check details and errors.

 **Important:**

The steps in this article apply to SharePoint Server 2013 Preview only.

In this article:

- [Before you begin](#)
- [Selecting apps to monitor in Central Administration](#)
  - [To add an app to the monitor apps list](#)
  - [To remove an app from the monitor apps list](#)
- [Monitoring app details in Central Administration](#)
  - [To view the app usage details in Monitored Apps](#)
  - [To view the app error details in Monitored Apps](#)
- [Monitoring app details in a SharePoint site](#)
  - [To view the app usage details in a SharePoint site](#)

## Before you begin

You must be a member of the Farm Administrators group or the site Owners group to perform the steps in this article.

 **Note:**

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

## Selecting apps to monitor in Central Administration

The Monitored Apps page displays the apps for SharePoint that a Farm Administrator monitors. Each app for SharePoint that is listed on this page includes details to help an administrator monitor performance. For example, each app for SharePoint provides the following properties: Name, Status,

---

Source, Licenses in Use, Licenses Purchased, Install Locations, and Runtime Errors. A Farm Administrator chooses to add, remove, and monitor apps for SharePoint.

### To add an app to the monitor apps list

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. In Central Administration, click **General Application Settings**.
3. On the General Application Settings page, in the **Apps** section, click **Monitor Apps**.
4. On the Monitored Apps page, in the **Action** group of the ribbon, click **Add App**.

**Note:**

If the App Catalog is not already created, or if the App Management Service application and app domain settings are not configured correctly the Add App dialog may create an error.

5. Select the checkbox for the app that you want to monitor, or type a name in the **Search for app name** box, and then click the Search icon.
6. On the search results page, select the app that you want to monitor.

**Note:**

Apps that you add to the Monitored Apps list previously are not displayed in the search results.

7. Click **Add App**.  
The app now appears in the list of monitored apps.

### To remove an app from the monitor apps list

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. On the Monitored Apps page, select the checkbox next to the app that you want to remove.
3. In the **Manage** group of the ribbon, click **Remove App**.

## Monitoring app details in Central Administration

This section explains how farm administrators can monitor and understand the apps for SharePoint details. There are multiple ways that an administrator can view the error and usage details for apps for SharePoint. By selecting an app in the Monitored Apps page, an administrator can use the ribbon to access the error or usage details for that app. An administrator can also click an app in the list on the Monitored Apps page to open the app details page and access the same error or usage details.

### To view the app usage details in Monitored Apps

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. On the Monitored Apps page, click the app that you want to view.

---

A new page opens and displays detailed information about the app, such as the following: licensing, errors, installations, and usage.

 **Note:**

The administrator can also select an app in the monitored apps list and in the **App Details** group of the ribbon, click **View Details**.

3. In the **Usage** section, click **Days**, **Months**, or **Years** to change the chart to those time frames.

### To view the app error details in Monitored Apps

1. Verify that the user account that is performing this procedure is a member of the Farm Administrators SharePoint group.
2. On the Monitored Apps page, click the number in the Runtime Errors column for the app you want to view.

 **Note:**

The administrator can also select an app in the monitored apps list and in the App Details group of the ribbon, click **View Errors**.

3. The App Monitoring Details dialog appears with information about each error for that app. You can use the Correlation ID to find the errors in the error log.
4. Click the URL in the Location column to view more error details for this app.
5. On the App Monitoring Details page, click the number next to **Runtime Errors**.
6. The App Monitoring Details dialog appears and includes a list of all Runtime Errors for this app, the time each error occurred, and the Correlation ID.

 **Note:**

The app error list can help you determine if you want to remove the app because there are too many errors or if the app is working as it should.

## Monitoring app details in a SharePoint site

This section explains how site owners can monitor and understand the usage of apps for SharePoint. A site owner can view the error and usage details for apps for SharePoint by selecting an app in the Site Contents page and then clicking Monitor in the app dialog box.

### To view the app usage details in a SharePoint site

1. Verify that the user account that is performing this procedure is a member of the site Owners group.
2. On the Site Contents page, in the quick launch pane, click **Apps**.  
A new page opens and displays all of the apps that are installed on this site.
3. On the Apps page click the icon next to the app you want to monitor and then click **Monitor** in the callout.  
The App Details page appears for the selected app and the site owner can see the details for licenses, errors Installs and usage.

- 
4. In the **Errors** section, click the number next to Install Errors, Runtime Errors, or Upgrade Errors to see the error details.

For example, click the number next to Runtime Errors and the Runtime Errors dialog appears. This includes a list of all Runtime Errors for this app, the time each error occurred, and the Correlation ID.

This app error list can help you determine if you want to remove the app because there are too many errors or if the app is working as it should.

5. In the **Usage** section, click **Days**, **Months**, or **Years** to change the chart to those time frames. The chart displays two bars for each time period that represents the number of times the app has been launched and the number of specific users that use this app each day.

**Note:**

If the app uses connections to external data sources through Business Connectivity Services, a graph that shows the number of calls made to the external data sources is also shown.

---

## Upgrade to SharePoint 2013 Preview

---

The following downloadable resources, articles on TechNet, video recordings, and related resources provide information about performing an upgrade to SharePoint 2013 Preview.

### Downloadable resources about upgrade

Download the following content for information about upgrade.

---

## What's new in SharePoint 2013 upgrade

---

SharePoint 2013 Preview does not support in-place upgrade for an existing environment. You must use the database-attach upgrade method to upgrade your databases to a new environment that is based on SharePoint 2013 Preview. Also, to provide more flexibility to farm administrators and site administrators, the upgrade process has changed to separate upgrade of the software and databases from upgrade of the sites.

### In-place upgrade of the farm is not supported

An upgrade to SharePoint Server 2010 or SharePoint Foundation 2010 provides an option to install the new version over the earlier version on the same hardware. This is called an in-place upgrade. During this process, the complete installation, that includes databases and sites, is upgraded in a fixed order. Although this is a simple method, in-place upgrade presents problems in performance and control for a farm administrator. There was no way to control the order in which content is upgraded, and a failure in a particular site collection could stop the whole process.

The database-attach upgrade method offers more flexibility, more control, and a better success rate. To use a database attach upgrade, you complete the following tasks:

1. Create and configure a new farm that is separate from the old farm
2. Copy the content and services databases to the new farm
3. Upgrade the data and sites

You can upgrade the content databases in any order and upgrade several databases at the same time to speed up the overall process.

For more information, see [Overview of the upgrade process to SharePoint 2013 Preview](#).

### Database-attach upgrade is available for some service application databases

For the SharePoint 2013 Preview, you can use the database attach upgrade method to upgrade the following service application databases:

- Business Data Connectivity  
This service application is available for both SharePoint Server 2013 Preview and SharePoint Foundation 2013 Preview.
- Managed Metadata  
This service application is available only for SharePoint Server 2013 Preview.
- PerformancePoint  
This service application is available only for SharePoint Server 2013 Preview.
- Secure Store  
This service application is available only for SharePoint Server 2013 Preview.

- 
- User Profile (Profile, Social, and Sync databases)  
This service application is available only for SharePoint Server 2013 Preview.
  - Search administration  
This service application is available only for SharePoint Server 2013 Preview.

For more information, see [Services upgrade overview for SharePoint Server 2013 Preview](#).

## Deferred site collection upgrade

In SharePoint 2010 Products, farm administrators use either the in-place upgrade process to upgrade sites immediately, or the command line to upgrade all sites at the same time or individually. In SharePoint 2013 Preview, farm administrators can now allow site collection owners to upgrade their sites to the new user interface on their own timeline. The commands for upgrading a site collection are on the Site Settings page in the Site Collection Administration section. There are also Windows PowerShell cmdlets to upgrade site collections to the new user interface. For more information, see [Plan for site collection upgrades in SharePoint 2013 Preview](#), [Upgrade a site collection to SharePoint 2013](#) and [Manage site collection upgrades to SharePoint 2013 Preview](#).

## Site collection health checker

Site collection owners or administrators can use a site collection health checker to detect any potential issues with their site collections and address them before they upgrade sites to the new version. The checker is available after upgrade also to detect any health issues on an ongoing basis. Note that some issues can be repaired automatically, but others require manual steps to repair. During a site collection upgrade, if the checker finds issues that can be repaired automatically, they are repaired at that time. For more information, see [Run site collection health checks in SharePoint 2013 Preview](#).

## Upgrade evaluation site collections

In SharePoint 2013 Preview, the upgrade of the software and data was separated from the upgrade of the site. This means that the sites can truly remain running in SharePoint 2010 mode until a site owner or administrator explicitly upgrades the site to the new user interface. Site collection owners can request an evaluation site, which is a separate copy of the site, to review the new interface and functionality. After they have reviewed the site and made necessary changes in their original site, they can then upgrade their sites to the new version. Evaluation sites are set to automatically expire and be deleted. For more information, see [Plan for upgrade evaluation sites](#), [Create an upgrade evaluation site \(Optional\)](#), and [Manage site collection upgrades to SharePoint 2013 Preview](#).

## Notifications for life-cycle events

An email message and a status bar notification in a site collection notifies site collection owners when an upgrade is available. Site collection owners can create an evaluation site from email and control the expiration and deletion of that site by using email also. A status bar notification in the site collection also informs all users if a site is in read-only mode. For more information, see [Plan settings for upgrade](#)

---

[notifications, self-service upgrade, and site collection creation](#) and [Manage site collection upgrades to SharePoint 2013 Preview](#).

## Throttles for site collection upgrade

To make sure that site collection upgrades do not cause an outage on your farm, there are throttles built in at the web application, database, and content level. This means that even if 100 site collection owners decide to upgrade their site collections at the same time, only some are run at the same time, and the rest are put into a queue to run later. For more information, see [Plan site collection upgrade throttling and queues](#) and [Manage site collection upgrades to SharePoint 2013 Preview](#).

## True “SharePoint 2010” instead of visual upgrade

Visual upgrade in SharePoint 2010 Products lets site owners and administrators see what their site would be like in the new user interface. However, it is not a true preview because the site itself has already been upgraded to the new functionality. Consequently, some Web Parts or other elements do not display correctly.

SharePoint 2013 Preview can host sites in both SharePoint 2010 and SharePoint 2013 modes. The installation contains both SharePoint 2010 and SharePoint 2013 versions of the following types of elements:

- Features, site templates, site definitions, and Web Parts  
The directories on the file system are duplicated in both the 14 and 15 paths, for example:
  - Web Server Extensions/14/TEMPLATE/Features
  - Web Server Extensions/15/TEMPLATE/Features
- IIS support directories:
  - \_Layouts, \_Layouts/15
  - \_ControlTemplates, \_ControlTemplates/15
- Solution deployment, which lets legacy solutions work in 2010 mode  
Note that existing SharePoint 2010 Products solutions can be deployed to SharePoint 2013 Preview and continue to function for 2010 sites, usually without requiring any changes.

Because of these directories, you can continue hosting unupgraded sites in an upgraded environment until all site collections are ready to upgrade. For more information, see [About site collection modes](#).

## Log files now in ULS format

The format of the upgrade, upgrade error, and site upgrade log files now comply with the Unified Logging System (ULS) conventions for easier review. For more information, see [Verify database upgrades in SharePoint 2013 Preview](#).

---

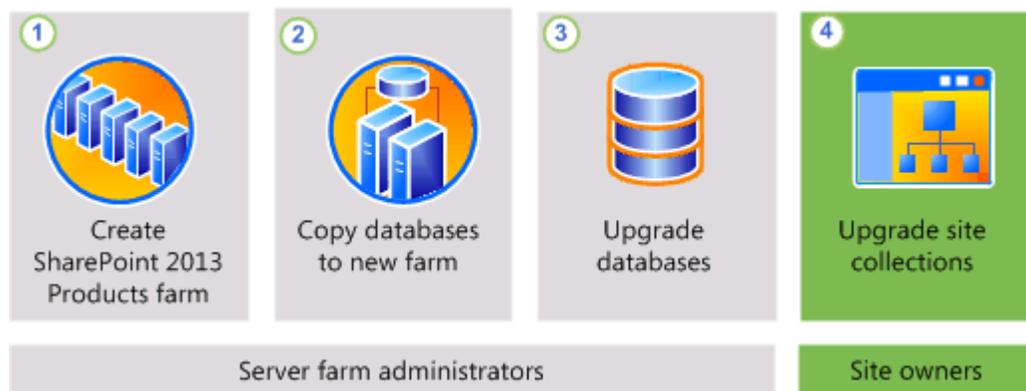

# Overview of the upgrade process to SharePoint 2013 Preview

---

To upgrade from SharePoint 2010 Products to SharePoint 2013 Preview, you use the database-attach method to upgrade. In the database-attach method, you first create and configure a SharePoint 2013 Preview farm. Then you copy the content and service application databases from the SharePoint 2010 Products farm, and then attach and upgrade the databases. This upgrades the data to the new version. Site owners can then upgrade individual site collections.

**Figure: The sequence of upgrade stages**

## UPGRADE STAGES

This article helps you understand the upgrade sequence so that you can plan an upgrade project. To get detailed steps for an upgrade, see [Upgrade databases from SharePoint 2010 to SharePoint 2013 Preview](#) and [Upgrade site collections to SharePoint 2013](#).

### **Important:**

This article applies to both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview, except for information about how to upgrade My Sites and specific service applications that are only in SharePoint Server 2013 Preview.

## Create the SharePoint 2013 Preview farm

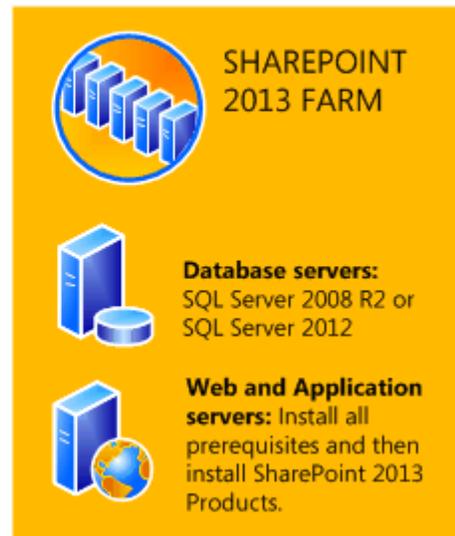

The first stage in the upgrade process creates the new SharePoint 2013 Preview farm:

1. A server farm administrator installs SharePoint 2013 Preview to a new farm. The administrator configures farm settings and tests the environment.
2. A server farm administrator sets the SharePoint 2010 Products farm to read-only so that users can continue to access the old farm while upgrade is in progress on the new farm.

**Figure: Create new farm, set old farm to read-only**

---

## CREATE NEW FARM, SET OLD TO READ-ONLY

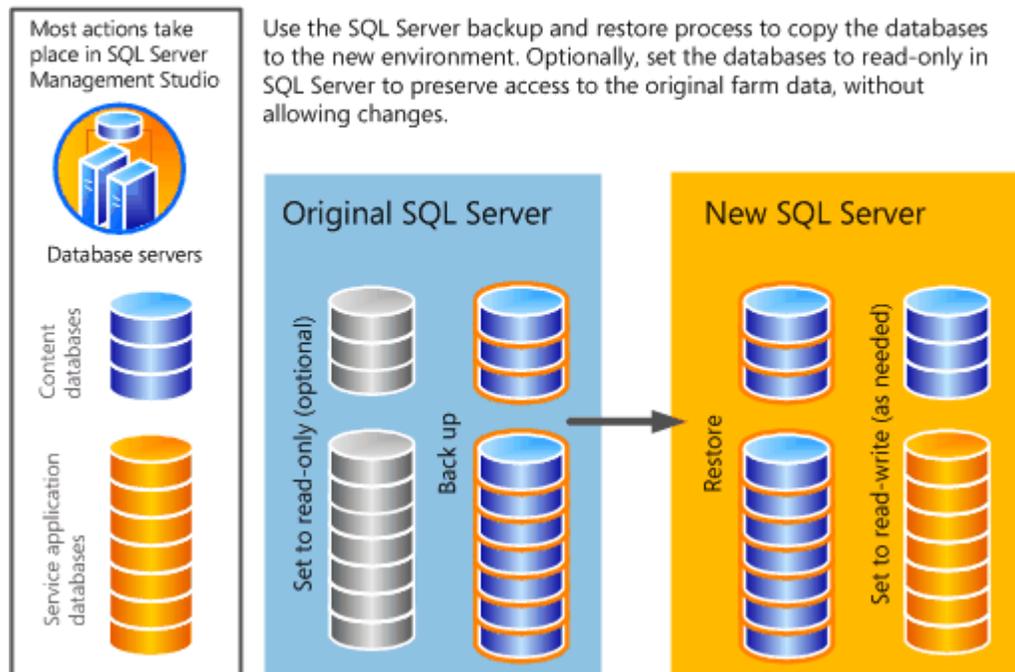

## Copy the SharePoint 2010 Products databases

The second stage in the upgrade process copies the databases to the new environment. You use SQL Server Management Studio for these tasks.

1. With the farm and databases in read-only mode, a server farm administrator backs up the content and service application databases from the SQL Server instance on the SharePoint 2010 Products farm.
2. The server farm administrator restores a copy of the databases to the SQL Server instance on the SharePoint 2013 Preview farm and sets the databases to read-write on the new farm.

**Figure: Use SQL Server tools to copy databases**

## COPY CONTENT AND SERVICE APPLICATION DATABASES TO NEW SQL SERVER

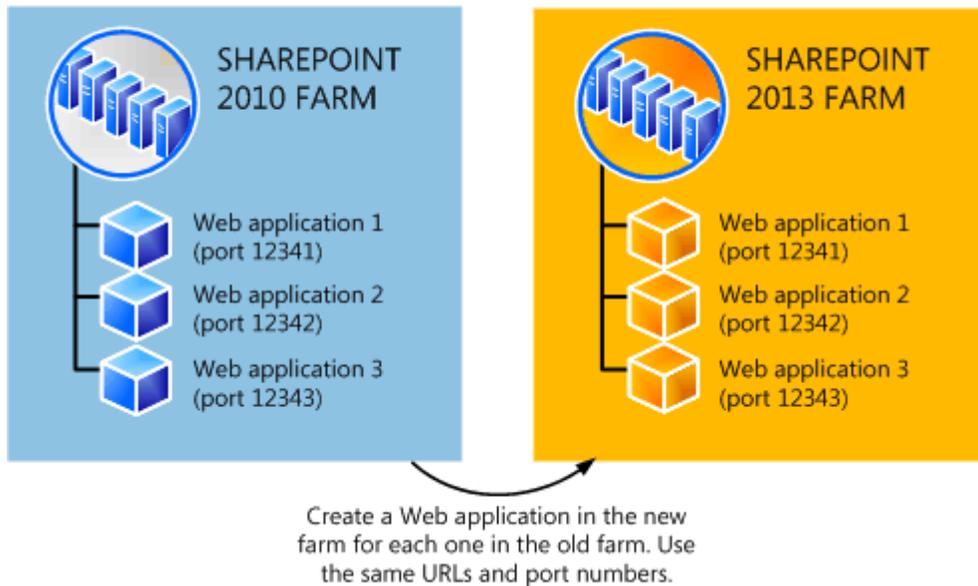

## Upgrade SharePoint 2010 Products databases and service applications

The third stage in the upgrade process upgrades the databases and service applications.

1. A server farm administrator configures the service applications for the new farm. The following service applications have databases that you can upgrade during this process:
  - SharePoint Server 2010 and SharePoint Foundation 2010
    - Business Data Connectivity service application
  - SharePoint Server 2010 only
    - Managed Metadata service application
    - PerformancePoint Services service application
    - Search service application
    - Secure Store Service application
    - User Profile service application
2. A server farm administrator creates a web application on the SharePoint 2013 Preview farm for each web application on the SharePoint 2010 Products farm.

**Figure: Create web applications for upgrade**

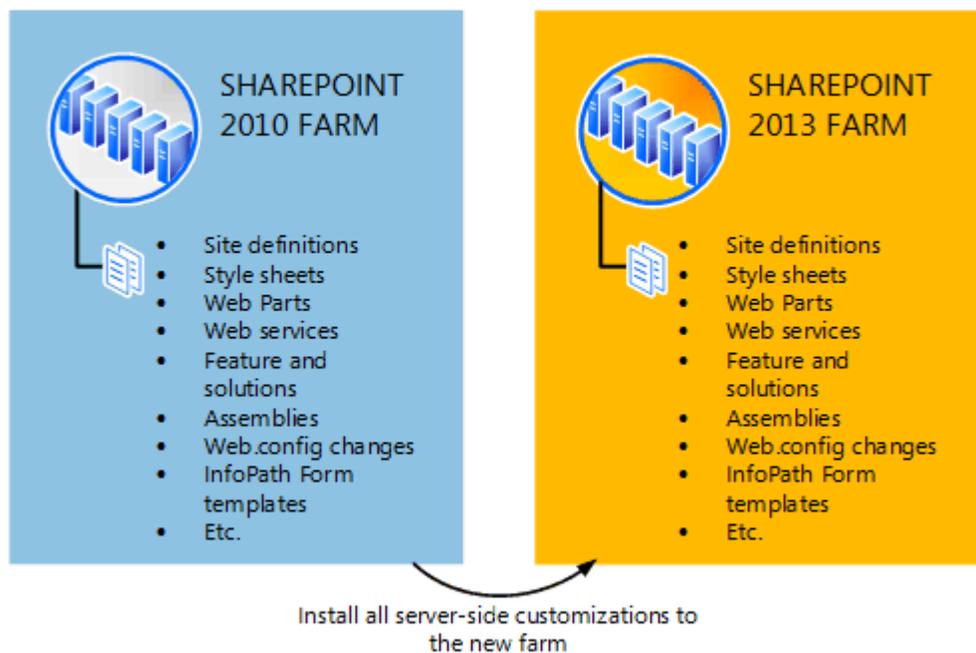

## CREATE WEB APPLICATIONS

3. A server farm administrator installs all server-side customizations.

**Figure: Copy customizations to the new farm**

## INSTALL CUSTOMIZATIONS

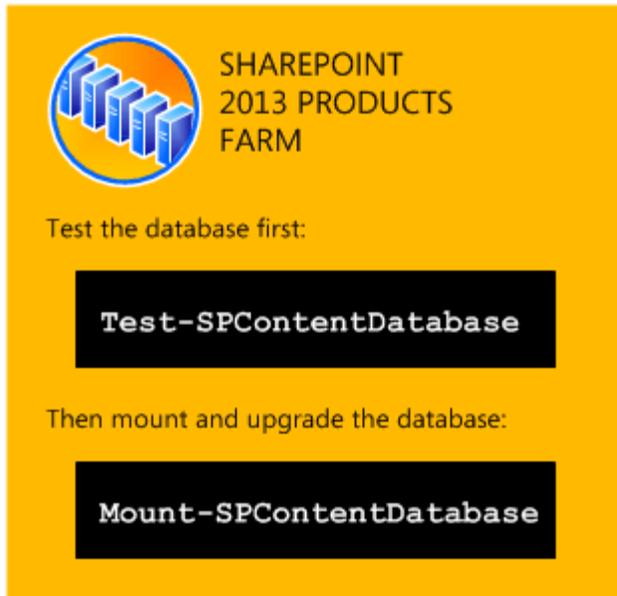

4. A server farm administrator then attaches the content databases to the new farm and upgrades the content databases for those web applications.

---

**Figure: Upgrade the databases by using Windows PowerShell**

## UPGRADE CONTENT DATABASES

5. A server farm administrator confirms that the upgrade is successful.

## Upgrade SharePoint 2010 Products site collections

The final stage in the upgrade process is to upgrade the site collections. In SharePoint 2013 Preview, site owners are in charge of upgrading their sites. The upgrade process for My Sites is slightly different from for other types of site collections.

### Upgrade My Sites

 **Important:**

This section applies to SharePoint Server 2013 Preview only.

A server farm administrator upgrades the My Site host and then individual users can upgrade their My Sites or the farm administrator can upgrade them by using Windows PowerShell. The following illustration shows four stages for the My Site host and My Sites during the upgrade process.

**Figure: Stages in upgrading My Sites**

1. The My Site host has not been upgraded. My Sites cannot be upgraded yet.

2. A server farm administrator has upgraded the My Site host. No My Sites have been upgraded.
3. Some users have upgraded their My Sites.
4. All My Sites have been upgraded.

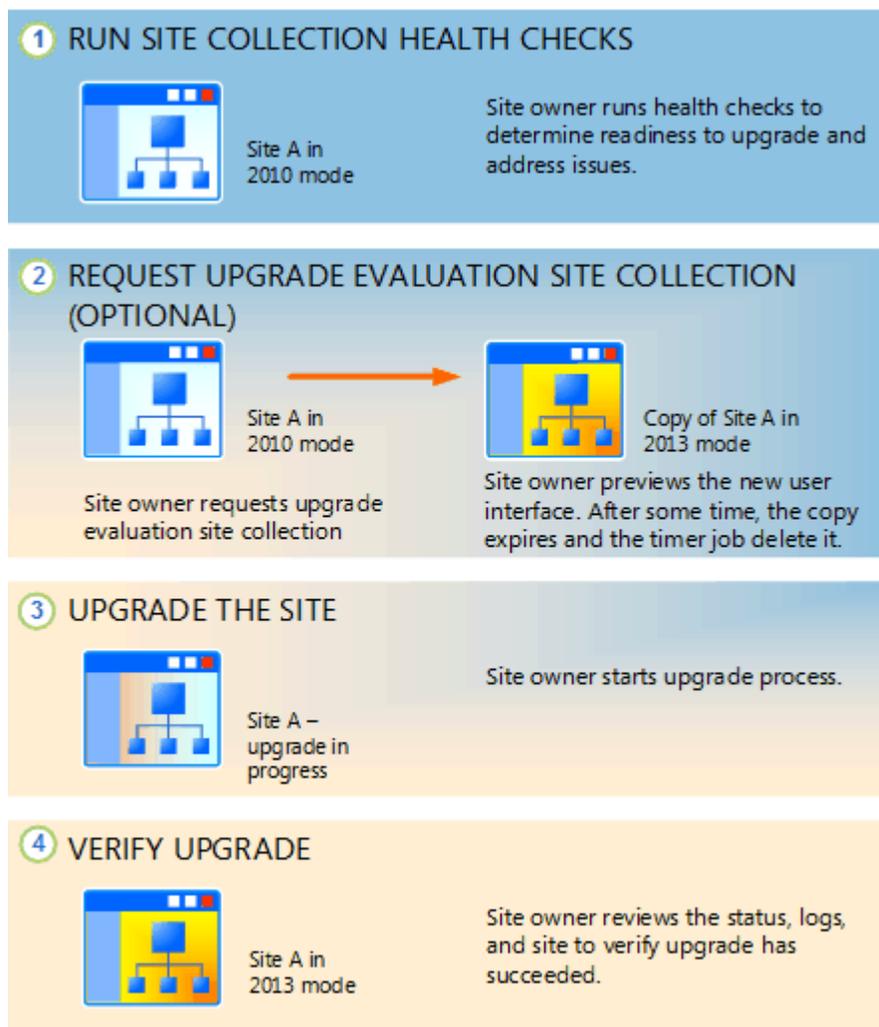

**Note:**

A server farm administrator can choose to force an upgrade of My Sites without waiting for users to upgrade them. For details and steps, read [Upgrade site collections to SharePoint 2013](#).

## Upgrade other SharePoint 2010 Products site collections

Owners of all other site collections can start to upgrade their sites as soon as they see a notification on their site's home page that the new version is available. The following illustration shows four stages for a site collection during the upgrade process.

### Stages in upgrading site collections

- 
1. The site owner runs the site collection health checks to determine readiness for upgrade. The site owner addresses issues before they continue with the next step.
  2. Optionally, the site owner requests an upgrade evaluation site collection. A timer job runs to create the site collection and the site owner receives an email message when the evaluation site collection is ready. The site owner previews the new user interface. After several days or weeks, the evaluation site collection expires and is deleted by a timer job.  
A server farm administrator can determine the length of time before expiration.
  3. When the site owner is ready, the site owner starts the upgrade process. The site collection health checks are run again automatically. The site owner must address issues before upgrading. If health checks return no issues, the upgrade starts.
  4. When upgrade is complete, the site owner sees the Upgrade Status page that contains the status and a link to the upgrade logs. The site owner reviews the site to make sure that everything works correctly.

**Note:**

A server farm administrator can also force specific site collections to be upgraded without waiting for the site owners to upgrade them. For details and steps, read [Upgrade site collections to SharePoint 2013](#).

---

# Services upgrade overview for SharePoint Server 2013 Preview

---

The upgrade process for SharePoint Server 2013 Preview uses the database attach upgrade method. When you move your databases to a new farm and upgrade the content, you must create your services infrastructure in the new farm, and configure the services appropriately for your new farm and new version. The following service applications have databases that can be upgraded when you upgrade from SharePoint Server 2010 to SharePoint Server 2013 Preview:

- Business Data Connectivity service application
- Managed Metadata service application
- PerformancePoint Services service application
- Search service application
- Secure Store Service application
- User Profile service application

Attaching and upgrading these databases configures these service applications. Settings for other services will have to be reconfigured when you upgrade.

 **Important:**

The content in this article about the Business Data Connectivity service application applies to both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview. Other services are available only in SharePoint Server 2013 Preview.

## Database attach upgrade with services

You must create the service applications on your new farm before you upgrade your content databases. The steps included in the installation guide above describe how to use the Farm Configuration Wizard to enable all service applications. Some service applications can be upgraded by using a service application database upgrade. If you want to upgrade these service applications by upgrading the service application databases, you should not use the Farm Configuration Wizard to configure these service applications when you set up your new farm.

The following service applications can be upgraded by performing a services database upgrade:

- **Business Data Connectivity service**  
The Business Data Connectivity service uses a database to store information about external data. This database must be upgraded as part of a services database attach upgrade. This service application is also available in SharePoint Foundation 2013 Preview.
- **Managed Metadata service**  
The Managed Metadata service uses a database to store metadata information. This database must be upgraded as part of a services database attach upgrade. You must attach and upgrade the database for this service and for the User Profile service before you can upgrade any My Sites.

- **PerformancePoint services**

PerformancePoint Services use a database to store information. This database must be upgraded as part of a services database attach upgrade.

- **Search**

In SharePoint Server 2010, the Search service application Administration database contains settings for the Search service application such as content sources, crawl rules, start addresses, server name mapping, and federated locations. You can upgrade a Search service application Administration database from SharePoint Server 2010 to SharePoint Server 2013 Preview by using a database attach approach.

You cannot use the database attach approach to upgrade any other search databases, such as crawl databases or property databases. (These databases are re-created when you perform a full crawl in the new farm.) Also, the upgrade process does not preserve or upgrade logical components of the SharePoint Server 2010 farm topology. After you perform the upgrade, you must manually re-create a topology as appropriate for the requirements of the organization.

- **Secure Store service**

The Secure Store Service uses a database to store information. This database must be upgraded as part of a services database attach upgrade. You have to upgrade the data for this service application so that any connections from Excel Services Application and Business Connectivity Services can work with existing passwords.

- **User Profile service**

The User Profile service uses databases to store profile, social, and sync information. These databases must be upgraded as part of a services database attach upgrade. You have to attach and upgrade the databases for this service and for the Managed Metadata service before you can upgrade any My Sites.

**Note:**

My Sites are not available in SharePoint Foundation 2010 or SharePoint Foundation 2013 Preview.

Specifically, the following service application databases can be upgraded:

| Service application                        | Default database name                                                                                                                       |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Business Data Connectivity                 | BDC_Service_DB_ID                                                                                                                           |
| Managed Metadata                           | Managed Metadata Service_ID                                                                                                                 |
| PerformancePoint                           | PerformancePoint Service Application_ID                                                                                                     |
| Search Administration                      | Search_Service_Application_DB_ID                                                                                                            |
| Secure Store                               | Secure_Store_Service_DB_ID                                                                                                                  |
| User Profile: Profile and Social databases | User Profile Service Application_ProfileDB_ID<br>User Profile Service Application_SocialDB_ID<br>User Profile Service Application_SyncDB_ID |

---

The steps to upgrade these service application databases are included in [Attach databases and upgrade to SharePoint 2013 Preview](#).

## Considerations for specific services

The following services in SharePoint Server 2013 Preview also require additional steps to enable and configure when you upgrade:

- **Excel Services**

You can enable this service by using the Farm Configuration Wizard, but you must make sure that you re-create all trusted data connections. For more information, see [Manage Excel Services Trusted Data Providers](#).

- **InfoPath Forms Service**

This service is not part of the Farm Configuration Wizard. If you want to use this service, you can use the **Configure InfoPath Forms Services** link on the **General Application Settings** page in SharePoint Central Administration to configure it. If you want to continue using form templates from your previous environment, you can export any administrator-deployed form templates (.xsn files) and data connection files (.udcx files) from your SharePoint Server 2010 environment, and then import them to your new SharePoint Server 2013 Preview environment by using the **Export-SPInfoPathAdministrationFiles** Windows PowerShell cmdlet. If the URL of the new server differs from the URL of the previous server, you can run the **Update-SPInfoPathAdminFileUrl** Windows PowerShell cmdlet to update links that are used in the upgraded form templates. For more information, see [Configure InfoPath Forms Services \(SharePoint Server 2010\)](#).

- **Office Web Apps**

Office Web Apps Preview Server is a new stand-alone server product that delivers Office Web Apps Preview functionality on your private network. It is installed and managed separately from SharePoint 2013 Preview. For more information, see [Office Web Apps Preview](#).

---

# Upgrade farms that share services (parent and child farms) to SharePoint 2013 Preview

---

Some services in SharePoint 2010 Products can be shared across multiple farms. A services farm hosts services such as Business Data Connectivity service, Search, and User Profiles that other farms consume. When you upgrade to SharePoint 2013 Preview, you first upgrade the services farm, and then upgrade the farms that consume those services. This article describes how to upgrade farms that share services.

Before you begin, make sure that you have reviewed the overall upgrade process described in [Overview of the upgrade process to SharePoint 2013 Preview](#).

**Note:**

This article applies to both SharePoint Server 2013 Preview and SharePoint Foundation 2013 Preview. However, only the Business Data Connectivity service is available in SharePoint Foundation 2013 Preview. The other services are available only in SharePoint Server 2013 Preview.

## Process for upgrading farms that share services

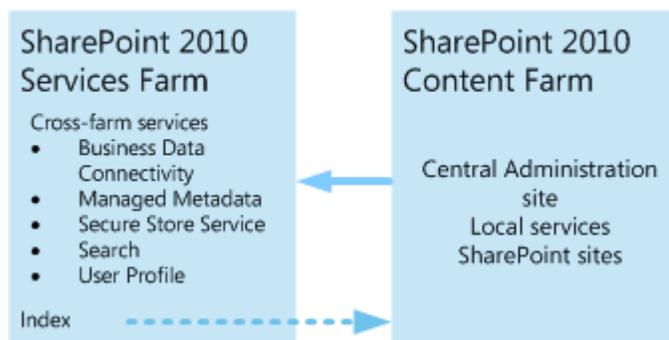

To upgrade farms that share services, you follow these steps:

### 1. Starting status: services farm and content farm running SharePoint 2010 Products

In your SharePoint 2010 Products environment, you have one or more content farms that use services from a services farm. The services farm provides cross-farm services and Enterprise Search indexes the content on the content farm.

#### Pre-upgrade state: 2010 content and services farms

2010 content farm consuming 2010 services

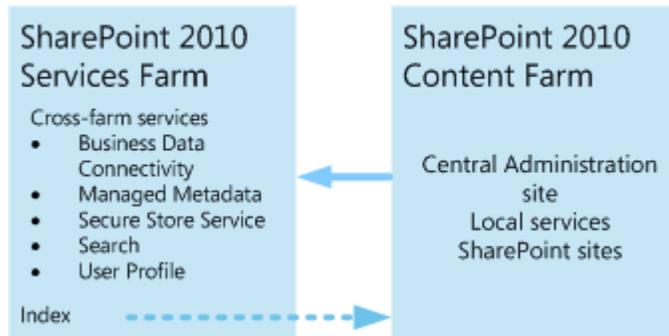

## 2. Create the SharePoint 2013 Preview services farm

Create a new farm to host the service applications, and install and configure SharePoint 2013 Preview.

### Create 2013 Services farm

Create 2013 services farm

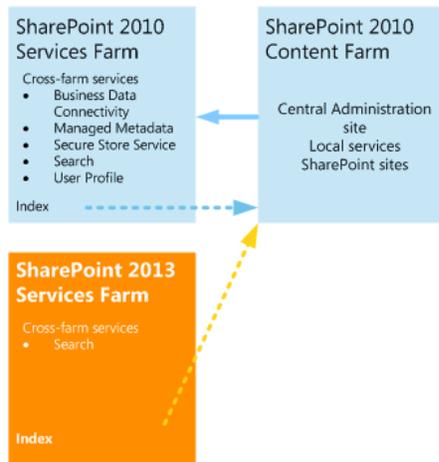

## 3. Upgrade the Search service application and optionally index the content in the SharePoint 2010 Products content farm

Upgrade the Search service application administration database and run a search crawl against the SharePoint 2010 Products content farm to create the index.

### Upgrade the Search service application

Upgrade search data and index content farm

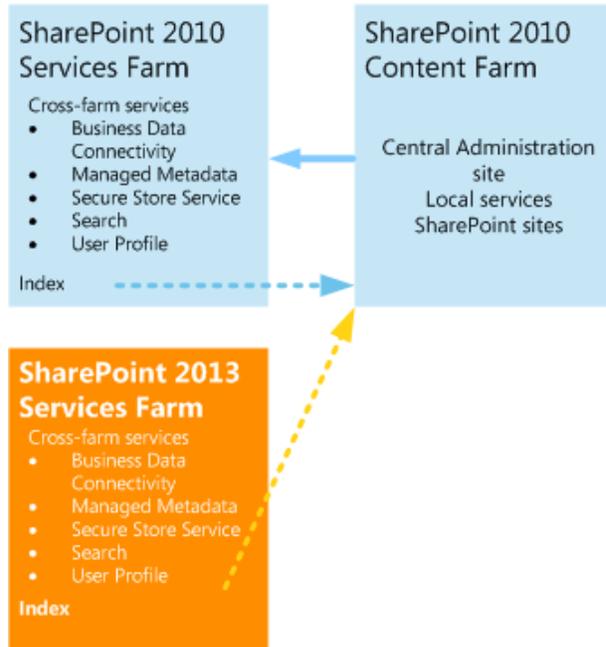

---

#### 4. Upgrade the other service applications.

Upgrade the databases for the other service applications.

##### Upgrade other service applications

Upgrade other service applications

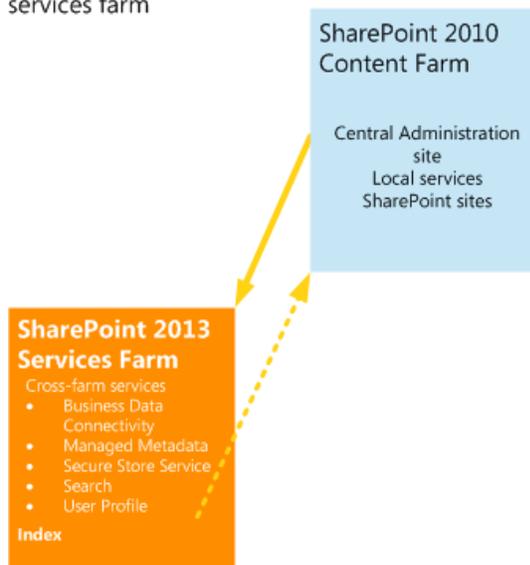

#### 5. Switch the services connection to SharePoint 2013 Preview services farm

Change the SharePoint 2010 Products content farm to consume services from the SharePoint 2013 Preview services farm and retire the SharePoint 2010 Products services farm.

##### Switch connection to 2013 services farm

Switch services connection and retire 2010 services farm

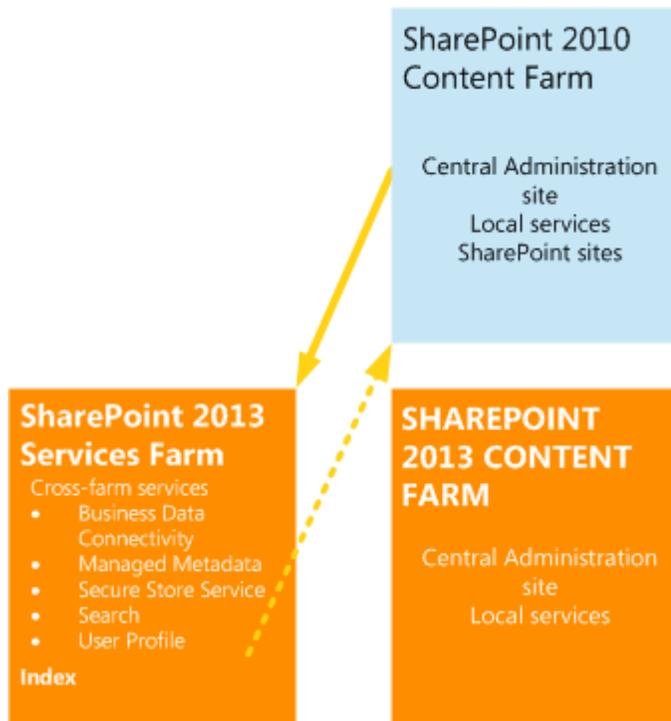

---

## 6. Create SharePoint 2013 Preview content farm

Create a new farm to host content, and install and configure SharePoint 2013 Preview.

### Create 2013 content farm

Create 2013 Content Farm

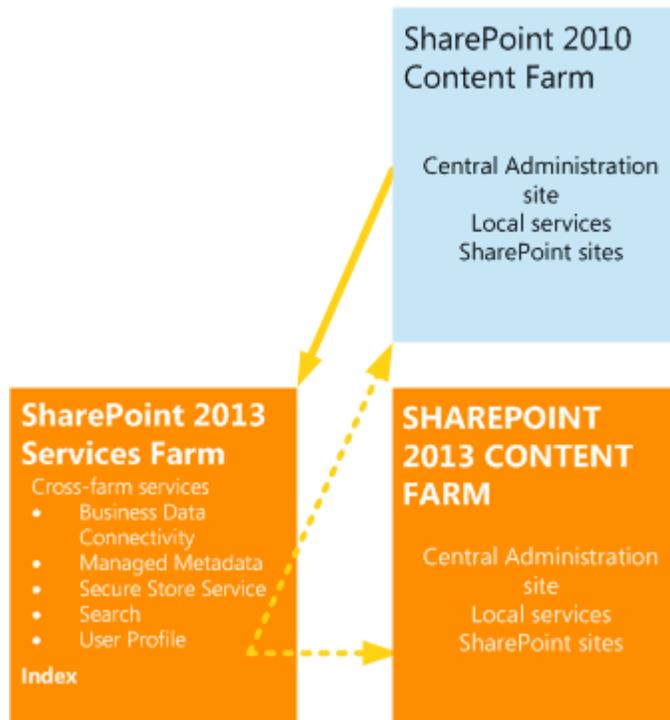

## 7. Upgrade and index the 2013 content farm

Upgrade the data in the SharePoint 2013 Preview content farm. Configure it to consume services from the SharePoint 2013 Preview services farm. Index the SharePoint 2013 Preview content farm.

### Upgrade and index the 2013 content farm

## Upgrade and index 2013 Content Farm

### 8. Retire the SharePoint 2010 Products content farm

Now that the SharePoint 2013 Preview content farm uses services from a SharePoint 2013 Preview services farm, you can retire the SharePoint 2010 Products content farm.

#### Retire 2010 content farm

##### Retire 2010 content farm

If more than one content farm uses services from the SharePoint 2010 Products services farm, repeat steps 5 through 7 for the remaining content farms until all farms are upgraded and are using services from SharePoint 2013 Preview. Except for the order of steps in this process, the process to create and upgrade each farm follows the database-attach upgrade steps outlined in [Attach databases and upgrade to SharePoint 2013 Preview](#). This process does not explain how to upgrade site collections. For more information about how to upgrade sites, see [Upgrade site collections to SharePoint 2013](#).

---

# Best practices for upgrading to SharePoint 2013 Preview

---

To increase your chances of a successful and faster upgrade to SharePoint 2013 Preview, follow these best practices to test and complete an upgrade.

## Best practices for testing upgrade

To understand your environment before you upgrade it, and to plan for the time that an upgrade will require, you should try one or more trial upgrades. The goal of testing upgrade is to find and fix issues and develop confidence in the outcome before the real upgrade. To develop an accurate trial of the upgrade process from SharePoint 2010 Products to SharePoint 2013 Preview, follow these best practices:

1. Know what is in your environment. Do a full survey first.  
Document the hardware and software in your environment, where server-side customizations are installed and used, and the settings that you need. This helps you plan the trial environment and also helps you recover if upgrade fails. A worksheet is available to record information about your environment. Download the worksheet at [SharePoint 2013 Products Preview Upgrade Worksheet](#).
2. Make your test environment as similar as possible to your real environment.  
If possible, use the same kind of hardware and use the same settings, the same URLs, and so on to configure it. Minimize the differences between your test environment and your real environment. As you introduce more differences, you are likely to spend time resolving unrelated issues to make sure that they will not occur during the actual upgrade.
3. Use real data.  
Use copies of your actual databases to run the tests. When you use real data, you can identify trouble areas and also determine upgrade performance. You can also measure how long different upgrade sequences and actions take on different kinds of data. If you cannot test all the data, test a representative subset of the data. Make sure that you find issues with the different kinds and sizes of sites, lists, libraries, and customizations that are present in your environment. If you cannot test all data because of storage concerns, try going over the data in several passes, removing the old trial copies before going on to the next batch.
4. Run multiple tests.  
A single test can tell you whether you will encounter big problems. Multiple tests will help you find all the issues that you might face and help you estimate a more accurate timeline for the process. By running multiple tests, you can determine the following:
  - The upgrade approaches that will work best for your environment
  - The downtime mitigation techniques that you should plan to use
  - How the process or performance may change after you address the issues that you uncovered in your first tests

---

Your final test pass can help you validate whether you have addressed the errors and are ready to upgrade your production environment.

5. Do not ignore errors or warnings.  
Even though a warning is not an error, a warning could lead to problems in the upgrade process. Resolve errors, but also investigate warnings to make sure that you know the results that a warning might produce.
6. Test the upgraded environment, not just the upgrade process.  
Check your service applications and run a search crawl and review the log files.

For more information about how to test upgrade, see [Use a trial upgrade to SharePoint 2013 Preview to find potential issues](#) and the [SharePoint 2013 Products Preview - Test Your Upgrade Process model](#).

## Best practices for upgrading to SharePoint 2013 Preview

To guarantee a smooth upgrade from SharePoint 2010 Products to SharePoint 2013 Preview, follow these best practices:

1. Ensure that the environment is fully functioning before you begin to upgrade.  
An upgrade does not solve problems that already exist in your environment. Therefore, make sure that the environment is fully functioning before you start to upgrade. For example, if you are not using web applications, unextend them before you upgrade. If you want to delete a web application in Internet Information Services (IIS), unextend the web application before you delete it. Otherwise, SharePoint 2013 Preview will try to upgrade the web application even though it does not exist, and the upgrade will fail. If you find and solve problems beforehand, you are more likely to meet the estimated upgrade schedule.
2. Perform a trial upgrade on a test farm first.  
Copy your databases to a test environment and perform a trial upgrade. Examine the results to determine the following:
  - Whether the service application data was upgraded as expected
  - The appearance of upgraded sites
  - The time to allow for post-upgrade troubleshooting
  - The time to allow for the upgrade processTry a full search indexing crawl. For more information, see [Use a trial upgrade to SharePoint 2013 Preview to find potential issues](#).
3. Plan for capacity.  
Ensure that you have enough disk, processor, and memory capacity to handle upgrade requirements. For more information about system requirements, see [System requirements \(SharePoint 2013 Preview\)](#). For more information about how to plan the disk space that is required for upgrade, see [Plan for performance during upgrade to SharePoint 2013 Preview](#).
4. Clean up before you upgrade  
Issues in your environment can affect the success of upgrade, and unnecessary or very large amounts of data can affect upgrade performance for both databases and site collections. If you

---

don't need something in your environment, consider removing it before upgrade. If there are issues detected, try to resolve them before you start to upgrade. For more information, see [Clean up an environment before an upgrade to SharePoint 2013 Preview](#).

5. Back up your databases.

Perform a full backup of your databases before you upgrade. That way, you can try upgrade again if it fails.

6. Optimize your environment before upgrade.

Be sure to optimize your SharePoint 2010 Products environment to meet any limits or restrictions, either from your business or governance needs or from the SharePoint 2013 Preview boundaries and limits before upgrade. This will help reduce errors during the upgrade process and prevent broken lists or sites after upgrade. For more information about limits in the product, see [SharePoint Server 2010 Capacity Management: Software Boundaries and Limits](#). For more information about large lists and how to address the lower limit on site collections, see [Clean up an environment before an upgrade to SharePoint 2013 Preview](#).

7. (Optional) Set the original databases to read-only if you want to keep your original environment available while you upgrade.

If you expect a long outage period while you upgrade, you can set the databases in the original environment to read-only. Users can continue to access the data but cannot change it. For more information, see [Attach databases and upgrade to SharePoint 2013 Preview](#).

8. After upgrade, review the Upgrade Status page and upgrade logs to determine whether you must address issues. Then review the upgraded sites.

The Upgrade Status page reports on the upgrade progress, and the upgrade logs list any errors or warnings that occurred during the upgrade process. Verify all the sites and test them before you consider the upgrade finished. For more information, see [Verify database upgrades in SharePoint 2013 Preview](#) and [Review site collections upgraded to SharePoint 2013 Preview](#).

9. Defer upgrade for site collections until you can get updated customizations to support 2013 mode.

If you wait until the customizations are available, you can complete the initial upgrade of database and services without significantly affecting use of the existing sites in 2010 mode.

---

# Review supported editions and products for upgrading to SharePoint 2013 Preview

---

When you plan an upgrade process, make sure that you verify that the intended upgrade path is supported. This article describes the editions and products that are supported and unsupported to upgrade to SharePoint 2013 Preview.

**!** **Important:**

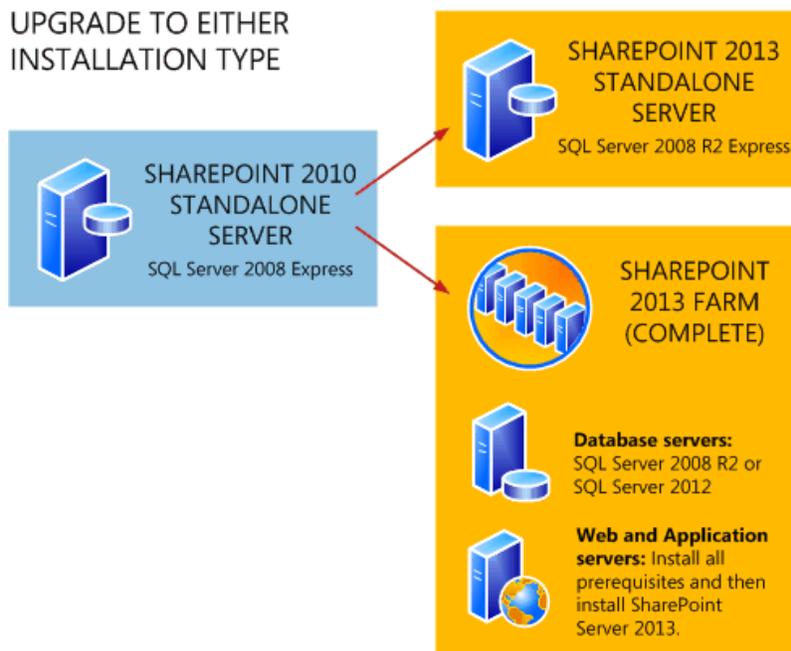

Upgrade from a pre-release version of SharePoint 2013 Preview to the release version of SharePoint 2013 Preview is not supported.

Pre-release versions are intended for testing only and should not be used in production environments. Upgrading from one pre-release version to another is also not supported.

## Supported topologies

For SharePoint 2013 Preview, the only upgrade method is the database-attach upgrade method. Because this method upgrades the databases instead of installing in place over an existing environment, you can attach the databases from a stand-alone installation to server farm (Complete) installation if you want to expand your environment.

**Figure: Upgrade to either stand-alone or server farm (Complete) topologies**

Before you create your new SharePoint 2013 Preview environment and attach and upgrade the databases, determine the type and size of the environment that you need.

---

## Physical topology guidance

The SQL Server topology — in addition to network, physical storage, and caching considerations — can significantly affect system performance. To learn more about how to map your solution design to the farm size and hardware that will support your business goals, see [Performance and capacity management](#). For more information about requirements, see [System requirements \(SharePoint 2013 Preview\)](#).

## Supported editions for upgrade

The following table lists the editions available for SharePoint Server 2010 and the supported and unsupported ending editions when you upgrade to SharePoint Server 2013 Preview.

| Starting edition                           | Supported ending edition                           | Unsupported ending edition                                                                                 |
|--------------------------------------------|----------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| SharePoint Server 2010, Standard edition   | SharePoint Server 2013 Preview, Standard edition   | SharePoint Server 2013 Preview, Enterprise edition<br>You can convert to Enterprise edition after upgrade. |
| SharePoint Server 2010, Enterprise Edition | SharePoint Server 2013 Preview, Enterprise edition | SharePoint Server 2013 Preview, Standard edition.                                                          |
| SharePoint Server 2010, Trial edition      | SharePoint Server 2013 Preview, Trial edition      | SharePoint Server 2013 Preview, full product<br>You can convert to the full product after upgrade.         |

## Supported cross-product upgrades

The following table lists which Microsoft server products can be upgraded to SharePoint Foundation 2013 Preview or SharePoint Server 2013 Preview.

| Starting product                   | Supported ending products                                            | Unsupported ending product         |
|------------------------------------|----------------------------------------------------------------------|------------------------------------|
| SharePoint Foundation 2010         | SharePoint Foundation 2013 Preview<br>SharePoint Server 2013 Preview |                                    |
| SharePoint Foundation 2013 Preview | SharePoint Server 2013 Preview                                       |                                    |
| SharePoint Server 2010             | SharePoint Server 2013 Preview                                       | SharePoint Foundation 2013 Preview |
| SharePoint Server 2013 Preview     | SharePoint Server 2013 Preview                                       | SharePoint Foundation 2013         |

---

| Starting product                                                          | Supported ending products                                                                 | Unsupported ending product            |
|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|---------------------------------------|
|                                                                           |                                                                                           | Preview                               |
| Search Server 2010                                                        | SharePoint Server 2013 Preview<br>or Search Server 2013 Preview                           | SharePoint Foundation 2013<br>Preview |

# Plan for upgrade to SharePoint 2013 Preview

---

In order to have a successful upgrade to SharePoint 2013 Preview, you must plan for the upgrade. This section contains articles that help you plan and prepare for upgrading from SharePoint 2010 Products to SharePoint 2013 Preview.

To understand how the upgrade process works, see the articles in [Get started with upgrades to SharePoint 2013 Preview](#).

The following downloadable resources, articles on TechNet, video recordings, and related resources provide information about how to plan for upgrade.

## TechNet articles about how to plan for upgrade

The following articles about how to plan for upgrade are available to view online. Writers update articles on a continuing basis as new information becomes available and as users provide feedback.

|                                                                                    | Content                                                                                          | Description                                                                                                                      |

# Determine strategy for upgrade to SharePoint 2013 Preview

---

When you upgrade your environment to SharePoint 2013 Preview, you want to limit how much downtime that users experience. You might also have a special case that you must address during upgrade. This article describes how to minimize downtime and work with these special cases.

In addition to the information in this article, make sure that you read [Review supported editions and products for upgrading to SharePoint 2013 Preview](#) to understand exactly which upgrade situations are valid and lead to successful upgrades.

## How to minimize downtime during upgrade

The following table lists the techniques that you can use during upgrade to reduce the time that users cannot access their content or to potentially increase upgrade performance.

- **Read-only databases** You can use read-only databases to continue to provide read-only access to content during the upgrade process. For this approach, you set the databases to read-only on the original farm while the upgrade is in progress on another farm. This method reduces perceived downtime for users. Also, if you encounter a problem with upgrade, you can restore the read-only farm to read-write and restore access to users while you rework your plans before you try upgrade again.
- **Parallel database upgrades** You can attach and upgrade multiple databases at a time to speed up the upgrade process overall. The maximum number of parallel upgrades depends on your hardware. This results in faster overall upgrade times for your environment. However, you must monitor the progress and your servers to make sure that the performance is acceptable, and for large databases, parallel upgrades can be slower than single upgrades.

For more information about upgrade performance, see [Plan for performance during upgrade to SharePoint 2013 Preview](#) and [Use a trial upgrade to SharePoint 2013 Preview to find potential issues](#).

The instructions for using these techniques are included in [Attach databases and upgrade to SharePoint 2013 Preview](#).

## Special cases

You might have other requirements or additional goals that you want to achieve when you perform an upgrade. The following table lists special cases and describes how to approach upgrade for each case.

| Case                                                           | Upgrade approach                                                                                              |
|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| Upgrading an environment that uses forms-based authentication? | Additional steps are required to upgrade when you are using forms-based authentication. For more information, |

| Case                                                                         | Upgrade approach                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                                                                              | see <a href="#">Configure forms-based authentication for a claims-based web application in SharePoint 2013 Preview</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Upgrading very large databases?                                              | In general, very large databases — especially databases that have a large number or large size of document versions inside them — take longer to upgrade than smaller databases. However, the complexity of the data determines how long it takes to upgrade, not the size of the database itself. If the upgrade process times out, it is usually because of connection issues. For more information about how long upgrade might take for your environment, see <a href="#">Plan for performance during upgrade to SharePoint 2013 Preview</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Upgrading from the server products in the Office 2007 release?               | Use a database attach upgrade method to upgrade to SharePoint 2010 Products, and then upgrade to SharePoint 2013 Preview.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Upgrading from SharePoint Foundation 2010 to SharePoint Server 2013 Preview? | Attach and upgrade the content databases from SharePoint Foundation 2010 to SharePoint Server 2013 Preview.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Changing languages?                                                          | <p>You have two choices, depending on whether a single site or your whole environment is changing languages:</p> <ul style="list-style-type: none"> <li>• To change the multiple user interface (MUI) language for a specific site, upgrade in the same language, and then install the new language pack and change to that language.</li> </ul> <p> <b>Caution:</b></p> <p>You must have the appropriate language packs installed to upgrade any sites based on a localized site definition. If you do not have the new language pack, the sites will not be available. Wait for the new language packs to be released before you try to upgrade those sites.</p> <ul style="list-style-type: none"> <li>• To change the installation language for your environment, set up your new environment in the new language, and then attach and upgrade your databases in the new language.</li> </ul> |

---

# Create plan for current customizations during upgrade to SharePoint 2013 Preview

---

If you have extensively customized your sites based on SharePoint 2010 Products, you must determine how you want to handle your customizations when you upgrade to SharePoint 2013 Preview. Your approach will vary based on the extent of the customizations, the kind of customization, the complexity of your site, and your goals for upgrading. Before you upgrade, you must identify and then evaluate the customizations in your environment and determine whether you will upgrade them, and how.

## Identify customizations in your environment

As part of an upgrade testing process, you should create an inventory of the server-side customizations in your environment (solutions, features, Web Parts, event handlers, master pages, page layouts, CSS files, and so on). For more information about how to identify customizations, see [Use a trial upgrade to SharePoint 2013 Preview to find potential issues](#).

You can use the [Upgrade Planning worksheet](#) to list specific customizations and then record the results of your evaluation in the next section.

## Evaluate the customizations

After you have identified the customizations, think about the potential upgrade effect of each one. The following table describes types of customizations and the kind of effect they can have during upgrade.

| Category of customization | Types of customizations                                                                   | Potential effect on upgrade                                                                                                                                                 |
|---------------------------|-------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Visually-affecting        | Master pages<br>Themes<br>Web Pages<br>Web Parts<br>Custom JavaScript<br>Custom CSS files | Should not affect database upgrade.<br><br>For site upgrades: likely to work well in 2010 mode, but need changes to work in 2013 mode.<br><br>Test carefully in both modes. |
| Data structure affecting  | Content types<br>List types<br>Web templates<br>Site definitions                          | Can affect database upgrade if content or list type names conflict with new content or list types in the product, or if templates or definitions are missing.               |
| Non-visually affecting    | Web services<br>Windows services<br>HTTP handler                                          | Might not be compatible with SharePoint 2013 Preview. Test carefully to determine effect. Be prepared to remove or replace.                                                 |

| Category of customization | Types of customizations | Potential effect on upgrade |
|---------------------------|-------------------------|-----------------------------|
|                           | HTTP module             |                             |

Now that you know what customizations that you have, and what type that they are, you can decide what to do about them. The following questions can help you evaluate the customizations:

- Is the customization still valuable?
  - Does it serve a useful business need?
  - Is it widely deployed and used?
  - Does it do something that you cannot do with standard features in the product?
- Is the customization well-designed?
  - Is it built on supported, predefined site definitions?
  - Does it follow best practices for customizations?
  - Is it a supported kind of customization, or does it introduce risk into your environment?

As you evaluate every customization, you can also think about your overall approach for customizations. You can choose from among these options:

1. **Keep the customizations, don't upgrade the sites** You can continue to run the site in 2010 mode in the upgraded environment. Although you can use this approach to keep the same functionality, you will be unable to take advantage of the features and capabilities that are available in the new version. Use this approach only temporarily - eventually you must address the issue (such as before an upgrade to the next version of the product).
2. **Replace or redo the customizations** If you want to use new functionality, plan to redesign your sites, or are significantly changing the information architecture, the upgrade is your opportunity to start over with new features, a new look, or a new organization. When you replace or redo customizations, you can take advantage of the new capabilities, change your design slightly if you want, or move to a more manageable design.
3. **Discard the customizations** Replace the customizations by using default functionality. You can reset pages to the default site definitions and remove any Web Parts or features that you no longer want to support. In fact, the site collection health-checker checks for unghosted pages and can reset the pages to the default versions. If you decide to discard any customizations, you must fix any issues that result from removing the customizations in the sites that used them. You can use your customizations inventory to determine which sites require this kind of attention before or after upgrade.

## Considerations for specific customizations

In addition to your overall decision about how to treat customizations in your environment during upgrade, you must examine specific types of customizations to determine whether you must perform any additional actions to make them work in the upgraded environment.

The following table lists some common customizations and a recommendation for addressing that kind of customization.

| Customization type                    | Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Site definition                       | <p>Migrate sites to a supported, predefined site definition, then apply custom features by using solution deployment.</p> <p>You can also continue to use a custom site definition. You do not have to create a new site definition that is based on SharePoint 2013 Preview.</p> <p>However, if you must perform custom upgrade actions for the definition, you might have to create an upgrade definition file for that site definition. For more information, see <a href="http://go.microsoft.com/fwlink/p/?LinkId=182339">Upgrade Definition Files</a> (<a href="http://go.microsoft.com/fwlink/p/?LinkId=182339">http://go.microsoft.com/fwlink/p/?LinkId=182339</a>) on MSDN.</p> |
| "Fabulous 40" application templates   | <p>Microsoft is not creating new versions of these templates. Environments that contain sites based on these templates can be upgraded as long as the templates are installed. But there might be issues when you try to upgrade the site collections. Make sure that you test each site before you upgrade the production environment. For more information, see <a href="#">Troubleshoot database upgrade issues in SharePoint 2013 Preview</a>.</p>                                                                                                                                                                                                                                   |
| Feature                               | <p>Evaluate, then redesign or redeploy if it is necessary.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Workflows and server controls         | <p>Depends on the solution. Contact the vendor to discover whether there is an updated solution. If a workflow is compatible with the new version, redeploy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Event handler                         | <p>Most event handlers will continue to work without changes. However, if the code for the event handler makes calls to APIs which were deprecated, you will have to rewrite it, and then redeploy it as a feature.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Managed paths (inclusions/exclusions) | <p>Re-create inclusions to make sure that you can access all site collections under those paths.</p> <p>Exclusions were not used in SharePoint 2010 Products. If you had any remaining from an earlier version, they do not have to be re-created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Themes                                | <p>Some themes will continue to work, others you might have to rework, depending on the extent of the customizations. Specifically:</p> <ul style="list-style-type: none"> <li>• If your theme has no custom CSS files, it should upgrade and work as expected.</li> <li>• If you have a custom master page that relies completely on custom CSS files, then you might have to reapply the master page after upgrade, or you choose a new theme in SharePoint 2013 Preview.</li> <li>• If you have a custom master page that relies on both custom CSS files and the SharePoint 2010 Products CSS, then you will</li> </ul>                                                              |

| Customization type                          | Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                             | have to choose a new theme or re-create your theme in SharePoint 2013 Preview.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Master pages and CSS files                  | Rework to accommodate the new user experience.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| JavaScript                                  | Test to determine whether any actions are required. In some cases, you might have to adjust the scripts to work with the new page model. Verify that it works in both 2010 and 2013 modes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Search provider or security trimmer         | Test to determine whether any actions are required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Web Parts                                   | <p>Test to determine whether any actions are required. You might have to adjust the Web Parts to work with strict XHTML mode.</p> <p>Test to verify that there have not been changes to any object models or Web services that you call from the Web Part.</p> <p>If a Web Part is located on a page but not in a Web Part Zone (so that it is, basically, HTML code embedded directly in a page), it will not work if you reset the page to the default template. There is a site collection health rule that will identify files in this status inside a site collection. There is a link from that rule to the page where they can reset to template.</p>                                                                                                                                                                                                                                                                                       |
| Services                                    | Test to determine whether any actions are required. Redesign or adjust code, as needed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Authentication providers                    | Test to determine whether any actions are required. Redeploy the provider with the same provider name (exactly. This includes the letter case) on a test farm and make sure that it works correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Custom search solutions that use SQL syntax | <p>Rework to use FQL syntax and KQL syntax.</p> <p>Custom search solutions in SharePoint Server 2013 Preview do not support <a href="#">SQL syntax</a>. Search in SharePoint Server 2013 Preview supports FQL syntax and KQL syntax for custom search solutions. You cannot use SQL syntax in custom search solutions using any technologies. This includes the query server object model, the client object model, and the Search REST service. Custom search solutions that use SQL syntax with the index server object model and the Query web service that were created in SharePoint Server 2010 will not work when you upgrade them to SharePoint Server 2013 Preview. Queries submitted via these applications will return an error. For more information about how to use FQL syntax and KQL syntax, see <a href="#">Keyword Query Language (KQL) syntax reference</a> and <a href="#">FAST Query Language (FQL) syntax reference</a>.</p> |

While you are reviewing customizations in your environment, you should also make sure that the environment is not using any features or elements that are deprecated. For example, Web Analytics

from SharePoint 2010 Products are not available in SharePoint 2013 Preview and you should turn them off before upgrading. Also, SQL Server Search queries are not available in SharePoint 2013 Preview. For more information, see [Changes from SharePoint 2010 to SharePoint 2013](#).

Some methods of deploying customizations might require additional steps in SharePoint 2013 Preview. The following table lists methods of deploying customizations and any issues that you might encounter.

| Deployment method                             | Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Customizations deployed as MSI files          | Contact the vendor for updated files. Most likely, you will have to get a replacement file compatible with SharePoint 2013 Preview.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Manually deployed features, files, or changes | You can re-deploy them to the equivalent directory in SharePoint 2013 Preview. However, consider packaging them into a deployable solution package for easier administration.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Sandbox solutions                             | No special steps. Sandbox solutions are upgraded with the content databases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Solution packages                             | <p>Redeploy to SharePoint 2013 Preview. Make sure that you deploy it to the appropriate directory (/14 or /15), depending on the version.</p> <p>Note that you can no longer add partial trust solution packages to the \bin directory. Any files deployed to the \bin directory must be full trust. Be sure to test any such solutions to make sure that deploying them in full trust does not introduce security vulnerabilities. Also, update any deployment scripts to make sure that they specify the correct trust level.</p> <p>For more information, see <a href="#">Install-SPSolution</a>.</p> |
| Administrator-deployed form templates         | You must extract them from SharePoint Server 2010 and redeploy them to SharePoint Server 2013 Preview. For more information, see <a href="#">Services upgrade overview for SharePoint Server 2013 Preview</a> .                                                                                                                                                                                                                                                                                                                                                                                          |

The following kinds of customizations are not supported. If you have any of these customizations in your environment, you must replace them by using a supported kind of customization before you can upgrade. Otherwise, you might experience upgrade issues that cannot be fixed:

- Predefined files, features, or site definitions that were changed.

**Warning:**

Some predefined file types — such as document icons or actions — can be carried forward in a supportable way, although this does not occur automatically. Do not copy over the old version files as that can cause other issues, instead, make the same changes to the new

---

version file Modifications to other predefined files, such as server-side ASPX pages, will be lost during upgrade if you reset to the site template or if you don't make the same changes in the new version files. Depending on the files that were changed and the extent of these changes, the upgrade experience can vary significantly.

- SharePoint databases that were changed, either by directly changing data or changing the schema. This includes adding or removing triggers, tables, views, or indexes.

If you have any of these kinds of customizations, remove them and replace them with supported customizations before you attempt to upgrade. This is a best practice for helping to make sure that not only your current upgrade will work, but any future upgrades will go more smoothly. Changing predefined files and databases will remain unsupported.

## **Ensure that future customizations follow best practices**

Ensure that your environment performs well and follows best practices. Deploy only those customizations that follow the best practices as described on the following page on MSDN:

---

# Plan for site collection upgrades in SharePoint 2013 Preview

---

When you upgrade from SharePoint 2010 Products to SharePoint 2013 Preview, site collections are not upgraded when you upgrade the content databases to a new version. The upgrade process is split to allow site collection administrators to decide when to upgrade their site collections. For a visual overview of the upgrade process, see [Overview of the upgrade process to SharePoint 2013 Preview](#).

Server farm administrators can control settings for upgrading site collections, such as settings for upgrade evaluation site collections, notifications, and upgrade throttling. This article helps you plan the settings to use to controlling the upgrade of a site collection.

## Determine the site collections that farm administrators should upgrade

By default, site collection administrators are in charge of when they upgrade their site collections, and they perform the upgrade themselves. However, under certain circumstances a farm administrator should probably perform the upgrade. For example, for sites that meet the following characteristics, the upgrade team at the farm level should perform tests before upgrade, and potentially upgrade the site collection:

- **Extremely important sites**  
If a site is very important to your business, farm administrators should carefully test it before they upgrade it, and then upgrade it themselves to make sure that the site collection is available for users as quickly as possible.
- **Very large sites**  
By default, if a site collection administrator starts to upgrade a site that is larger than 10 MB or with more than 10 subsites, the site is added to the upgrade queue, instead of being upgraded immediately. For very large site collections (larger than 10 GB), we recommend that you have a farm administrator upgrade the site collections instead of allowing the site collection administrators to start the upgrade. This way, the farm administrators can test these sites and then monitor the progress of the upgrade.
- **Highly-customized sites**  
Carefully test sites that are based on custom site definitions or that have many other customizations before you upgrade them. If there are issues with server-side customizations, then farm administrators should address them, test again, and then perform the upgrade so that they can troubleshoot any issues that occur. If there are issues with the design of a site, a designer and site collection administrator can address them.

Farm administrators can upgrade sites by using Windows PowerShell. For more information, see [Upgrade a site collection to SharePoint 2013](#).

---

## Plan settings for upgrade notifications, self-service upgrade, and site collection creation

When a site collection is available to upgrade, a status bar on a site indicates that site collection administrators can upgrade it. They can choose to upgrade the site collection then, or be reminded later.

Farm administrators can determine whether to allow site collection administrators to upgrade their sites at all. You can set a property to prevent the site collection administrators from starting to upgrade, which also turns off the notification in the status bar. Then you can perform the upgrades yourself by using Windows PowerShell. If you choose to upgrade some sites centrally, you should have a plan to decide when each site will be upgraded and who will verify the site after upgrade.

Although administrators can upgrade all site collections immediately, we do not recommend this, for the following reasons:

- You would risk that some sites would have unforeseen issues that you'd have to address. This could create or prolong an outage.
- A high volume of issues could arrive at your helpdesk or troubleshooting process when users start to work with upgraded sites at the same time.

You can control settings for site collection upgrade and site creation. You can determine the following:

- Whether the site collection administrator can upgrade the site collection.
- Which mode (2010 or 2013, or both) can be used when a user creates a site collection.

For example, you might want users to keep creating 2010 mode sites for a while, until most of site collections are upgraded, or you might want to force new sites to be created in 2013 mode so that you don't have to upgrade them later.

### Properties that control site collection upgrade and site creation

| Property                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPSite.AllowSelfServiceUpgrade      | Determines whether an upgrade notification can be set for a site collection.<br>Default is true - notifications are set automatically.<br>If set to false, the upgrade notification will not appear on the status bar.                                                                                                                                                                                                                       |
| SPWebApplication.CompatibilityRange | Determines in which modes a site collection can be created. For example, 2010 mode (14) or 2013 mode (15). The following ranges are available: <ul style="list-style-type: none"><li>• <b>OldVersions</b> Use this range to enable users to create only 2010 mode sites.</li><li>• <b>NewVersion</b> Use this range to enable users to create only 2013 mode sites.</li><li>• <b>AllVersions</b> Use this range to enable users to</li></ul> |

| Property | Description                                                                                                                                                                                                  |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | <p>create either 2010 or 2013 mode sites.</p> <p>You can use these ranges or set your range by using the <b>New-Object</b> command to set the <b>Microsoft.Sharepoint.SPCompatibilityRange</b> property.</p> |

For more information about how to set these properties, see [Manage site collection upgrades to SharePoint 2013 Preview](#).

You can also control settings upgrade notifications. You can determine the following:

- Whether to add a link to more information from the **Upgrading now** status bar.
- How many days to wait before reminding a site collection administrator about upgrade if they choose **Remind me later** on the status bar.

If a user clicks **Remind me later**, the current date is added to the number that is set for the UpgradeReminderDelay and the notification is hidden until that new date occurs. For example, if the setting is 30, then the notification will appear 30 days from the current date.

The following properties control site collection upgrade notifications:

## Properties that control upgrade notifications

| Property                                | Description                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPWebApplication.UpgradeMaintenanceLink | <p>Adds another link to the <b>upgrading now</b> status message so that users can follow it, and find more information.</p> <p>Default is empty.</p>                                                                                                                                                           |
| SPWebApplication.UpgradeReminderDelay   | <p>Sets the number of days to suspend the upgrade notification in the status bar after a user clicks <b>Remind me later</b>.</p> <p>Default is 30 days.</p> <p>If set to 0, then the upgrade notification is not removed from the status bar and the notification cannot be set to <b>Remind me later</b>.</p> |

For more information about how to set these properties, see [Manage site collection upgrades to SharePoint 2013 Preview](#).

---

## Plan for upgrade evaluation sites

Site collection administrators can request a preview of their site collection. This preview site is called an *upgrade evaluation site collection*. An upgrade evaluation site collection enables site collection administrators to see their site's content in a new, separate copy of the site that is running on the SharePoint 2013 Preview. Unlike visual upgrade in SharePoint Server 2010, the upgrade evaluation site collection is a complete copy of the site collection. It is separate from the original and has its own URL. Actions that the site collection administrators perform in the upgrade evaluation site collection do not affect the original site. Both the original site and the upgrade evaluation site are available for search, and timer jobs that run for all site collections also run on the upgrade evaluation sites.

When a site collection administrator requests an evaluation site collection, the request is added to a timer job (known as "Create Upgrade Evaluation Site Collections") which runs one time per day. This timer job creates a full copy of the site collection at a unique URL. Upgrade evaluation site collections are set to expire automatically and be deleted. The default time for expiration is 30 days, which can be configured by setting a value for the web application or by changing a value on the evaluation site collection itself.

Farm administrators can choose to prevent users from creating upgrade evaluation sites by setting the **SPSite.AllowSelfServiceUpgradeEvaluation** property for a site collection.

Timer jobs create and delete upgrade evaluation sites. The following timer jobs are used:

### Timer jobs for upgrade evaluation site collections

| Job name                                                                   | Description                                                                                            | When run                             |
|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|--------------------------------------|
| Create Upgrade Evaluation Site Collections (job-create-upgrade-eval-sites) | Creates upgrade evaluation sites.                                                                      | Runs daily, between 1:00 and 1:30 AM |
| Delete Upgrade Evaluation Site (job-delete-upgrade-eval-sites)             | Deletes expired upgrade evaluation sites and sends notifications for sites near their expiration date. | Runs daily, between 1:00 and 1:30 AM |
| Upgrade site collections (job-upgrade-sites)                               | Upgrades site collections in the queue for a content database.                                         | Runs every 1 minute                  |

You can decide when and how often these timer jobs run, and you can also run them manually.

### How the upgrade evaluation site collections are created

The Create Upgrade Evaluation Site Collections job timer collects the list of site collections that were queued for evaluation sites, and then copies the sites to new URLs and Site IDs. It also adds the sites to the upgrade queue so that they will be picked up by the Upgrade Site Collections timer job later. To create the copy of the site:

1. If you have an Enterprise version of SQL Server, the Create Upgrade Evaluation Site Collections job timer takes a snapshot of the database and reads the data from the snapshot to a destination

database (with the source database being the default target). This doesn't affect the read-only status of the source site throughout the whole process.

2. For other versions of SQL Server that do not have snapshot capabilities, the Create Upgrade Evaluation Site Collections job timer backs up a site collection and restores it to a new URL. This makes the source site read-only for the whole duration of the process.

The Upgrade Site Collections job collects the list of site collections that were queued for upgrade and then upgrades the queued sites from oldest to newest. The recently added evaluation site is then upgraded (or at least upgrade is tried).

## Plan site collection upgrade throttling and queues

To make sure that site collection upgrades do not cause an outage on your farm, there are throttles built in at the web application, database, and content level. This means that even if 100 site collection administrators decide to upgrade their site collections at the same time, only some are run at the same time, and the rest are put into a queue to run later.

Site collection upgrades are throttled:

### Throttle levels for site collection upgrade

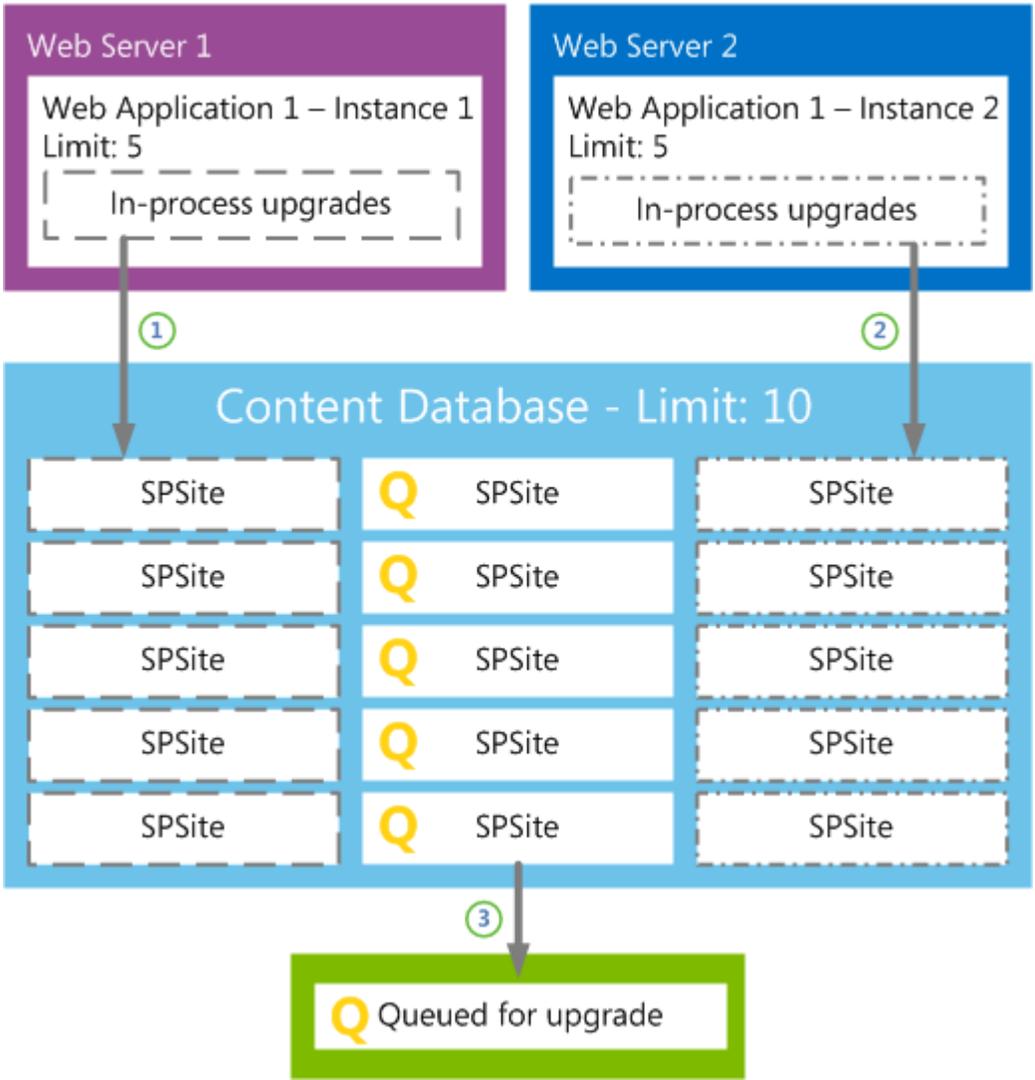

| Level                                                     | Maximum number of site collections that can be upgraded at a time                                                                                                                               | Property that controls the throttle setting                                                          |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| Web application                                           | Default is 5 per web application instance. Additional requests are queued.                                                                                                                      | SPWebApplication.SiteUpgradeThrottleSettings<br><b>AppPoolConcurrentUpgradeSessionLimit</b>          |
| Content database                                          | Default is 10 per content database. Additional requests are queued.                                                                                                                             | SPContentDatabase.ConcurrentSiteUpgradeSessionLimit                                                  |
| Content of a site collection (size and number of subwebs) | Default is that a site that is more than 10 MB, or has more than 10 subwebs, cannot be upgraded in a self-service manner by the site collection administrator, but must be upgraded by the farm | SPWebApplication.SiteUpgradeThrottleSettings<br><b>UsageStorageLimit</b> and <b>SubwebCountLimit</b> |

| Level | Maximum number of site collections that can be upgraded at a time | Property that controls the throttle setting |
|-------|-------------------------------------------------------------------|---------------------------------------------|
|       | administrator.                                                    |                                             |

The following illustration shows the relationship between the web application and content database upgrade throttle limits.

**Upgrade throttles and the site upgrade queue for web applications and content databases**

Web application and content database limits

In this illustration, the content database contains fifteen sites, and all sites were requested to start upgrade.

- 
1. Because of the web application throttle limit, only five sites can start to upgrade for web application 1 - instance 1 on Web server 1.
  2. An additional five sites start to upgrade on web application 1 - instance 2 on Web server 2.
  3. Because of the content database throttle, five sites are sent to the upgrade queue to wait their turn.

You can use the default throttling settings, or you can specify your own values for how many site collections can be upgraded at the same time. Farm administrators can also override throttle settings when they upgrade a site by using Windows PowerShell. Exercise caution when you change these values and make sure that you verify the settings that you want to use in a test environment before you implement them in production. If you increase throttling too much, you could create performance problems in your environment. For example, too many parallel upgrades could affect site rendering. For information about how to change these settings, see [Manage site collection upgrades to SharePoint 2013 Preview](#).

## About site collection modes

In order to make it possible to upgrade site collections separately from upgrading content databases, SharePoint 2013 Preview introduces the concept of site collection "modes" (also known as *compatibility levels*). Site collections are in 2010 mode in the new environment until they are specifically upgraded to 2013 mode. You can create new site collections in either mode. Although farm administrators can configure this setting, the default setting is to create sites in 2010 mode). When a site collection is in 2010 mode, the user interface resembles the SharePoint 2010 Products interface, and only features that were available in SharePoint 2010 Products are enabled. In 2013 mode, the interface and features are updated to SharePoint 2013 Preview.

You have to make sure that the solution packages, features, and other custom components are available for both site modes. For more information, see [Create plan for current customizations during upgrade to SharePoint 2013 Preview](#).

## Train site collection administrators

It is important to train users about how to upgrade their site collections and how to review their sites in an upgrade evaluation site collection. Educated users are prepared and know what to expect, which will minimize helpdesk support and frustrations.

Inform users about changes and new features. Also, let them know about possible issues that they can expect. For instance, they might have issues with customizations, such as pages that do not display correctly. For information about general upgrade issues, see [Review site collections upgraded to SharePoint 2013 Preview](#) and [Troubleshoot site collection upgrade issues in SharePoint 2013 Preview](#).

Explain to site collection administrators that their upgrade evaluation sites are copies, and any changes they make there will not persist in their upgraded sites. There is also a notification bar in the preview site that indicates that it is a copy.

By default, site collection administrators control upgrade for their sites. They can use upgrade evaluation site collections to preview the new user interface and features. This gives them time to make sure that everything works correctly, and they can address any issues in their original site before upgrading it. When site collection administrators are ready, they can upgrade their sites.

---

We recommend that you have a plan and set a time limit for how long to allow site collection administrators to postpone upgrade of their sites. For example, each site collection administrator may be given 90 days to work with his or her site collection administrators to evaluate and then upgrade their sites. This time limit makes sure that users are given a reasonable time to become familiar with the new user interface and to resolve any issues in their sites. Ensure that you communicate the time limit to the users, and that they know that you can force through an upgrade of all sites. Also, you can use a Windows PowerShell command to check the compatibility level for sites in a content database so that you can see how many sites are in 2010 mode and how many are in 2013 mode. For more information, see [Manage site collection upgrades to SharePoint 2013 Preview](#).

It is important to tell site collection administrators that as long as sites use the 2010 mode, new features will not be available. However, as soon as sites are upgraded to the new version, application features automatically appear.

---

# Plan for performance during upgrade to SharePoint 2013 Preview

---

An important part of planning an upgrade from SharePoint 2010 Products to SharePoint 2013 Preview is determining how long the upgrade process will take and how much storage space will be required. Every environment is unique and includes different hardware capabilities and different database and site characteristics. The space and the length of time required to run an upgrade will vary greatly depending on your environment. The best way to estimate these factors is to perform one or more trial upgrades, and then review the space and time that it took. For more information about how to perform a trial upgrade, see [Use a trial upgrade to SharePoint 2013 Preview to find potential issues](#).

## About upgrade performance for SharePoint 2013 Preview

One of the main reasons that database upgrade and site collection upgrade are now separate actions for SharePoint 2013 Preview is to give you more control over upgrade performance.

- **How upgrade works for SharePoint 2010 Products**

During an upgrade to SharePoint 2010 Products, when the database was upgraded, all of the site collections in that database were also upgraded. That meant that for certain steps, such as activating features or updating the Quick Launch control, the upgrade process needed to perform the step repeatedly for each site collection in a database before the database upgrade was completed.

**Upgrade process for SharePoint 2010 Products**

SHAREPOINT 2010 PRODUCTS

- **How upgrade works for SharePoint 2013 Preview**

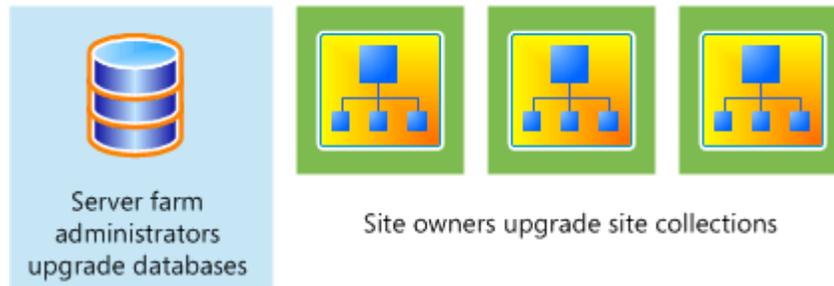

When you upgrade to SharePoint 2013 Preview, the database upgrade no longer starts these site-specific steps. Therefore, the database upgrade stage is much faster. Some tests have found that a database can be upgraded to SharePoint 2013 Preview in two-thirds of the time that it took to upgrade the same data to SharePoint 2010 Products. These site-specific steps must still be performed. However, they are performed only when the site collection is upgraded, and then only

---

for that site. Because each site collection is upgraded independently, you can manage the performance effect of those upgrades on your environment.

### Upgrade process for SharePoint 2013 Products

#### SHAREPOINT 2013 PRODUCTS

For SharePoint 2013 Preview, you can control the performance effect of site collection upgrades by controlling how many sites can be upgraded at a time. There is a site collection upgrade queue that maintains a list of site collections currently requested to be upgraded. And there are throttles on the content database and web application levels to control how many site collection upgrades can occur at a time. For more information about these controls, see [Plan for site collection upgrades in SharePoint 2013 Preview](#) and [Manage site collection upgrades to SharePoint 2013 Preview](#).

In addition to planning for performance during upgrade, you must also plan for the performance of your production environment after upgrade. Test your planned environment to make sure that you can support your environment by using the hardware that you have planned.

## Estimate the space that you must have for the upgrade

As the databases are upgraded, they expand temporarily. Also, many transactions occur while the upgrade process runs. Therefore, you must make sure that the log files have room to expand to accommodate the changes that are occurring. Therefore, you have to plan for growth in both the databases and the log files.

### Database growth

Because of the changes in table structures in the new version, the databases grow temporarily while the data is reorganized. This space can be recovered after upgrade, but you should make sure that there is room for the databases to grow up to 50 percent larger than their current sizes during upgrade (be aware that after upgrade, you can reduce the database again to recover much of this space).

You should also make sure that there is room on your database servers for your databases to grow over time with typical use. To check how large your databases currently are, use Enterprise Manager in SQL Server.

---

## Transaction log growth

In addition to database space, you must also have room for the transaction log files for the databases. These log files must grow quickly to accommodate the number of changes occurring in the databases. In very large environments, there is a possibility that the default growth rate for the transaction log files (10 percent) is not enough to keep up with the upgrade process. This can cause a time-out. Again, a trial upgrade is the best way to determine whether the transaction log files can keep up with the upgrade process. If your environment is very large, or if the process timed out during a trial upgrade, consider expanding the SQL Server transaction log files beforehand to make sure that you have room for the number of transactions that must be processed. For more information about how to expand the SQL Server transaction logs, see [Expanding a Database \(SQL Server 2008 R2\)](#).

## Estimate how long the upgrade will take

With your disk space estimates in hand, and some testing done, you can now calculate a rough estimate of how long the actual upgrade process will take. Upgrade times vary widely among environments. The performance for an upgrade depends greatly on the hardware being used, the complexity of the sites, and the particular characteristics of your implementation. For example, if you have many large document libraries, these may take longer to upgrade than a simpler site.

Factors that influence performance for upgrade are described in the following list.

- **Environment factors** The following factors can affect the performance for both database and site collection upgrade:
  - Simultaneous upgrades
  - SQL Server disk input/output per second
  - SQL Server database to disk layout
  - SQL Server temporary database optimizations
  - SQL Server CPU and memory characteristics
  - Web server CPU and memory characteristics
  - Network bandwidth and latency
- **Database factors** The following factors can affect the performance of database upgrade. The number of:
  - Site collections
  - Subwebs
  - Lists
  - Rowspan within lists
  - Document versions (number and size)
  - Documents
  - LinksPlus the overall database size itself.
- **Site collection factors** The following factors can affect the performance of site collection upgrade. The number of:

- 
- Subwebs
  - Lists
  - Activated upgrading features
  - Document versions (number and size)
  - Documents
  - Links

How your data is structured can affect how long it takes to upgrade it. For example, 10,000 lists with 10 items each will have a longer upgrade time than 10 lists with 10,000 items. The actions required to upgrade the list infrastructure must be performed for each list, regardless of the number of items. Therefore, more lists equals more actions. The same goes for most of the items under database factors or site collection factors.

The structure of your hardware can also have a big effect on performance. Generally, the database server performance is more important than web server performance, but underpowered hardware or connectivity issues at either tier can significantly affect upgrade performance. Web servers have a significant part to play in database upgrade performance, mainly by issuing the commands to make data and structural changes in the databases. The database servers have to process those changes and work with a large set of data for every command. Web server performance becomes a bigger issue during site collection upgrade, when the upgrade process iterates several actions for each site collection (which might occur for multiple site collections at a time). Site collection upgrade also affects the database server as each action must occur in SQL Server.

The best way to estimate overall time is to do a trial upgrade of the data, and then review the upgrade log files. The log files contain the duration for an upgrade — look for Total Elapsed Time at the bottom of the upgrade log file. Use this time to estimate the duration for your full set of content. You can also use the log files to check your progress during the upgrade process. The upgrade.log file is located at %COMMONPROGRAMFILES%\Microsoft Shared\web server extensions\15\LOGS.

To determine durations from the logs, examine:

- The times spent in each upgrade sequence per log.
- The times spent per upgrade action instance per log.
- The minimum, maximum, and average times.

Make sure that you separate out the database upgrade times from time that is spent upgrading site collections for accurate planning. Perform multiple trial upgrades to guarantee more accurate data. Then collate the data from multiple tests to determine likely performance per sequence, action, and database. You can use the **Get-SPUpgradeActions** cmdlet in Windows PowerShell to see how many actions occur for the farm. For more information, see [Get-SPUpgradeActions](#).

The estimate you arrive at based on your trial upgrade is for the actual upgrade process for the data. It does not include all of the steps that you have to perform before and after this step, which can take more time than the upgrade of the data itself. When estimating how long the upgrade will take, in addition to the time that is required for data to be processed, you must also estimate how long the activities during the upgrade phases will take.

Consider the following factors:

- 
- **Creating custom elements** Upgrading Web Parts or re-doing custom templates to take advantage of new features will take some time. The process of creating custom elements should begin early, during the evaluation phase of your project.
  - **Backing up the databases** You must perform a full backup — not a differential backup — of your databases for a database-attach upgrade. For large environments, this step can take significant time. In particular, if you are backing up to a network location, network latency issues can slow this process down.
  - **Creating service applications and configuring services** Creating service applications and configuring services does not take long. However, if you must contact a database administrator to create the databases for you before you create service applications, you might need a day or two of lead time.
  - **Running a search crawl on all content** For large sites, this step can take more than 24 hours. Unless you run a crawl, searches cannot return results because the index is not upgraded.
  - **Verifying the environment after upgrade** For large environments, it can take a while to verify the environment and check the site collections to make sure that they are in a good state before you allow users access to them. For more information, see [Verify database upgrades in SharePoint 2013 Preview](#).

For site collection upgrade, consider the following factors:

- **Verifying sites and making changes** Allow enough time for users to validate their sites after the upgrade. This may take several days. For more information, see [Review site collections upgraded to SharePoint 2013 Preview](#).

Additional factors in your environment can also contribute to longer upgrade times. They include the following:

- **Very large document libraries** A document library with more than 250,000 documents all in the root of the document library (instead of in folders) will take a long time to upgrade, and the upgrade might not be successful. Following the guidelines for using folders to break up large document libraries can help you manage the library size. For example, if you rearrange the same document library so that the 250,000 documents are divided into 125 folders, it should upgrade more easily.
- **Very large databases** Databases larger than 100 GB can take a long time to upgrade. If you have content databases that are larger than 100 GB and include mixed site types (such as My Sites and team sites together with published sites), we recommend that you divide them up into smaller databases that contain a consistent type of data before you run the upgrade.

 **Note:**

My Sites are available only with SharePoint Server, not SharePoint Foundation.

You can use the **Move-SPSiteWindows** PowerShell cmdlet to move sites between databases. For more information, see [Move-SPSite](#).

Be sure that you are following the capacity planning guidelines from the previous and new versions before you attempt the upgrade. If you have exceeded the guidelines for best performance, the upgrade process might take longer, or it might fail (for example, the process might time out repeatedly on the same large document library). If your deployment does not meet the

---

recommended capacity guidelines, consider whether you have to do some work to meet those guidelines before you try the upgrade. Again, a trial upgrade can help you with that decision.

- **Wide lists (lists with many columns)**

Wide lists are lists with more columns than fit in a single rowspan in the content database. These lists can take longer to process during upgrade, or might not upgrade. For more information, see [Clean up an environment before an upgrade to SharePoint 2013 Preview](#).

- **Sites with many subwebs**

Site collections that contain hundreds or thousands of subwebs will take much longer to process during site collection upgrade. For example, a site collection with thousands of subwebs might take many hours instead of many minutes, or longer, to upgrade.

- **Communications requirements**

You have to notify the users and your team of the upgrade schedule, and give them time to do their tasks. For more information, see [Create a communication plan for the upgrade to SharePoint 2013 Preview](#).

- **Managing system center alerts and alarms**

You have to monitor system performance during upgrade, but you will not have to monitor specific features. Pause any unnecessary alarms and alerts from Microsoft Systems Center Operations Manager or Microsoft Operations Manager, and then turn them on again after upgrade.

- **Turning SQL Server mirroring and log shipping (or AlwaysOn Availability Groups) on/off**

You should turn off mirroring and log shipping before you upgrade, and then turn them on again after you are sure that your environment is running correctly after the upgrade. We recommend that you do not run mirroring or log shipping during upgrade, because this creates additional load on the servers that are running SQL Server and also wastes resources mirroring or shipping temporary data.

This also applies to AlwaysOn Availability Groups in SQL Server 2012.

Test the upgrade process to discover how long it may take, then create a schedule for the upgrade operations and test that to determine your timeline. You should include the time that that is required to do the pre-upgrade and post-upgrade steps in your operations timeline: If it takes 5 hours to back up your databases, you must include that time in your timeline. Also include buffer time in case you have to restore or recover — you should determine both your planned outage (realistic case) and your emergency outage (worst case) timelines.

## Environment performance after upgrade

After you complete an upgrade, the environment will likely experience some lag in performance as it works through the changes. Make sure that you confirm the actual performance against your expected performance after upgrade to make sure that your new farm is performing within acceptable bounds. Check SQL Server responsiveness: is the disk queue length too long? Are CPU and memory usage too high? Also look for web and application server responsiveness: is the number of requests per second (RPS) acceptable? What about page load time (initial and secondary page requests). Review your overall environment performance and make adjustments as needed.

---

# Create a communication plan for the upgrade to SharePoint 2013 Preview

---

It is important that you communicate with users during the upgrade process from SharePoint 2010 Products to SharePoint 2013 Preview. Site users have to know what to expect when they visit their sites again after you have upgraded the environment. Site owners have to know how they can help prepare for upgrade and what they have to do to upgrade their site collections in SharePoint 2013 Preview and My Sites in SharePoint Server 2013 Preview. Both site users and site owners have to know when the upgrade will occur. As part of the planning process, determine the following:

- Who are the members of the upgrade team, what other stakeholders are involved, and who will be affected by the upgrade?
- What information must the upgrade team have, and when?
- What information must site users and other stakeholders have, and when?

This article describes how to create a communication plan so that the upgrade team, stakeholders, and users know what to expect before, during, and after the upgrade.

## Who is a member of the upgrade team?

For small deployments in which sites were not customized extensively, the upgrade team might consist of only one person. For larger deployments, on the other hand, several people with different roles can be required, as described in the following list:

- **Server administrators** Server administrators perform most of the upgrade tasks. There must be at least one server administrator on the upgrade team because running the Setup wizard requires someone who is a member of the Administrators group on each front-end web server.

 **Note:**

Farm administrators might not be local administrators for the server.

- **Database administrators** If you have a separate database administration team, you must coordinate with them to schedule the upgrade and perform the upgrade.
- **Server security teams** You must coordinate with your security teams, such as the Active Directory Domain Services (AD DS) team, to verify accounts and permissions or to take advantage of the new policy settings that you can apply for SharePoint 2013 Preview.
- **Network teams** You must coordinate with the network teams, especially if you must switch DNS to point to your new farm, or add the new servers to the network infrastructure.
- **Client deployment team** Communicate with client deployment teams to coordinate deployments of new client and server applications. Client deployment might have to occur before you upgrade, or it might be an option for users after their sites are upgraded.

- 
- **Services administrators** You must communicate with the administrators for service applications, such as the Business Data Connectivity service, to make sure that they are ready for the upgrade and they can review or reconfigure the appropriate settings in the new version.
  - **IT or application Helpdesk leadership and personnel** If you have a helpdesk for your company, make sure that they know about the timing for the upgrade and are prepared for questions after upgrade. Helpdesk should be a key stakeholder for planning and testing so that they can be understand the potential changes from an upgrade and the effect that it will have on users.
  - **Site collection owners** You must notify site collection owners when the upgrade process is about to occur. Warn them about any issues that you find when you run the pre-upgrade checker or when you upgrade their sites. You must also communicate with site collection owners about their role in upgrade. Site collection owners can upgrade their own sites in SharePoint 2013 Preview. Site collection owners can run health checks and review upgrade evaluation sites before they upgrade their sites.
  - **Site designers and developers and third-party solution providers** If you have custom templates, Web Parts, Web services, or other custom elements that are associated with your sites, you must work with the associated site designers and developers or third-party solution providers. Because custom elements can fail or perform differently in an upgraded environment, you have to make sure that designers or developers can create new versions of these custom elements or verify that these elements were upgraded correctly. Because their work can have a big influence on the upgrade schedule, work with these stakeholders early in the process. For more information about potential issues with custom elements, see [Use a trial upgrade to SharePoint 2013 Preview to find potential issues](#).
  - **Site users** Although you do not have to include site users in making decisions about the upgrade process, you must tell site users when it will occur and what they should expect.
  - **Sponsors and other stakeholders** Other people in your organization might be involved in the upgrade planning process. Make sure that you include them in your communication plan appropriately.

 **Note:**

An upgrade team can include one or more members in each role, depending on your organization.

## When and what to communicate to the upgrade team

In general, the server administrators and service application administrators set the timeline for upgrade, and site owners are notified only when the process is about to begin. However, because team members have their own tasks to perform at particular points in the overall upgrade process, it is very important that you have a solid plan to communicate the progress of the upgrade to all team members so that everyone knows when it is time to perform their particular tasks.

The whole upgrade team must work together to determine the dates and times to perform the upgrade. We recommend that you choose an upgrade window to occur when site usage is lowest. For small single-server deployments, upgrade may be completed in less than a day. Larger deployments can take more time, up to a weekend. There is no way to determine the precise length of time that will be

---

required to upgrade any particular site collection. Because of this, it is very important to communicate with other team members involved in the upgrade process in addition to users. The day or days that you choose for upgrading should be far enough in the future that the upgrade team has enough time to complete all of the preliminary steps. When you plan the timeline, make sure that you schedule time to validate the upgraded sites and time to implement any changes or do any work to re-brand sites.

It is important to communicate with site owners, designers, and developers at the following points during the upgrade process:

- Before the trial upgrade so that they know the general timeline and their roles in the process.
- After you perform a trial upgrade to find issues. For example, issues such as customized site templates or custom Web Parts should be reported to the appropriate site owner, designer, or developer before you schedule the upgrade, to give them time to investigate the issues and take preliminary steps. Or a developer might decide that it would be prudent to rebuild a Web Part before the upgrade occurs. And site owners might want to note any customizations that were done to their sites, such as site templates and changes to core Active Server Page Extension (ASPX) files.
- After the environment is upgraded so that they can review the sites and make any changes that are needed.
- When you are ready for them to upgrade their site collections.

## When and what to communicate to site users

It is equally important to communicate with the users of the sites to tell them about the following issues:

- **When the environment will be upgraded** In particular, you must also inform them if their sites will be unavailable during the upgrade.
- **When their sites will be upgraded** Site collection owners should communicate to their site users about the timeline for upgrading the site collection. If you, as a server farm administrator, are upgrading a site, you should communicate when that will occur.
- **How the upgrade might affect them and what they should know about the new environment** For example, the site will look different and function slightly differently in the new user interface. You can also point them to available content, such as What's New articles or training materials, to learn about the new version.
- **How to obtain help** If they find an issue with their site after upgrade, how can they obtain help in addressing it?

You can use the new system status bar in the site collections to notify users of these items. For more information about how to set notifications for the status bar, see [Plan settings for upgrade notifications, self-service upgrade, and site collection creation](#) in the article [Plan for site collection upgrades in SharePoint 2013 Preview](#).

---

# Clean up an environment before an upgrade to SharePoint 2013 Preview

---

Before you start to upgrade from SharePoint 2010 Products to SharePoint 2013 Preview, you should make sure that your environment is functioning in a healthy state and that you clean up any content that you do not have to upgrade. You can also take the time to remove or rearrange content so that you will have the structure that you want after you perform the upgrade.

## Items to clean up

Many of these items can be removed or repaired by using Stsadm command-line tool or Windows PowerShell cmdlets.

### Important:

To use the Stsadm command-line tool, you must be a member of the Administrators group on the local computer.

To use Windows PowerShell cmdlets in the SharePoint 2013 Management Shell, you must have the following memberships:

- **securityadmin** fixed server role on the SQL Server instance.
- **db\_owner** fixed database role on all databases that are to be updated.
- Administrators group on the server on which you are running the Windows PowerShell cmdlets.

## Delete unused or underused site collections and subwebs

You do not want to upgrade content that you do not have to keep. If it was unused for a long time and is not needed in the future, back it up, and then delete it to free storage and administrative resources, improve upgrade performance, and reduce upgrade risk. Be sure to communicate with site owners or organizational contacts regarding the site status — you want to make sure that the site is not needed before you delete it (for example, you do not want to delete sites that are required for compliance, such as emergency procedures, even though they may not be frequently updated).

For more information about how to delete site collections and subwebs, see the following articles:

- [Remove-SPSite](#)
- [Remove-SPWeb](#)

## Address large lists (lists with lots of data)

By default, large list query throttling is turned on in SharePoint 2010 Products. This behavior has not changed in SharePoint 2013 Preview. If a list is very large, and users use a view or perform a query that exceeds the limit or throttling threshold, the view or query will not be permitted. If you are upgrading content from the server products in the Office 2007 release, check any large lists and have the site owner or list owner address the issue. For example, they can create indexed columns with filtered

---

views, organize items into folders, set an item limit on the page for a large view, or use an external list. For more information about large list throttling and how to address issues with large lists, see [Manage lists and libraries with many items](#) on Office Online.

## Address wide lists (lists with too many columns)

Wide lists are lists with more columns than fit in a single rowspan in the content database. During upgrade, the database is changed to a sparse table structure, and a very wide list can cause upgrade to fail. Use the **Test-SPContentDatabase** command in Windows PowerShell to look for wide lists in the content databases and then remove extra columns before you upgrade.

## Address many site collections in a content database

If you have 5,000 or more site collections in a database, consider breaking them out into multiple databases. In SharePoint 2010 Products, there was a default warning at 9,000 site collections and a hard limit at 15,000 site collections. In SharePoint 2013 Preview, these values change to 2,000 site collections for the warning and 5,000 site collections for the limit. To avoid errors during upgrade or broken sites after upgrade, we recommend that you move some site collections into separate databases. If you have multiple content databases, you can also speed up an upgrade process by upgrading multiple databases in parallel.

## Remove extraneous document versions

Large numbers of document versions can slow down an upgrade significantly. If you do not have to keep multiple versions, you can have users delete them manually or use the object model to find and remove them. For more information about how to programmatically remove extraneous versions, see [Versions Web Service](#) on MSDN.

## Remove unused templates, features, and Web Parts

First, verify that no sites are using the template, feature, or Web Part. You can use the **Stsadm -o EnumAllWebs** operation with the **-includefeatures** and **-includewebparts** parameters to identify these customizations in your environment. This operation identifies Web Parts, features, event handlers, and setup files that are being used in your environment. The **EnumAllWebs** command also specifies which files are used by which sites. Changes were made to the **EnumAllWebs** command in the February 2011 Cumulative update to make it return both site collection and web-level features. For more information, and to get the cumulative update, see [Description of the SharePoint Foundation 2010 cumulative update package \(SharePoint Foundation server-package\): March 3, 2011](#).

You can remove a feature during site collection upgrade. Simple features can also be removed by deprecating them in the template. You can use feature upgrade to remove more complex features. For more information, see [Upgrading Features](#) and [Feature Upgrade Overview](#) on MSDN.

For more information about how to identify customizations in your environment, see [Use a trial upgrade to SharePoint 2013 Preview to find potential issues](#). If customizations are not being used, delete them. For more information about how to manage these kinds of customizations, see [Features and Templates](#) and [Solutions and Web Part Packages](#) on MSDN.

---

## Remove PowerPoint Broadcast sites

These sites and site templates are not available in SharePoint 2013 Preview because the Office Web Apps Server Preview are now installed separately from the SharePoint 2013 Preview environment. Sites based on these templates will not work in SharePoint 2013 Preview. Remove these types of sites before you upgrade.

You can use the **Get-SPSiteWindows** PowerShell command together with the following options to find these sites:

```
Get-SPSite | Where-Object{$_ .RootWeb.Template -eq "PowerPointBroadcast#0"}
```

This will return all sites that use that template.

You can also use the **Get-SPSite** and **Remove-SPSiteWindows** PowerShell commands together with the following options to remove these sites:

```
Get-SPSite | Where-Object{$_ .RootWeb.Template -eq "PowerPointBroadcast#0"} | Remove-SPSite
```

Be sure to back up these sites before you remove them. For more information, see [Get-SPSite](#) and [Remove-SPSite](#).

## Finish Visual Upgrades in SharePoint 2010 Products

During an upgrade from the server products in the Office 2007 release to SharePoint 2010 Products, you could allow site owners to use Visual Upgrade to keep sites in the old experience on the upgraded environment. When you upgrade to SharePoint 2013 Preview, all sites that are still in the old experience in SharePoint 2010 Products are automatically upgraded to the 2010 experience. If you want the opportunity to address any issues and review the sites before they are switched to the new experience, upgrade them to the new experience in your SharePoint 2010 Products environment and review them before you upgrade them to SharePoint 2013 Preview. We recommend that you finish visual upgrades before you upgrade to SharePoint 2013 Preview. Finishing visual upgrades before you upgrade provides the following benefits:

- You can address issues while you still have the server products in the Office 2007 release components available.
- You can have users be involved in reviewing and fixing issues in their sites.
- You can roll back to the old experience temporarily if it is necessary. You cannot roll back when you are in the SharePoint 2013 Preview experience.
- You avoid adding potential errors to the upgrade process. The fewer operations occurring during upgrade, the better. Trying to troubleshoot errors is more difficult when you have more processes involved. And users might think that upgrade has caused an issue when it's really the experience changing to the new version. If you have an issue with how the site interface is displaying, how will you know whether it is an old issue from the site that was forced through visual upgrade, a problem with the 2010 mode in SharePoint 2013 Preview, or a problem with a new CSS file?

To check for sites in the old experience, on the SharePoint 2010 Products environment, you can use the **Get-SPSite** Windows PowerShell command.

### To check for and upgrade sites still in the old experience in the SharePoint 2010 Products environment by using Windows PowerShell

1. Verify that you have the following memberships:

- 
- **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2010 Products**.
4. Click **SharePoint 2010 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command to return all site collections that are in or have subwebs in the old experience:  

```
Get-SPSite | ForEach-Object{$_ .GetVisualReport() }
```
6. At the Windows PowerShell command prompt, type the following command to upgrade those sites to the new experience:  

```
Get-SPSite | ForEach-Object{$_ .VisualUpgradeWebs() }
```

For more information, see [Get-SPSite](#) and [Manage visual upgrade \(SharePoint Server 2010\)](#).

## Repair data issues

Make sure that you repair all issues in your databases or site content before you upgrade. In particular, check the following items:

- **Check databases for corrupted data**

Clean up your databases to remove any orphaned sites or other corrupted data, such as a corrupted list. Consider defragmenting if you have removed sites or subsites from the database. For more information, see:

- [Databaserepair: Stsadm operation](#)
- [Forcedeletelist: Stsadm operation](#)

- **Check databases for duplicate or orphaned site collections**

Make sure that site collections exist in only one content database. Occasionally, site collections can leave behind duplicate or orphaned references in old content databases if they are moved to new databases, or if a copy of a database was attached to the farm, or if there was an error when a site collection was provisioned. If a site collection is referenced in more than one content database or there is more than one instance of the site collection in a content database, it can cause issues when you upgrade by using the database attach upgrade method. If you upgrade a duplicate version of the site collection first, the site map in your configuration database might end up pointing to that version of the site instead of the current version.

Before you upgrade, use the **Enumallwebs** operation in stsadm command-line tool to discover which sites are in which content databases and compare the results. Also, examine each site

---

collection in the results and check whether it is listed as missing in the site map. Being listed as missing indicates that it is an orphaned site. For more information, see [Enumallwebs: Stsadm operation](#). If you find duplicate or orphaned sites, you can use the **Remove-SPSite** cmdlet in Windows PowerShell to remove the duplicate or orphaned sites from the database.

For more information, see [Remove-SPSite](#).

- **Check variations**

In publishing environments, check for any variations that must be fixed. For more information, see [Variationsfixuptool: Stsadm operation](#).

## Making structural changes

To make structural changes to your environment, such as moving site collections or changing how your databases are allocated, you can use the following methods:

- **Move-SPSite** Use this to move site collections between databases. If a database is very large or contains lots of site collections, you can move sites to address this to make upgrade more efficient. Also, you can move all collaboration sites into one database and all My Sites into another to make the upgrade administration easier for those different sets of sites. You can also use this operation to divide large databases if they contain multiple site collections. This can also help increase upgrade efficiency.

For more information, see [Move-SPSite](#).

- **Export-SPWeb and Import-SPWeb** Use this method to move subwebs or site collections inside a farm or between farms. For more information, see [Export-SPWeb](#) and [Import-SPWeb](#).

[Use a trial upgrade to SharePoint 2013 Preview to find potential issues](#)

---

# Test and troubleshoot an upgrade to SharePoint 2013 Preview

---

Before you upgrade from SharePoint 2010 to SharePoint 2013 Preview, you should take time to test an upgrade process and understand the issues that you might face in an actual upgrade. After you perform a test upgrade, or after you upgrade your actual databases, you might find issues that have to be addressed. After you address issues, you can restart the upgrade to try again.

The following downloadable resources, articles on TechNet, video recordings, and related resources provide information about how to test and troubleshoot upgrade.

## Downloadable resources about how to test and troubleshoot upgrade

Download the following content for information about how to test and troubleshoot upgrade.

|                                                                                    | Content                                                                            | Description                                                                             |

# Use a trial upgrade to SharePoint 2013 Preview to find potential issues

---

Before you start an upgrade from SharePoint 2010 Products to SharePoint 2013 Preview, you should test the upgrade process to make sure that you know exactly what you have to do to have a successful upgrade. A trial upgrade to test the process can reveal the following issues:

- Whether an upgrade plan will work or if you must make adjustments.
- The customizations that are in your environment so that you can plan to deal with them during upgrade.
- Whether you should upgrade your hardware to make an upgrade run more efficiently and more quickly.
- The timing for upgrade, or how long upgrade will take for your environment.
- What you must plan for, operationally — for example, resources to have available.

In addition, you can use the trial upgrade to become familiar with the upgrade tools and the process itself so that you know what to expect when you perform the actual process. Through testing, you can discover the following issues:

- What does the upgrade user interface look like? How do you know when you have finished one phase and are moving through another?
- Where are the log files, and how do you read them? What information do they provide?
- Whether you must adjust any scripts or commands that are used during the upgrade process, especially if you are relying on any scripts that were used in upgrading to SharePoint 2010 Products.
- Whether you have the right plan to address any outages.

This article describes basic steps for testing upgrade, and it gives recommendations for reviewing the results and adjusting an upgrade plan based on what you learn during the tests.

In addition, the following resources can be helpful when you test the upgrade process:

- **SharePoint 2013 Preview Upgrade Worksheet**  
Download the [SharePoint 2013 Products Preview Upgrade Worksheet](#) and use it to record information about your environment while you test upgrade.
- **SharePoint 2013 Preview - Test Your Upgrade Process model**  
Download the [SharePoint 2013 Products Preview - Test Your Upgrade Process model](#) poster to see a visual display of information about how to test the upgrade process.
- See best practices for testing the upgrade process in [Best practices for upgrading to SharePoint 2013 Preview](#).

---

## Set up a test environment

You can use either virtual or physical hardware to test the upgrade process. Every environment is unique. Therefore, there are no general guidelines for how long upgrade will take or how difficult a particular customization will be to upgrade. The best way to gauge how upgrade will go is to perform a series of trial upgrades.

Here are some things to consider when you create your test environment:

- Make your test farm as similar as possible to your real farm — for example, hardware, software, and available space.
- Use the same URLs in your test farm as in your real farm. Otherwise, you will waste time diagnosing issues that relate to the URLs that will not occur in the real upgrade. You can do this by using the same URLs and testing only from computers that have host file changes.
- Use the different computer names for your web and application servers. This will prevent Active Directory Domain Services (AD DS) conflicts.
- Use separate servers that run SQL Server for your test farm  
If you are using the same servers that run SQL Server for your test and production farm, you can affect the performance of your production farm while you run your tests. We recommend that you use different SQL Server computers (not just instances) for your production and test farms.
- Use the same database names in your test environment.  
That way, you can validate any scripts that you use to manage your environment. Again, make sure that you use separate servers that are running SQL Server or you risk affecting your production environment.
- Be sure that you transfer all the settings and customizations to the test environment. The section [Identify and install customizations](#) provides information about collecting this information.

Make sure that actions that you take in the test environment do not affect the live environment. Be cautious with the following:

- External data connections  
Even though you are working with a copy of the environment, the link to the data source is real. Changes that you make to the data in the test environment affect the production environment.
- Running commands against a live database still in production  
Make sure that you use copies of your databases for testing, not a live version in your production environment. For example, if you run **Test-SPContentDatabase** against a live database, instead of a copy, you might affect performance on your production environment.

## Using a virtual test environment

When you test by using a virtualized environment, you do not have to have lots of hardware. You can replicate your environment by using just two servers that are running Hyper-V. One server has images for the front-end web servers and application servers, and the other server has images for the database servers.

However, virtual environments might not have the same performance metrics as physical environments. If your production environment is physical, you must consider this difference when you calculate the

---

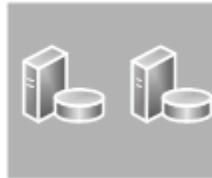

time that is required to upgrade your production environment. Generally, you can get better performance estimates if you use a physical server for SQL Server. Make sure that it has similar performance specifications to your server that runs SQL Server in your production environment.

### Distribution of servers in a virtual test environment

Virtual Server: Web and Application Servers

Virtual Server: Database Servers

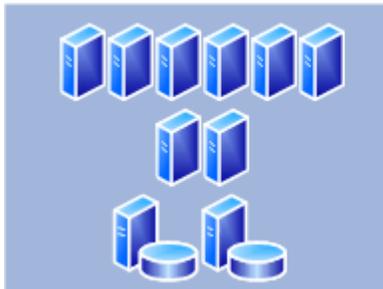

## Using a physical test environment

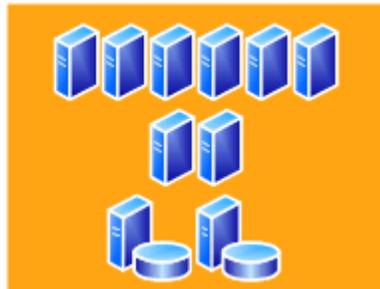

When you test by using a physical environment, you must replicate your proposed production server farm environment as closely as possible. If you simplify the number of front-end web servers, application servers, or database servers too much, you will not have an accurate estimate of how long the upgrade process will take. You may not account for complications that arise from interactions between servers in the same role (such as SQL Server transactions). If you have multiple servers in a role in your proposed production farm, use at least two servers for that role in the test farm to test for such issues.

### Distribution of servers in a physical test environment

Production Farm

Test Farm

## Identify and install customizations

To have an accurate test process, you must find all the customizations in your current environment and copy them to the test environment. For more information about the types of customizations that you have to identify, see [Create plan for current customizations during upgrade to SharePoint 2013 Preview](#).

- Use the **Stsadm -o enumallwebs** operation on all content databases in your SharePoint 2010 Products environment to identify specific customizations in subsites. This operation lists an ID for each site collection and subsite in your environment and the templates that the site relies on. For more information, see [Enumallwebs: Stsadm operation](#).

- 
- Use a tool such as WinDiff (a tool that is provided with most Microsoft operating systems) to compare your production environment servers with your test farm servers. You can use this tool to see which files exist on your servers and the differences between them.
  - Check the web.config files for any changes, and look in the SafeControls element to find any custom controls.
  - Use the SharePoint Diagnostics Tool (SPDiag) to find deployed solutions. For more information, see [SharePoint Diagnostics Tool \(SPDiag\)](#).
  - Create a list of all customizations that you find. Identify the source of the customizations, if it is possible. For example, are there third-party add-ins or templates that were customized in-house? After you identify the source, you can then check for updated or upgraded versions of the customizations. Download the [SharePoint 2013 Products Preview Upgrade Worksheet](#) and record information about your environment, based on your research on your customizations.

**Tip:**

Whom do you contact about customizations that you did not create?

- Contact Microsoft if you have problems with a template that you downloaded from the Microsoft website.
- Contact your third-party solution vendor if you have problems with a template or component that they supplied you for the earlier version. An upgraded version may be available.

After you identify all the customizations, copy them to the appropriate servers in your test farm. Ensure that the following customizations are deployed:

- Solutions - by default legacy solutions are deployed to the /14 directories. Use the **AddToLatest** parameter when you install the solutions to deploy them to the /15 directories.
- Custom Master Pages
- Custom JavaScript
- Custom CSS files (including those for themes)
- Custom workflow actions (must be included in actions file)
- Confirm large list query throttling settings to make sure that large lists are displayed as expected.

When you test customizations, use the following guidance:

- Check for visual changes.
- Check for behavioral changes.
- Test in both 2010 and 2013 mode site collections.
- Look for any language or resource loading issues.

This is an issue that can occur when customizations exist in 2010 mode and new customizations replace them in 2013 mode. Because there is only one global directory for language resources, there can be an issue loading the correct file. Make sure that replacement 2013 customizations include the 2010 resources so that the customizations can continue to work correctly in both modes.

- Validate that upgrade did not affect customizations. Ensure that customizations do not block site collection upgrade.

---

You can use the **Test-SPContentDatabase** Windows PowerShell cmdlet before you attach a database to SharePoint 2013 Preview to determine whether any customizations are missing from the environment. Run this command for each database after you restore the databases to your database server but before you run the upgrade. Note that this cmdlet runs silently — it will not return any output unless there is an issue found.

## Copy real data to the test environment and upgrade databases

You cannot achieve your testing goals unless you use your actual data. Use the Microsoft SQL Server backup and restore tools to create a copy of your content and services databases.

There is no better way to tell what may occur during upgrade than to perform the test on a copy of all the data. However, this might not always be a realistic option for initial testing. You can test in phases by testing one database at a time (if the databases are large) so that you can make sure that you test whatever is unique about that dataset. Or, you can assemble a subset of data from representative sites in your environment. If you want to first test by using a subset of your data, be sure that the subset has the following characteristics:

- The data subset contains sites that are typical of the sites that you support in your environment.
- The size and complexity of the data subset closely resembles the actual size and complexity of your environment.

### Important:

Testing a subset of your data does not produce a valid benchmark for how long it will take to process the whole volume of data for your environment.

After you copy the data, take a first pass through the upgrade process to see what happens. This is just the preliminary round. Follow the steps in [Attach databases and upgrade to SharePoint 2013 Preview](#) to try the database attach upgrade process.

When you test the upgrade process, make sure that you test services that are shared across farms. Consider all states, such as the following:

- A SharePoint Server 2010 farm connected to a SharePoint Server 2013 Preview services farm.
- A SharePoint Server 2013 Preview farm connected to a SharePoint Server 2013 Preview services farm.
- Different version farms for different services.

Use the test environment to find any security, configuration, compatibility, and performance issues for service applications.

## Review results after you upgrade databases

After your test upgrade has finished, you can review the results and revisit your plans. Look at the log files, look at the upgraded sites, and review your customizations. How did upgrade work for your environment? What did you discover? What do you have to rethink about the upgrade plan?

---

## Review the log files

Review the upgrade log file and the upgrade error log file (generated when you run the upgrade). The upgrade log file (.log) and the upgrade error log file (.err) are located at %COMMONPROGRAMFILES%\Microsoft Shared\Web server extensions\15\LOGS. The log files are named in the following format: Upgrade-YYYYMMDD-HHMMSS-SSS.log, where YYYYMMDD is the date and HHMMSS-SSS is the time (hours in 24-hour clock format, minutes, seconds, and milliseconds).

The format of the log files complies with the Unified Logging System (ULS) conventions. To review the log files to find and troubleshoot issues, start at the top of the files. Errors or warnings may be repeated if they occur for several site collections in the environment, or if they block the upgrade process completely. For example, if you cannot connect to the configuration database, the upgrade process will try (and fail) several times and these tries will be listed in the log file.

## Review sites in 2010 mode

Verify that the site collections that were not upgraded work as expected in 2010 mode. Sites should look and behave as they did in SharePoint 2010 Products. Some changes are expected. For example, Office Web Apps Preview and the web analytics features have changed in SharePoint Server 2013 Preview and sites that used these features will be affected. For information about specific things to look for, see [Review site collections upgraded to SharePoint 2013 Preview](#).

## Run upgrade again, if it is necessary

If you have to, you can restart the upgrade process for a database by using the **Upgrade-SPContentDatabase** Windows PowerShell cmdlet. For more information about this cmdlet, see [Upgrade-SPContentDatabase](#). For more information, see [Restart a database-attach upgrade or a site collection upgrade to SharePoint 2013 Preview](#).

## Upgrade site collections and My Sites

After you have tested and validated upgrade for the content and services databases, you can test the upgrade process for site collections. Follow the steps in [Upgrade site collections to SharePoint 2013](#) to test the site collection upgrade process. If you have My Sites in your environment, see [Overview of the upgrade process to SharePoint 2013 Preview](#) for more information about the process of upgrading them.

### Note:

Content about My Sites applies only to SharePoint Server 2013 Preview.

## Review results after you upgrade site collections

Review upgraded sites visually to identify any issues that have to be addressed before you run the upgrade process on your production environment. For more information about specific things to look for, see [Review site collections upgraded to SharePoint 2013 Preview](#).

---

Review the site collection upgrade log files to check for any issues, starting from the top down. Check the summary section near the end of the log file to see a count of issues and the actual upgrade status (if there is no status, that means that the upgrade process failed and site upgrade must be retried). The site collection log files are stored both in the site collection itself (in the `_catalogs/Upgrade` document library), and on the file system. The file system log file has more information if you want details about issues. The file system version of the site upgrade log file is located at `%COMMONPROGRAMFILES%\Microsoft Shared\Web server extensions\15\LOGS`. The log files are named in the following format: `SiteUpgrade-YYYYMMDD-HHMMSS-SSS.log`, where `YYYYMMDD` is the date and `HHMMSS-SSS` is the time (hours in 24-hour clock format, minutes, seconds, and milliseconds).

## Adjust your plans and test again

Repeat the testing process until you are sure that you have found all the issues that you may face and that you know how to deal with them. Your goal is to know what your plan is if it is 4:00 P.M. on Sunday, you have to be back online Monday morning, and it is not going well. Is there a point of no return? Test your fallback plan and make sure that it works before you begin your real upgrade.

---

# Troubleshoot database upgrade issues in SharePoint 2013 Preview

---

Even after you test the upgrade process to identify potential issues, you might experience unexpected issues during an upgrade from SharePoint 2010 Products to SharePoint 2013 Preview. If you experience issues after upgrade, the sooner you detect and fix them, the better the end-user experience will be.

This article includes a list of common issues and describes general principles to help you identify and address upgrade issues. After you identify and address the issues, you can resume upgrade. For more information about how to resume upgrade, see [Restart a database-attach upgrade or a site collection upgrade to SharePoint 2013 Preview](#).

## General principles to identify issues

Check the upgrade status to see where upgrade stopped (if it did stop), and check log files to find errors or warnings. Next, address the issues that you find before you resume the upgrade.

### First, check upgrade status and log files

Upgrade status indicators and log files indicate what went wrong during the upgrade process. We recommend that you carefully review all the errors that were logged in the upgrade log files. Warnings might not always indicate an issue, but you should review them all to determine whether any of them are likely to cause even more issues.

1. Review the Upgrade Status page in the SharePoint Central Administration website.  
For more information about how to check upgrade status, see [Verify database upgrades in SharePoint 2013 Preview](#).
2. Review the following log files:
  - The upgrade error log file and the upgrade log file (which contains more detailed information than the upgrade error log file).
  - ULS or trace log files.  
These files are stored in the %COMMONPROGRAMFILES%\Microsoft Shared\Web Server Extensions\15\LOGS folder and are named *Servename\_YYYYMMDD-MMSS.log*.
  - The application event log file.  
This file can be viewed by using the Event Viewer.  
For more information about the upgrade log files, see [Verify database upgrades in SharePoint 2013 Preview](#). For more information about the trace log file, see [Trace Logs](#) on MSDN.

---

## Then, address issues in order

Some issues have more effect than others. For example, a missing server-side file can cause many seemingly unrelated errors at the site level.

Address issues in the following order:

1. Missing server-side files or customizations, such as features or Web Parts.  
Be sure to install all server-side customizations, such as features, Web Parts, and so on. Be sure to install customizations to the correct location in your new farm. For example, additional style sheets that you must have for SharePoint 2010 Products should be installed in the /14 path, not the new /15 path so that site collections that you have not upgraded can use them. Also, make sure that that you transfer all unique settings from the Web.config files for each web application to the new servers.
2. Configuration issues in the server farm, web application, or service applications, such as managed paths or service applications that are not started.
3. Additional issues that you discover on a site-by-site basis, starting with high-profile or very important sites.

As you identify and fix the top-level issues, you can try to run upgrade again to see whether any issues that occurred later in the upgrade process have also been fixed.

## Common issues

Check to see whether any of the following issues cause an upgrade error or warning.

### Q: I want to upgrade from a pre-release version of SharePoint 2013 Preview

- **A:** Upgrade from a pre-release version of SharePoint 2013 Preview to the release version of SharePoint 2013 Preview is not supported.  
Pre-release versions are intended for testing only and should not be used in production environments. Upgrading from one pre-release version to another is also not supported.

### Q: The log says I have missing templates, features, or other server-side customizations

- **A:** Identify all server-side customizations and install them before you upgrade

One common error during upgrade is missing server-side files — either files that were installed with SharePoint 2010 Products or customized files. When you prepared for upgrade, you should have created an inventory of the server-side customizations (such as site definitions, templates, features, Web Parts, assemblies) that your sites required. Check this inventory to make sure that all the files that are needed for your customizations are installed in your new environment.

You can use the **test-spcontentdatabase** Windows PowerShell cmdlet before you upgrade the database to identify missing files. You can also use the **enumallwebs** operation in Stsadm.exe to identify server-side customizations that are being used.

---

In the upgrade log files, you may see errors such as the following:

- ERROR Found Reference Count web(s) using missing web template Site Template Identifier (Icid: Site Template Language Code) in ContentDatabase Content Database Name.
- ERROR Found a missing feature Id = *[Feature Identifier]*
- WARNING File *[Relative File Path]* is referenced *[Reference Count]* times in the database, but is not installed on the current farm.
- WARNING WebPart class *[Web Part Identifier]* is referenced *[Reference Count]* times in the database, but is not installed on the current farm.
- WARNING Assembly *[Assembly Path]* is referenced in the database, but is not installed on the current farm.
- WARNING Feature could not be upgraded. Exception: Feature definition id '*Feature Identifier*' could not be found.

If you can obtain a missing server-side file or dependency, install it, and then run upgrade again for the affected sites. If the file or dependency (such as a Web Part) was deprecated, you have to investigate whether you want to rebuild the site, page, or Web Part to use a different template, feature, or Web Part. If you can redo the customization by using dependencies that were not deprecated, you can run upgrade again for the affected sites. If you cannot remove the dependency, you cannot upgrade the site.

After you install the missing file or dependency, use the **test-SPContentDatabase** Windows PowerShell cmdlet on a test server to determine whether any other files for that database are missing. If you only run upgrade again, the error might not appear in the log files, even though it might still be occurring.

## **Q: The log file says that something is not right with my farm, web application, or service application configuration settings**

- **A:** Verify your farm and web application settings.
- **A:** Create and start missing service applications
- **A:** Verify that managed paths (included paths) are configured correctly for each web application.

In the upgrade log files, you may see errors such as the following:

- ERROR Template *Template Id*: SPSite Id=*Site Id* could not be accessed due to exception. Skipping SPWeb Id=*Web Id* for template upgrade. Exception: System.IO.FileNotFoundException: The site with the id *Site Id* could not be found.

This error indicates that a managed path is missing. Add the managed path for the site collection into the web application and restart upgrade for the content database that contains this site collection.

---

## Q: I see errors and warnings during upgrade about connectivity or corruption

- **A:** Verify your power connections and connection to the network and to SQL Server. Loss of connectivity to data sources can cause errors. If your servers cannot connect to the databases, they cannot be upgraded.
- **A:** Clean up orphaned sites, lists, and other database corruptions before you try upgrade again. For more information about how to clean up data issues, see [Clean up an environment before an upgrade to SharePoint 2013 Preview](#).

In the upgrade log files, you may see errors such as the following:

- WARNING The orphaned sites could cause upgrade failures.
- ERROR Database [*Content Database Name*] contains a site (Id = [*Site Collection Identifier*], Url = [*Site Collection URL*]) that is not found in the site map.

Fix any orphaned items or database corruptions, and then run upgrade again.

## Q: I ran out of disk space

- **A:** Free some space, or increase the size of the transaction log file before you resume upgrade. If you run out of space (for example, for transaction log files on your database servers), upgrade cannot continue.

For more information, see [Managing the Size of the Transaction Log File](#).

## Q: I see an error about authentication

- **A:** Make sure that the web application is using the right authentication method.

A mismatch in authentication methods can cause problems when you upgrade. The following resources can help if you have a mismatch between authentication methods:

- **Classic-to-claims authentication**

Make sure that the web applications that you created in SharePoint 2013 Preview use the same authentication method that was used in SharePoint 2010 Products. Claims-based authentication is the default authentication method for web applications in SharePoint 2013 Preview. If the web application was using classic mode, you can either update it to claims before you upgrade the database, or create the web application in classic mode and then migrate it to claims. For more information about how to change to claims authentication in SharePoint 2010 Products, see [Migrate from classic-mode to claims-based authentication in SharePoint 2013 Preview](#). For more information about how to create a web application that uses classic mode, and then migrating to claims, see [Create web applications that use classic mode authentication in SharePoint 2013 Preview](#) and [Migrate from classic-mode to claims-based authentication in SharePoint 2013 Preview](#)

- **Forms-based authentication**

Additional steps are necessary if you are upgrading an environment that uses forms-based authentication. Follow the steps in [Configure forms-based authentication for a claims-based web application in SharePoint 2013 Preview](#) to upgrade forms-based authentication providers.

---

## **Q: SQL Server says I don't have permissions**

- **A:** If you receive an error about an unknown account, or if a database is not upgraded, check the permissions for the database. In particular, between instances of SQL Server, make sure that you verify that security is configured correctly. Check that the login accounts that you use have the appropriate fixed roles and permissions on the databases, and that they will still be valid if you upgrade across domains.
- **A:** Make sure the account that you use to attach the databases is a member of the **db\_owner** fixed database role for the databases that you want to upgrade.

## **Q: A database will not upgrade**

- **A:** Verify that the database is not set to read-only. You cannot upgrade a database that is set to read-only. Make sure that you set the databases to read-write before you attach and upgrade the databases.

## **Q: I changed a database name during restore, but I cannot find the files that have that name**

- **A:** When you rename a database at restore time, you must also rename the database and log file names in the file system (the MDF and LDF files) so that they match.

## **Q: I cannot back up the Search service application Administration database**

- **A:** Before you can back up the Search service application Administration database, you must stop the Search service on your SharePoint Server 2010 farm. To stop the Search service, on the original farm, on the **Start** menu, click **Administrative Tools**, and then click **Services**. Right-click **SharePoint Server Search 14**, and then click **Stop**. Be sure to start the service again after you back up the database.

## **Q: Trusted connections are not working for Excel Services after upgrade**

- **A:** You must manually create all trusted data connections for Excel Services after upgrade.

## **Q: My workflows are no longer associated correctly**

- **A:** Verify that the Workflow Auto Cleanup timer job is turned off. If you had disabled the Workflow Auto Cleanup timer job in your SharePoint 2010 Products environment, make sure that you disable this timer job in the new environment also. If this timer job is enabled in the new environment and disabled in the SharePoint 2010 Products environment, you might lose workflow associations when you upgrade.

---

# Troubleshoot site collection upgrade issues in SharePoint 2013 Preview

---

When you upgrade a site collection to SharePoint 2013 Preview, errors can occasionally occur. This article helps you understand those errors and address them.

For more information about how to review UI issues in sites, see [Review site collections upgraded to SharePoint 2013 Preview](#).

## Check upgrade status and log files

Upgrade status indicators and log files should give you an indication of what went wrong during the upgrade process. We recommend that you carefully review all the errors in the upgrade log files. Warnings might not always indicate an issue, but you should review them all to determine whether any of them are likely to cause even more issues.

1. Review the upgrade status page for your site collection.  
On the **Site Settings** page for the site collection, in the **Site Collection Administration** section, click **Site collection upgrade**. On the **Site Collection Upgrade** page, click **Review Site Collection Upgrade Status**.
2. Review the site collection upgrade log files. You can review the site collection upgrade logs from the following locations:
  - **For site collection administrators:** There are also log files for site collection upgrade stored inside the site collection itself, in the Maintenance Logs catalog at (`http://<SiteName>/_catalogs/MaintenanceLogs/YYYYMMDD-HHMMSS-SSS.txt` , where `YYYYMMDD` is the date and `HHMMSS-SSS` is the time (hours in 24-hour clock format, minutes, seconds, and milliseconds).
  - **For farm administrators:** The site collection upgrade log file and the upgrade error log file are located at `%COMMONPROGRAMFILES%\Microsoft Shared\Web server extensions\15\LOGS`. The logs are named in the following format: `SiteUpgrade-YYYYMMDD-HHMMSS-SSS.log`, where `YYYYMMDD` is the date and `HHMMSS-SSS` is the time (hours in 24-hour clock format, minutes, seconds, and milliseconds). These file system logs have more information if you want details about issues.

## Common issues

Check to see whether any of the following issues are causing an upgrade error or warning or a problem in your site.

### Q: I don't see a UI control on the page that used to be there

- **A:** Reset the page to the default version (that is, reghost it).

---

Making changes to the site UI can cause problems in site upgrades. If a page was customized to place a UI control in a non-standard location, you can reset the page to the default version to recover the control.

To reset the page, you can use the **Reset to site definition** link under **Site Actions** on the Site Settings page or use the **Reset to Template** command in SharePoint Designer.

## **Q: The view on a large list is not working any longer**

- **A:** Create indexed columns, folders, or new views for large lists. You might have to add the indexed column to your existing views.

If a list is very large, and users use a view or perform a query that exceeds the limit or throttling threshold, the view or query will not be permitted. You can create indexed columns with filtered views, organize items into folders, set an item limit on the page for a large view, or use an external list. For more information about large list throttling and how to address issues with large lists, see [Manage lists and libraries with many items](#) on Office Online.

## **Q: I see an error about a duplicate content type name**

- **A:** Rename content types or fields that conflict with default names.

Occasionally, custom elements (such as a content type) may have a name that conflicts with a name in the new version.

In the upgrade log files, you may see an error such as the following:

- Failed to activate site collection features on site Site Url. Exception: A duplicate content type name "*name*" was found.

This error indicates that a third-party content type was added to the specified site in SharePoint Server 2010. During upgrade to SharePoint Server 2013 Preview its name conflicted with the default content type by the same name. Rename the third-party content type in the specified site to a different name and run upgrade again. Note that either renaming or removing a content type can cause any customizations dependent on that content type to stop working.

## **Q: My site looks ugly, doesn't behave as expected, or I see script errors**

- **A:** Either edit the page or reset the page to the default version, or remove or replace the custom files.

A problem with custom or inline JavaScript or CSS files can cause these issues.

## **Q: Custom content in my site disappeared or doesn't work**

- **A:** Change the master page, or change the content so that it doesn't require specific zones.

The master page might have different zone layouts and the content might no longer reference it correctly. As a last resort, you can also reset the page to the default version. However, if you reset the page, you might lose zone specific content.

---

## **Q: I receive an error that says a control or page cannot render**

- **A:** Do one of the following:
  - If a Web Part was added that is not installed, contact the farm administrator to have it installed. If is a Web Part that is no longer available or not supported, then use the Web Part maintenance view to remove the Web Part from the page (remove, do not just close the Web Part).
  - If a page was directly edited, either edit it again to remove the control or Web Part or reset the page to the default version.

A Web Part or other control might have been added to the page that is not installed or is no longer supported. Either a Web Part was added to a zone or the page was directly edited to add a control or Web Part reference directly inline (possibly on a master page).

---

# Restart a database-attach upgrade or a site collection upgrade to SharePoint 2013 Preview

---

In some cases, you might have to restart upgrade to finish a database-attach upgrade from SharePoint 2010 Products to SharePoint 2013 Preview. For example: if a template or language pack is missing from the environment, or if you lose the connection to SQL Server, you will have to resolve the issue and then restart upgrade. You might also need to retry or restart a site collection upgrade if it was unable to complete.

 **Note:**

One frequent cause of failures during upgrade is that the environment is missing customized features, solutions, or other elements. Be sure that any custom elements that you must have are installed on your front-end web servers before you start the upgrade process. You can use the **test-sptestcontentdatabase** Windows PowerShell cmdlet to identify any custom elements that your sites might be using. For more information, see [Identify and install customizations](#) in the article "Use a trial upgrade to find potential issues."

## Restart upgrade for a database by using Windows PowerShell

If the upgrade ran into issues during the database-attach upgrade, you can restart the upgrade process for the database after you have addressed the issue by using a Windows PowerShell cmdlet.

### To restart upgrade for a database by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt (PS C:\>), type the following command:

---

```
upgrade-spcontentdatabase <Name>
```

Where:

- *Name* is the database name that you want to upgrade.  
You can also use the **-id** parameter and provide the database GUID instead of a database name. You can run the following cmdlet to find the GUID for a content database:

```
Get-SPContentDatabase -Identity <content_database_name>
```

For more information, see [Upgrade-SPContentDatabase](#) and [Get-SPContentDatabase](#).

## Restart upgrade for a site collection

If upgrade ran into issues during a site collection upgrade, you can restart the upgrade process for the site collection after you have addressed the issue. You can use either the Site Settings page or a Windows PowerShell cmdlet to restart upgrade for a site collection.

### To restart upgrade for a site collection

1. Verify that the user account that performs this procedure is a site collection administrator.
2. On the Site Settings page for the site collection, in the **Site Collection Administration** section, click **Site collection upgrade**.
3. On the Site Collection Upgrade page, click **Upgrade this Site Collection**.  
This option starts to upgrade your site collection. A box opens to verify that you want to start the process.
4. Click **I'm ready** to start the actual upgrade.

#### Note:

The site collection health checks are run automatically in repair mode before the upgrade starts. The results from the health checks are included in the upgrade log for the site collection. If there is an error, you must address it before you can continue to upgrade.

The upgrade starts, and the **Upgrade status** page for the site collection is displayed. This page automatically updates while the upgrade is in progress and displays information about the process, such as the following:

- Errors or warnings
- When the upgrade started
- Where you can find the upgrade log file

After the upgrade is complete, the **Upgrade status** page is displayed in the new user interface with the message, Upgrade Completed Successfully.

5. Click **Let's see the new site** to go to the home page.

Farm administrators can restart upgrade by using Windows PowerShell.

### To restart upgrade for a site collection by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.

- 
- **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
Upgrade-SPSite <http://site> -VersionUpgrade [-Unthrottled]
```

Where:

- *<http://site>* is the URL for the site collection.
- Add the option **-Unthrottled** option to skip the site collection upgrade queue and start the upgrade immediately.

For more information, see [Upgrade-SPSite](#).

# Upgrade databases from SharePoint 2010 to SharePoint 2013 Preview

---

After you learn about the upgrade process, plan for your upgrade, and test your upgrade process by following the steps in the articles in [Test and troubleshoot an upgrade to SharePoint 2013 Preview](#), you are ready to perform a database-attach upgrade to SharePoint 2013 Preview. Follow the steps in this section for both a trial upgrade and your actual upgrade for your production farm.

The following downloadable resources, articles on TechNet, video recordings, and related resources provide information about upgrading databases to SharePoint 2013 Preview.

## Downloadable resources about upgrading databases

Download the following content for information about upgrading databases.

# Checklist for database-attach upgrade (SharePoint 2013 Preview)

---

This checklist helps you confirm that you follow all the steps that you must follow as you prepare for upgrade, perform the upgrade, and perform post-upgrade steps. This checklist applies only to upgrade of the content and service application databases. It does not apply to upgrade of My Sites or other site collections. For more information, see [Upgrade site collections to SharePoint 2013](#).

In this article:

- [Prepare for upgrade](#)
- [Complete the database attach upgrade](#)
- [Complete post-upgrade steps](#)

Some steps include notes about how long that step might take. These rough estimates only give you a relative idea of the duration of the step. To discover how much time each step will take for your environment, we recommend that you perform trial upgrades in a test environment. For more information, see [Use a trial upgrade to SharePoint 2013 Preview to find potential issues](#) and [Plan for performance during upgrade to SharePoint 2013 Preview](#).

## Important:

The steps in this article apply to both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview, except for the steps about how to upgrade the service applications, which apply mostly to SharePoint Server 2013 Preview (the Business Data Connectivity service application applies to both).

## Prepare for upgrade

Follow these steps in order before you start an upgrade to SharePoint 2013 Preview:

### Pre-upgrade steps

| Step | Notes                                                                                                                                                                                                                                                                   |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ ]  | <p><b>Create an inventory of server-side customizations in the environment</b></p> <p>Create an inventory of the server-side customizations in your environment (solutions, features, Web Parts, event handlers, master pages, page layouts, CSS files, and so on).</p> |

| Step | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                       |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
|      | <p>Record all customizations needed for your environment in the upgrade worksheet.</p> <p>Detailed steps: <a href="#">Identify and install customizations</a> in the "Use a trial upgrade to find potential issues" article.</p>                                                                                                                                                                                                                                                                         |                                                                                                                       |
| [ ]  | <p><b>Clean up your environment</b></p> <p>Before you begin to upgrade, make sure that your environment is functioning in a healthy state and that you clean up any content that you do not have to upgrade. Clean up any orphaned sites or data, address any large lists and large ACLs, remove extraneous document versions, and remove any unused templates, features and Web Parts.</p> <p>Detailed steps: <a href="#">Clean up an environment before an upgrade to SharePoint 2013 Preview</a>.</p> | <p>Complete this step one time for the whole environment.</p> <p>This process might take days or weeks to finish.</p> |
| [ ]  | <p><b>Test the upgrade process</b></p> <p>Try out upgrade in a test environment to find any issues and determine how long your actual upgrade might take.</p> <p>Detailed steps: <a href="#">Use a trial upgrade to SharePoint 2013 Preview to find potential issues</a></p>                                                                                                                                                                                                                             | <p>Perform this step multiple times, until you are prepared to perform the actual upgrade.</p>                        |

## Complete the database attach upgrade

Follow these steps in order while you upgrade the content and service application databases for your environment.

Detailed steps: [Attach databases and upgrade to SharePoint 2013 Preview](#).

## Prepare the new environment

| Step | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                    |

## Complete post-upgrade steps

Follow these steps in order after you perform a database-attach upgrade.

### Post upgrade steps for database attach upgrade

| Step | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| []   | <p><b>Verify that site collections are working as expected in 2010 mode</b></p> <p>Review the site collections and make sure that they work in 2010 mode before you begin to upgrade any site collections. You can use a similar review list as the one provided for upgraded sites in <a href="#">Checklists for reviewing upgraded sites</a></p>                                                                                       | Complete this step one time for your whole environment.                                        |
| []   | <p><b>Migrate user accounts to claims authentication, if it is necessary</b></p> <p>By default, new web applications in SharePoint 2013 Preview use claims authentication. If you were using classic authentication in the previous environment, you must migrate the users to claims authentication. For more information, see <a href="#">Migrate from classic-mode to claims-based authentication in SharePoint 2013 Preview</a>.</p> | Complete this step one time for every web application that has changed authentication methods. |

| Step | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                      |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ ]  | <p><b>Update links that are used in any upgraded InfoPath form templates</b></p> <p>For a database-attach upgrade, you exported and imported all InfoPath form templates in your environment when you created the new environment. After upgrade, you can now update the links that are used in those upgraded form templates to point to the correct URLs by using a Windows PowerShell cmdlet.</p> <p>For more information, see <a href="#">Configure InfoPath Forms Services (SharePoint Server 2010)</a>.</p> | Complete this step one time for your whole environment.                                                                                                                              |
| [ ]  | <p><b>Configure your Search topology</b></p> <p>The architecture for the Search service has changed for SharePoint Server 2013 Preview. Plan and configure your Search topology to suit your environment and the new architecture. For more information, see <a href="#">Scale search for performance and availability (SharePoint Server 2013 Preview)</a> and <a href="#">Manage search topology (SharePoint Server 2013 Preview)</a>.</p>                                                                      | Complete this step one time for your whole environment.                                                                                                                              |
| [ ]  | <p><b>Start a full crawl</b></p> <p>After all content is upgraded and all settings are configured, you can start a full search crawl of your content. For more information, see <a href="#">Start, pause, resume, or stop a crawl (SharePoint Server 2013 Preview)</a>.</p>                                                                                                                                                                                                                                       | <p>Complete this step one time for your whole environment.</p> <p>A full crawl can take several hours or days to complete, depending on how much content is in your environment.</p> |
| [ ]  | <p><b>Back up your farm</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Complete this step one time for                                                                                                                                                      |

---

| Step | Notes                                                                                                                                                                                                                         |                         |

# Attach databases and upgrade to SharePoint 2013 Preview

---

When you use the database-attach upgrade approach to upgrade from SharePoint 2010 Products to SharePoint 2013 Preview, you upgrade the content databases and several service application databases. You do not upgrade the configuration database for your farm.

This article describes how to set up your new environment and perform a database-attach upgrade. This article does not provide steps for how to upgrade a site collection. For steps to upgrade a site collection, see [Upgrade site collections to SharePoint 2013](#).

For an overview of the whole upgrade process, see [Overview of the upgrade process to SharePoint 2013 Preview](#). For an overview of how to upgrade services, see [Services upgrade overview for SharePoint Server 2013 Preview](#).

## Important:

Although this article applies to both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview, the sections about how to upgrade service applications apply to SharePoint Server 2013 Preview. (The exception is the section about how to upgrade the Business Data Connectivity service application which applies to SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview).

This article is about 35 printed pages.

## Before you begin

Before you start to upgrade, you must collect information and settings about your existing environment. You have to know what is in your SharePoint 2010 Products environment before you can start to build your SharePoint 2013 Preview environment. Gather information such as the following:

- Alternate access mappings
- Authentication providers and authentication modes that are being used
- Quota templates
- Managed paths
- Self-service site management settings
- Incoming and outgoing e-mail settings
- Customizations

Before you create the new environment for a database-attach upgrade, review the following information about permissions, hardware requirements, and software requirements.

- [Hardware and software requirements \(SharePoint 2013 Preview\)](#)
- [Initial deployment administrative and service accounts in SharePoint Server 2013 Preview](#)

---

Before you attach and upgrade databases, review the following information about permissions, hardware requirements, and software requirements. Follow the specified steps to install or configure prerequisite software or to change settings.

- Ensure that the account that you use to attach the databases is a member of the **db\_owner** fixed database role for the content databases that you want to upgrade.
- Check for and repair all database consistency errors.

For more information, see [Database maintenance for SharePoint Server 2010](#).

You also have to turn off or remove services or components in the SharePoint 2010 Products environment that could cause errors in the upgrade process. The following services or components should be removed or stopped before you back up your databases:

- **Web Analytics** The architecture for the Web Analytics service application is different in SharePoint 2010 Products. The presence of SharePoint Server 2010 Web Analytics information in your content databases could cause an error during upgrade. Stop the Web Analytics service application before you back up the content databases. Features and Web Parts from Web Analytics in SharePoint Server 2010 will not exist in SharePoint Server 2013 Preview, even for a site collection in 2010 mode. Remove any Web Analytics Web Parts or features from SharePoint Server 2010 site collections before upgrade.

For more information about this change to Web Analytics, see [Changes from SharePoint 2010 to SharePoint 2013](#).

- **PowerPoint Broadcast Sites** The Office Web Apps Preview have changed into a separate server product, Office Web Apps Preview Server, which can serve multiple SharePoint farms for viewing and editing documents. Because of this change, PowerPoint Broadcast sites cannot be upgraded to SharePoint Server 2013 Preview. For more information about how to install and use Office Web Apps Preview with SharePoint 2013 Preview, see [Deploy Office Web Apps \(Installed on SharePoint 2010 Products\)](#).

 **Note:**

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 15 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

[Back to top](#)

---

# Install SharePoint 2013 Preview in a new environment

Before you can upgrade your databases, you must use SharePoint 2013 Preview to configure a new server or server farm. The first step in creating your new environment is to install SharePoint Server 2013 Preview or SharePoint Foundation 2013 Preview and configure your new server or server farm. You must do the following:

1. Run the Microsoft SharePoint Products Preparation Tool to install all required software.
2. Run Setup to install the product.
3. Install all language packs that you want in your environment.

 **Note:**

For more information about how to install available language packs, see [Install or uninstall language packs for SharePoint 2013 Preview](#).

4. Run the SharePoint Products Configuration Wizard to configure your server or servers.

 **Important:**

Some service applications can be upgraded by using a service application database upgrade. If you want to upgrade these service applications by upgrading the service application databases, do not use the Farm Configuration Wizard to configure these service applications when you set up your new farm.

For step-by-step instructions for these tasks, see [Install SharePoint 2013 Preview](#).

[Back to top](#)

## Configure service applications and farm settings

You must create the service applications on your new farm before you upgrade your content databases. The steps in [Install SharePoint 2013 Preview](#) describe how to use the Farm Configuration Wizard to enable all service applications.

You can upgrade the following service applications by performing a services database upgrade:

- Business Data Connectivity service
- Managed Metadata service
- PerformancePoint services
- Search
- Secure Store service
- User Profile service

For an overview of how to upgrade these service applications, see [Services upgrade overview for SharePoint Server 2013 Preview](#). The steps that you must follow to upgrade these service application databases are included in the [Upgrade service application databases](#) section.

The following services in SharePoint Server 2013 Preview also require additional steps to enable and configure when you upgrade:

---

- **Excel Services**

You can use the Farm Configuration Wizard to enable this service, but you must make sure that you create all trusted data connections again. For more information, see [Configure Excel Services in SharePoint](#).

- **InfoPath Forms Service**

This service is not part of the Farm Configuration Wizard. To use this service, use the **Configure InfoPath Forms Services** link on the **General Application Settings** page in Central Administration to configure it. To continue to use form templates from your previous environment, export all administrator-deployed form templates (.xsn files) and data connection files (.udcx files) from your SharePoint Server 2010 environment, and then import them to your new SharePoint Server 2013 Preview environment. For more information, see [Configure InfoPath Forms Services \(SharePoint Server 2010\)](#).

- **Office Web Apps**

Office Web Apps Server Preview is a new stand-alone server product that delivers Office Web Apps Preview functionality on your private network. You install and managed it separately from SharePoint Server 2013 Preview. It cannot be installed on the same server or virtual machine instance as SharePoint 2013 Preview. For more information, see [Deploy Office Web Apps Server 2013 Preview](#).

The next step in creating the new environment is to apply general farm settings. You must manually reapply configuration settings from your SharePoint 2010 Products farm, such as the following:

- Incoming and outgoing e-mail settings  
For more information, see [Configure incoming email for a SharePoint 2013 Preview farm](#) and [Configure outgoing email for a SharePoint 2013 Preview farm](#).
- All farm-level security and permission settings, such as adding user or group accounts to the Farm Administrators group
- Blocked file types  
For more information, see [Manage blocked file types \(SharePoint 2013 Preview\)](#).

And you must configure all new farm-level settings that you want to use, such as the following:

- Usage and health data collection  
For more information, see [Configure usage and health data collection \(SharePoint 2013 Preview\)](#).
- Diagnostic logging  
For more information, see [Configure diagnostic logging \(SharePoint 2013 Preview\)](#).
- Settings and schedules for timer jobs

 **Important:**

If you had disabled the Workflow Auto Cleanup timer job in your SharePoint 2010 Products environment, make sure that you disable this timer job in your new environment also. If this timer job is enabled in the new environment and disabled in the SharePoint 2010 Products environment, you might lose workflow associations when you upgrade. For more information about this timer job, see [Disable preservation of workflow history \(SharePoint Server 2010\)](#).

You will create web applications later in the process, after you upgrade the service application databases. For more information, see [Create web applications](#).

---

[Back to top](#)

## Set the previous version databases to be read-only

To maintain user access to your original environment, set the SharePoint 2010 Products databases to read-only before you back up the databases. Even if you don't want to maintain access over the long term, set the databases to read-only to make sure that you capture all the data in the backup so that you restore and upgrade the current state of the environment without allowing additional changes to be made. If the databases are set to read-only, users can continue to view content. However, they will be unable to add or change content.

### Important:

You cannot upgrade a database that is set to read-only. Make sure that you set the databases to read-write before you attach and upgrade the databases. For more information about how to set the databases to read-write, see the [Set the databases to read-write](#) section.

### To set a database to read-only in SQL Server 2005, SQL Server 2008, or SQL Server 2008 R2

1. Verify that the user account that is performing this procedure is a member of the **db\_owner** fixed database role for the databases.
2. In SQL Server Management Studio, in Object Explorer, connect to an instance of the Database Engine, expand the server, and then expand **Databases**.
3. Find the database that you want to configure to be read-only, right-click the database, and then click **Properties**.
4. In the **Database Properties** dialog box, in the **Select a page** section, click **Options**.
5. In the details pane, under **Other options**, in the **State** section, next to **Database Read-Only**, click the arrow, and then select **True**.

You can use Transact-SQL to configure the **READ\_ONLY** database availability option. For more information about how to use the **SET** clause of the **ALTER DATABASE** statement, see [Setting Database Options](#).

[Back to top](#)

## Back up the SharePoint 2010 Products databases by using SQL Server tools

You back up the databases in SQL Server Management Studio. A backup copy of the database guarantees that you have the data in a safe state if you must enable the original farm again and is required for a database-attach upgrade. Repeat the procedure for the following databases in the SharePoint 2010 Products server farm:

- All content databases (default database name: **WSS\_Content\_ID**)
- The following service application databases:

| Service application                               | Default database name                                                                                                                       |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Business Data Connectivity                        | BDC_Service_DB_ID                                                                                                                           |
| Managed Metadata                                  | Managed Metadata Service_ID                                                                                                                 |
| PerformancePoint                                  | PerformancePoint Service Application_ID                                                                                                     |
| Search Administration                             | Search_Service_Application_DB_ID                                                                                                            |
| Secure Store                                      | Secure_Store_Service_DB_ID                                                                                                                  |
| User Profile: Profile, Social, and Sync databases | User Profile Service Application_ProfileDB_ID<br>User Profile Service Application_SocialDB_ID<br>User Profile Service Application_SyncDB_ID |

The Business Data Connectivity service application is available in both SharePoint Foundation 2010 and SharePoint Server 2010. The other service applications are available only in SharePoint Server 2010. Although SharePoint Foundation 2010 includes search functionality, it is not the same Search service application that is in SharePoint Server 2010 and it cannot be upgraded.

You do not have to back up the configuration or admin content databases, because you recreated these databases when you set up the SharePoint 2013 Preview server farm. Upgrading the configuration or admin content databases and the Central Administration site collection is not supported.

After you complete this procedure, you will have created backups of the read-only content databases.

## To back up a database in SQL Server 2005, SQL Server 2008, or SQL Server 2008 R2

1. Verify that the user account that is performing this procedure is a member of the **db\_owner** fixed database role for the databases.
2. In Management Studio, in Object Explorer, connect to an instance of the Database Engine, expand the server, and then expand **Databases**.
3. Right-click the database that you want to back up, point to **Tasks**, and then click **Back Up**. The **Back Up Database** dialog box appears.
4. In the **Source** area, in the **Database** box, verify the database name.
5. In the **Backup type** box, select **Full**.
6. Under **Backup component**, select **Database**.
7. In the **Backup set** area, in the **Name** box, either accept the backup set name that is suggested or type a different name for the backup set.
8. In the **Destination** area, specify the type of backup destination by selecting **Disk** or **Tape**, and then specify a destination. To create a different destination, click **Add**.
9. Click **OK** to start the backup process.

---

Repeat the previous procedure to back up all the content and appropriate service application databases that SharePoint 2010 Products uses in your environment.

 **Important:**

Before you can back up the Search service application Administration database, you must stop the Search service on your SharePoint Server 2010 farm. To stop the Search service, on the original farm, on the **Start** menu, click **Administrative Tools**, and then click **Services**. Right-click **SharePoint Server Search 14**, and then click **Stop**. Be sure to start the service again after you back up the database.

[Back to top](#)

## Record the passphrase for the Secure Store service application

The Secure Store service application uses a passphrase to encrypt information. You must record this passphrase so that you can use it in the new environment. Otherwise, you will not have access to the information in the Secure Store.

## Export the encryption key for the User Profile service application

The User Profile Service service application requires an encryption key that is stored separately from the database and is needed if you want to upgrade the User Profile Sync database. You must export the Microsoft Identity Integration Server Key (MIIS) encryption key from your SharePoint Server 2010 environment. You will import this exported key to the SharePoint Server 2013 Preview environment after you upgrade the User Profile service application databases. By default, the key is located on the server that is running SharePoint Server 2010 and that is hosting the Microsoft Forefront Identity Manager services in the following directory: *<root directory drive>\Program Files\Microsoft Office Servers\14.0\Synchronization Service\Bin*.

### To export the encryption key for the User Profile service application

1. Verify that you have the following memberships:
  - Administrators group on the server on which you are running the command.
2. Open the Command Prompt window, and then change to the following folder:  
%Program Files%\Microsoft Office Servers\14.0\Synchronization Service\Bin\
3. To export the key, type the following at the command prompt, and then press ENTER:  
miiskmu.exe
4. In the Microsoft Identity Integration Server Key Management Utility wizard, verify that **Export key** set is selected, and then click **Next**.
5. In the **Account Name** box, type the account name for the farm administrator.
6. In the **Password** box, type the password for the farm administrator.

- 
7. In the **Domain** box, type the domain that contains the farm administrator account, and then click **Next**.
  8. In the **Specify export file name and location** box, type or click browse to select the path and file name to use for the exported key, and then click **Next**.  
The key is exported as a file that has a .BIN file name extension.
  9. Verify the information, and then click **Finish**.  
A message appears indicating that the key was successfully exported.
  10. Click **Close** to close the Microsoft Identity Integration Server Key Management Utility.
- For more information, see [Back up a User Profile Service application \(SharePoint Server 2010\)](#).

[Back to top](#)

## Restore a backup copy of the database

After you configure the new SharePoint 2013 Preview server farm, you can restore the backup copies of the databases to SQL Server 2008 R2. Start with one database, and then verify that the restoration has worked before you restore the other databases.

### **Important:**

Be sure to keep a copy of your original backups in reserve, just in case upgrade fails and you have to troubleshoot and try again.

### **To restore a backup copy of a database in SQL Server 2008 R2**

1. Verify that the user account that is performing this procedure is a member of the **db\_owner** fixed database role for the databases.
2. After you connect to the appropriate instance of the SQL Server 2008 Database Engine, in Object Explorer, expand the server name.
3. Right-click **Databases**, and then click **Restore Database**.  
The **Restore Database** dialog box appears.
4. In the **Restore Database** dialog box, on the **General** page, type the name of the database to be restored in the **To database** list.

### **Tip:**

When you type the name for the restored database, you do not have to use the original name. If you want to change the database name from a name with a long GUID to a shorter, more friendly name, this is an opportunity to make that change. Be sure to also change the database and log file names in the file system (the MDF and LDF files) so that they match.

5. In the **To a point in time** text box, keep the default (**Most recent possible**).
6. To specify the source and location of the backup sets to restore, click **From device**, and then use the browse button to select the backup file.
7. In the **Specify Backup** dialog box, in the **Backup media** box, be sure that **File** is selected.

- 
8. In the **Backup location** area, click **Add**.
  9. In the **Locate Backup File** dialog box, select the file that you want to restore, click **OK**, and then, in the **Specify Backup** dialog box, click **OK**.
  10. In the **Restore Database** dialog box, under **Select the backup sets to restore** grid, select the **Restore** check box next to the most recent full backup.
  11. In the **Restore Database** dialog box, on the **Options** page, under **Restore options**, select the **Overwrite the existing database** check box.
  12. Click **OK** to start the restore process.

[Back to top](#)

## Set the databases to read-write

You must also set the databases back to read-write on your SharePoint 2013 Preview farm before you attach and upgrade them.

### To set a database to read-write in SQL Server

1. In SQL Server Management Studio, in Object Explorer, connect to an instance of the Database Engine, expand the server, and then expand **Databases**.
2. Select the database that you want to configure to be read-write, right-click the database, and then click **Properties**.
3. In the **Database Properties** dialog box, in the **Select a page** section, click **Options**.
4. In the details pane, under **Other options**, in the **State** section, next to **Database Read-Only**, click the arrow, and then select **False**.

[Back to top](#)

## About upgrading the service application databases

To upgrade a service application database, you create a new service application and provide the name of the existing database to use for the new service application. As the service application is created, the database is upgraded. This process has several steps.

1. Start the service instances  
The first step is to start service instances for the five service applications that you can upgrade: the Business Data Connectivity service, Managed Metadata Web Service, PerformancePoint Services service, Secure Store service, User Profile service, and Search service. Most of these service instances can be started from Central Administration. However the SharePoint Server Search service instance must be started by using Windows PowerShell.
2. Create the service applications and upgrade the databases  
After you have started the service instances, the next step is to create the service applications and upgrade the databases. You must use Windows PowerShell to restore the service application databases.
3. Create proxies for the service applications

---

After you have upgraded the service application databases, you create the proxies for the service applications and add them to the default proxy group. You must create proxies for the following service applications:

- Managed Metadata service application
- Search service application
- Secure Store service application
- PerformancePoint Services service application
- User Profile service application

The Business Data Connectivity service application automatically creates a proxy and assigns it to the default proxy group when you create the service application.

#### 4. Verify that the proxies are in the default group

The following sections provide procedures to complete these steps.

#### **Note:**

The Business Data Connectivity service application is available in both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview. The other service applications are available only in SharePoint Server 2013 Preview. Although SharePoint Foundation 2013 Preview includes search functionality, it is not the same Search service application that is in SharePoint Server 2013 Preview and it cannot be upgraded.

[Back to top](#)

## Start the service instances

The following procedures start the service instances.

### To start service application instances from Central Administration

1. In SharePoint 2013 Central Administration, on the **Application Management** page, in the **Service Applications** section, click **Manage Services on Server**.
2. Next to the **Business Data Connectivity service**, click **Start**.
3. Next to the **Managed Metadata Web Service**, click **Start**.
4. Next to the **PerformancePoint Services service**, click **Start**.
5. Next to the **Secure Store Service**, click **Start**.
6. Next to the **User Profile Service**, click **Start**.

The Search service instance must be started by using Windows PowerShell because you cannot start it from Central Administration unless a Search Service application already exists.

### To start the Search service instance by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.

---

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. To start the Search service instance, at the Windows PowerShell command prompt, type the following commands and press **ENTER** after each one:  

```
$SearchInst = Get-SPEnterpriseSearchServiceInstance
Stores the identity for the Search service instance on this server as a variable
Start-SPServiceInstance $SearchInst
Starts the service instance
```

For more information, see [Get-SPEnterpriseSearchServiceInstance](#) and [Start-SPServiceInstance](#).

[Back to top](#)

## Upgrade the Secure Store service application

To upgrade the Secure Store service application, you create the new service application and upgrade the database, create a proxy and add it to the default proxy group, and then restore the passphrase from the previous environment.

### To upgrade the Secure Store service application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.  
An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. To store the application pool for a particular service application as a variable, at the Windows PowerShell command prompt, type the following command:

---

#### Windows PowerShell

```
$applicationPool = Get-SPServiceApplicationPool -Identity `SharePoint Web Services default`
```

Where:

- *SharePoint Web Services default* is the name of the service application pool that will contain the new service applications.

This cmdlet sets the service application pool as a variable that you can use again in the cmdlets that follow. If you have multiple application pools and have to use a different application pool for a particular service application, you can repeat this step to get the appropriate application pool before you create the service application.

6. To upgrade the Secure Store service application, at the Windows PowerShell command prompt, type the following command:

#### Windows PowerShell

```
$sss = New-SPSecureStoreServiceApplication -Name `Secure Store` -ApplicationPool $applicationPool -DatabaseName `SecureStore_Upgrade_DB` -AuditingEnabled
```

Where:

- *SecureStore* is the name that you want to give the new Secure Store service application.
- *SecureStore\_Upgrade\_DB* is the name of the service application database that you want to upgrade.

This command sets a variable, *\$sss*, that you use when you create the proxy later.

For more information, see [New-SPSecureStoreApplication](#).

After you create the Secure Store service application and upgrade the database, you have to refresh the encryption key. For information about how to refresh the encryption key, see [Refresh the encryption key](#).

7. Type the following command to create a proxy for the Secure Store service application:

#### Windows PowerShell

```
New-SPSecureStoreServiceApplicationProxy -Name ProxyName -ServiceApplication $sss -DefaultProxyGroup
```

Where:

- *ProxyName* is the proxy name that you want to use.
- *\$sss* is the variable that you set earlier to identify the new Secure Store service application.

#### Tip:

If you do not use the variable *\$sss*, then you must use an ID to identify the Secure Store service application instead of a name. If you have to find the ID, you can run the **Get-SPServiceApplication** cmdlet to return a list of all service application IDs.

- *DefaultProxyGroup* adds the Secure Store service application proxy to the default proxy group for the local farm.

For more information, see [New-SPSecureStoreServiceApplicationProxy](#).

8. Type the following command to restore the passphrase for the Secure Store service application:

```
Update-SPSecureStoreApplicationServerKey -Passphrase <Passphrase>
```

---

Where:

- *<Passphrase>* is the Passphrase for the Secure Store service application from your previous environment.

For more information, see [Update-SPSecureStoreApplicationServerKey](#).

[Back to top](#)

## Upgrade the Business Data Connectivity service application

To upgrade the Business Data Connectivity service application, you create the new service application and upgrade the database. You do not have to create a proxy for the Business Data Connectivity service application. The Business Data Connectivity service application automatically creates a proxy and assigns it to the default proxy group when you create the service application.

### Note:

The Business Data Connectivity service application is available in both SharePoint Foundation 2013 Preview and SharePoint Server 2013 Preview.

### To upgrade the Business Data Connectivity service application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

### Note:

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. To store the application pool for a particular service application as a variable, at the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
$applicationPool = Get-SPServiceApplicationPool -Identity 'SharePoint Web Services default'
```

Where:

- 
- *SharePoint Web Services default* is the name of the service application pool that will contain the new service applications.

This cmdlet sets the service application pool as a variable that you can use again in the cmdlets that follow. If you have multiple application pools and have to use a different application pool for a particular service application, you can repeat this step to get the appropriate application pool before you create the service application.

6. To upgrade the Business Data Connectivity service application, at the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
New-SPBusinessDataCatalogServiceApplication -Name 'BDC Service' -ApplicationPool $applicationPool -DatabaseName 'BDC_Service_DB'
```

Where:

- *BDC Service* is the name that you want to give the new Business Data Connectivity service application.
- *BDC\_Service\_DB* is name of the service application database that you want to upgrade.

For more information, see [New-SPBusinessDataCatalogServiceApplication](#).

[Back to top](#)

## Upgrade the Managed Metadata service application

To upgrade the Managed Metadata service application, you create the new service application and upgrade the database, and then create a proxy and add it to the default proxy group. You must upgrade the Managed Metadata service application before you can upgrade the User Profile service application.

### To upgrade the Managed Metadata service application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

#### **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.

- 
5. To store the application pool for a particular service application as a variable, at the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
$applicationPool = Get-SPServiceApplicationPool -Identity 'SharePoint Web Services default'
```

Where:

- *SharePoint Web Services default* is the name of the service application pool that will contain the new service applications.

This cmdlet sets the service application pool as a variable that you can use again in the cmdlets that follow. If you have multiple application pools and have to use a different application pool for a particular service application, you can repeat this step to get the appropriate application pool before you create the service application.

6. To upgrade the Managed Metadata service application, at the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
$mms = New-SPMetadataServiceApplication -Name 'Managed Metadata Service Application' -ApplicationPool $applicationPool -DatabaseName 'Managed Metadata Service_DB'
```

Where:

- *Managed Metadata Service Application* is the name that you want to give the new Managed Metadata service application.
- *Managed Metadata Service\_DB* is name of the service application database that you want to upgrade.

This command sets a variable, \$mms, that you use when you create the proxy later.

For more information, see [New-SPMetadataServiceApplication](#).

7. At the Windows PowerShell command prompt, type the following command to create a proxy for the Managed Metadata service application:

**Windows PowerShell**

```
New-SPMetadataServiceApplicationProxy -Name ProxyName -ServiceApplication $mmd -DefaultProxyGroup
```

Where:

- *ProxyName* is the proxy name that you want to use.
- \$mmd is the variable that you set earlier to identify the new Managed Metadata service application.
- *DefaultProxyGroup* adds the Managed Metadata service application proxy to the default proxy group for the local farm.

For more information, see [New-SPMetadataServiceApplicationProxy](#).

[Back to top](#)

---

# Upgrade the User Profile service application

To upgrade the User Profile service application, you create the new service application and upgrade the database, and then create a proxy and add it to the default proxy group. After you have created the User Profile Service service application, you must import the Microsoft Identity Integration Server Key (MIIS) encryption key. Finally, you can start the User Profile Synchronization service.

 **Note:**

You must upgrade the Managed Metadata service application before you can upgrade the User Profile service application.

## To upgrade the User Profile service application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. To store the application pool for a particular service application as a variable, at the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
$applicationPool = Get-SPServiceApplicationPool -Identity 'SharePoint Web Services default'
```

Where:

- *SharePoint Web Services default* is the name of the service application pool that will contain the new service applications.

This cmdlet sets the service application pool as a variable that you can use again in the cmdlets that follow. If you have multiple application pools and have to use a different application pool for a particular service application, you can repeat this step to get the appropriate application pool before you create the service application.
6. To upgrade the User Profile service application, at the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

---

```
$upa = New-SPProfileServiceApplication -Name 'User Profile Service Application' -
ApplicationPool $applicationPool -ProfileDBName 'User Profile Service
Application_ProfileDB' -SocialDBName 'User Profile Service Application_SocialDB'
-ProfileSyncDBName 'User Profile Service Application_SyncDB'
```

Where:

- *User Profile Service Application* is the name that you want to give the new User Profile service application.
- *User Profile Service Application\_ProfileDB* is name of the User Profile service application Profile database that you want to upgrade.
- *User Profile Service Application\_SocialDB* is name of the User Profile service application Social database that you want to upgrade.
- *User Profile Service Application\_SyncDB* is name of the User Profile service application Sync database that you want to upgrade.

This command sets a variable, \$upa, that you use when you create the proxy later.

For more information, see [New-SPProfileServiceApplication](#).

7. Type the following command to create a proxy for the User Profile service application:

**Windows PowerShell**

```
New-SPProfileServiceApplicationProxy -Name ProxyName -ServiceApplication
ServiceApplicationID -DefaultProxyGroup
```

Where:

- *ProxyName* is the proxy name that you want to use.
- \$upa is the variable that you set earlier to identify the new User Profile service application.
- *ServiceApplicationID* is ID of the User Profile service application that you created earlier.

**Tip:**

If you do not use the variable \$upa, then you must use an ID to identify the User Profile service application instead of a name. If you have to find the ID, you can run the **Get-SPServiceApplication** cmdlet to return a list of all service application IDs.

- *DefaultProxyGroup* adds the User Profile service application proxy to the default proxy group for the local farm.

For more information, see [New-SPProfileServiceApplicationProxy](#).

After you have created the User Profile Service service application, you must import the Microsoft Identity Integration Server Key (MIIS) encryption key. Import this key to the following directory: *<root directory drive>\Program Files\Microsoft Office Servers\15.0\Synchronization Service\Bin*.

## To import the encryption key for User Profile service application

1. Verify that you have the following memberships:
  - Administrators group on the server on which you are running the command.
2. Open the Command Prompt window, and then change to the following folder:  
%Program Files%\Microsoft Office Servers\15.0\Synchronization Service\Bin\
3. To import the key, type the following at the command prompt, and then press ENTER:

---

```
miiskmu.exe /i Path {0E19E162-827E-4077-82D4-E6ABD531636E}
```

Where:

- *Path* is the path and file name for the key that you want to import.  
You might also have to enter a user name and password. These are the credentials for the farm administrator.

For more information, see [Install a software update \(SharePoint Server 2010\)](#).

After you have imported the encryption key, you can start the User Profile Synchronization service.

## Start the User Profile Synchronization service

1. In Central Administration, on the **System Settings** page, under Servers click **Manage services on Server**.
2. Next to the User Profile Synchronization Service, click **Start**.
3. In the **Select the User Profile Application** section, select the User Profile service application that you upgraded.
4. In the **Service Account Name and Password** section, type the account name and password to use for the User Profile Synchronization service.

[Back to top](#)

## Upgrade the PerformancePoint Services service application

To upgrade the PerformancePoint Services service application, you create the new service application and upgrade the database, and then create a proxy and add it to the default proxy group.

### To upgrade the PerformancePoint Services service application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.  
An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

#### **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.

---

4. Click **SharePoint 2013 Management Shell**.

5. To store the application pool for a particular service application as a variable, at the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
$applicationPool = Get-SPServiceApplicationPool -Identity 'SharePoint Web Services default'
```

Where:

- *SharePoint Web Services default* is the name of the service application pool that will contain the new service applications.

This cmdlet sets the service application pool as a variable that you can use again in the cmdlets that follow. If you have multiple application pools and have to use a different application pool for a particular service application, you can repeat this step to get the appropriate application pool before you create the service application.

6. To upgrade the PerformancePoint Services service application, at the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
$pps = New-SPPerformancePointServiceApplication -Name 'PerformancePoint Service' -ApplicationPool $applicationPool -DatabaseName 'PerformancePoint Service Application_DB'
```

Where:

- *PerformancePoint Service* is the name that you want to give the new PerformancePoint Services service application.
- *PerformancePoint Service Application\_DB* is name of the PerformancePoint Services service application database that you want to upgrade.

This command sets a variable, \$pps, that you use when you create the proxy later.

For more information, see [New-SPPProfileServiceApplication](#).

7. Type the following command to create a proxy for the PerformancePoint Services service application:

**Windows PowerShell**

```
New-SPPerformancePointServiceApplicationProxy -Name ProxyName -ServiceApplication ServiceApplicationNameorID -Default
```

Where:

- *ProxyName* is the proxy name that you want to use.
- \$pps is the variable that you set earlier to identify the new PerformancePoint Services service application.
- *Default* adds the PerformancePoint Services service application proxy to the default proxy group for the local farm.

For more information, see [New-SPPerformancePointServiceApplicationProxy](#).

[Back to top](#)

---

# Upgrade the Search service application

To upgrade the Search service application, you create the new service application and upgrade the database, and then create a proxy and add it to the default proxy group.

 **Note:**

This section applies to only SharePoint Server 2013 Preview. Although SharePoint Foundation 2013 Preview includes search functionality, it is not the same Search service application that is in SharePoint Server 2013 Preview and it cannot be upgraded.

## To upgrade the Search service application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. To store the application pool for a particular service application as a variable, at the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
$applicationPool = Get-SPServiceApplicationPool -Identity 'SharePoint Web Services default'
```

Where:

- *SharePoint Web Services default* is the name of the service application pool that will contain the new service applications.  
This cmdlet sets the service application pool as a variable that you can use again in the cmdlets that follow. If you have multiple application pools and have to use a different application pool for a particular service application, you can repeat this step to get the appropriate application pool before you create the service application.
6. To upgrade the Search service application, at the Windows PowerShell command prompt, type the following command:

```
$searchInst = Get-SPEnterpriseSearchServiceInstance -local
Gets the Search service instance and sets a variable to use in the next command
```

---

```
Restore-SPEnterpriseSearchServiceApplication -Name '<SearchServiceApplicationName>' -
applicationpool $applicationPool -databasename '<SearchServiceApplicationDBName>' -
databaseserver <ServerName> -AdminSearchServiceInstance $searchInst
```

Where:

- *SearchServiceApplicationName* is the name of the Search service application.
- *AppPoolName* is the application pool name.
- *SearchServiceApplicationDBName* is the name of the Search service application Administration database that you want to upgrade.
- *AdminSearchServiceInstanceID* is the ID for the Search Service application instance.

 **Note:**

A Search service application upgrade might fail because of an issue that occurs during upgrade, such as network or SQL Server latency. If an error message appears during the Search service application upgrade, do the following:

- a) Delete the Search Administration database that you were trying to upgrade.
- b) Using the backup copy that you made of the Search Administration database, repeat the following procedures in this article for the Search service application only:
  - i. [Restore a backup copy of the database](#)
  - ii. [Set the databases to read-write](#)
- c) Upgrade the Search service application by typing the command again at the Windows PowerShell command prompt.

For more information, see [Restore-SPEnterpriseSearchServiceApplication](#).

You must follow several steps to create the Search service application proxy and add it to the default proxy group. You must complete separate actions to find the ID for the Search service application, create the new proxy, get the proxy ID, and then add the proxy to the default proxy group.

7. Type the following command to get the ID for the Search service application and store it as a variable:

**Windows PowerShell**

```
$ssa = Get-SPEnterpriseSearchServiceApplication
```

For more information, see [Get-SPEnterpriseSearchServiceApplication](#).

8. Type the following command to create a proxy for the Search service application:

**Windows PowerShell**

```
New-SPEnterpriseSearchServiceApplicationProxy -Name ProxyName -SearchApplication $ssa
```

Where:

- *ProxyName* is the proxy name that you want to use.
- *\$ssa* is the variable that you set earlier to identify the new Search service application.  
For more information, see [New-SPEnterpriseSearchServiceApplicationProxy](#).

- 
9. Type the following command to get the Search service application proxy ID for the proxy you just created and set it as the variable \$ssap:

**Windows PowerShell**

```
$ssap = Get-SPEnterpriseSearchServiceApplicationProxy
```

For more information, see [Get-SPEnterpriseSearchServiceApplicationProxy](#).

10. Type the following command to add the Search service application proxy to the default proxy group:

**Windows PowerShell**

```
Add-SPServiceApplicationProxyGroupMember -member $ssap -identity " "
```

Where:

- \$ssap is the variable that you set earlier to identify the ID for the proxy you just created for the Search service application.
- You use an empty **identity** parameter (" ") to add it to the default group.  
For more information, see [Add-SPServiceApplicationProxyGroupMember](#).

[Back to top](#)

## Verify that all of the new proxies are in the default proxy group

Use the following procedure to verify that the steps to create the proxies and add them to the default proxy group worked.

### To verify that all of the new proxies are in the default proxy group by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.  
An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following commands:

---

```
$pg = Get-SPServiceApplicationProxyGroup -Identity " "
$pg.Proxies
```

Where:

- \$pg is a variable you set to represent the default proxy group.
- You use an empty **identity** parameter (" ") to specify the default proxy group.  
This returns a list of all proxies in the default proxy group, their display names, type names, and IDs.

For more information, see [Get-SPServiceApplicationProxyGroup](#).

Now that the service applications are upgraded, you can start the process to upgrade the content databases. The first step in that process is to create the web applications that are needed for each content database.

[Back to top](#)

## Create web applications

Create a web application for each web application that existed in the SharePoint 2010 Products environment. For each web application, do the following:

- Use the same URL and configure alternate-access mapping settings.  
If you use a different URL, Office applications might not be redirected correctly to the new URLs and all bookmarks to the old URLs will not work.
- Use the same authentication method.  
For example, if you use Windows Classic authentication in your old environment, and you want to continue to use it, then you must create a web application that uses Windows Classic authentication. Because claims-based authentication is now the default option for SharePoint 2013 Preview, you must use Windows PowerShell to create a web application that uses Windows Classic authentication. For more information, see [Create web applications that use classic mode authentication in SharePoint 2013 Preview](#) and [Create claims-based web applications in SharePoint 2013 Preview](#).
- Recreate included paths.
- Recreate quota templates.
- Configure email settings for the web application.  
For more information, see [Configure email integration for a SharePoint 2013 Preview farm](#).
- Enable self-service site creation for any web application that used it in the previous environment.  
Recreate any self-service site creation settings.
- Create the managed path for the My Sites (/personal) on the web application that hosts My Sites.  
My Sites are available in SharePoint Server only.
- Recreate any web application policies or other web application settings that you had configured in the previous environment.

[Back to top](#)

---

## Reapply customizations

One frequent cause of failures during upgrade is that the new environment does not have customized features, solutions, or other elements. Make sure that all custom elements from the SharePoint 2010 Products environment are installed on your front-end web servers before you upgrade any content databases.

In this step, you manually transfer all customizations to your new farm. Make sure to install any components that your sites depend on to work correctly, such as the following:

- Custom site definitions
- Custom style sheets, such as cascading style sheets, and images
- Custom Web Parts
- Custom Web services
- Custom features and solutions
- Custom assemblies
- Web.config changes (such as security)

Ensure that you transfer all unique settings from the Web.config files for each web application to the new servers.

- Administrator-approved form templates (.xsn files) and data connection files (.udcx files) for InfoPath. InfoPath is available in SharePoint Server 2010 only.
- Any other components or files on which your sites depend.

SharePoint 2013 Preview can host sites in both SharePoint 2010 Products and SharePoint 2013 Preview modes. The installation for SharePoint 2013 Preview contains both SharePoint 2010 Products and SharePoint 2013 Preview versions of many elements. The directories on the file system are duplicated in both the /14 and /15 paths, for example:

- Web Server Extensions/14/TEMPLATE/Features
- Web Server Extensions/15/TEMPLATE/Features

There are also two versions of the IIS support directories: \_Layouts, \_Layouts/15 and \_ControlTemplates, \_ControlTemplates/15.

Be sure to install customizations to the correct location in your new farm. For example, additional style sheets for SharePoint 2010 Products should be installed in the /14 path, not the new /15 path so that site collections that you haven't upgraded can use them. If you want a solution to be available to both paths, install it two times, and the second time use the **addtolatest** parameter when you install it, and it will be installed to the /15 path. For more information, see [Install-SPSolution](#).

For more information about how to update customizations for use in SharePoint 2013 Preview, see [Redeploying Customizations and Solutions in SharePoint Foundation 2010 and SharePoint Server 2010](#). For more information about how to deploy customizations to your environment, see [Deploy customizations - overview \(SharePoint Server 2010\)](#).

[Back to top](#)

---

## Verify custom components

To make sure that you have identified all custom components for your environment, use the **Stsadm -o enumallwebs** operation in the SharePoint 2010 Products environment and use the **includefeatures** and **includewebparts** parameters. This operation can report the templates, features, Web Parts, and other custom elements that are used for each site. For more information about how to use the **enumallwebs** operation, see [Enumallwebs: Stsadm operation \(Office SharePoint Server\)](#) and [Clean up an environment before an upgrade to SharePoint 2013 Preview](#).

You can also use the **Get-SPWeb** Windows PowerShell cmdlet in your SharePoint 2010 Products environment to see template that are associated with each site and then verify that the template is installed in your SharePoint 2013 Preview environment. For more information about this operation, see [Get-SPWeb](#).

Before you attach the content databases to the web applications, use the **Test-SPContentDatabase** Windows PowerShell cmdlet to verify that you have all the custom components that you must have for that database.

### To verify custom components are available by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```
Windows PowerShell
```

```
Test-SPContentDatabase -Name DatabaseName -WebApplication URL
```

Where:

- *DatabaseName* is the name of the database that you want to test.
- *URL* is the URL for the web application that will host the sites.

For more information, see [Test-SPContentDatabase](#).

[Back to top](#)

---

# Attach a content database to a web application and upgrade the database

When you attach a content database, you upgrade the database and add the site collections in that database to the web application that you specify. However, for SharePoint 2013 Preview, the process does not upgrade the site collections.

When you attach a content database, include the root site for the web application in the first content database that you attach. In other words, before you continue, examine the root of the web application in the SharePoint 2010 Products server farm to determine the first site collection. After you attach the database that contains the root site, attach the other content databases for the web application in any order. You do not have to create any site collections to store the content before you attach the database. This process attaches the content databases and the site collections inside that database. Make sure that you do not add new site collections until you have restored all the content databases.

## Tip:

Each site collection in a content database has a GUID that is registered in the configuration database and associated with the site collection. Therefore, you cannot add the same site collection two times to the farm, even in separate web applications. Although you can successfully attach the database in this situation, you will be unable to browse to the site collection.

If you must have a copy of a site collection in the same farm, first attach the database that contains the site collection to a separate farm, and then use the **Backup-SPSite** and **Restore-SPSite** Windows PowerShell cmdlets to copy the site collection to the other farm. The backup and restore process creates a new GUID for the site collection. For more information about these cmdlets, see [Backup-SPSite](#) and [Restore-SPSite](#).

For My Sites, attach the content database that contains the My Site host before attaching databases that contain the My Sites.

By default, when you created the web applications in the new SharePoint 2013 Preview environment, a content database was created for each web application. You can ignore these default databases until after you have attached your SharePoint 2010 Products databases, and then you can delete the default databases.

## Important:

If you are moving the content databases across domains or forests or to another environment that has different service accounts, make sure that the permissions for the service accounts are still correct before you attach the databases.

You must use the **Mount-SPContentDatabase** cmdlet to attach a content database to a web application. Using the SharePoint Central Administration pages to attach a content database is not supported for upgrading.

Ensure that the account that you use to attach the databases is a member of the **db\_owner** fixed database role for the content databases that you want to upgrade.

---

 **Note:**

One frequent cause of failures during upgrade is that the environment is missing customized features, solutions, or other elements. Be sure that all custom elements from the SharePoint 2010 Productsenvironment are installed on your front-end web servers in the SharePoint 2013 Preview environment before you start the upgrade process. Use the **test-spcontentdatabase** Windows PowerShell cmdlet to identify custom elements that your sites might be missing.

## To attach a content database to a web application by using Windows PowerShell

1. Verify that you have the following memberships:

- **securityadmin** fixed server role on the SQL Server instance.
- **db\_owner** fixed database role on all databases that are to be updated.
- Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.

3. Click **Microsoft SharePoint 2013 Products**.

4. Click **SharePoint 2013 Management Shell**.

5. At the Windows PowerShell command prompt, type the following command:

```
Windows PowerShell
```

```
Mount-SPContentDatabase -Name DatabaseName -DatabaseServer ServerName -WebApplication
URL
```

Where:

- *DatabaseName* is the name of the database that you want to upgrade.
- *ServerName* is server on which the database is stored.
- *URL* is the URL for the web application that will host the sites.

For more information, see [Mount-SPContentDatabase](#).

 **Tip:**

To upgrade from SharePoint Foundation 2010 to SharePoint Server 2013 Preview, attach the SharePoint Foundation 2010 content databases directly to the SharePoint Server 2013 Preview environment. Just follow the same steps in this article, only use the SharePoint Foundation 2010 databases and a SharePoint Server 2013 Preview farm. The upgrade process will upgrade the version and the product at the same time.

[Back to top](#)

---

## Verification: Verify upgrade for the first database

After you attach a database, you can use the **Upgrade Status** page in Central Administration to check the status of upgrade on your databases. After the upgrade process is complete, you can review the upgrade log file to see whether upgrade produced issues. You can use a Windows PowerShell cmdlet to check the upgrade status for all the content databases. For more information about verifying and troubleshooting upgrade, see [Verify database upgrades in SharePoint 2013 Preview](#) and [Troubleshoot database upgrade issues in SharePoint 2013 Preview](#).

### To view the Upgrade Status page

- Verify that the user account that is performing this procedure is a member of the **db\_owner** fixed database role for the databases.
- In Central Administration, click **Upgrade and Migration**, and then click **Check upgrade status**.

### To view the upgrade log file

- The upgrade error log file and the upgrade log file are located at %COMMONPROGRAMFILES%\Microsoft Shared\web server extensions\15\LOGS. The upgrade log file contains more detailed information than the upgrade error log. Be sure to check the summary at the bottom of the log files for information about the overall status and a count of the warnings and errors in the file.

The logs are text files named in the following format:

- *Upgrade-YYYYMMDD-HHMMSS-SSS-error.log*
  - *Upgrade-YYYYMMDD-HHMMSS-SSS.log*
- Where
- *YYYYMMDD* is the date
  - *HHMMSS-SSS* is the time (hours in 24-hour clock format, minutes, seconds, and milliseconds)

An example for an upgrade error log is *Upgrade-20120105-132126-374-error.log*, and an example for an upgrade log is *Upgrade-20120105-132126-374.log*.

#### Note:

The format of the upgrade log for SharePoint 2013 Preview is based on the same structure as ULS.

The upgrade log file includes the name of the content database being upgraded.

### To view upgrade status for all databases by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
Get-SPContentDatabase | ft Name, NeedsUpgradeIncludeChildren
```

This cmdlet returns a table-style list of databases in your farm and indicates whether the database needs an upgrade to SharePoint 2013 Preview.

[Back to top](#)

## Attach the remaining databases

After you restore the first content database and verify success, you can continue to restore and upgrade other databases. You can perform parallel database attach upgrades to upgrade more than one database at a time. Use separate Command Prompt windows to run multiple upgrades. It is recommended that you separate the start time for each new database upgrade session by several minutes to prevent issues with temporary locks set for the web application during attachment. Otherwise you might receive an error on the upgrade session. The wait time to clear temporary locks varies depending on the number of site collections, or the speed of the database server hardware.

[Back to top](#)

## Verification: Verify upgrade for additional databases

After you upgrade all additional databases, view the Upgrade Status page to monitor progress and verify that the upgrade process is complete. Review the log file to identify any other issues.

[Back to top](#)

## Next steps

After you upgrade the databases, you might want to perform additional steps to make sure that your farm is ready for use. For example:

- Verify that site collections are working as expecting in 2010 mode.  
Visually review site collections. You can use a similar review list as the one provided for upgraded sites in [Checklists for reviewing upgraded sites](#).
- Migrate user accounts to claims authentication, if it is necessary.  
By default, new web applications in SharePoint 2013 Preview use claims authentication. If you were using classic authentication in the previous environment, you must migrate the users to claims

---

authentication. For more information, see [Migrate from classic-mode to claims-based authentication in SharePoint 2013 Preview](#).

- Update links that are used in any upgraded InfoPath form templates.

For a database-attach upgrade, you exported and imported all InfoPath form templates in your environment when you created the new environment. After upgrade, you can now update the links that are used in those upgraded form templates to point to the correct URLs by using a Windows PowerShell cmdlet.

For more information, see [Configure InfoPath Forms Services \(SharePoint Server 2010\)](#).

InfoPath is available in SharePoint Server only.

- Configure your Search topology

The architecture for the Search service has changed for SharePoint Server 2013 Preview. Plan and configure your Search topology to suit your environment and the new architecture. For more information, see [Scale search for performance and availability \(SharePoint Server 2013 Preview\)](#) and [Manage search topology \(SharePoint Server 2013 Preview\)](#).

- Perform a full crawl

For more information, see [Start, pause, resume, or stop a crawl \(SharePoint Server 2013 Preview\)](#).

- Back up your farm

For more information, see [Back up a farm in SharePoint 2013 Products Preview](#).

Although SharePoint Foundation 2013 Preview includes search functionality, it is not the same Search service application that is in SharePoint Server 2013 Preview. These steps apply only to SharePoint Server 2013 Preview.

After your farm is ready, you can enable access to users, and then start to upgrade site collections. For information about how to upgrade site collections, see [Upgrade site collections to SharePoint 2013](#).

---

# Verify database upgrades in SharePoint 2013 Preview

---

After you upgrade databases to SharePoint 2013 Preview, you must verify that the content was successfully upgraded to the new version. You can verify the status of the database-attach upgrade (is it still in progress, or has it been completed successfully or with errors or failures?) to see whether issues remain for you to address. When you follow these steps as part of a trial upgrade, you can use them to identify customizations that have to be reworked before you attempt to upgrade your production environment. When you upgrade your production environment, it is even more important that you know whether the upgrade has completed and what issues remain to be addressed.

In some cases, you might have to restart upgrade to finish upgrading your databases. For more information about how to restart upgrade, see [Restart a database-attach upgrade or a site collection upgrade to SharePoint 2013 Preview](#). For information about how to restart a site collection upgrade, see [Manage site collection upgrades to SharePoint 2013 Preview](#).

## Verify upgrade status for databases

You can use the following methods to verify upgrade:

- Use the Upgrade Status page in Central Administration  
This page lists all farm, service, or content database upgrades and their statuses. This includes a count of errors or warnings.
- Review the log files to look for errors or warnings  
If upgrade was not successfully completed, you can view the log files to find the issues, address them, and then restart the upgrade process.

## Review the log files for database attach upgrade

To verify that upgrade has succeeded, you can review the following log and error files:

- The upgrade log file and the upgrade error log file.  
Review the upgrade log file and the upgrade error log file (generated when you run the upgrade). The upgrade log file and the upgrade error log file are located at %COMMONPROGRAMFILES%\Microsoft Shared\Web server extensions\15\LOGS. The logs are named in the following format: Upgrade-YYYYMMDD-HHMMSS-SSS.log, where YYYYMMDD is the date and HHMMSS-SSS is the time (hours in 24-hour clock format, minutes, seconds, and milliseconds). The upgrade error log file combines all errors and warnings in a shorter file and is named Upgrade-YYYYMMDD-HHMMSS-SSS-error.log.  
The format of the log files complies with the Unified Logging System (ULS) conventions. To review the log files to find and troubleshoot issues, start at the top of the files. Errors or warnings may be repeated if they occur for several site collections in the environment, or if they block the upgrade process completely. For example, if you cannot connect to the configuration database, the upgrade process will try (and fail) several times and these tries will be listed in the log file.

---

If you find blocking issues in the log file, you can resolve the issues and then restart upgrade to continue with the process.

## Check upgrade status for databases

The Upgrade Status page lists the upgrade sessions and gives details about the status of each session — whether it succeeded or failed, and how many errors or warnings occurred for each server. The Upgrade Status page also includes information about the log and error files for the upgrade process and suggests remedies for issues that might have occurred.

### To view upgrade status in SharePoint Central Administration

1. Verify that you have the following administrative credentials:
  - To use SharePoint Central Administration, you must be a member of the Farm Administrators group.
2. On the Central Administration home page, in the **Upgrade and Migration** section, click **Check upgrade status**.

## Validate the upgraded environment

After you determine whether upgrade was completed successfully, validate your environment. Review the following items:

- Service applications
  - Are they configured correctly?
  - Are the service application proxies configured the way that you want?
  - Do you have to create new connections between farms?
- Site collections
  - Are sites that were not upgraded working as expected in 2010 mode?
  - Are all features associated with the sites working?
- Search
  - Run a crawl, and review the log files.
  - Run search queries, and verify that the queries work as expected and provide appropriate results. Twenty-four hours later, view the query reports and look for issues.
  - Search for people and profiles.
  - Check any Search customizations to make sure that they work as expected.

---

# Migrate from classic-mode to claims-based authentication in SharePoint 2013 Preview

---

Claims-based authentication is an essential component to enable the advanced functionality of SharePoint 2013 Preview. To move classic-mode web applications from SharePoint 2010 Products to SharePoint 2013 Preview, you convert them to claims-based web applications within SharePoint 2010 Products, and then migrate them to SharePoint 2013 Preview. The procedures in this article illustrate various supported scenarios.

The Windows PowerShell **Convert-SPWebApplication** cmdlet in SharePoint 2013 Preview converts classic-mode web applications to claims-based web applications.

## Warning:

After you convert a web application to claims-based authentication, you cannot revert it to classic-mode authentication.

## Convert SharePoint 2010 Products classic-mode web applications to claims-based authentication in SharePoint 2010 Products and then migrate to SharePoint 2013 Preview

In SharePoint 2010 Products, complete the following procedure to convert an existing web application to claims-based authentication. After you convert the web application to claims-based authentication, complete the additional step to migrate the web application to SharePoint 2013 Preview. To complete this procedure, you need the following information:

- The URL of the web application that you are converting: *http://yourWebAppUrl*
- A user account to set as a site administrator: *yourDomain\yourUser*

### To convert a SharePoint 2010 Products web application to claims-based authentication

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running Windows PowerShell cmdlets.
  - You must read [about Execution Policies](http://go.microsoft.com/fwlink/p/?LinkId=193050) (<http://go.microsoft.com/fwlink/p/?LinkId=193050>).
  - Add memberships that are required beyond the minimums above.An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 15 Products cmdlets.

---

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. Paste the following code into a text editor, such as Notepad:

```
$WebAppName = "http://<yourWebAppUrl>"
$account = "<yourDomain>\<yourUser>"
$wa = get-SPWebApplication $WebAppName
```

```
Set-SPwebApplication $wa -AuthenticationProvider (New-SPAuthenticationProvider) -Zone
Default
```

Where:

- *<yourWebAppUrl>* is the URL of the web application.
  - *<yourDomain>\<yourUser>* is the domain to which the server belongs and the name of the user account.
3. Save the file and add the .ps1 extension, such as SuggestedNameOfFile.ps1.

 **Note:**

You can use a different file name, but you must save the file as an ANSI-encoded text file whose extension is .ps1.

4. On the **Start** menu, click **All Programs**.
5. Click **Microsoft SharePoint 2013 Products**.
6. Click **SharePoint 2013 Management Shell**.
7. Change to the directory where you saved the file.

**Windows PowerShell**

```
./SuggestedFileName.ps1
```

For more information, see [Get-SPWebApplication](#) and [Set-SPWebApplication](#).

8. At the **Migration** prompt, click **Yes** to continue. Wait for the migration to complete. Migration can take several hours to complete, depending on the number of users in each site collection.
9. Paste the following code into a text editor, such as Notepad:

This code specifies the user account as an administrator for the site:

```
$account = "<yourDomain>\<yourUser>"
$account = (New-SPClaimsPrincipal -identity $account -identitytype 1).ToEncodedString()
$zp = $wa.ZonePolicies("Default")
$p = $zp.Add($account,"PSPolicy")
$fc=$wa.PolicyRoles.GetSpecialRole("FullControl")
$p.PolicyRoleBindings.Add($fc)
$wa.Update()
```

Where:

- *<yourDomain>\<yourUser>* is the domain to which the server belongs and the name of the user account.

- 
10. Save the file and add the .ps1 extension, such as SuggestedNameOfFile.ps1.
  11. At the Windows PowerShell command prompt, type the following command:

```
Windows PowerShell
```

```
./SuggestedFileName.ps1
```

For more information, see [New-SPClaimsPrincipal](#).

**Note:**

We recommend that you use Windows PowerShell when performing command-line administrative tasks. The Stsadm command-line tool has been deprecated, but is included to support compatibility with previous product versions.

After you complete the previous procedures, you might experience one or more of the following issues:

- Users who submit valid credentials when accessing the migrated web application might be notified that they do not have permissions. If this occurs, the `portalsuperuseraccount` property and the `portalsuperreaderaccount` property of the web application were probably configured prior to migration. If this is the case, update the `portalsuperuseraccount` property and the `portalsuperreaderaccount` property to use the new claims-based account name. After migration, you can find the new claims-based account name in the web application policy for the migrated web application.
- If existing alerts are not invoked after migration, you might have to delete and recreate the alerts.
- If Search crawl does not function on the web application after migration, make sure that the Search crawl account lists the new converted account name. If the new converted account name is not listed, you must manually create a new policy for the crawl account.

## **To migrate a claims-based SharePoint 2010 Products web application to SharePoint 2013 Preview**

1. In SharePoint 2013 Preview, create a claims-based web application. For more information, see [Create claims-based web applications in SharePoint 2013 Preview](#).
2. Attach the two existing SharePoint 2010 Products content databases to the newly created SharePoint 2013 Preview claims-based web application.

**Note:**

When you attach the SharePoint 2010 Products content databases to the SharePoint 2013 Preview claims-based web application, the databases will be upgraded to the SharePoint 2013 Preview database format. You have to verify that the content databases work correctly after you attach them.

---

# Convert SharePoint 2010 Products classic-mode web applications to SharePoint 2013 Preview claims-based web applications

In SharePoint 2013 Preview, complete the following procedure to convert an existing SharePoint 2010 Products classic-mode web application to a SharePoint 2013 Preview web application that uses claims-based authentication.

## To convert a SharePoint 2010 Products classic-mode web application to a SharePoint 2013 Preview claims-based authentication

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running Windows PowerShell cmdlets.
  - You must read [about Execution Policies](http://go.microsoft.com/fwlink/p/?LinkId=193050) (<http://go.microsoft.com/fwlink/p/?LinkId=193050>).
  - Add memberships that are required beyond the minimums above.  
An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 15 Products cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

2. In the SharePoint 2013 Preview environment, on the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. Change to the directory where you saved the file.
6. At the Windows PowerShell command prompt, type the following command:  

```
New-SPWebApplication -name "ClassicAuthApp" -Port 100 -ApplicationPool "ClassicAuthAppPool" -ApplicationPoolAccount (Get-SPManagedAccount "<domainname>\<user>")
New-SPSite http:// <servername>:port -OwnerAlias "<domainname>\<user>" -name "ClassicAuthSC" -Template "STS#0"
```

Where:

- **<domainname>\<user>** is the domain to which the server belongs and the name of the user account.
- **<servername>** is the name of the server.
- **<domainname>\<user>** is the domain to which the server belongs and the name of the user account.

- 
7. Attach the two existing SharePoint 2010 Products content databases to the new SharePoint 2013 Preview classic-mode web application.

 **Note:**

When you attach the SharePoint 2010 Products content databases to the SharePoint 2013 Preview classic-mode web application, the databases are upgraded to the SharePoint 2013 Preview database format. You have to verify that the content databases work correctly after you have attached them.

8. From the Windows PowerShell command prompt, type the following:  
`Convert-SPWebApplication -Identity <yourWebAppUrl> -To Claims  
-RetainPermissions [ -Force]`

Where:

- `<yourWebAppUrl><domainname>\<user>` is the URL of the web application and the domain to which the server belongs.

 **Note:**

**Convert-SPWebApplication** converts the web application to claims-based authentication. You have to verify that the users can access the web application after you have converted it.

9. If necessary, attach a third SharePoint 2010 Products content database to the new SharePoint 2013 Preview classic-mode web application, and verify that the content database working correctly after you have attached it.
10. From the Windows PowerShell command prompt, type the following:  
`Convert-SPWebApplication -Identity yourWebAppUrl -To Claims  
-RetainPermissions [ -Force]`

Verify that users can access the web application after you have converted it to claims-based authentication.

For more information, see [New-SPWebApplication](#), [Get-SPManagedAccount](#), [New-SPSite](#), and [Convert-SPWebApplication](#).

 **Note:**

We recommend that you use Windows PowerShell when performing command-line administrative tasks. The Stsadm command-line tool has been deprecated, but is included to support compatibility with previous product versions.

## Convert SharePoint 2013 Preview classic-mode web applications to claims-based web applications

In SharePoint 2013 Preview, complete the following procedures to first create a classic-mode Web application, and then convert it to claims-based authentication.

---

## To create a classic-mode Web application in SharePoint 2013 Preview

- Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running Windows PowerShell cmdlets.
  - You must read [about Execution Policies](http://go.microsoft.com/fwlink/p/?LinkId=193050) (<http://go.microsoft.com/fwlink/p/?LinkId=193050>).
  - Add memberships that are required beyond the minimums above.An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 15 Products cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

- From the Windows PowerShell command prompt, type the following:

```
New-SPWebApplication -Name <Name>
-ApplicationPool <ApplicationPool>
-AuthenticationMethod <WindowsAuthType>
-ApplicationPoolAccount <ApplicationPoolAccount>
-Port <Port> -URL <URL>
```

Where:

- *<Name>* is the name of the new web application that uses classic-mode authentication.
- *<ApplicationPool>* is the name of the application pool.
- *<WindowsAuthType>* is either “NTLM” or “Kerberos”. Kerberos is recommended.
- *ApplicationPoolAccount* is the user account that this application pool will run as.
- *<Port>* is the port on which the web application will be created in IIS.
- *<URL>* is the public URL for the web application.

 **Note:**

For more information, see [New-SPWebApplication](#).

 **Note:**

After you successfully create the web application, when you open the Central Administration page, you see a health rule warning that indicates that one or more web applications is enabled with classic authentication mode. This is a reflection of our recommendation to use claims-based authentication instead of classic mode authentication.

---

## To convert a SharePoint 2013 Preview classic-mode web application to claims-based authentication

- From the Windows PowerShell command prompt, type the following:  
Convert-SPWebApplication -Identity "http:// <servername>:port" -To Claims  
-RetainPermissions [-Force]

Where:

- <servername> is the name of the server.

Verify that users can access the web application after you have converted it to claims-based authentication.

For more information, see [New-SPWebApplication](#), [Get-SPManagedAccount](#), [New-SPSite](#), and [Convert-SPWebApplication](#).

### Note:

We recommend that you use Windows PowerShell when performing command-line administrative tasks. The Stsadm command-line tool has been deprecated, but is included to support compatibility with previous product versions.

## Migrate SharePoint 2010 Products classic-mode web applications to SharePoint 2013 Preview classic-mode web applications

In SharePoint 2013 Preview, complete the following procedure to create a classic-mode web application, and then migrate an existing SharePoint 2010 Products classic-mode Web application to SharePoint 2013 Preview.

### To migrate a SharePoint 2010 Products classic-mode web application to SharePoint 2013 Preview

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running Windows PowerShell cmdlets.
  - You must read [about Execution Policies](http://go.microsoft.com/fwlink/p/?LinkId=193050) (<http://go.microsoft.com/fwlink/p/?LinkId=193050>).
  - Add memberships that are required beyond the minimums above.

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 15 Products cmdlets.

### Note:

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see Permissions and [Add-SPShellAdmin](#).

- 
2. From the Windows PowerShell command prompt, type the following:

```
New-SPWebApplication -name "ClassicAuthApp" -Port 100 -ApplicationPool
"ClassicAuthAppPool" -ApplicationPoolAccount (Get-SPManagedAccount
"<domainname>\<user>")
New-SPSite http:// <servername>:port -OwnerAlias "<domainname>\<user>" -name
"ClassicAuthSC" -Template "STS#0"
```

Where:

- *<domainname>\<user>* is the domain to which the server belongs and the name of the user account.
  - *<servername>* is the name of the server.
  - *<domainname>\<user>* is the domain to which the server belongs and the name of the user account.
3. Attach the two existing SharePoint 2010 Products content databases to the new SharePoint 2013 Preview classic-mode web application. Verify that the content databases work correctly after you have attached them.

For more information, see [New-SPWebApplication](#), [Get-SPManagedAccount](#), and [New-SPSite](#).

 **Note:**

We recommend that you use Windows PowerShell when performing command-line administrative tasks. The Stsadm command-line tool has been deprecated, but is included to support compatibility with previous product versions.

---

## Upgrade site collections to SharePoint 2013

---

The following downloadable resources, articles on TechNet, video recordings, and related resources provide information about upgrading site collections to SharePoint 2013 Preview.

### Downloadable resources how to upgrade site collections

Download the following content for information about how to upgrade site collections.

|                                                                                   | Content                                                                  | Description                                                       |

---

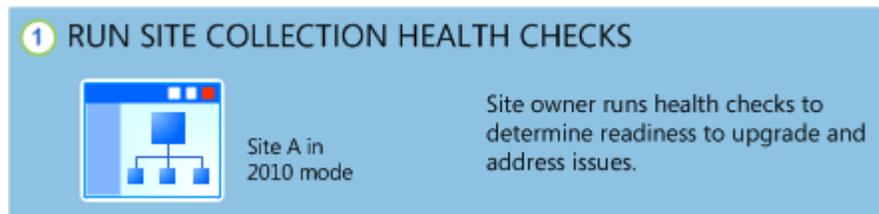

# Run site collection health checks in SharePoint 2013 Preview

---

SharePoint 2013 Preview includes a set of rules that you can run against a site collection to verify that it is working as expected. These rules are part of the site collection health checks. You can run the health checks from the Site Settings page or by using Windows PowerShell.

If you are upgrading a site collection to SharePoint 2013 Preview, the first step in the process is to run the health checks.

## Upgrade step 1: Run site collection health checks

For a visual overview of the entire upgrade process, see [Overview of the upgrade process to SharePoint 2013 Preview](#).

You run the health checks manually to prepare for an upgrade. In addition, the health checks are run automatically in repair mode when you start to upgrade a site collection. You can also run the health checks at any time to verify that a site is working as expected. The site collection pre-upgrade health checks examine a site collection and list potential upgrade issues, such as missing or unsupported elements. For example, the results itemize customized files so that you can identify the custom file and reset it to the default template in the site definition, if you want. After you run the checks, a report lists potential issues. The report also has information about how to address the issues.

The site collection health checker includes the following rules:

## Site collection health check rules

| Rule name                | Description                                                                                                                                                                              | Rule ID                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|
| <b>Customized Files</b>  | This rule checks for any files that were customized (or unghosted) in the site collection or subsites. When run in repair mode, it can reset the page to the default (reghost the file). | cd839b0d-9707-4950-8fac-f306cb920f6c |
| <b>Missing Galleries</b> | This rule checks for all default galleries and reports if any are missing from the site collection or subsites.                                                                          | ee967197-ccbe-4c00-88e4-e6fab81145e1 |

| Rule name                                   | Description                                                                                                                                                          | Rule ID                              |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|
| <b>Missing Site Templates</b>               | This rule checks to make sure that the template the site is based on is available and reports if any elements are missing.                                           | 5258ccf5-e7d6-4df7-b8ae-12fcc0513ebd |
| <b>Unsupported Language Pack References</b> | This rule checks to make sure that the language packs that are used by the site collection exist and are referenced correctly by the site collection.                | 99c946f7-5751-417c-89d3-b9c8bb2d1f66 |
| <b>Unsupported MUI References</b>           | This rule checks to make sure that the multi-user interface elements that are used by the site collection exist and are referenced correctly by the site collection. | 6da06aab-c539-4e0d-b111-b1da4408859a |

## Before you begin

This is the first step in upgrading a site collection. Before you upgrade a site collection, you must have already configured the environment that uses SharePoint 2013 Preview and upgraded the databases. For more information about these steps, see [Attach databases and upgrade to SharePoint 2013 Preview](#).

### Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

## Run the site collection pre-upgrade health checks by using Site Settings

Site collection owners can run the site collection health checks from the **Site Settings** page in their site collections.

---

## To run the pre-upgrade checks for a site collection

1. Verify that the user account that performs this procedure is a site collection administrator.
2. On the **Site Settings** page for the site collection, in the **Site Collection Administration** section, click **Site collection health checks**.
3. On the **Run site collection health checks** page, click **Start checks**.  
A report lists all checked issues and issues that you should resolve.
4. Resolve all issues, and then click **Try it again** to verify that you fixed them.

## Run the site collection pre-upgrade health checks by using Windows PowerShell

Farm administrators can use the following Windows PowerShell cmdlets to run the site collection health checks and to repair issues: **Test-SPSite Repair-SPSite**.

### To run the site collection health checks in test mode by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.
  - Either a site collection administrator or be granted full read (for test mode) for the web application by policy. For more information about permission policies for web applications, see [Manage permission policies for a web application \(SharePoint Server 2010\)](#).

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```
Test-SPSite -Identity <SiteURL> [-Rule <RuleID>]
```

Where:

- **<SiteURL>** is URL for the site collection you want to check.
- **<RuleID>** is ID for a specific rule that you want to run.

---

## To run the site collection health checks in repair mode by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.
  - Either a site collection administrator or be granted full control (for repair mode) for the web application by policy. For more information about permission policies for web applications, see [Manage permission policies for a web application \(SharePoint Server 2010\)](#).

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:  
`Repair-SPSite -Identity <SiteURL> [-Rule <RuleID>]`

Where:

- `<SiteURL>` is URL for the site collection you want to repair.
- `<RuleID>` is ID for a specific rule that you want to run.

## Additional steps

If you are performing an upgrade to SharePoint 2013 Preview, you can start the site collection upgrade after you have addressed all issues from the health checks. You can create an upgrade evaluation site to try the new user interface for your site, or you can upgrade your site collection directly. To learn about how to create evaluation site collections or upgrade a site collection, see [Upgrade a site collection to SharePoint 2013](#).

---

# Upgrade a site collection to SharePoint 2013

---

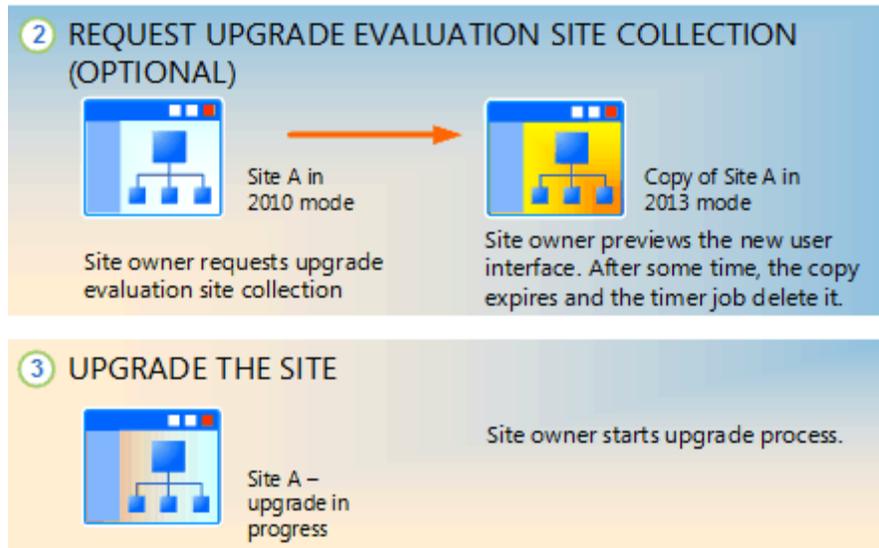

After a server farm administrator has upgraded the databases, site collection administrators can upgrade individual site collections. When site collection administrators first browse to their sites after the database has been upgraded, a notification bar at the top of the site indicates that their sites can be upgraded. The choices are to **Start now** or **Remind me later**. **Start now** begins the site collection upgrade process.

To upgrade a site collection, site collection administrators complete the following steps:

1. Run the site collection health checks to verify the site is ready to upgrade. For more information, see [Run site collection health checks in SharePoint 2013 Preview](#).
2. Create an upgrade evaluation site to preview the differences between versions. (Optional)
3. Upgrade the site collection.
4. Verify that upgrade was successful and the site works as expected. For more information, see [Review site collections upgraded to SharePoint 2013 Preview](#).

This article discusses the second and third steps, and includes procedures for performing these tasks from Site Settings. For information about using Windows PowerShell cmdlets to upgrade sites from the command line, see [Manage site collection upgrades to SharePoint 2013 Preview](#).

## Upgrade step 2: Request evaluation site collection and Step 3: Upgrade the site

For a visual overview of the upgrade process, including site collection upgrade, see [Overview of the upgrade process to SharePoint 2013 Preview](#). For more information about how farm administrators can control site collection upgrades, see [Manage site collection upgrades to SharePoint 2013 Preview](#). For more conceptual information about site upgrade, including how to plan for upgrade, see [Plan for site collection upgrades in SharePoint 2013 Preview](#).

---

### **Important:**

If you upgrade from SharePoint Server 2010 to SharePoint Server 2013 Preview, there are special considerations for My Sites. (My Sites are not available in SharePoint Foundation 2013 Preview.) Make sure that you upgrade the My Site Host site collection before you allow users to access their individual My Sites in SharePoint Server 2013 Preview. This makes sure that the server software and database changes are complete so that users can upgrade their individual My Sites successfully.

A user can upgrade his or her My Site by following the steps to upgrade a site collection later in this article, or a farm administrator can upgrade My Sites by using Windows PowerShell.

### **Note:**

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](http://go.microsoft.com/fwlink/p/?LinkId=246502) (http://go.microsoft.com/fwlink/p/?LinkId=246502)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 15 Products](http://go.microsoft.com/fwlink/p/?LinkId=246501) (http://go.microsoft.com/fwlink/p/?LinkId=246501)
- [Keyboard shortcuts](http://go.microsoft.com/fwlink/p/?LinkId=246504) (http://go.microsoft.com/fwlink/p/?LinkId=246504)
- [Touch](http://go.microsoft.com/fwlink/p/?LinkId=246506) (http://go.microsoft.com/fwlink/p/?LinkId=246506)

## Create an upgrade evaluation site (Optional)

As a site collection administrator, you can request a preview of your site collection; this is called an upgrade evaluation site collection. An upgrade evaluation site collection enables you to see your site's content in a new, separate copy of the site that is running on the SharePoint 2013 Preview. Unlike visual upgrade in SharePoint Server 2010, the upgrade evaluation site collection is a complete copy of the site collection, separate from the original. Actions that you take in the upgrade evaluation do not affect the original site.

When you request an evaluation site collection, the request is added to a Timer job (named "Create Upgrade Evaluation Site Collections") which runs once a day. You will receive an e-mail message when the upgrade evaluation site is available. This might take up to 24 hours. The message includes a link to the evaluation site. Upgrade evaluation site collections are set to automatically expire (after 30 days by default). If yours expires before you have finished evaluating the changes, you can request another upgrade evaluation site collection.

### To request an upgrade evaluation site collection

1. Verify that the user account that performs this procedure is a site collection administrator.
2. On the Site Settings page for the site collection, in the **Site Collection Administration** section, click **Site collection upgrade**.
3. On the Step up to SharePoint 2013 page, click **Try a demo upgrade**.

---

This option starts the process of generating an upgrade evaluation site collection.

4. In the Create Upgrade Evaluation Site Collection box, click **Create Upgrade Evaluation Site Collection**.

A box opens and informs you that a demo site request was received.

5. Click **Close** to close the box.

You will receive an e-mail message when the upgrade evaluation is available. The e-mail message will contain a link to the site collection. Review the site and confirm that your site collection will look and behave as expected in the new user interface.

After you have reviewed the upgrade evaluation and made any necessary changes in your original site based on your evaluation, you can upgrade your site collection.

Farm administrators can use Windows PowerShell to request an upgrade evaluation site collection. For more information, see [Manage site collection upgrades to SharePoint 2013 Preview](#).

## Upgrade a site collection

After you run the pre-upgrade checks and optionally review an upgrade evaluation site collection, you can upgrade your site collection to SharePoint 2013 Preview.

### To upgrade a site collection

1. Verify that the user account that performs this procedure is a site collection administrator.
2. On the Site Settings page for the site collection, in the **Site Collection Administration** section, click **Site collection upgrade**.
3. On the Site Collection Upgrade page, click **Upgrade this Site Collection**.  
This option starts the process of upgrading your site collection. A box opens to verify that you want to start the process.
4. Click **I'm ready** to start the actual upgrade.

#### **Note:**

The site collection health checks are run automatically in repair mode before the upgrade starts. The results from the health checks are included in the upgrade log for the site collection. If there is an error, you must address it before you can continue to upgrade.

The upgrade starts, and the **Upgrade status** page for the site collection is displayed. This page automatically updates while the upgrade is in progress and displays information about the process, such as the following:

- Errors or warnings
- When the upgrade started
- Where you can find the upgrade log file

After the upgrade is complete, the **Upgrade status** page is displayed in the new user interface with the message, Upgrade Completed Successfully.

5. Click **Let's see the new site** to go to the home page.

---

Farm administrators can use Windows PowerShell to upgrade a site collection. For more information, see [Manage site collection upgrades to SharePoint 2013 Preview](#).

## Verification

To verify that upgrade has succeeded, check the **Upgrade status** page for the site collection.

### View upgrade status in Site Settings

Site collection administrators can view the **Upgrade Status** page in Site Settings to verify that upgrade has succeeded for a site collection.

#### To view upgrade status in Site Settings

1. Verify that the user account that performs this procedure is a site collection administrator.
2. On the **Site Settings** page for the site collection, in the **Site Collection Administration** section, click **Site collection upgrade**.
3. On the **Site Collection Upgrade** page, click **Review Site Collection Upgrade Status**.

The **Upgrade Status** page for the site collection is displayed.

Farm administrators can use Windows PowerShell to view site collection upgrade status. For more information, see [Manage site collection upgrades to SharePoint 2013 Preview](#).

## Additional steps

Next, review your upgraded site collection to be sure that everything is working as expected. For more information see [Review site collections upgraded to SharePoint 2013 Preview](#).

---

# Review site collections upgraded to SharePoint 2013 Preview

---

Use these steps in your test environment to identify any issues before you upgrade your production environment. And review your upgraded sites to fix any issues after you have upgraded a site collection.

When you perform tests before upgrading your environment:

- Begin by validating high-impact or high-profile sites, and then move on to lower-priority sites. As part of the planning process, you should have identified which sites are high-impact and high-profile and require immediate attention, and which can wait a bit longer.
- To verify basic functionality, create a new site collection by using a representative set of lists, libraries, Web Parts, and so on. Review the new site to make sure that the common, basic elements of your sites are working.
- If pages do not render, you can check the **Site Settings** page by going directly to the URL ([http://siteurl/\\_layouts/settings.aspx](http://siteurl/_layouts/settings.aspx)). If the **Site Settings** page works and the upgrade has succeeded, there might be issues with the master page or home page. If the **Site Settings** page does not work, go to the site collection upgrade log file to see whether you can get more information about the problem.

You can review the site collection upgrade logs from the following locations:

- **For site collection administrators:** There are also log files for site collection upgrade stored inside the site collection itself, in the Maintenance Logs catalog at ([http://<SiteName>/\\_catalogs/MaintenanceLogs/YYYYMMDD-HHMMSS-SSS.txt](http://<SiteName>/_catalogs/MaintenanceLogs/YYYYMMDD-HHMMSS-SSS.txt) , where YYYYMMDD is the date and HHMMSS-SSS is the time (hours in 24-hour clock format, minutes, seconds, and milliseconds).
- **For farm administrators:** The site collection upgrade log file and the upgrade error log file are located at %COMMONPROGRAMFILES%\Microsoft Shared\Web server extensions\15\LOGS. The logs are named in the following format: SiteUpgrade-YYYYMMDD-HHMMSS-SSS.log, where YYYYMMDD is the date and HHMMSS-SSS is the time (hours in 24-hour clock format, minutes, seconds, and milliseconds). These file system logs have more information if you want details about issues.

Use the following checklists to review your upgraded sites and look for issues for either trial upgrades or upgrades in a production environment.

## Checklists for reviewing upgraded sites

### Web Parts

The following table lists issues with Web Parts that can occur after upgrade and how to address them.

**Tip:**

To test your Web Parts quickly, you can build a new Web Part page that contains all the custom Web Parts before you test an upgrade, and then review the page for any missing or broken Web Parts after the trial upgrade.

| What to check                                                                                                             | What to do if there is a problem                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Do all the Web Parts from your original site appear in your upgraded site?                                                | <p>If a Web Part zone exists in a customized (<i>unghosted</i>) page, but not in the site definition, the Web Parts from that Web Part zone may have been moved into the bottom zone on the page during the upgrade.</p> <p>Either in Edit Mode for the page in the browser or in SharePoint Designer 2013 Preview, look for missing Web Parts in the bottom zone or other zones, or check whether the Web Parts were closed. For more information about how to work with Web Parts and Web Part zones in SharePoint Designer 2013 Preview, see the SharePoint Designer Help system.</p>                                                                                                  |
| Are there any broken Web Parts pages and are the Web Parts displayed correctly (in the correct zone, location, and size)? | <p>Either in Edit Mode for the page in the browser or in SharePoint Designer 2013 Preview, drag the Web Part into the correct zone or modify the Web Part properties to correct any sizing or positioning problems.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Are there any extra or missing Web Parts?                                                                                 | <p>Open the page either in Edit Mode for the page in the browser or in SharePoint Designer 2013 Preview. If you see additional Web Parts on your page, look for closed or inactive Web Parts on the original version of the page. Were the closed or inactive Web Parts opened by the upgrade process? If so, you can modify the Web Part properties to close these Web Parts.</p> <p>If Web Parts are missing, look for errors in SharePoint Designer 2013 Preview such as "Error Rendering Control" or "Missing Assembly." These errors indicate that the Web Part was not installed or was configured incorrectly for the new environment and must be reinstalled or reconfigured.</p> |
| Do the Web Parts work correctly?                                                                                          | <p>Open the page either in Edit Mode for the page in the browser or in SharePoint Designer 2013 Preview, and look for errors that indicate that a component or service is missing. Make sure that any components or services that the Web Parts rely on exist in the upgraded site. Particularly for the</p>                                                                                                                                                                                                                                                                                                                                                                              |

| What to check                                                                                                                                    | What to do if there is a problem                                                                                                                                                                                                                                                                                                                           |

| Are any Web Parts pages still checked out?                                                                                                       | If you check out a page to make changes, make sure that you check in the page again.                                                                                                                                                                                                                                                                       |
| Are your Excel Web Access Web Parts working correctly? Did you create your connections again correctly? Are external data sources still working? | Verify all connections and external data sources.                                                                                                                                                                                                                                                                                                          |

**Tip:**

If you have problems with a Web Part, append **?contents=1** to the end of the URL syntax ([http:// siteurl/default.aspx?contents=1](http://siteurl/default.aspx?contents=1)), and then press ENTER. This opens the Web Part Maintenance page where you can remove and repair the broken Web Part.

## Large lists

By default, large list query throttling is turned on in SharePoint 2013 Preview. If a list is very large, and users use a view or perform a query that exceeds the limit or throttling threshold, the view or query will not be permitted. Check any large lists in your environment and have the site administrator or list owner address the issue. For example, they can create indexed columns with filtered views, organize items into folders, set an item limit on the page for a large view, or use an external list. For more information about large list throttling and how to address issues with large lists, see [Manage lists and libraries with many items](#) on Office Online.

## Styles and appearance

The following table lists common issues with the style and appearance of your web site after upgrade and how to address them.

**Tip:**

Most of the issues in this section can be resolved by correcting the links to an item.

| What to check                              | What to do if there is a problem       |
|--------------------------------------------|----------------------------------------|
| Are all the images on your pages displayed | Verify or fix the links to the images. |

| What to check                                                                                  | What to do if there is a problem                                                                                                                               |
|------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| correctly?                                                                                     |                                                                                                                                                                |
| Are the appropriate cascading style sheet colors and styles used in the appropriate locations? | Verify or fix the links to the cascading style sheet file. Verify the link on the master page.                                                                 |
| Theme choices are different in SharePoint 2013 – which theme do you want to use?               | Your site's home page, or other pages on your site, may look different after the site is upgraded. You may have to re-create or revise a theme and reapply it. |
| Do you have any JavaScript controls that are not working?                                      | Verify or fix the links to the controls.                                                                                                                       |
| Are your pages displayed correctly in the browser?                                             | Verify that any HTML on the page is in strict XHTML mode.                                                                                                      |
| Are any script errors displayed on any pages?                                                  | Verify the scripts and links, and verify that any HTML is in strict XHTML mode.                                                                                |

## Customized (unhosted) pages

Customized (also known as unhosted) pages are pages that were edited and are now unique versions of the pages for the site, instead of the default template pages. The following table lists issues with customized pages that can occur after upgrade and how to address them.

| What to check                                           | What to do if there is a problem                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Are your customizations still in place?                 | Determine whether you have only one issue or a larger problem with the whole page.<br><br>If you added a brand-new page to your original site (for example, if you replaced Default.aspx with a different file instead of changing the existing Default.aspx file), the new page has no association with the site definition. Therefore, it might not resemble the other pages on the upgraded site — nor can it be reset to resemble them. If you want your customized page to have the same appearance and behavior as the other pages on your site, consider creating a brand-new page that is based on the site definition and then transferring your customizations to that new page. |
| Can you still access the editing controls on the pages? | If you customized the editing controls (for example, the Site Actions link or the Edit Page link in SharePoint 2010 Products), check whether they still appear. If they don't appear, you can replace                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| What to check                                                                                                                        | What to do if there is a problem                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                      | <p>them with the editing controls of the new version by resetting the page to the default version.</p> <p>Use the <b>Reset to Template</b> command in SharePoint Designer to reset the page to the default version (also known as <i>reghosting</i>). After you have restored the default page, you can then reapply your customizations in the browser by applying a different master page, or by reapplying the customizations in SharePoint Designer.</p>                                                                                                                                                                                                                                       |
| <p>Are your customizations still appropriate in the new environment, or do you want to update to the new functionality and look?</p> | <p>If you want the new functionality and features, you must reset any customized pages to use the template. Resetting the page basically discards the customizations and attaches your page to the appropriate master page. Any customizations that you want can then be transferred to the master page instead of being stored in individual pages.</p> <p>Use the <b>Reset to Template</b> command in SharePoint Designer to reset the page to the default version (that is, reghost it). After you have restored the default page, you can then reapply your customizations in the browser by applying a different master page, or by reapplying the customizations in SharePoint Designer.</p> |
| <p>Are any pages still checked out?</p>                                                                                              | <p>If you check out a page to make changes, make sure that you check in the page again.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# Manage site collection upgrades to SharePoint 2013 Preview

---

Even though site collection administrators can now upgrade their own sites to SharePoint 2013 Preview, server farm administrators can still control when and whether a site collection is upgraded by managing the upgrade queue. You can also view and manage the upgrade throttling settings for a web application or content database to manage your farm's performance for site collection upgrades.

## Before you begin to upgrade site collections to SharePoint 2013 Preview

Farm administrators can control settings for site collection upgrade, such as notifications, throttling, and the upgrade queue, and can upgrade site collections by using Windows PowerShell. Before you change these settings or upgrade a site collection, you should understand the settings and the implications for making changes. For more information about the settings for site collection upgrade, see [Plan for site collection upgrades in SharePoint 2013 Preview](#). For information about how to upgrade a site collection from the Site Settings page, see [Upgrade a site collection to SharePoint 2013](#).

### Note:

Because SharePoint 2013 Preview runs as websites in Internet Information Services (IIS), administrators and users depend on the accessibility features that browsers provide. SharePoint 2013 Preview supports the accessibility features of supported browsers. For more information, see the following resources:

- [Plan browser support](#)
- [Accessibility for SharePoint Products](#)
- [Accessibility features in SharePoint 2013 Products](#)
- [Keyboard shortcuts](#)
- [Touch](#)

## Control upgrade notifications and self-service upgrade

When a site collection is available to upgrade, site collection administrators see a status bar on their sites indicating that they can upgrade them. They can choose to upgrade the site collection then or be reminded later. You can control settings for these notifications and control whether site collection administrators can upgrade their site collections. For more information about these properties, see [Plan settings for upgrade notifications, self-service upgrade, and site collection creation](#).

---

## To view the upgrade notification and self-service upgrade settings by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following commands to view the upgrade notification settings for a web application:

```
$wa=Get-SPWebApplication <URL>
$wa.UpgradeReminderDelay
$wa.UpgradeMaintenanceLink
```

Where:

- **<URL>** is URL for the web application that you want to check.

This command returns the Upgrade reminder delay setting for the specified web application.

6. At the Windows PowerShell command prompt, type the following command to view the self-service upgrade setting for a site collection:

```
$site=Get-SPSite <URL>
$wa.AllowSelfServiceUpgrade
```

Where:

- **<URL>** is URL for the site collection that you want to affect.

For more information, see [Get-SPWebApplication](#) and [Get-SPSite](#).

## To change the upgrade notification and self-service upgrade settings for a web application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

**Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command to change the upgrade notification settings for a web application:

```
$wa=Get-SPWebApplication <URL>
$wa.UpgradeReminderDelay=<Value>
$wa.UpgradeMaintenanceLink='<LinkURL>'
```

Where:

- <URL> is URL for the web application that you want to affect.
  - <Value> is the numeric value that you want to set for the delay (for example, 10 for 10 days).
  - <LinkURL> is a link where the user can find more information.
6. At the Windows PowerShell command prompt, type the following command to change the self-service upgrade setting for a site collection:

```
$site=Get-SPSite <URL>
$wa.AllowSelfServiceUpgrade=<Value>
```

Where:

- <URL> is URL for the site collection that you want to affect.
- <Value> is either 'true' to allow site collection administrators to upgrade the site, or 'false' to not show them the notification and not allow them to upgrade.

For more information, see [Get-SPWebApplication](#) and [Get-SPSite](#).

## Control the compatibility range for site creation modes

You can control which mode (2010 or 2013, or both) can be used when a user creates a site collection. The CompatibilityRange property on a web application controls the site modes available for a web application. You can view or change the settings for CompatibilityRange by using Windows PowerShell.

### To view the compatibility range for site creation modes for a web application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.

---

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following commands to view the compatibility range settings for a web application:

```
$wa=Get-SPWebApplication <URL>
Stores the web application at that URL as a variable
$wa.CompatibilityRange
Returns the CompatibilityRange for the specified web application
```

Where:

- **<URL>** is URL for the web application that you want to check.

This command returns the compatibility range for the specified web application. For example:

```
MaxCompatibilityLevel MinCompatibilityLevel DefaultCompatibilityLevel Singular

 15 14 15 F
else
```

6. At the Windows PowerShell command prompt, type the following commands to view the maximum, minimum, and default settings for a specific range:

```
[Microsoft.SharePoint.SPCompatibilityRange]::<RangeName>
```

Where:

- **RangeName** is one of the following values: **OldVersions**, **NewVersion**, **AllVersions**.

This command returns the compatibility range for the specified value. For example, for **NewVersion**:

```
MaxCompatibilityLevel MinCompatibilityLevel DefaultCompatibilityLevel Singular

 15 15 15 T
rue
```

For more information, see [Get-SPWebApplication](#).

## To change compatibility range for site creation modes for a web application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.

- 
- Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command to change the compatibility range settings to a specific range:

```
$wa=Get-SPWebApplication <URL>
Stores the web application at that URL as a variable
$wa.CompatibilityRange = [Microsoft.SharePoint.SPCompatibilityRange]::<RangeName>
Specifies which range to use
$wa.Update()
Updates the CompatibilityRange setting to use only the range you specified
$wa.CompatibilityRange
Returns the new CompatibilityRange for the web application
```

Where:

- *<URL>* is URL for the web application that you want to change.
  - *RangeName* is one of the following values: **OldVersions**, **NewVersion**, **AllVersions**.
6. At the Windows PowerShell command prompt, type the following command to change the values for the CompatibilityRange manually:

```
$wa=Get-SPWebApplication <URL>
Stores the web application at that URL as a variable
$range = New-Object Microsoft.SharePoint.SPCompatibilityRange(<Integer>,<Integer>)
Creates a new compatibility range from <Integer> to <Integer>
$wa.CompatibilityRange = $range
Specifies which range to use
$wa.Update()
#Updates the CompatibilityRange setting to use only the range you specified with $range
$wa.CompatibilityRange
Returns the new CompatibilityRange for the web application
```

Where:

- *<URL>* is URL for the web application that you want to change.
- *Integer* is a number to use as the minimum or maximum value. For example, (14,15) would set the MinCompatibilityLevel to 14 (2010) and the MaxCompatibilityLevel to 15 (2013). The DefaultCompatibilityLevel is automatically set to the lower of the MaxCompatibilityLevel and the current major version (for example, 15).

---

This command sets and then returns the range that you specified. For example:

| MaxCompatibilityLevel | MinCompatibilityLevel | DefaultCompatibilityLevel | Singular |
|-----------------------|-----------------------|---------------------------|----------|
| -----                 | -----                 | -----                     | -----    |
| 15                    | 14                    | 15                        |          |
| False                 |                       |                           |          |

For more information, see [Get-SPWebApplication](#).

## Control the queue for upgrades of sites to SharePoint 2013 Preview

Every site that is set to upgrade is added to the queue, even if it is processed immediately. A site is removed from the queue after it is upgraded, or if it has encountered an error that must be addressed by a site collection or server administrator. If an unexpected failure occurs during the process (such as a power outage or service interruption), the site remains in the queue and the timer service will try the upgrade again automatically. Server farm administrators can manage the queue to remove a site from the queue, add a site to the queue, or upgrade a site manually.

Server farm administrators can manage the queue to do the following:

- Determine site collections that are in the upgrade queue.  
Each web application has its own upgrade queue. You can show the sites that are in the queue for a specific content database associated with that web application.
- See all sites that are currently being upgraded.  
You can view the queue and filter it to show only the sites that are currently being upgraded for a specific content database.
- Add a site collection to the upgrade queue.  
If you want to upgrade a site collection, you can add it to the queue.
- Remove a site collection from the upgrade queue.  
You can remove a site collection from the upgrade queue. Stop the timer job, remove the site from the queue, and then restart the timer job to resume upgrade for the remaining sites in the queue. You cannot remove a site collection from the queue if it is currently being upgraded.

The following procedure contains steps to view and manage the site collection upgrade queue.

### To manage the upgrade queue by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.  
An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

**Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. To view all site collections in the queue for a content database, at the Windows PowerShell command prompt, type the following command:  

```
Get-SPSiteUpgradeSessionInfo -ContentDatabase <DatabaseName> -ShowInProgress - ShowCompleted -ShowFailed |ft
```

Where:
  - *<DatabaseName>* is name of the database that you want to check. You can also use the GUID for the database instead of the name.  
For more information, see [Get-SPSiteUpgradeSessionInfo](#).
6. To see all sites that are currently being upgraded, at the Windows PowerShell command prompt, type the following command:  

```
Get-SPSiteUpgradeSessionInfo -ContentDatabase <DatabaseName> -ShowInProgress
```

Where:
  - *<DatabaseName>* is name of the database that you want to check. You can also use the GUID for the database instead of the name.  
For more information, see [Get-SPSiteUpgradeSessionInfo](#).
7. To see whether a particular site is in the queue, at the Windows PowerShell command prompt, type the following command:  

```
Get-SPSiteUpgradeSessionInfo -Site <http://site>
```

Where:
  - *<http://site>* is URL for the site collection you want to add to the upgrade queue.  
For more information, see [Get-SPSiteUpgradeSessionInfo](#).
8. To add a site collection to the upgrade queue, at the Windows PowerShell command prompt, type the following command:  

```
Upgrade-SPSite <http://site> -VersionUpgrade -QueueOnly
```

Where:
  - *<http://site>* is URL for the site collection you want to add to the upgrade queue.  
For more information, see [Upgrade-SPSite](#).
9. To remove a site collection from the upgrade queue, at the Windows PowerShell command prompt, type the following command:  

```
Remove-SPSiteUpgradeSessionInfo -Identity <URL>
```

Where:
  - *<URL>* is URL for the site collection you want to add to the upgrade queue.

---

For more information, see [Remove-SPSiteUpgradeSessionInfo](#).

## Control site throttle settings for upgrade to SharePoint 2013 Preview

You can view and change the upgrade throttle settings for a content database and web application by viewing and setting the **SPContentDatabase.ConcurrentSiteUpgradeSessionLimit** and **SPWebApplication.SiteUpgradeThrottleSettings** properties. For descriptions of the properties that control throttle levels and the default values, see [Plan for site collection upgrades in SharePoint 2013 Preview](#).

For more information about web application properties, see [SPWebApplication Properties](#). For more information about content database properties, see [SPContentDatabase Properties](#).

The following procedure provides steps to view upgrade throttling settings for a web application.

### To view the upgrade throttle settings for a web application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```
$wa = Get-SPWebApplication <URL>
$wa.SiteUpgradeThrottleSettings
```

Where:

- **<URL>** is URL for the web application that you want to check. This command returns the set of throttling settings for the specified web application. For example:

```
AppPoolConcurrentUpgradeSessionLimit : 5
UsageStorageLimit : 10
SubwebCountLimit : 10
Name :
TypeName :
```

```

Microsoft.SharePoint.Administration.SPSiteUpgradeThrottleSettings
DisplayName :
Id : ca76dda0-7050-4c6b-a126-05917da39f8a
Status : Online
Parent : SPWebApplication Name=SharePoint - 80
Version : 8222
Properties : {}
Farm : SPFarm
Name=SharePoint_ConfigUpgradedPersistedProperties : {}

```

For more information, see [Get-SPWebApplication](#).

You can change the upgrade throttle settings for a web application. The following procedure provides steps to change the upgrade throttling settings for a web application.

## To change the upgrade throttle settings for a web application by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

### Note:

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```

$wa=Get-SPWebApplication <URL>
$wa.SiteUpgradeThrottleSettings.AppPoolConcurrentUpgradeSessionLimit=<Value>
$wa.SiteUpgradeThrottleSettings.UsageStorageLimit=<Value>
$wa.SiteUpgradeThrottleSettings.SubwebCountLimit=<Value>

```

Where:

- **<URL>** is URL for the web applications that you want to affect.
- **Value** is the numeric value that you want to set for that limit (for example, 8).

This command changes the throttling settings for a web application to the value that you supply.

For more information, see [Set-SPWebApplication](#).

The following procedure provides steps to view upgrade throttling settings for a content database.

---

## To view the throttle settings for a content database by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```
$db = Get-SPContentDatabase <DatabaseName>
Stores the database name as a variable to use in the next command
$db.ConcurrentSiteUpgradeSessionLimit
Returns the value for the limit for that database
```

Where:

- *<DatabaseName>* is name of the database that you want to check. You can also use the GUID for the database instead of the name.

This command returns the set of throttling settings for the specified content database.

For more information, see [Get-SPContentDatabase](#).

You can change the upgrade throttle settings for a content database. The following procedure provides steps to change the upgrade throttling settings for a content database.

## To change the throttle settings for a content database by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

**Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following commands:

```
$db = Set-SPContentDatabase <DatabaseName>
Stores the database name as a variable to use in the next command

$db.ConcurrentSiteUpgradeSessionLimit=<value>
Changes the limit to the value you specify.
```

Where:

- *<DatabaseName>* is name of the database that you want to affect. You can also use the GUID for the database instead of the name.
- *<value>* is a numeric value to set the property to, such as 9.  
This command changes the throttling settings for the specified content database to the value that you supply.

For more information, see [Set-SPContentDatabase](#).

## Create upgrade evaluation site collections by using Windows PowerShell

Site collection administrators can request a preview of their site collection. This preview site is called an upgrade evaluation site collection. Farm administrators can request an upgrade evaluation site collection by using Windows PowerShell.

### To request an upgrade evaluation site collection by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets.
  - Either a site collection administrator or be granted full control (for repair mode) for the web application by policy. For more information about permission policies for web applications, see [Manage permission policies for a Web application \(SharePoint Server 2010\)](#).

An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

**Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```
Request-SPUpgradeEvaluationSiteCollection -identity URL to site
```

Where:

- *URL to site* is the URL to a site collection in 2010 mode.

For more information, see [Request-SPUpgradeEvaluationSite](#).

## Upgrade site collections by using Windows PowerShell

You can upgrade a single site collection or all site collections in a specific database by using Windows PowerShell.

### To upgrade a single site collection in a database by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

**Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```
Windows PowerShell
```

```
Upgrade-SPSite <http://site> -VersionUpgrade [-Unthrottled]
```

Where:

- *<http://site>* is the URL for the site collection.

- 
- Add the option **-Unthrottled** option to skip the site collection upgrade queue and start the upgrade immediately.

This cmdlet upgrades the specific site collection to 2013 mode. For more information, see [Upgrade-SPSite](#).

To upgrade all site collections in a database, use Windows PowerShell. However, because sites can continue to run in 2010 mode in the SharePoint 2013 Preview environment, this is not a necessary procedure for most environments. If you do choose to upgrade all site collections immediately, site collection owners do not have an opportunity to use an upgrade evaluation site to preview the new user interface or change their original site before upgrading. We do not recommend that you upgrade all site collections immediately as part of your initial upgrade. However, you might want to upgrade all site collections after some time has passed and all customizations were verified in 2013 mode.

## To upgrade all site collections in a database by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

### Note:

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
Get-SPSite -ContentDatabase <DBName> -Limit All | Upgrade-SPSite -VersionUpgrade -QueueOnly
```

Where:

- **<DBName>** is the name of the content database for which you want to upgrade all site collections.

The **-QueueOnly** parameter adds the site collections to the upgrade queue. This allows the timer job to perform parallel upgrades when it is possible and can save time. The sites are upgraded in the order in which they are added to the queue.

This cmdlet upgrades all site collections in the specific content database to 2013 mode.

## View upgrade status by using Windows PowerShell

You can view upgrade status for all databases, for a single site collection, or for all site collections.

---

## To view upgrade status for a single site collection by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```
Get-SPSiteUpgradeSessionInfo -Site <http://site>
```

Where:

- *<http://site>* is the URL of the site collection.  
This cmdlet returns the upgrade status for the specified site collection together with information about the upgrade session and a link to the log files for more information. For more information, see [Get-SPSiteUpgradeSessionInfo](#).

6. Or, you can use the following command to view the information about a specific site collection upgrade:

```
$sc = Get-SPSite <http://site>
Sets a variable for the site collection
$sc.CompatibilityLevel
Returns the compatibility level for the site collection (either 14 or 15 for 2010 or
2013 mode)
$sc.UpgradeInfo
Returns the upgrade information for the site collection
```

Where:

- *<http://site>* is the URL of the site collection.  
This command returns the compatibility level and upgrade information (such as a pointer to the log file) for the specified site collection. If the compatibility level is "15," then it has been upgraded to 2013 mode. For more information, see [Get-SPSite](#).

## To view upgrade status for a single database by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.

- 
- **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

**Windows PowerShell**

```
Get-SPSiteUpgradeSessionInfo -ContentDatabase <DatabaseName> -ShowInProgress -
ShowCompleted -ShowFailed
```

Where:

- *<DatabaseName>* is the name of the database that you want to check.  
This cmdlet returns any site collections that have an upgrade in progress, completed, or failed and lists their status, plus a link to the log files for more information. You can use only one parameter to find only in progress, completed, or failed upgrades. For more information, see [Get-SPSiteUpgradeSessionInfo](#).

## To view upgrade status for all site collections by using Windows PowerShell

1. Verify that you have the following memberships:
  - **securityadmin** fixed server role on the SQL Server instance.
  - **db\_owner** fixed database role on all databases that are to be updated.
  - Administrators group on the server on which you are running the Windows PowerShell cmdlets. An administrator can use the **Add-SPShellAdmin** cmdlet to grant permissions to use SharePoint 2013 Preview cmdlets.

 **Note:**

If you do not have permissions, contact your Setup administrator or SQL Server administrator to request permissions. For additional information about Windows PowerShell permissions, see [Add-SPShellAdmin](#).

2. On the **Start** menu, click **All Programs**.
3. Click **Microsoft SharePoint 2013 Products**.
4. Click **SharePoint 2013 Management Shell**.
5. At the Windows PowerShell command prompt, type the following command:

```
Get-SPSite -Limit All
```

---

This cmdlet returns the URL for all site collections in the environment and the compatibility level (14 or 15) for each site collection.
