

Dynamics 365 and Power Platform: Availability, data location, language, and localization

CY2020 Q4

The purpose of this document is to provide comprehensive information about product availability and customer data location for Customer engagement, Enterprise resource planning, and Power Platform family of applications. The information will be updated periodically, and Microsoft provides no license, express or implied, in this document. In this report, the following information can be found:

- Product availability
- Data location
- Language
- Localization

Please review and respect the full disclaimer included in all printed and electronically distributed versions of this

Dynamics 365 and Power Platform Data Centers

Overview

We own and offer an unmatched breadth and depth of cloud capabilities and services supported by one of the world's largest developer and partner ecosystems. When subscribing to our services, a customer has three options to choose from.

 Global	 Local	 Sovereign
<p>A public internet cloud deployment option that lets customers access hyper-scale; globally connected cloud services deployed from regional Microsoft datacenters.</p>	<p>A cloud option that addresses local data residency requirements by letting all public cloud users within a country keep their data in the country. The datacenters are part of the globally connected cloud services offered by Microsoft.</p>	<p>A cloud option that adheres to the strictest standards of operation. Data remains inside the country of residence at all times. Customers who select this option can access hyper-scale cloud services isolated from global cloud services and deployed from local datacenters to meet specific and unique requirements.</p>

- **Global cloud:** United States, Europe, Asia Pacific
- **Local cloud:** Canada, Brazil, United Kingdom, France, Germany, India, Japan, Australia, United Arab Emirates, Switzerland, Republic of South Africa
- **Sovereign cloud:** US Government, Germany(retiring), China

This overall level of agility gives customers more freedom of choice in finding the option that best fits their specific requirements.

Learn more about privacy and compliance at the [Microsoft Trust Center](#).

Datacenter locations

We have a worldwide network of datacenters set up around the world in 17 different locations, making us one of the top three global networks. This level of localization helps organizations' more easily meet data residency, sovereignty, and compliance requirements. In addition, in many parts of the world, we offer the option of choosing global, local, and sovereign clouds. Please review the [product sections](#) for details on specific service availability.

Global reach of Microsoft Cloud infrastructure

Customer Engagement Applications

Overview

Dynamics 365 revolutionizes CRM by applying intelligence to all forms of data. This enables organizations to evolve from reactive business decisions to proactive insights that empower your employees to accelerate business results. Dynamics 365 is the world's connected business cloud designed to help you better understand your business and act strategically to be successful.

Microsoft Dynamics 365 Sales

Overview

[Dynamics 365 Sales](#) is an enterprise-grade customer engagement software that enables sales teams to build strong relationships with their customers, take actions based on insights, and close deals faster. As the most popular application on the Dynamics 365 platform, Sales encompasses many scenarios that range from traditional outbound sales models to complex configurations that meet many large enterprise business needs.

Where your Microsoft Dynamics 365 Sales data is stored

Dynamics 365 Sales can be deployed into the Microsoft Azure datacenters (also referred to as "regions") listed below.

With Dynamics 365 Sales customers can specify the region where their [customer data](#) will be stored. Microsoft may replicate customer data to other regions available within the same geography for data durability, except as specified below. No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data.

Regions where Dynamics 365 Sales can be deployed

Explore Dynamics 365 Sales by geography [here](#).

Note:

- For China-specific information, learn more [here](#).

Storing customer data – customer data at rest in geo

Microsoft will not transfer customer data outside the selected Azure geographic location (geo) for Dynamics 365 Sales except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- Customers use services that are designed to operate globally, including the following:
 - Dynamics 365 home page, which stores application names, descriptions, and logos globally for performance.
 - Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#).
 - Azure Multi-Factor Authentication, which may store Multi-Factor Authentication data globally. You can find more information [here](#).
 - Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#).
 - Services that provide global routing functions and do not process or store customer data. This includes Azure DNS, which provides domain name services that route to different regions; or
 - Preview, beta, or other pre-release services, which typically store customer data in the United States but may store it globally.
 - Additionally, certain types of customer data (specifically the application name, application description, and application logo) will be stored globally, rather than in the primary storage geo.
- Customers configure external services to extend Dynamics 365 Sales such customer configurations may cause customer data to be transferred outside of the selected geo. Examples of customer configurable external services include:
 - **Machine Learning Cognitive Services:** If features that use cognitive services are activated, customer data for domains such as product recommendations and demand forecasting can be synchronized outside of the configured region. Use of these features is optional. You can find more information [here](#).
 - **Data integration:** Configuration of Dynamics 365 Sales data management features that work with external services (whether provided by Microsoft or a third party) may result in the transfer of core customer data outside of the region configured for the production environment to a geographic location that customers designate. You can find more information [here](#).
 - **Microsoft Power BI, Microsoft Power Apps, and Microsoft Power Automate:** Customers who connect their Power BI, Power Apps, or Power Automate deployment to Dynamics 365 Sales may send customer data outside of the designated region to the geographic area where their Power BI, Power Apps, or Power Automate is deployed. You can find more details [here](#).

- **Microsoft Visual Studio Team Services:** Customers can choose where to store custom code, metadata, and data assets that support their Dynamics 365 Sales implementation. You can find more information about the availability of Visual Studio Team Services [here](#).

Microsoft Dynamics 365 Customer Service

Overview

[Dynamics 365 Customer Service](#) is an end-to-end, self-support and assisted-support service that supports multiple channels of customer engagement, provides comprehensive and efficient case routing and management for agents, and enables authoring and consumption of knowledge management articles. Dynamics 365 Customer Service also provides AI suggestions feature for similar cases and knowledge articles.

Where your Microsoft Dynamics 365 Customer Service data is stored

Dynamics 365 Customer Service can be deployed into the Microsoft Azure datacenters (also referred to as "regions") listed below.

With Dynamics 365 Customer Service customers can specify the region where their [customer data](#) will be stored. Microsoft may replicate customer data to other regions available within the same geography for data durability, except as specified below. No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data.

Regions where Dynamics 365 Customer Service can be deployed

Explore Dynamics 365 Customer Service product by geography [here](#).

Note:

- Because there is only one region in Brazil, customer data in Brazil South may be replicated to South Central US (Texas) for disaster recovery purposes.
- For China-specific information, learn more [here](#)
- Dynamics 365 Customer Service AI suggestions feature for similar cases and knowledge articles are available in the following geographies:
 - East US, West US, South Central US
 - Brazil South
 - Canada

Dynamics 365 Customer Service AI suggestions feature for similar cases and knowledge articles:

- English

Note:

This feature is available to admins for configuration only in organizations that have their base language set in any of the above language(s) **for this feature** and to end users who set their UI language to any of the above **for this feature** in personalization settings. More language support is planned in the roadmap.

Microsoft Dynamics 365 Field Service

Overview

[Dynamics 365 Field Service](#) is an end-to-end solution for on-site service that empowers organizations to move from being reactive to providing proactive or predictive field service, and to embrace new business models such as outcome-based service or “anything-as-a-service.”

Where your Microsoft Dynamics 365 Field Service data is stored

Dynamics 365 Field Service can be deployed into the Microsoft Azure datacenters (also referred to as “regions”) listed below.

With Dynamics 365 Field Service customers can specify the region where their [customer data](#) will be stored. Microsoft may replicate customer data to other regions available within the same geography for data durability, except as specified below. No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data.

Regions where Dynamics 365 Field Service can be deployed

Explore Dynamics 365 Field Service product by geography [here](#).

Note:

- Because there is only one region in Brazil, customer data in Brazil South may be replicated to South Central US (Texas) for disaster recovery purposes.
- For China-specific information, learn more [here](#).

Storing customer data – customer data at rest in geo

Microsoft will not transfer customer data outside the selected Azure geographic location (geo) for Dynamics 365 Field Service except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- Customers use services that are designed to operate globally, including the following:
 - Dynamics 365 home page, which stores application names, descriptions, and logos globally for performance.

Microsoft Dynamics 365 Marketing

Overview

[Dynamics 365 Marketing](#) is a marketing automation solution that can help businesses turn more prospects into business relationships. Since its launch in April 2018, Dynamics 365 Marketing has seen increasing adoption by organizations looking to align sales and marketing, make smarter decisions, and grow with an adaptable platform. The app goes beyond basic email marketing to provide deep insights and generate qualified leads for your sales teams. Its graphical content creation and design tools make visually rich emails, landing pages, and customer journeys easy to design and execute.

Where your Microsoft Dynamics 365 Marketing data is stored

Dynamics 365 Marketing can be deployed into the Microsoft Azure datacenters (also referred to as "regions") listed below.

With Dynamics 365 Marketing customers can specify the region where their [customer data](#) will be stored. Microsoft may replicate customer data to other regions available within the same geography for data durability, except as specified below. No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data.

Regions where Dynamics 365 Marketing can be deployed

Explore Dynamics 365 Marketing product by geography [here](#).

Note:

- Because there is only one region in Brazil, customer data in Brazil South may be replicated to South Central US (Texas) for disaster recovery purposes.
- For China-specific information, learn more [here](#)

Storing customer data – customer data at rest in geo

Microsoft will not transfer Customer Data outside the selected Azure geographic location (geo) for Dynamics 365 Marketing except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- Customers use services that are designed to operate globally, including the following:
 - Email marketing sending used to send marketing messaging globally as configured by the customer.
 - Marketing resource file delivery through content delivery networks to deliver marketing content globally – like pictures in emails.
 - Dynamics 365 home page, which stores application names, descriptions, and logos globally for performance.
 - Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#).

- Azure Multi-Factor Authentication, which may store Multi-Factor Authentication data globally. You can find more information [here](#).
- Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#).
- Services that provide global routing functions and do not process or store customer data. This includes Azure DNS, which provides domain name services that route to different regions; or
- Preview, beta, or other pre-release services, which typically store customer data in the United States but may store it globally.
- Additionally, certain types of customer data (specifically the application name, application description, and application logo) will be stored globally, rather than in the primary storage geo.
- Customers configure external services to extend Dynamics 365 Marketing, such customer configurations may cause customer data to be transferred outside of the selected geo. Examples of customer configurable external services include:
 - **Machine Learning Cognitive Services:** If features that use cognitive services are activated, customer data for domains such as product recommendations and demand forecasting can be synchronized outside of the configured region. Use of these features is optional. You can find more information [here](#).
 - **Data integration:** Configuration of Dynamics 365 Marketing data management features that work with external services (whether provided by Microsoft or a third party) may result in the transfer of core customer data outside of the region configured for the production environment to a geographic location that customers designate. You can find more information [here](#).
 - **Microsoft Power BI, Microsoft Power Apps, and Microsoft Power Automate:** Customers who connect their Power BI, Power Apps, or Power Automate deployment to Dynamics 365 Marketing may send customer data outside of the designated region to the geographic area where their Power BI, Power Apps, or Power Automate is deployed. You can find more details [here](#).
 - **Microsoft Visual Studio Team Services:** Customers can choose where to store custom code, metadata, and data assets that support their Dynamics 365 Marketing implementation. You can find more information about the availability of Visual Studio Team Services [here](#).
- Customers customize the schema and display names for fields, entities, relations, attributes, and other elements in Dynamics 365 Marketing, in which case the customized schema and display names may be referenced by other object definitions and may get shared through various other channels that are outside of the designated geo. However, the data entered for the fields, entities, relations, attributes, and other elements themselves will not be transferred outside the designated geo.
- Customers customize the schema and display names for fields, entities, relations, attributes, and other elements in Dynamics 365 for Marketing, in which case the customized schema and display names may be referenced by other object definitions and may get shared through various other channels that are outside of the designated geo. However, the data entered for the fields, entities, relations, attributes, and other elements themselves will not be transferred outside the designated geo. For example: If customer uses the customization capabilities of Dynamics 365 for Marketing to create a new entity with schema name / display name : "Solution1_promotion" / "Promotion" and field "Solution1_Promotion.Name" / "Name", then the strings entered between the quotation marks ("Solution1_promotion", "Promotion", "Solution1_Promotion.Name", "Name") may be referenced by other object definitions and may get shared through various other channels that are outside of the

designated geo. However, if “Spring 2019 Promotion” is entered as the “Solution1_Promotion.Name” then “Spring 2019 Promotion” will remain within the designated geo.

Enterprise resource planning applications

Overview

Dynamics 365 revolutionizes ERP by applying intelligence to all forms of data. This enables organizations to evolve from reactive business decisions to proactive insights that empower your employees to accelerate business results. Dynamics 365 is the world's connected business cloud designed to help you better understand your business and act strategically to be successful.

Overview – translation and localization

Organizations doing business in a particular country must comply with country-specific laws, regulations, and common business practices to handle their daily business transactions and operations and meet their legal obligations for activities conducted in the country. Microsoft recognizes that non-adherence to these laws and regulations can lead to severe consequences for an organization doing business in that country.

Microsoft Dynamics 365 Finance & Microsoft Dynamics 365 Supply Chain Management software helps organizations manage their various business processes through its extensible architecture. Microsoft extends the business process functionality of its Microsoft Dynamics 365 Finance & Microsoft Dynamics 365 Supply Chain Management software by developing specific commercial requirements, language, and non-vertical, national, or international functionality to address specific tax, accounting, or financial reporting requirements for countries where Microsoft makes this software generally available. The process of adapting software to meet local laws or requirements is called localization. The process of adapting software to meet language requirements is called translation.

Laws and regulations vary by country. While Microsoft Dynamics 365 Finance & Microsoft Dynamics 365 Supply Chain Management software "out-of-the-box" is localized and/or translated to address specific laws and/or regulations for countries, it is not supported in terms of localizations, translations, or technical support in all countries. Features or functionalities that are available in a country may not be available in all countries. Rather, we look to our channel partners, who are an important part of our global strategy, to deliver Microsoft Dynamics 365 Finance & Microsoft Dynamics 365 Supply Chain Management solutions that help customers meet their compliance obligations. Channel partners may adapt the Microsoft Dynamics 365 Finance & Microsoft Dynamics 365 Supply Chain Management software to:

- Supplement the base Microsoft Dynamics 365 Finance & Microsoft Dynamics 365 Supply Chain Management application by developing functionality to meet specific laws or regulations that are not covered by features provided "out-of-the-box" (e.g., regulations that are unique to states, provinces, cities, or municipalities in a country); or

- Create their own localizations and/or translations in countries where Microsoft does not offer a localized and/or translated version of Microsoft Dynamics 365 Finance & Microsoft Dynamics 365 Supply Chain Management software

Partner-created solutions are owned, implemented, maintained, and serviced by, or on behalf of, the originating channel partner.

Microsoft Dynamics 365 Finance

Overview

Dynamics 365 Finance helps to maximize financial visibility and profitability through automated and modernized global financial operations. Dynamics 365 Finance enables monitors performance in real time, predict future outcomes, and makes data-driven decisions to drive business growth.

Where your Microsoft Dynamics 365 Finance data is stored

Dynamics 365 Finance can be deployed into the Microsoft Azure datacenters (also referred to as “regions”) listed below.

With Dynamics 365 Finance customers can specify the region where their customer data will be stored. Microsoft may replicate customer data to other regions available within the same geography for data durability, except as specified below. No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data.

Regions where Dynamics 365 Finance can be deployed

Explore Dynamics 365 Finance product by geography [here](#).

Note:

- Because there is only one region in Brazil, customer data in Brazil South may be replicated to South Central US (Texas) for disaster recovery purposes.
- For China-specific information, learn more [here](#)

Storing customer data – customer data at rest in geo

Microsoft will not transfer customer data outside the selected Azure geographic location (geo) for Dynamics 365 Finance except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- Customers use services that are designed to operate globally, including the following:
 - Dynamics 365 home page, which stores application names, descriptions, and logos globally for performance.
 - Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#).
 - Azure Multi-Factor Authentication, which may store Multi-Factor Authentication data globally. You can find more information [here](#).
 - Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#).
 - Services that provide global routing functions and do not process or store customer data. This includes Azure DNS, which provides domain name services that route to different regions; or

- Preview, beta, or other pre-release services, which typically store customer data in the United States but may store it globally.
- The administration portal for Dynamics 365 Finance known as Microsoft Dynamics Lifecycle Services (LCS), stores certain customer data on servers located in the United States such as:
 - Your code or metadata, and data packages (e.g., master or application configuration data) to support the Dynamics 365 Finance application lifecycle.
 - Business process models and task guides.
 - Usage and diagnostic logs during the application lifecycle process; and
 - Content related to support requests submitted to Microsoft such as support issues, service requests, and hotfix requests.
- Dynamics 365 Finance collects usage and diagnostic logs where customer data is stored in the United States.
- Customers configure external services to extend Dynamics 365 Finance such customer configurations may cause customer data to be transferred outside of the selected geo. Examples of customer configurable external services include:
 - **Machine Learning Cognitive Services:** If features that use cognitive services are activated, customer data for domains such as product recommendations and demand forecasting can be synchronized outside of the configured region. Use of these features is optional. You can find more information [here](#).
 - **Data integration:** Configuration of Dynamics 365 Finance data management features that work with external services (whether provided by Microsoft or a third party) may result in the transfer of core customer data outside of the region configured for the production environment to a geographic location that customers designate. You can find more information [here](#).
 - **Microsoft Power BI, Microsoft Power Apps, and Microsoft Power Automate:** Customers who connect their Power BI, Power Apps, or Power Automate deployment to Dynamics 365 Finance and Operations may send customer data outside of the designated region to the geographic area where their Power BI, Power Apps, or Power Automate is deployed. You can find more details [here](#).
 - **Microsoft Visual Studio Team Services:** Customers can choose where to store custom code, metadata, and data assets that support their Dynamics 365 Finance and Operations implementation. You can find more information about the availability of Visual Studio Team Services [here](#).

Microsoft Dynamics 365 Commerce

Overview

[Dynamics 365 Commerce](#)—built on proven Dynamics 365 Retail capabilities—is an end-to-end retail solution delivering seamless commerce across all channels encompassing sales, mobility, intelligence and productivity to help retailers and workers achieve more in a cloud-first, mobile-first way. The application offers comprehensive support to operate a broad range business processes including e-commerce, clienteling, merchandising, point of sale, inventory and channel management capabilities while providing immersive customer experiences across physical and digital channels.

Where your Microsoft Dynamics 365 Commerce is stored

Dynamics 365 Commerce can be deployed into the Microsoft Azure datacenters (also referred to as “regions”) listed below.

With Dynamics 365 Commerce, customers can specify the region where their [customer data](#) will be stored. Microsoft may replicate customer data to other regions available within the same geography for data durability, except as specified below. No matter where customer data is stored, Microsoft does not control or limit the locations from where customers or their end users may access customer data.

Regions where Dynamics 365 Commerce can be deployed

Explore Dynamics 365 Commerce product by geography [here](#).

Note:

- Because there is only one region in Brazil, customer data in Brazil South may be replicated to South Central US (Texas) for disaster recovery purposes.
- For China-specific information, learn more [here](#)

Storing customer data – customer data at rest in geo

Microsoft will not transfer customer data outside the selected Azure geographic location (geo) for Dynamics 365 Commerce except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- Customers use services that are designed to operate globally, including the following:
 - Dynamics 365 home page, which stores application names, descriptions, and logos globally for performance.
 - Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#).
 - Azure Multi-Factor Authentication, which may store Multi-Factor Authentication data globally. You can find more information [here](#).
 - Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#).

- Services that provide global routing functions and do not process or store customer data. This includes Azure DNS, which provides domain name services that route to different regions; or
- Preview, beta, or other pre-release services, which typically store customer data in the United States but may store it globally.
- Customer data that is stored locally in the commerce scale unit (CSU) is synchronized to the production instance location the customer has chosen based on the above section “Azure regions where Dynamics 365 Commerce can be deployed.”
- The administration portal for Dynamics 365 Commerce known as Microsoft Dynamics Lifecycle Services (LCS), stores certain customer data on servers located in the United States such as:
 - Your code or metadata, and data packages (e.g., master or application configuration data) to support the Dynamics 365 Commerce application lifecycle
 - Business process models and task guides
 - Usage and diagnostic logs during the application lifecycle process; and
 - Content related to support requests submitted to Microsoft such as support issues, service requests, and hotfix requests.
- Customers use Dynamics 365 Commerce **site builder** to upload and play videos those videos are stored on servers located in the United States.
- Customers use Microsoft Dynamics 365 Fraud Protection integration with Dynamics 365 Commerce, customer data may be processed and stored in the United States or any other country in which Microsoft or its sub processors operate.
- Dynamics 365 Commerce collects usage and diagnostic logs where customer data is stored in the United States.
- Customers configure external services to extend Dynamics 365 Commerce such customer configurations may cause customer data to be transferred outside of the selected geo. Examples of customer configurable external services include:
 - **Machine Learning Cognitive Services:** If features that use cognitive services are activated, customer data for domains such as product recommendations and demand forecasting can be synchronized outside of the configured region. Use of these features is optional. You can find more information [here](#).
 - **Data integration:** Configuration of Dynamics 365 Commerce data management features that work with external services (whether provided by Microsoft or a third party) may result in the transfer of core customer data outside of the region configured for the production environment to a geographic location that customers designate. You can find more information [here](#).
 - **Microsoft Power BI, Microsoft Power Apps, and Microsoft Power Automate:** Customers who connect their Power BI, Power Apps, or Power Automate deployment to Dynamics 365 Commerce may send customer data outside of the designated region to the geographic area where their Power BI, Power Apps, or Power Automate is deployed. You can find more details [here](#).
 - **Microsoft Visual Studio Team Services:** Customers can choose where to store custom code, metadata, and data assets that support their Dynamics 365 Commerce implementation. You can find more information about the availability of Visual Studio Team Services [here](#).

Microsoft Dynamics 365 Business Central

Overview

Dynamics 365 Business Central is a comprehensive business management solution designed for small to medium-sized businesses. The service helps to streamline your processes, make smarter decisions, and accelerate growth.

Where your Microsoft Dynamics 365 Business Central data is stored

Dynamics 365 Business Central (previously known as Dynamics 365 Finance and Operations, Business edition) can be deployed into the Microsoft Azure datacenters (also referred to as “regions”) listed below.

With Dynamics 365 Business Central, customers select a country on sign-up, and this specifies the geography (also referred to “geo”) where their [customer data](#) will be stored. Microsoft may replicate customer data to other regions available within the same geography for data durability. No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data. Microsoft also reserves the right to move customer data to other regions/geos, as and when they become available, for load balancing purposes or to bring data closer to customers”.

Regions where Dynamics 365 Business Central can be deployed

Explore Dynamics 365 Business Central by geography [here](#).

Note:

- Because there is only one region in Brazil, customer data in Brazil South may be replicated to South Central US (Texas) for disaster recovery purposes.

Storing customer data – customer data at rest in geo

Microsoft will not transfer customer data outside the selected Azure geographic location (geo) for Dynamics 365 Business Central except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- Customer uses services that are designed to operate globally, including the following:
 - Dynamics 365 home page, which stores application names, descriptions, and logos globally for performance.
 - Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#).
 - Azure Multi-Factor Authentication, which may store Multi-Factor Authentication data globally. You can find more information [here](#).
 - Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#).

- Services that provide global routing functions and do not process or store customer data. This includes Azure DNS, which provides domain name services that route to different regions; or
- Preview, beta, or other pre-release services could store customer data outside of the provisioned geo.
- Dynamics 365 Business Central collects usage and diagnostic logs where customer data is stored in the United States.

Note : Microsoft also reserves the right to move customer data to other regions/geos, as and when they become available, for load balancing purposes or to bring data closer to customers.

- Customers configure external services to extend Dynamics 365 Business Central such customer configurations may cause customer data to be transferred outside of the selected geo. Examples of customer configurable external services include:
 - **Machine Learning Cognitive Services:** If features that use cognitive services are activated, customer data could be synchronized outside of the configured region. Use of these features is optional. You can find more information [here](#).
 - **Extensions and integrations:** Configuration of Dynamics 365 Business Central to work with external services (whether provided by Microsoft or a third party) may result in the transfer of customer data outside of the region configured for the production environment. You can find more information [here](#).
 - **Microsoft Power BI, Microsoft Power Apps, Microsoft Exchange and Microsoft Power Automate:** Customers who connect their Power BI, Power Apps, Exchange or Power Automate deployment to Dynamics 365 Business Central may send customer data outside of the designated region to the geographic area where their Power BI, Power Apps, or Power Automate is deployed. You can find more details [here](#).

Microsoft Dynamics 365 Project Service Automation

Overview

[Dynamics 365 Project Service Automation](#) is an end-to-end solution for project-based organizations to manage projects from sales through delivery. The application has deep resource management, sales, pricing, invoicing, time and expense entry, and approval capabilities along with a minimum set of project task and work breakdown structure (WBS) capabilities. With Microsoft Project re-platforming onto the Common Data Service platform, the Project Service Automation application that is already on the Common Data Service platform is uniquely positioned to leverage this industry-standard set of project-planning and task scheduling capabilities. The service industries module in Dynamics 365 Finance is especially strong in project accounting, with revenue recognition and customer-facing invoicing that leverage date-effective exchange rates and a rich sales tax feature set.

Where your Microsoft Dynamics 365 Project Service Automation data is stored

Dynamics 365 Project Service Automation can be deployed into the Microsoft Azure datacenters (also referred to as “regions”) listed below.

With Dynamics 365 Sales customers can specify the region where their [customer data](#) will be stored. Microsoft may replicate customer data to other regions available within the same geography for data durability, except as specified below. No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data.

Regions where Dynamics 365 Project Service Automation can be deployed

Explore Dynamics 365 Project Service Automation by geography [here](#).

Note:

- Because there is only one region in Brazil, customer data in Brazil South may be replicated to South Central US (Texas) for disaster recovery purposes.

Storing customer data – customer data at rest in geo

Microsoft will not transfer customer data outside the selected Azure geographic location (geo) for Project Service Automation except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- Customers use services that are designed to operate globally, including the following:
 - Dynamics 365 home page, which stores application names, descriptions, and logos globally for performance.
 - Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#).

- Azure Multi-Factor Authentication, which may store Multi-Factor Authentication data globally. You can find more information [here](#).
- Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#).
- Services that provide global routing functions and do not process or store customer data. This includes Azure DNS, which provides domain name services that route to different regions; or
- Preview, beta, or other pre-release services, which typically store customer data in the United States but may store it globally.
- Additionally, certain types of customer data (specifically the application name, application description, and application logo) will be stored globally, rather than in the primary storage geo.
- Customers configure external services to extend Dynamics 365 Project Service Automation, such customer configurations may cause customer data to be transferred outside of the selected geo. Examples of customer configurable external services include:
 - **Data integration:** Configuration of Dynamics 365 Project Service Automation data management features that work with external services (whether provided by Microsoft or a third party) may result in the transfer of core customer data outside of the region configured for the production environment to a geographic location that customers designate. You can find more information [here](#).
 - **Microsoft Power BI, Microsoft Power Apps, and Microsoft Power Automate:** Customers who connect their Power BI, Power Apps, or Power Automate deployment to Dynamics 365 Project Service Automation may send customer data outside of the designated region to the geographic area where their Power BI, Power Apps, or Power Automate is deployed. You can find more details [here](#).
 - **Microsoft Visual Studio Team Services:** Customers can choose where to store custom code, metadata, and data assets that support their Dynamics 365 Project Service Automation implementation. You can find more information about the availability of Visual Studio Team Services [here](#).

Microsoft Dynamics 365 Project Operations

Overview

[Dynamics 365 Project Operations](#) is an end-to-end solution for project-based organizations to manage projects from sales through delivery. The application has deep resource management, sales, pricing, invoicing, time and expense entry, and approval capabilities along with a minimum set of project task and work breakdown structure (WBS) capabilities.

Where your Microsoft Dynamics 365 Project Operations data is stored

Dynamics 365 Project Operations can be deployed into the Microsoft Azure datacenters (also referred to as “regions”) listed below. Microsoft may replicate customer data to other regions available within the same geography for data durability, except as specified below. No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data.

Regions where Dynamics 365 Project Operations can be deployed

Explore Dynamics 365 Project Operations on by geography [here](#).

Note:

- Because there is only one region in Brazil, customer data in Brazil South may be replicated to South Central US (Texas) for disaster recovery purposes.

Storing customer data – customer data at rest in geo

Microsoft will not transfer customer data outside the selected Azure geographic location (geo) for Project Operations except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- Customers use services that are designed to operate globally, including the following:
 - Dynamics 365 home page, which stores application names, descriptions, and logos globally for performance.
 - Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#).
 - Azure Multi-Factor Authentication, which may store Multi-Factor Authentication data globally. You can find more information [here](#).
 - Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#).
 - Services that provide global routing functions and do not process or store customer data. This includes Azure DNS, which provides domain name services that route to different regions; or
 - Preview, beta, or other pre-release services, which typically store customer data in the United States but may store it globally.

- Additionally, certain types of customer data (specifically the application name, application description, and application logo) will be stored globally, rather than in the primary storage geo. Customers configure external services to extend Dynamics 365 Project Operations, such customer configurations may cause customer data to be transferred outside of the selected geo. Examples of customer configurable external services include:
- **Data integration:** Configuration of Dynamics 365 Project Operations management features that work with external services (whether provided by Microsoft or a third party) may result in the transfer of core customer data outside of the region configured for the production environment to a geographic location that customers designate. You can find more information [here](#).
- **Microsoft Power BI, Microsoft Power Apps, and Microsoft Power Automate:** Customers who connect their Power BI, Power Apps, or Power Automate deployment to Dynamics 365 Project Operations may send customer data outside of the designated region to the geographic area where their Power BI, Power Apps, or Power Automate is deployed. You can find more details [here](#).
- **Microsoft Visual Studio Team Services:** Customers can choose where to store custom code, metadata, and data assets that support their Dynamics 365 Operations implementation. You can find more information about the availability of Visual Studio Team Services [here](#).

Microsoft Dynamics 365 Human Resources

Overview

[Dynamics 365 Human Resources](#) enables organizations to centralize workforce data and drive operational excellence across HR programs. As people resources are the most expensive part of operating expenses, the imperatives of efficiency and cost reduction have always been a part of the HR mandate; however, when workforce practices are disconnected and lack a cohesive strategy across the company, the result is high turnover rates, longer hiring cycles, and lower employee engagement. All of which contribute to lack of product innovation, expensive operational errors, less satisfied customers, and suboptimal financial results. Our vision for Dynamics 365 Human Resources is to help HR teams balance operational excellence, organizational agility, and the employee experience to create a workplace where people and the business thrive.

Where your Microsoft Dynamics 365 Human Resources data is stored

Dynamics 365 Human Resources includes core HR capabilities and functionality that provides additional experiences such as Attract and Onboard. Such functionality may also be available for purchase as a standalone modular application through web-direct (e.g. Dynamics 365 Human Resources: Attract or Dynamics 365 Human Resources: Onboard). Unless noted, this article applies to Dynamics 365 Human Resources and each standalone modular app.

Dynamics 365 Human Resources can be deployed in the Microsoft Azure datacenters (also referred to as "regions") listed below.

With Dynamics 365 Human Resources, customers can specify the [geography](#) where their [customer data](#) will be stored¹. Microsoft may replicate customer data to other regions available within the same geography for data durability, except as specified below.

No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data.

¹Does not apply to standalone modular applications. See [here](#) for additional details.

Regions where Dynamics 365 Human Resources can be deployed

Explore Dynamics 365 Human Resources by geography [here](#).

Storing customer data – customer data at rest in geo

Microsoft will not transfer customer data outside the selected Azure geographic location for Dynamics 365 Human Resources except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- The customer uses a Microsoft service that is designed to operate globally including the following:
 - Dynamics 365 home page, which stores application names, descriptions, and logos globally for performance.

- Dynamics 365 Human Resources provisioning service¹ stores a list of environments accessible to each user, which is stored in the United States.
- Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#);
- Azure Multi-Factor Authentication, which may store Multi-Factor Authentication data globally
- You can find more information [here](#);
- Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#);
- Services that provide global routing functions and do not process or store customer data. This includes Traffic Manager, which provides load balancing, and Azure DNS, which provides domain name services that route to different regions; or
- Preview, beta, or other pre-release services, which typically store customer data in the United States but may store it globally.
- The administration portal for Dynamics 365 Human Resources, known as Microsoft Dynamics Lifecycle Services (LCS)¹, stores certain customer data on servers located in the United States such as:
 - Data packages (e.g., master or application configuration data) to support the Dynamics 365 Human Resources application lifecycle.
 - Business process models and task guides.
 - Usage and diagnostics logs collected during the application lifecycle process; and
 - Content related to support requests submitted to Microsoft such as support issues, service requests, and hotfix requests.
- Dynamics 365 Human Resources collects usage and diagnostic logs where customer data is stored in the United States.
- Customers configure external services to extend Dynamics 365 Human Resources, such customer configurations may cause customer data to be transferred outside of the selected geo. Examples of customer configurable external services include:
 - **Data integration:** Configuration of Dynamics 365 Human Resources data management features that work with external services (whether provided by Microsoft or a third party) may result in the transfer of core customer data outside of the region configured for the production environment to a geographic location that customers designate. You can find more information [here](#).
 - **Microsoft Power BI, Microsoft Power Apps, and Microsoft Power Automate:** Customers who connect their Power BI, Power Apps, or Power Automate deployment to Dynamics 365 Human resources may send customer data outside of the designated region to the geographic area where their Power BI, Power Apps, or Power Automate is deployed. You can find more details [here](#).
 - **Teams Apps :** Customers that use the Dynamics 365 Human Resources app in Teams may send customer data outside of the geographic region where Dynamics 365 Human Resources is deployed to the geography where their Dynamics 365 Human Resources Teams service is deployed. You can find more information [here](#)

¹Does not apply to standalone modular applications. See [here](#) for additional details.

Microsoft Dynamics 365 Customer Service Insights

Overview

[Dynamics 365 Customer Service Insights](#) provides an actionable view into critical performance metrics, operational data, and emerging trends using industry-leading artificial intelligence. These insights empower customer service managers to make better decisions to improve customer satisfaction and operational efficiency with confidence. Thanks to the power of artificial intelligence (AI), machine learning, and business intelligence (BI), you can easily get a clear view into your contact center on what is happening, why it is happening, and what could happen, and then decide your best course of action. The AI model used by Customer Service Insights proactively learns from users' gestures and optimizes over time per each individual customer. Best of all, the AI capabilities are included out of the box and don't require any AI expertise to use.

Microsoft Dynamics 365 Customer Insights

Overview

Customer experience is at the very core of every organization's digital transformation ambitions. To compete in today's market, organizations need to build meaningful relationships with their customers on a personal level. The ability to effectively personalize at scale requires a complete, unified view of customers. Build a deep understanding of customers by connecting customer data from various transactional, behavioral, and observational sources to create a 360-degree customer view to deliver insights that drive customer-centric experiences and processes.

The latest release of [Microsoft Dynamics 365 Customer Insights](#) includes new capabilities to help businesses further unify data across sources to get a single view of customers, optimize engagement, and discover insights that drive personalized experiences.

Where your Microsoft Dynamics 365 Customer Insights data is stored

Dynamics 365 Customer Insights can be deployed into the Microsoft Azure datacenters (also referred to as "regions") listed below.

With Dynamics 365 Customer Insights customers can specify the region where their customer data will be stored. Microsoft may replicate customer data to other regions available within the same geography for data durability. No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data.

Regions where Dynamics 365 Customer Service can be deployed

Explore Dynamics 365 Customer Insights product by geography [here](#).

Storing customer data – customer data at rest in geo

Microsoft will not transfer customer data outside the selected Azure geographic location (geo) for Dynamics 365 Customer Insights except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- Customers use services that are designed to operate globally, including the following:
 - Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#).
 - Azure Multi-Factor Authentication, which may store Multi-Factor Authentication data globally. You can find more information [here](#).
 - Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#).
 - Services that provide global routing functions and do not process or store customer data. This includes Azure DNS, which provides domain name services that route to different regions; or

- Preview, beta, or other pre-release services, which typically store customer data in the United States but may store it globally.
- Additionally, certain types of customer data (specifically the environment name) will be stored globally, rather than in the primary storage geo.
- Customers configure external services to extend Dynamics 365 Customer Insights such customer configurations may cause customer data to be transferred outside of the selected geo. Examples of such customer configurable external services include:
 - **Machine Learning Cognitive Services:** If features that use cognitive services are activated, customer data for domains such as product recommendations and demand forecasting can be synchronized outside of the configured region. Use of these features is optional. You can find more information [here](#).
 - **Data integration:** Configuration of Dynamics 365 Customer insights data management features that work with external services (whether provided by Microsoft or a third party) may result in the transfer of core customer data outside of the region configured for the production environment to a geographic location that customers designate. You can find more information [here](#).
 - **Microsoft Power BI, Microsoft Power Apps, and Microsoft Power Automate:** Customers who connect their Power BI, Power Apps, or Power Automate deployment to Dynamics 365 Customer Insights may send customer data outside of the designated region to the geographic area where their Power BI, Power Apps, or Power Automate is deployed. You can find more details [here](#).

Microsoft Dynamics 365 Sales Insights

Overview

[Dynamics 365 Sales Insights](#) makes AI accessible to everyone across the sales organization, giving sales teams time back so they can focus on building relationships with customers. Insights tailored to every member of the sales team are now available with a new digital assistant. The assistant offers sellers contextual relationship insights and transforms guided selling with next-best-action recommendations. Sales managers benefit from smart coaching suggestions based on customer conversations.

Microsoft Dynamics 365 Market Insights – Public preview

Overview

Today, business professionals face several challenges to understanding their customers and their market. An enormous amount of information is continuously being updated and coming from many different sources. In addition, some of the information needed may not be accessible. It may also take weeks or months to collect and understand the information about a specific topic, and this information is often expensive to access, gather and process. In the worst case, you may miss an important event or find out about it too late. These challenges result in low visibility into market trends and missed opportunities to build customer relationships.

With [Dynamics 365 Market Insights](#), you can close this gap with access to a variety of insights about the things you're interested in most (e.g., your products, customers, competitors, partners, events, and general topics). These insights come from a variety of data sources (including but not limited to news, web data, internet browsing behavior, and search activity) and are delivered to you in a concise, timely and proactive manner. In addition to providing relevant news about your topic(s), Dynamics 365 Market Insights also enables you to make more informed decisions based on what consumers say, seek, and feel about their products and brands.

Microsoft Dynamics 365 Fraud Protection

Overview

Today's digitally transformed merchants conducts most business online and in real time with little human intervention. This reduces merchants' costs and improves the customer experience, but it also exposes merchants to serious threats from those who attempt to take advantage of the online channel's relative anonymity and accessibility.

[Dynamics 365 Fraud Protection](#) provides insights and tools to detect payment and account creation fraud. The service will help enable an e-commerce merchant to drive down fraud loss, increase bank acceptance rates to yield higher revenue, and improve the online shopping experience of its customers.

Currently the merchants DFP environment can be provisioned in two geographies – US and Europe. Data residency applies to the boundaries of the geography where environment is provisioned.

Availability

Product is available for transaction globally except China and Russia.

Data locations

Dynamics 365 Fraud Protection operates in the geographical (geo) locations listed below. To determine where customer data will be stored, customers can choose the geo of the tenant account during initial signup and creation of the account. Microsoft may replicate data to other regions for data resiliency but will not replicate or move customer data outside the geo. Customers and their end users may move, copy or access their customer data from any location globally.

Note: Microsoft continuously looks for opportunities to deploy the business application platform to more geographical locations.

Explore Dynamics 365 Fraud Protection by geography [here](#).

Disclaimer: Please consult with your legal department or counsel if using Dynamics 365 for Fraud Protection in India satisfies your local requirements in light of the current online services architecture. Please read the following content to obtain further [information](#).

Power Platform

Power BI

Overview

[Power BI](#) is a business analytics solution that lets you visualize your data and share insights across your organization or embed them in your app or website. Connect to hundreds of data sources and bring your data to life with live dashboards and reports.

Certification and attestations

You can be assured that the data you entrust to us is held in accordance with stringent industry safeguards. Power BI complies with the standards listed below, and compliance is verified by third-party audits and certifications.

[Find out more about certifications and attestations for Power Platform.](#)

Privacy

At Microsoft, we're serious about strict standards regarding the privacy and protection of customer data. We take strong measures to protect your data from unauthorized persons or inappropriate access. Not only do Microsoft policies prohibit your data from being mined for marketing or advertising, we also restrict access by Microsoft personnel and subcontractors, and carefully define requirements for responding to government requests for customer data. However, your customer data is available to you at any time and for any reason.

Microsoft complies with international data protection laws regarding transfers of customer data across borders. We also offer an expanding network of global datacenters to help customers meet geographic restrictions on data storage.

[Learn more about how Microsoft manages your data](#)

[Find out where your Power Platform data is stored](#)

Security

Discover powerful security technologies

Your data is securely protected because the Power BI is built on [Microsoft Azure](#). This means that Power BI benefits from the Azure platform's powerful security technologies. Encryption of data, at rest and in transit, also preserves confidentiality. In addition, Power BI uses separate front-end and back-end clusters, the Gateway role, and secure data storage architecture. This helps protect your information and allows your organization's data to be unified whether in the cloud or on premises.

Power BI is governed by the [Microsoft Online Services Terms](#) and the [Microsoft Online Services Privacy Statement](#).

[Get an overview of the Power Platform](#)

Keep data secure with identity and access management

Now you can make sure that user access to your data is secure and controlled. Power BI uses [Azure Active Directory \(Azure AD\)](#) identity and access management mechanisms to help ensure that only authorized users can access the environment, data, and reports.

Power BI uses Azure AD as an identity repository for authentication and authorization. When users sign in to Power BI via a secure (HTTPS) website, all communication between the user's web browser and a business application platform service is encrypted.

The [Azure Traffic Manager](#) receives the request, and—based on the user's location—determines the location of the nearest service deployment, then responds with the IP address of that web front end (WFE) cluster.

To learn more about how the Azure Traffic Manager performs traffic routing, [read the Microsoft Azure documentation on Traffic Manager traffic-routing methods](#).

To find out about the Azure Content Delivery Network (CDN) from which necessary files are downloaded, [watch the Microsoft Azure documentation CDN videos](#).

Encryption to safeguard data

Encryption can help protect your data both at rest and in transit. Data requested and transmitted is encrypted in transit using HTTPS.

Data transferred through the on-premises data gateway is encrypted. Data that users upload is typically sent to Azure Blob storage, and all metadata and artifacts for the system itself are stored in an Azure SQL database and Azure Table storage.

Secure access for Power BI data

In Power BI, your data is secure because access authorization is based on a user's identity. The Power BI service handles data at rest (not currently being acted upon) and data in process (being actively accessed or updated by users or the service). Data is divided into two categories:

- Data accessed by direct query
- Data not accessed by direct query

Direct queries are directly translated to the native language of an underlying data source. Non-direct queries do not include credentials for the underlying data. The distinction between a direct query and other queries determines how the Power BI service handles the data at rest and whether the query itself is encrypted.

Power BI uses [Azure Storage](#) for Blob storage and [Azure SQL Database](#) for metadata that the system generates and uses. The user never connects directly to these storage repositories—all user connections are made to the Gateway role. The Gateway role then forwards requests for data to other roles such as the Presentation role, which is used to render the dashboard.

Only authorized users can access data based on identity. However, when users access data, it becomes their responsibility to secure any data they share. With static reports, authorized users can share reports with unauthorized users. With dynamic reports, users can see reports only if they are authenticated and authorized. Here's how static and dynamic reports handle data:

- **Static reports.** When a static report is created, the data is fixed in the report—similar to a PDF. (There is no "callback" to the Power BI system to view the data visualized in the report.)
- **Dynamic reports.** With a dynamic report, the data doesn't reside in the report. Instead, the report is generated by pulling data from SQL Server Analysis Services, using the [Power BI Analysis Service Connector](#) to connect to SQL Server.

[Learn more about Power BI security](#)

Storing customer data

Power BI stores information that is global in nature, such as user identities and profile information, in a datacenter located in the United States. All Power BI customer data, as well as the geo-redundant mirrors, is maintained within the selected geo.

Power BI works and uses several Microsoft Azure services. Please refer to the [Microsoft Azure datacenter map](#) for details on the retention of customer data by location.

Microsoft will not transfer customer data outside the selected geo except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- The customer configures an account to enable such transfer of customer data, including through the use of the following:
- Features that are designed to operate globally, such as Content Delivery Network (CDN), which provides a global caching service and stores customer data at edge locations around the world; and the Dynamics 365 and Power Platform home page and Admin Center portals, which store application names, descriptions, and logos globally for performance.
- Common Data Service, which stores entity and field names (but not the content of database tables) globally.
- ISV Studio, which stores data in the United States but may store it globally.
- Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#).
- Azure Multi-Factor Authentication, which may store authentication data globally. You can find more information [here](#).
- Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#)
- Services that provide global routing functions and do not process or store customer data. This includes Traffic Manager, which provides load balancing between different regions, and Azure DNS, which provides domain name services that route to different regions.

- Preview, beta, or other prerelease services, which typically store customer data in the United States but may store it globally.

Note: Microsoft does not control or limit the geos from which customers, or their end users may access customer data.

[Microsoft Azure datacenter map](#)

[Learn more about how Microsoft manages your data](#)

Data protection and infrastructure security

Your data is secure and protected because Power BI is built on Microsoft Azure. Power BI employs Azure infrastructure security which relies on best security practices and technologies to safeguard data as it travels within Microsoft datacenters and across the internet.

Architecture

The architecture of Power BI services is designed to help protect your data. Power BI is deployed in datacenters around the world, and each deployment consists of two clusters:

- **WFE cluster.** All users connect to the WFE before accessing any information in Power BI. Servers in the WFE cluster authenticate users, using Azure AD to store user identities and authorize access to data. The Azure Traffic Manager finds the nearest Power BI deployment, and that WFE cluster manages login and authentication.
- **Back-end cluster.** All subsequent activity and access to data is handled through the back-end cluster. It manages dashboards, visualizations, datasets, reports, data storage, data connections, and data refresh activities. The back-end cluster hosts many roles, including Azure API Management, Gateway, Presentation, Data, Background Job Processing, and Data Movement.

Users directly interact only with the Gateway role and Azure API Management which are accessible through the internet. These roles perform authentication, authorization, distributed denial-of-service (DDoS) protection, bandwidth throttling, load balancing, routing, and other security, performance, and availability functions. There is a distinct boundary between the roles that users can access and the roles that are accessible only by the system.

Threat management

We work to constantly strengthen threat management to increase protection and reduce risks —so you know your data remains secure now and in the future. The Azure [multi-pronged threat management approach](#) protects business application platform services by using intrusion detection, DDoS attack prevention, penetration testing, data analytics, and machine learning.

Physical security

Power BI is deployed in Microsoft regional datacenters. These datacenters are protected by layers of defense-in-depth security that include perimeter fencing, video cameras, security personnel, secure entrances, and real-time communications networks, continuing from every area of the facility to each physical server unit.

[Take a virtual datacenter tour](#)

Data locations

Power BI operates in the geographical (geo) locations listed below. To determine where customer data will be stored, customers can choose the geo of the tenant account during initial signup and creation of the account. Microsoft may replicate data to other regions for data resiliency but will not replicate or move customer data outside the geo. Customers and their end users may move, copy, or access their customer data from any location globally.

Note: Microsoft continuously looks for opportunities to deploy the business application platform to more geographical locations.

Explore Power BI by geography [here](#).

Note:

- Because there is only one region in Brazil, customer data in Brazil South may be replicated to South Central US (Texas).
- Power BI in China is a separate service sold and operated by 21Vianet. The Azure datacenter map outlines the locations of datacenters where 21Vianet stores customers data. For resiliency and availability, 21Vianet may replicate customer data in at least two datacenters, but always within China.
- For customers of Power BI Germany, customer data remains in the identified German datacenters under control of T-Systems, a Deutsche Telekom company acting as a German data trustee
- Power BI Government is sold separately to qualifying government customers. For data resiliency and availability, Microsoft may replicate customer data in at least two datacenters – but always within Power BI Government regions.

[Power BI security white paper](#)

Power Apps

Overview

[Power Apps](#) is a suite of apps, services, connectors, and a data platform that provides an environment for rapidly developing custom apps for your business needs. Using Power Apps, you can quickly build custom business apps that connect to your business data stored either in the underlying data platform (Common Data Service) or in various online and on-premises data sources (SharePoint, Excel, Office 365, Dynamics 365, SQL Server, and so on). Use Power Apps [documentation](#) to get expert information and answers to address your needs, regardless of how you use Power Apps.

Certification and attestations

You can be assured that the data you entrust to us is held in accordance with stringent industry safeguards. Power Apps complies with the standards listed below, and compliance is verified by third-party audits and certifications.

[Find out more about certifications and attestations for Power Platform.](#)

Your data is securely protected because Power Apps is built on [Microsoft Azure](#). This means that Power Apps benefits from the Azure platform's powerful security technologies. Encryption of data, at rest and in transit, also preserves confidentiality. In addition, Power Apps uses separate front-end and back-end clusters, the Gateway role, and secure data storage architecture. This helps protect your information and allows your organization's data to be unified whether in the cloud or on premises.

Power Apps is governed by the [Microsoft Online Services Terms](#) and the [Microsoft Online Services Privacy Statement](#).

[Get an overview of Power Platform](#)

Keep data secure with identity and access management

Now you can make sure that user access to your data is secure and controlled. Power Apps uses [Azure Active Directory \(Azure AD\)](#) identity and access management mechanisms to help ensure that only authorized users can access the environment, data, and reports.

Power Apps uses Azure AD as an identity repository for authentication and authorization. When users sign-in to Power Apps via a secure (HTTPS) website, all communication between the user's web browser and Power Apps is encrypted.

The [Azure Traffic Manager](#) receives the request, and—based on the user's location—determines the location of the nearest service deployment, then responds with the IP address of that web front end (WFE) cluster.

To learn more about how the Azure Traffic Manager performs traffic routing, [read the Microsoft Azure documentation on Traffic Manager traffic-routing methods](#).

To find out about the Azure Content Delivery Network (CDN) from which necessary files are downloaded, [watch the Microsoft Azure documentation CDN videos](#).

Encryption to safeguard data

Encryption can help protect your data both at rest and in transit. Data requested and transmitted is encrypted in transit using HTTPS.

Data transferred through the on-premises data gateway is encrypted. Data that users upload is typically sent to Azure Blob storage, and all metadata and artifacts for the system itself are stored in an Azure SQL database and Azure Table storage.

Secure connectivity for Power Apps and Power Automate

Power Apps and Power Automate ensure that your data is secure because they connect to external services on behalf of users. So only authorized users can access your data with authorization decisions based on the user's identity. It's impossible for a flow or app to perform an operation in a service for which the creator does not have permissions.

Even when users grant other users access to a flow or app, access to the data is not shared when sharing an app. Users must provide their own credentials to create their own non-shared connection to the data sources. Users can share their flows or apps with other authenticated users in their organizations, and each user provides their own credential to create their own (non-shared) connection to the data sources.

Authorization tokens are easy to manage. Power Automate and Power Apps connect through Azure API Management, which stores the authorization tokens that users create for those services. These tokens are automatically refreshed when they expire and live until they are explicitly revoked by the user who created the connection. They do not expire when the user's password changes. In addition, administrators can manage the flows and apps in an organization as well as which services they have access to, through the Power Automate or Power Apps Admin centers.

Finally, administrators can configure Data Loss Prevention policies to control the flow of data between different services in their flows and apps. These policies can block data from being sent to non-compliant systems even if the end user would have access to send this information manually.

[Learn about data loss prevention policies](#)

Storing customer data

Power Apps stores information that is global in nature, such as user identities and profile information, in a datacenter located in the United States. All Power Apps customer data, as well as the geo-redundant mirrors, is maintained within the selected geo.

Power Apps works and uses several Microsoft Azure services. Please refer to the [Microsoft Azure datacenter map](#) for details on the retention of customer data by location.

Microsoft will not transfer customer data outside the selected geo except when:

- It is necessary for Microsoft to provide customer support, troubleshoot the service, or comply with legal requirements.
- The customer configures an account to enable such transfer of customer data, including through the use of the following:
- Features that are designed to operate globally, such as Content Delivery Network (CDN), which provides a global caching service and stores customer data at edge locations around the world; and the Dynamics 365 and the Power Platform home page and Admin Center portals, which store application names, descriptions, and logos globally for performance.
- Common Data Service, which stores entity and field names (but not the content of database tables) globally.
- ISV Studio, which stores data in the United States but may store it globally.
- Azure Active Directory, which may store Active Directory data globally. You can find more information [here](#).
- Azure Multi-Factor Authentication, which may store authentication data globally. You can find more information [here](#).
- Customer data collected during the onboarding process by the Microsoft Office 365 Admin Center. You can find more information [here](#)
- Services that provide global routing functions and do not process or store customer data. This includes Traffic Manager, which provides load balancing between different regions, and Azure DNS, which provides domain name services that route to different regions.
- Preview, beta, or other prerelease services, which typically store customer data in the United States but may store it globally.
- Additionally, certain types of customer data (specifically the application name, application description, and application logo) will be stored globally, rather than in the primary storage geo.

Note: Microsoft does not control or limit the geos from which customers, or their end users may access customer data.

Data protection and infrastructure security

Your data is secure and protected because Power Apps is built on Microsoft Azure. Power Apps employs Azure infrastructure security which relies on best security practices and technologies to safeguard data as it travels within Microsoft datacenters and across the internet.

Architecture

The architecture of Power Apps is designed to help protect your data. Power Apps is deployed in datacenters around the world, and each deployment consists of two clusters:

- **WFE cluster.** All users connect to the WFE before accessing any information in Power Apps. Servers in the WFE cluster authenticate users, using Azure AD to store user identities and authorize access to data. The Azure Traffic Manager finds the nearest Power Apps deployment, and that WFE cluster manages login and authentication.
- **Back-end cluster.** All subsequent activity and access to data is handled through the back-end cluster. It manages dashboards, visualizations, datasets, reports, data storage, data connections, and data refresh activities. The back-end cluster hosts many roles, including Azure API Management, Gateway, Presentation, Data, Background Job Processing, and Data Movement.

Users directly interact only with the Gateway role and Azure API Management which are accessible through the internet. These roles perform authentication, authorization, distributed denial-of-service (DDoS) protection, bandwidth throttling, load balancing, routing, and other security, performance, and availability functions. There is a distinct boundary between the roles that users can access and the roles that are accessible only by the system.

Threat management

We work to constantly strengthen threat management to increase protection and reduce risks —so you know your data remains secure now and in the future. The Azure [multi-pronged threat management approach](#) protects Power Apps by using intrusion detection, DDoS attack prevention, penetration testing, data analytics, and machine learning.

Physical security

Power Apps are deployed in Microsoft regional datacenters. These datacenters are protected by layers of defense-in-depth security that include perimeter fencing, video cameras, security personnel, secure entrances, and real-time communications networks, continuing from every area of the facility to each physical server unit.

[Take a virtual datacenter tour](#)

Data locations

Power Apps operates in the geographical (geo) locations listed below. To determine where customer data will be stored, customers can choose the geo of the tenant account during initial signup and creation of the account. Microsoft may replicate data to other regions for data resiliency but will not replicate or move customer data outside the geo. Customers and their end users may move, copy, or access their customer data from any location globally.

Note: Microsoft continuously looks for opportunities to deploy Power Apps to more geographical locations.

Explore Power Apps by geography [here](#).

Note:

- Because there is only one region in Brazil, customer data in Brazil South may be replicated to South Central US (Texas).
- US Government is sold separately to qualifying government customers. For data resiliency and availability, Microsoft may replicate customer data in at least two datacenters – but always within Government regions.

Availability

Power Automate

Overview

[Power Automate](#) is the popular process automation and workflow product from Microsoft. Every month, over a million people automate everything from simple notifications to highly tailored multi-step approval processes spanning organizational boundaries. Power Automate exemplifies the future of automation by infusing intelligence and empowering completely non-technical users to automate complex workflows—all without tortuous IT deployments.

Certification and attestations

You can be assured that the data you entrust to us is held in accordance with stringent industry safeguards. Power Automate complies with the standards listed below, and compliance is verified by third-party audits and certifications.

[Find out more about certifications and attestations for Power Platform.](#)

Privacy

At Microsoft, we are serious about strict standards regarding the privacy and protection of customer data. We take strong measures to protect your data from unauthorized persons or inappropriate access. Not only do Microsoft policies prohibit your data from being mined for marketing or advertising, we also restrict access by Microsoft personnel and subcontractors, and carefully define requirements for responding to government requests for customer data. However, your customer data is available to you at any time and for any reason.

Microsoft complies with international data protection laws regarding transfers of customer data across borders. We also offer an expanding network of global datacenters to help customers meet geographic restrictions on data storage.

Power Virtual Agents

Overview

[Power Virtual Agents](#) enables anyone in your organization to create AI-powered bots that can chat with users about specific topics. They can answer routine questions, resolve common issues, or automate tasks that take up valuable customer or employee time.

Creating a bot is typically a complex and time-intensive process, requiring long content update cycles and a team of experts. Power Virtual Agents gives anyone in your organization the ability to create powerful custom bots using an easy, code-free graphical interface, without the need for AI experts, data scientists, or teams of developers. A bot can interact with users, ask for clarifying information, and ultimately answer a user's questions.

Data location of an organization using Power Virtual Agents

Power Virtual Agents can be deployed into the Microsoft Azure datacenters (also referred to as "regions") listed in this article. You can choose the datacenter you want to use [when setting up your environment](#).

Microsoft may replicate customer data to other regions available within the same geography for data durability. No matter where customer data is stored, Microsoft does not control or limit the locations from which customers, or their end users may access customer data.

Data will be stored in United States if a bot author's tenant location is not listed under the Data locations table above. For France, data will be stored in Europe.

Data locations

Explore Power Virtual Agents supported [data locations](#).

Customer data

Microsoft will not transfer customer data outside the selected Azure geographic location (geos) for Power Virtual Agents except when:

- Microsoft must provide customer support, troubleshoot the service, or comply with legal requirements.
- Customers use services that are designed to operate globally, including the following:
 - Email used to send marketing messaging globally, as configured by the customer.
 - The Dynamics 365 home page, which stores application names, descriptions, and logos globally for performance.
 - [Azure Active Directory](#), which may store Active Directory data globally.
 - [Azure Multi-Factor Authentication](#), which may store multi-factor authentication data globally.
 - Customer data collected during the onboarding process by the [Microsoft Office 365 Admin Center](#).
 - Services that provide global routing functions and do not process or store customer data. This includes Azure DNS, which provides domain name services that route to different regions; or preview, beta, or other pre-release services, which typically store customer data in the United States but may store it globally.

- Additionally, certain types of customer data (specifically the application name, application description, and application logo) will be stored globally, rather than in the primary storage geographic location.
- Customers configure external services to extend Power Virtual Agents. Such customer configurations may cause customer data to be transferred outside of the selected geographic location. Examples of customer configurable external services include:
 - [Customer Service Hand-off](#) – Configurable external services that hand-off bot escalations to a human agent.
 - Multi-Channel – Configurable to external channels such as Facebook and internal non-PVA services (Microsoft Teams).
 - Facebook documentation
 - Microsoft Teams documentation
 - Customer Service Insights Topic suggestion – Topic suggestions from Customer Service Insights are automated into Power Virtual Agents with a single click. Data may go to a bot in a different geographic region than the workspace region in Customer Service Insights.
