Overview

This Licensing Quick Reference Guide is for people who want to gain a basic understanding of how Microsoft® SQL Server® 2012 software is licensed through Microsoft Volume Licensing programs. This guide does not supersede or replace any of the legal documentation covering SQL Server 2012 product use rights. Specific product license terms are defined in the product Software License Terms—or in the case of Microsoft Volume Licensing—in the Microsoft Volume Licensing agreement under which the software was acquired and/or the Microsoft Volume Licensing Product Use Rights (PUR). This licensing guide is not a legal use rights document. Program specifications and business rules are subject to change.

This version of the SQL Server 2012 Licensing Quick Reference Guide has been released prior to the general availability (GA) of SQL Server 2012. An updated guide will be released at GA. This guide is subject to change. The most current version of this guide can be downloaded at: <http://go.microsoft.com/fwlink/?LinkId=230678>

© 2012 Microsoft Corporation. All Rights Reserved.

This document is for informational purposes only. MICROSOFT MAKES NO WARRANTIES, EXPRESS OR IMPLIED, IN THIS SUMMARY.

Microsoft provides this material solely for informational and marketing purposes. Customers should refer to their agreements for a full understanding of their rights and obligations under Microsoft's Volume Licensing programs. Microsoft software is licensed not sold. The value and benefit gained through use of Microsoft software and services may vary by customer. Customers with questions about differences between this material and the agreements should contact their reseller or Microsoft account manager. Microsoft does not set final prices or payment terms for licenses acquired through resellers. Final prices and payment terms are determined by agreement between the customer and its reseller. Eligibility for Software Assurance benefits varies by offering and region and is subject to change. The Terms and Conditions of your Volume License Agreement and the Terms and Conditions under which any specific Software Assurance benefits are offered will take precedence in the case of any conflict with the information provided here. For eligibility criteria and current benefit program rules, see the Microsoft Product List.

SQL Server 2012 Editions

SQL Server 2012 is offered in three main editions to accommodate the unique feature, performance and price requirements of organizations and individuals:

- **Enterprise Edition** is ideal for mission critical applications and large scale data warehousing.
- **Business Intelligence Edition**, a new offering, provides premium corporate and self-service BI.
- **Standard Edition** delivers basic database, reporting and analytics capabilities.

The new editions are offered in a straightforward, tiered model that creates greater consistency across the product editions, features and licensing. The Enterprise Edition includes all the capabilities available in SQL Server 2012. The Business Intelligence Edition includes all Standard Edition capabilities, plus all Business Intelligence capabilities included in the Enterprise Edition.

SQL Server 2012 Capabilities	SQL Server 2012 Editions		
	Standard	Business Intelligence	Enterprise
Licensing Options	Core-Based or Server+CAL	Server+CAL	Core-Based
Windows Server Core Edition Support	●	●	●
Basic High Availability	●	●	●
Basic OLTP	●	●	●
Basic Reporting & Analytics	●	●	●
Programmability & Developer Tools (T-SQL, CLR, data types, FileTable)	●	●	●
Manageability (Management Studio, Policy-Based Management)	●	●	●
Enterprise Data Mgmt. (Data Quality Services, Master Data Services)		●	●
Self-service Business Intelligence (Power View, PowerPivot for SPS)		●	●
Corporate Business Intelligence (Semantic model, advanced analytics)		●	●
Advanced Security (Advanced auditing, Transparent Data Encryption)			●
Data Warehousing (ColumnStore Index, compression, partitioning)			●
AlwaysOn High Availability			●
StreamInsight	Basic	Basic	Advanced

This table shows a comparison of key capabilities across the main SQL Server 2012 editions

With SQL Server 2012, the Web Edition is being offered only under a Microsoft Services Provider License Agreement (SPLA). The Datacenter Edition has been retired, with all capabilities now available in SQL Server 2012 Enterprise Edition. Workgroup and Small Business Editions have also been retired; and the Developer, Express and Compact Editions continue to be available, along with the SQL Server 2008 R2 Parallel Data Warehouse and Parallel Data Warehouse for Developers Editions.

- For general information on each of the SQL Server 2012 editions, visit: <http://www.microsoft.com/sqlserver/en/us/future-editions/sql2012-editions.aspx>
- For detailed product specifications and a full feature by feature comparison of the SQL Server 2012 editions, visit: [http://msdn.microsoft.com/en-us/library/ms143287\(v=sql.110\).aspx](http://msdn.microsoft.com/en-us/library/ms143287(v=sql.110).aspx)

SQL Server 2012 Licensing Models

Prior to the release of SQL Server 2012, SQL Server 2008 R2 and earlier software versions were licensed through Microsoft Volume Licensing programs using one of two software licensing models: a Per Processor licensing model, designed to reflect the computing power used; and a Server plus Client Access License (Server+CAL) licensing model, which is based on the users or devices accessing the product.

With SQL Server 2012, Microsoft continues to offer customers a variety of licensing options aligned with how customers typically purchase specific workloads. The Server+CAL licensing model provides the option to license users and/or devices and then have low cost access to incremental SQL Server deployments. However, for customers who cannot count users or require premium database capabilities, the way Microsoft licenses SQL Server for computing power is changing. In the new computing-power based license model for SQL Server 2012, the measure of computing power is shifting from physical processors to cores. Core-based licensing provides a more precise measure of computing power and a more consistent licensing metric, regardless of whether solutions are deployed on physical servers on-premise, or in virtual or cloud environments.

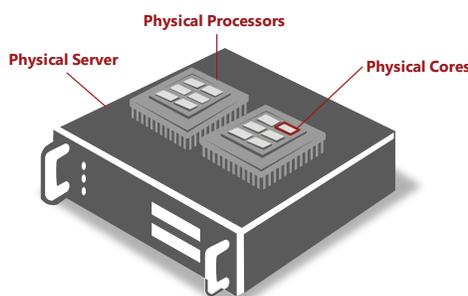

SQL Server 2012 Editions	Description	Licensing Options		
		Server+CAL	Core-based	Requirements
Enterprise	High-end datacenter, data warehousing and BI capabilities		●	
Business Intelligence	Enterprise BI and high scale analytics	●		SQL Server CALs required
Standard	Basic database and BI capabilities	●	●	SQL Server CALs required when licensing Server+CAL

This table compares the licensing options for each of the main SQL Server 2012 editions

Core-Based Licensing

Under the new Per Core licensing model, each server running SQL Server 2012 software or any of its components (such as Reporting Services or Integration Services) must be assigned an appropriate number of SQL Server 2012 core licenses. The number of core licenses needed depends on whether customers are licensing the physical server or individual virtual Operating System Environments (OSEs).

Unlike the Server+CAL licensing model, the Per Core model allows access for an unlimited number of users or devices to connect from either inside or outside an organization’s firewall. With the Per Core model, customers do not need to purchase additional client access licenses (CALs) to access the SQL Server software.

This figure depicts a physical server with two physical processors, each containing six physical cores

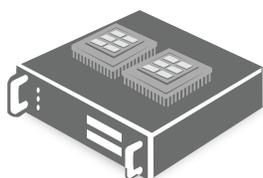

Physical Server	A <u>server</u> is a physical hardware system capable of running server software. A hardware partition or blade is considered to be a separate physical hardware system.
Physical Processor	A <u>processor</u> is generally a physical chip that resides in a physical socket of the hardware partition and contains one or more cores.
Physical Core	Each physical processor contains smaller processing units called <u>physical cores</u> . Some processors have two cores, some four, some six or eight, and so on. Figure 3 shows an example of two physical processors with six cores each.
Hardware Thread	A <u>hardware thread</u> is either a physical core or a hyper-thread in a physical processor.
Physical Operating System Environment	A <u>physical Operating System Environment (OSE)</u> is configured to run directly on a physical hardware system and is all or part of an operating system instance. Instances of SQL Server software can be installed to run in the physical OSE.

How to License SQL Server 2012 Using the Per Core Licensing Model

When running in a physical Operating System Environment (OSE), all physical cores on the server must be licensed. To determine how many core licenses are required:

1. Count the total number of physical cores for each processor in the server.
2. Multiply the number of cores by the appropriate core factor to determine the number of licenses required for each processor in the server. Note: The core factor used depends on the processor type deployed.
3. Purchase the appropriate number of core licenses required for each processor in the server.
4. Core licenses are sold in packs of two; so customers must divide the number of licenses required by two, to determine the actual number of line items to order.

2 Intel Xeon 6-core processors

Number of core licenses required:

$$\begin{array}{r}
 \mathbf{12} \quad (\text{total cores on the server}) \\
 \times \quad \mathbf{1} \quad (\text{core factor from the table below}) \\
 \hline
 = \quad \mathbf{12} \quad \text{core licenses required}
 \end{array}$$

Purchase 6 "2-Pack" SKUs of core licenses
(cores sold in 2-core packs)

Microsoft SQL Server 2012 Core Factor Table*	
Processor Type	Core Factor
All processors not mentioned below	1
AMD Processors (31XX, 32XX, 41XX, 42XX, 61XX, 62XX Series Processors with 6 or more cores)	0.75
Single-Core Processors	4
Dual-Core Processors	2

* This is an example of how to calculate core license requirements and the core factor table. The core factor table is subject to change. You can find the core factor table at any time, updated at the link below.

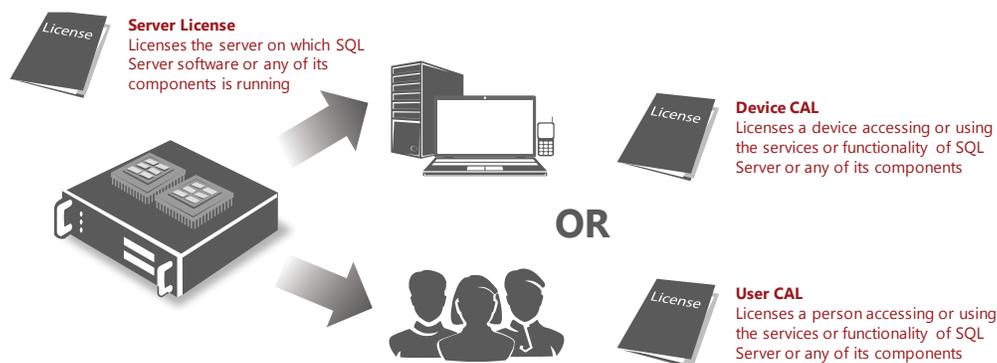

- ➡ For more information on the SQL Server 2012 Core Factor Table, including how to determine and use the appropriate core factor when licensing SQL Server 2012 under the Per Core model, visit: <http://go.microsoft.com/fwlink/?LinkID=229882>

The Per Core licensing model is appropriate when:

- Deploying the SQL Server 2012 Enterprise Edition.
- Deploying Internet or extranet workloads, systems that integrate with external-facing workloads (even if external connectivity or data goes through one or more other systems), or when the number of users/devices cannot otherwise be easily counted.
- Implementing centralized deployments that span a large number of direct and/or indirect users/devices.
- The total licensing costs are lower than those incurred using the Server+CAL licensing model.
- For details on how to license virtual OSEs using the Per Core model, refer to the Licensing SQL Server 2012 for Virtual Environments section of this guide.

Server+CAL Licensing

When licensing SQL Server software under the Server+CAL model, customers purchase a server license for each server and a client access license (CAL) for each device (Device CAL) and/or user (User CAL) accessing SQL Server or any of its components. A CAL is not software; it is a license granting users and devices access to the SQL Server software.

This figure illustrates the licenses used in the Server+CAL licensing model

How to License SQL Server 2012 Using the Server+CAL Licensing Model

Under the Server+CAL licensing model, each Operating System Environment (OSE) running SQL Server 2012 software or any of its components must have a SQL Server 2012 server license assigned to the physical server hosting the OSE. Each server license allows customers to run any number of SQL Server instances in an OSE, either physical or virtual. Note: When running SQL Server software in a physical OSE, each hardware partition or blade is considered to be a separate server for licensing purposes.

To access a licensed SQL Server, each user or device must have a SQL Server CAL that is the same version or newer than the SQL Server software version being accessed. For example, to access a server running SQL Server 2012 software, a user needs a SQL Server 2012 CAL. Note: Devices not operated by humans require device CALs, even when connecting to SQL Server indirectly. For human operated devices such as PCs or hand-held terminals, a user CAL or device CAL may be used.

SQL Server CALs are version specific. Each SQL Server 2012 CAL provides access to any number of licensed SQL Server instances (SQL Server 2012 or earlier) in a customer's organization, regardless of the platform (32-bit, 64-bit or IA64) or product edition, including legacy SQL Server Workgroup and SQL Server for Small Business edition servers. Note: Use of hardware or software that reduces the number of devices or users that directly access or use the software (multiplexing/pooling) does not reduce the number of CALs required. For details on how to license SQL Server in a multiplexed application environment, refer to the [Advanced Licensing Scenarios](#) section of this guide.

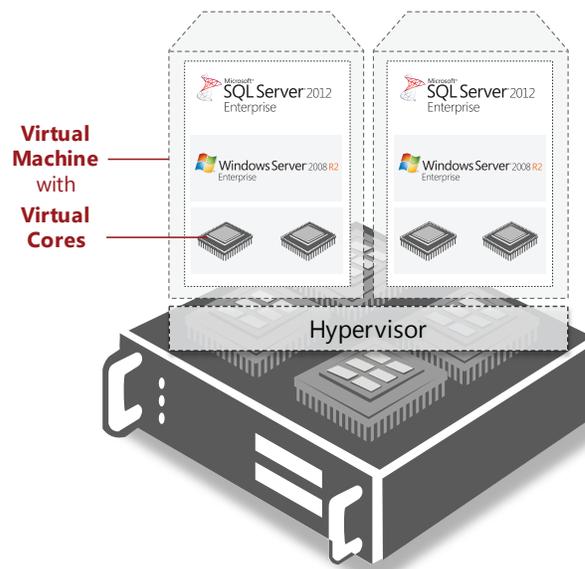

The Server+CAL licensing model is appropriate when:

- Deploying the SQL Server Business Intelligence Edition.
- Deploying SQL Server Standard Edition in scenarios where you can easily count users/devices and the total licensing costs are lower than using the Per Core licensing model.
- Accessing multiple SQL Server databases and/or planning to scale out use of SQL Server by adding new servers over time. Once you have purchased the necessary CALs, you only need to purchase low cost server licenses for new server system deployments.
- Accessing "legacy" Enterprise Edition Servers in the Server+CAL licensing model. For more detailed information on this topic, refer to the [Additional Product Information](#) section of this guide.

Licensing SQL Server 2012 in a Virtualized Environment

Microsoft SQL Server is increasingly being deployed in virtualized environments, which enable running instances of SQL Server concurrently in separate virtual Operating System Environments (OSEs), or virtual machines (VMs).

SQL Server 2012 offers expanded virtualization rights, options and benefits to provide greater flexibility for customers deploying in virtual environments. When deploying SQL Server 2012 software in virtualized environments, customers have the choice to license either individual virtual machines (VMs) as needed, or to license for maximum virtualization in highly virtualized, private cloud, or dynamic environments. Maximum virtualization can be achieved by licensing the entire physical server with Enterprise Edition core licenses and covering those licenses with Software Assurance.

This figure depicts two virtual machines, each containing two virtual cores

Licensing Individual Virtual Machines

As customers consolidate existing workloads and refresh hardware, they may find that a SQL Server instance uses only a fraction of available system computing power. When deploying databases in virtual environments that require just a fraction of a physical server, savings can be achieved by licensing individual VMs.

How to License Individual Virtual Machines Using the Per Core Licensing Model

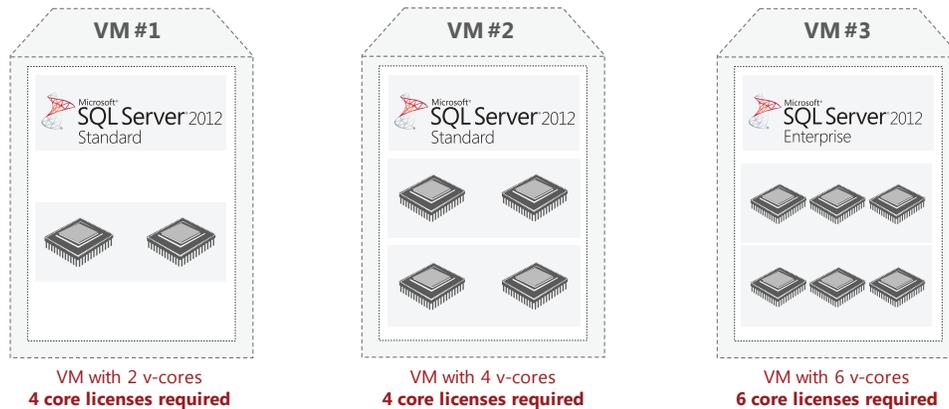

Similar to the Per Core licensing model in physical OSEs, all virtual cores (v-cores) supporting virtual OSEs that are running instances of SQL Server 2012 software must be licensed accordingly.

To license individual VMs using the Per Core model, customers must purchase a core license for each v-core (or virtual processor, virtual CPU, virtual thread) allocated to the VM, subject to a four core license minimum per VM. For licensing purposes, a v-core maps to a hardware thread. When licensing individual VMs, core factors do not apply

Note: Licensing individual VMs is the only licensing option available for SQL Server 2012 Standard Edition customers who are running the software in a virtualized environment under the Per Core model.

With SQL Server 2012, Microsoft also offers support for license mobility as an exclusive Software Assurance (SA) benefit available for all SQL Server software editions. For more information on licensing for application mobility, refer to the Advanced Licensing Scenarios section of this guide.

- 1 License the virtual cores in each virtual machine
- 2 There is a minimum of 4 core licenses required for each virtual machine

This figure illustrates the licensing requirements for three different virtual machines under the Per Core licensing model

Additional licenses may be required if:

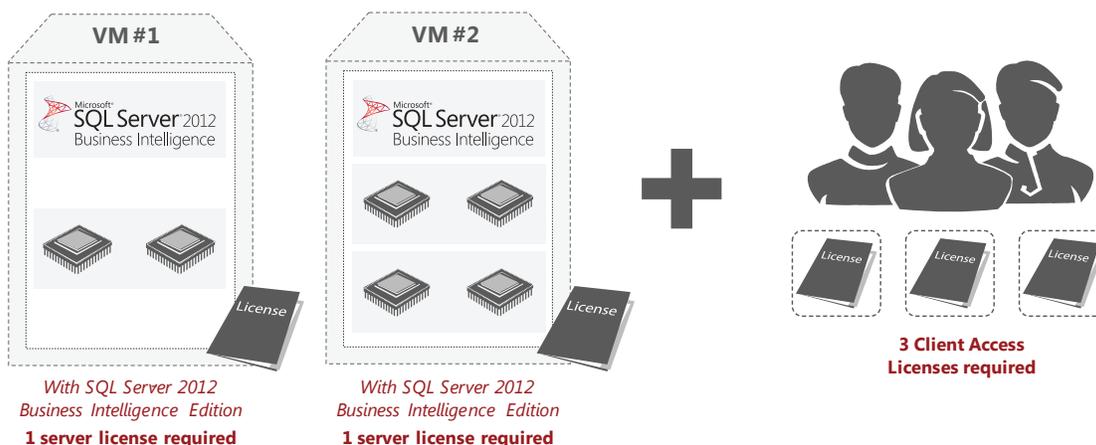

- A single hardware thread is supporting multiple virtual cores. (A core license is required for each v-core.)
- Multiple hardware threads are supporting a single virtual core. (A core license allows a single v-core supported by a single hardware thread.)

How to License Individual Virtual Machines Using the Server+CAL Licensing Model

To license individual VMs using the Server+CAL model (available for SQL Server 2012 Standard and Business Intelligence editions only) customers simply purchase one server license for each VM running SQL Server software, regardless of the number of virtual processors allocated to the VM. Note: Each user or device accessing SQL Server 2012 software, regardless of a virtual or physical deployment, requires a SQL Server 2012 CAL.

For details on how to license individual VMs with legacy SQL Server Enterprise Edition server licenses, please refer to the [Advanced Licensing Scenarios](#) section of this guide

- 1 License each virtual machine with a server license
- 2 License each user or device with a CAL

This figure shows an example of licensing virtual machines under the Server+CAL licensing model

Licensing for Maximum Virtualization

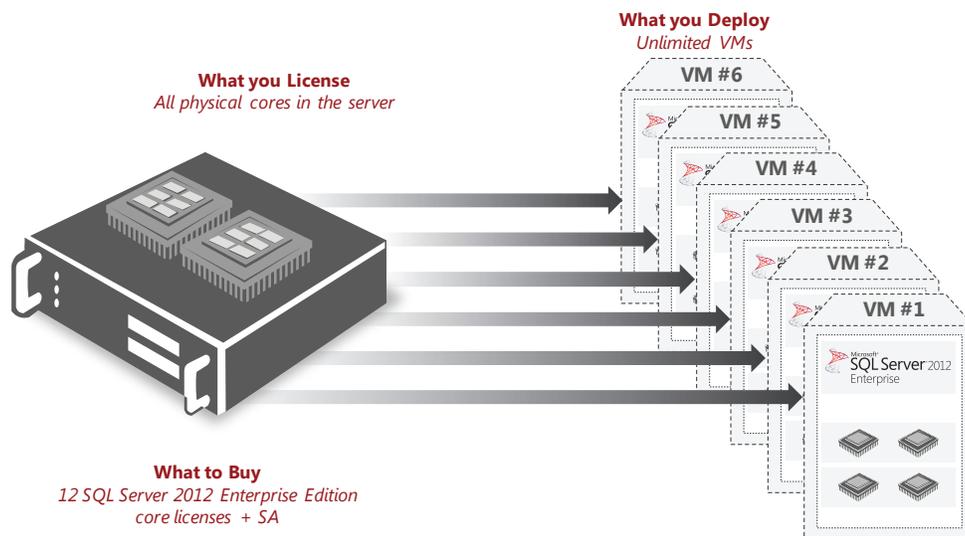

With the SQL Server 2012 Enterprise Edition, customers that have licensed all physical cores on the server can run an unlimited number of instances of the software in a number of OSEs (physical and/or virtual) equal to the number of core licenses assigned to the server. For example, a four processor server with four cores per processor—fully licensed with sixteen core licenses—could run SQL Server software in up to sixteen VMs, regardless of the number of virtual cores allocated to each VM.

With the addition of Software Assurance (SA) coverage for all Enterprise Edition core licenses (when the server is fully licensed), customers' use rights are expanded, allowing them to run any number of instances of the software in any number of OSEs (physical or virtual). This enables customers to deploy an unlimited number of VMs to handle dynamic workloads and fully utilize hardware computing capacity. Note: This benefit ends when SA coverage expires.

Licensing for maximum virtualization can be an ideal solution when:

- Deploying SQL Server private cloud scenarios with high VM density.
- Hyper-threading is being used.
- Using dynamic provisioning and de-provisioning of VM resources.

- 1 Fully license the server with SQL Server 2012 Enterprise Edition core licenses and Software Assurance
- 2 Deploy an unlimited number of virtual machines

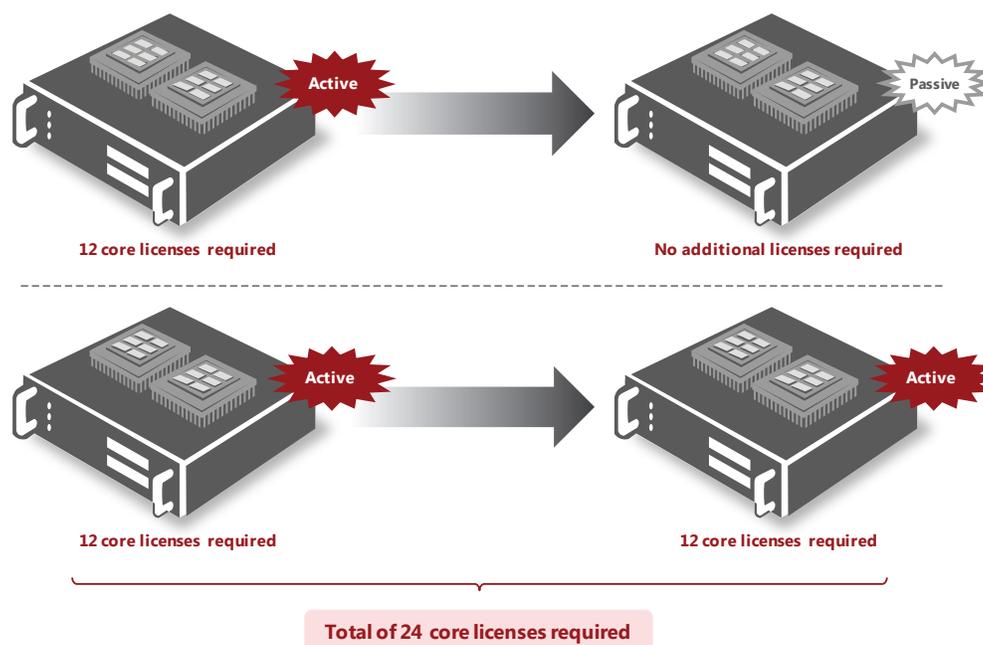

Shown is an example of licensing for unlimited VMs with Enterprise Edition core licenses and SA (assuming a core factor of 1)

Advanced Licensing Scenarios and Detailed Examples

In this section, we will introduce a few advanced SQL Server 2012 licensing scenarios to help illustrate how these principles can be applied in specific situations. For detailed licensing terms applicable to your specific deployment scenario, refer to the Microsoft Volume Licensing Product Use Rights (PUR) or contact your Microsoft reseller.

Licensing SQL Server for High Availability

SQL Server software can be configured so that if one server fails, its processing will be picked up, recovered and continued by another server. All editions of SQL Server 2012 provide basic high availability features including backup log shipping, database mirroring and two-node failover clustering. Advanced (AlwaysOn) high availability features in SQL Server 2012 Enterprise Edition include enhanced support for multiple, active (readable) secondary servers and support for multi-site failover clustering.

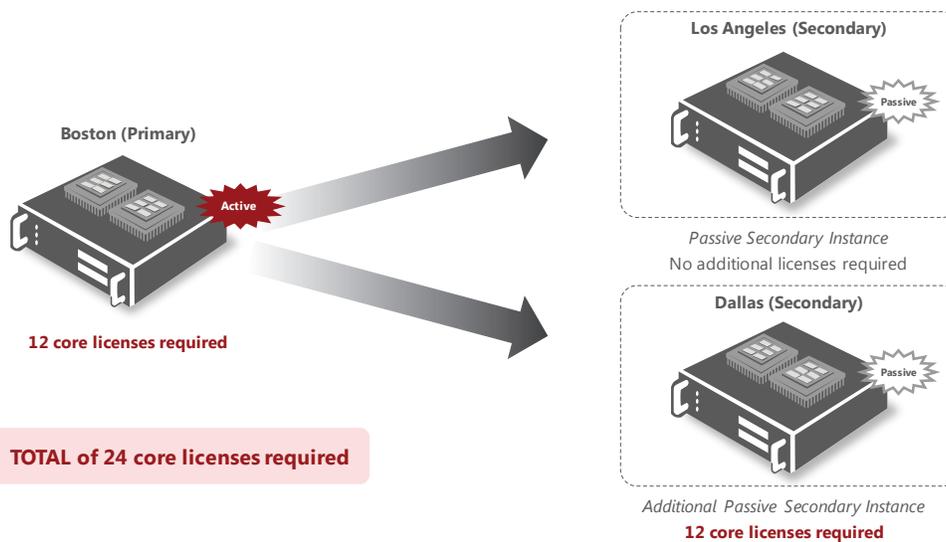

This figure shows an example of licensing active and passive secondary SQL Server 2012 databases with a core factor of 1

Failover Basics

For each properly licensed instance of SQL Server, customers can run a supporting *passive* instance in a separate OSE for the purposes of temporary support. A passive SQL Server instance is one that is not serving SQL Server data to clients or running active SQL Server workloads. This passive failover instance can run on a server other than the licensed server.

- The secondary server being used for failover support does not need to be separately licensed for SQL Server as long as it is truly passive. If it is serving data, such as reports to clients running active SQL Server workloads, or performing any “work” such as additional backups being made from secondary servers, then it must be licensed for SQL Server.
- Primary server licenses include support for one secondary server only, and any additional secondary servers must be licensed for SQL Server. Note: The rights to run a passive instance of SQL Server for temporary support are not transferable to other licensed servers for purposes of providing multiple passive secondary servers to a single primary server.
- When licensing SQL Server 2012 under the Per Core model, the number of core licenses must be based on the server that requires the higher number of licenses. This way, when the failover server takes over, it is adequately licensed. For a passive instance of SQL Server to be properly licensed, it cannot require more core licenses than the licensed primary system.

This figure shows an example of licensing SQL Server 2012 when using multiple passive secondary databases with a core factor of 1

AlwaysOn Availability Groups

New for the SQL Server 2012 Enterprise Edition, AlwaysOn Availability Groups enable customers to configure multiple databases that will failover as a unit, with support for up to four active secondary servers and two synchronous secondary servers. The ability to utilize secondary servers can improve the performance of primary, reporting and backup workloads due to better balancing of workloads across instances, providing better return on hardware investment.

Note: When secondary servers are actively used to support these scenarios—that is, the servers used for failover are no longer truly passive—they must be fully licensed accordingly.

Licensing SQL Server for Non-production Use

The SQL Server 2012 Developer Edition is a full-function version of the SQL Server software—with all the features and capabilities of the Enterprise edition—licensed under the Developer Tools model, which is a “per user” model. One license is required for each person that accesses or uses the software.

When using SQL Server software for development, test or demonstration purposes, only the users are licensed and there is no need for a corresponding license for the actual server systems running SQL Server software in this case.

As long as only licensed users have access to the software, customers can install as many copies of the software on any number of servers that are used exclusively for development, test or demonstration purposes. This is significant, because it allows customers to run the software on multiple devices (for testing purposes, for example) without having to license each non-production server system.

- Before using SQL Server software under the Developer Tools model, customers must assign one license to each user accessing the software.
- Once licensed, customers can install the SQL Server 2012 Developer Edition software, and all licensed users can use copies to design, develop, test and/or demonstrate programs. Customers cannot use the software in a production environment. Any production data that was used for design, development or test purposes must be removed prior to deploying the software for production use.

MSDN Subscriptions

SQL Server software can also be licensed for non-production use through certain MSDN subscription offerings, including the Visual Studio Professional, Premium and Ultimate subscription levels. Similar to the standalone SQL Server Developer Edition, MSDN subscriptions are licensed on a per-use basis and the software cannot be used in a production environment.

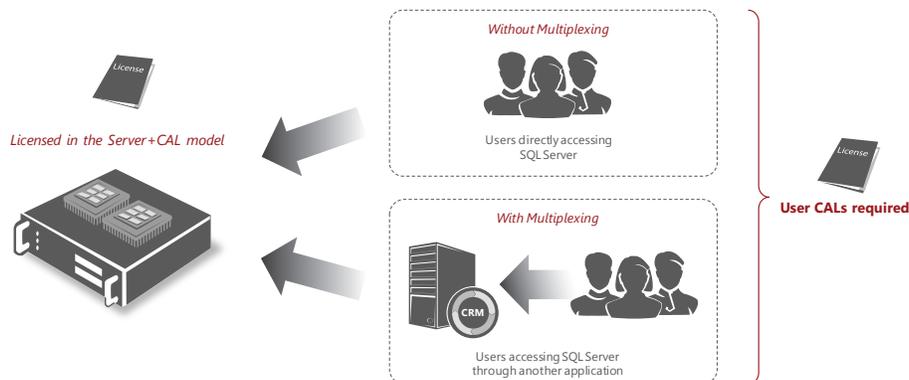

- ➔ For more information on MSDN Subscriptions that include SQL Server software, visit: <http://msdn.microsoft.com>

Licensing SQL Server in a Multiplexed Application Environment

“Multiplexing” refers to the use of hardware or software to pool connections, reroute information, or reduce the number of devices or users that directly access or use SQL Server. Multiplexing can also include reducing the number of devices or users SQL Server directly manages.

When licensing SQL Server software under the Server+CAL licensing model, users and devices that indirectly access SQL Server data through another application or hardware device require SQL Server CALs.

- Multiplexing does not reduce the number of Microsoft licenses required. Users are required to have the appropriate licenses, regardless of their direct or indirect connection to SQL Server.
- Any user or device that accesses the server, files, data or content provided by the server that is made available through an automated process requires a SQL Server CAL.
- The number of tiers of hardware or software between the SQL Server and the user or devices that ultimately use its data, services, or functionality does not affect the number of CALs required.
- Manual transfer of data from employee to employee does not require a CAL for the receiving employee. For example, if an employee sends a Microsoft Office Excel® version of a report to another employee, the receiving employee does not require a CAL (as long as the report does not access a server running SQL Server in some way).

This figure illustrates the licenses used in the Server+CAL licensing model via multiplexing

SQL Server CALs are required for users or devices that directly input into, query, or view data from a SQL Server database. Similarly, SQL Server CALs are required for users or devices that input data into, query, or view data from a SQL Server database through a pooling device (such as the CRM Server in the figure above). This includes users who view data through web-based applications or enter information into a database through an intermediary product.

When users actively send SQL Server data by email or other messaging technology, recipient users do not require a SQL Server CAL. With multiplexing, these rules do not change. Likewise, the paper distribution of data does not require SQL Server CALs for the recipients of the paper report. Users who receive data directly or indirectly from SQL Server require CALs, but if these users print the data, recipient users do not require a SQL Server CAL.

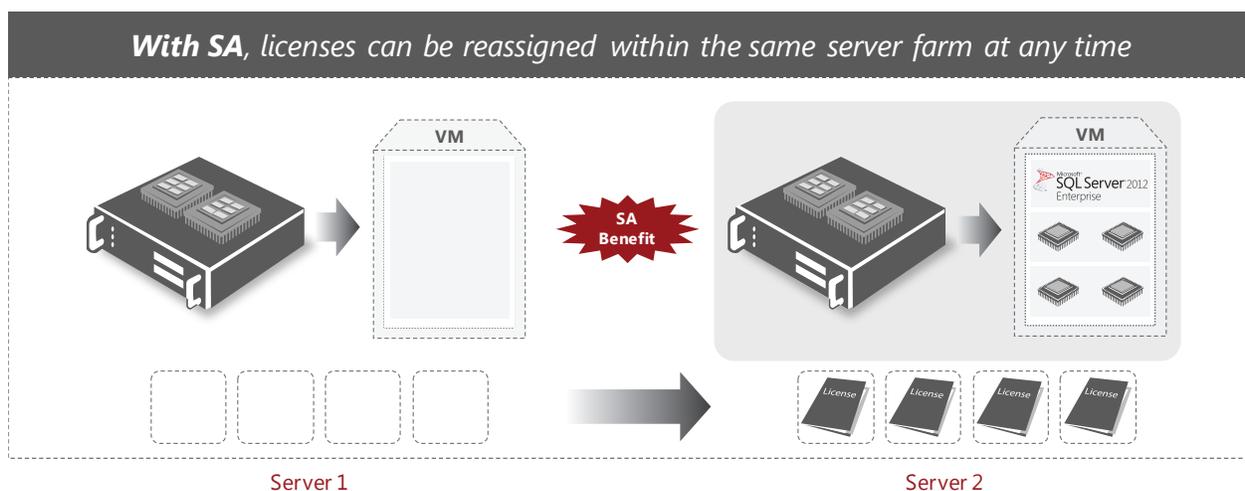

- For more details on how multiplexing affects the licensing of SQL Server 2012 products under the Server+CAL model, download the Volume Licensing Brief at: <http://download.microsoft.com/download/8/7/3/8733d036-92b0-4cb8-8912-3b6ab966b8b2/multiplexing.docx>

Licensing SQL Server for Application Mobility

License Mobility is a use right that is available for all editions of SQL Server 2012 software licenses with active Software Assurance (SA) coverage. With this SA benefit, customers can re-assign SQL Server licenses to different servers within a server farm as often as needed. Customers can also reassign licenses to third party shared servers. License Mobility is available for licenses under both the Per Core and Server+CAL license models.

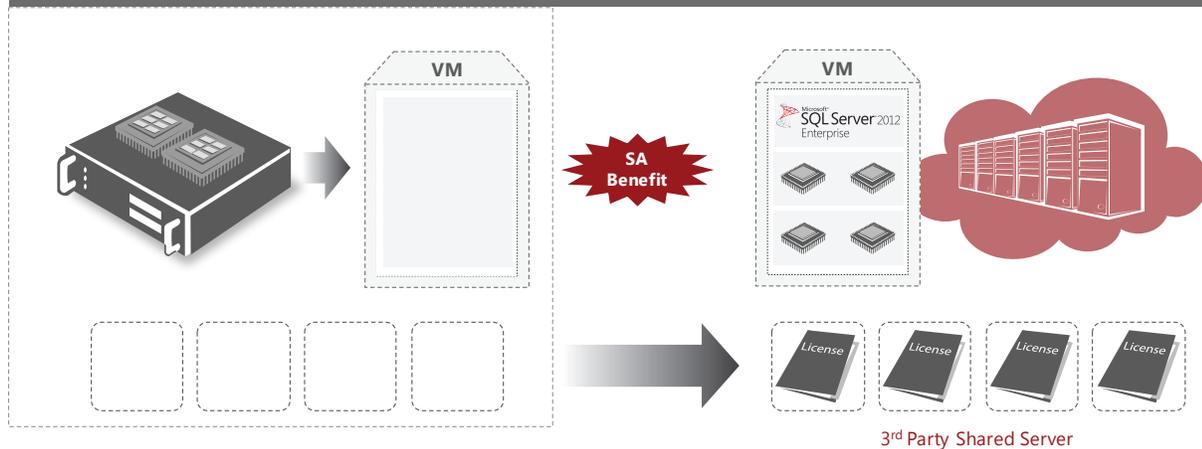

- SQL Server licenses that are not covered with active SA can only be reassigned to a different server within the server farm once every 90 days, and they cannot be reassigned to a third party web hoster or non-private cloud, at any time.
- All SQL Server licenses with active SA can be reassigned to another server within the server farm as often as needed; however, they can only be reassigned to another server in another server farm once every 90 days.
 - » A server farm may consist of up to two data centers located in time zones that are within four hours of one another and/or with the European Union (EU) and/or European Free Trade Association (EFTA).
 - » A given data center may only be part of one server farm.

License Mobility can benefit customers who license individual virtual machines (VMs) and then want to reassign those licenses to different VMs within a server farm—as workloads move dynamically—or to VMs in cloud environments. Note: License Mobility relates directly to the reassignment of the *license* and has nothing to do with the mobility of the actual software instances running in the VM.

In this figure, core licenses are being reassigned within the same server farm through License Mobility

With SA, licenses can be reassigned to a third party hoster or the cloud

In this figure, core licenses are reassigned to a 3rd party shared server through License Mobility

- ➔ For more information on how to use License Mobility to extend the value SQL Servers licenses, visit: <http://www.microsoft.com/licensing/software-assurance/license-mobility.asp>

Licensing SQL Server Appliances

Microsoft has partnered with leading hardware providers to offer an array of appliance-based offerings that are pre-configured, pre-tuned and optimized for SQL Server. By deploying an appliance instead of building a solution, customers can reduce investment, dramatically accelerate time to value, and enable IT resources to focus on other priorities. Appliance offerings optimized for the SQL Server Parallel Data Warehouse and other editions of SQL Server software include:

- Dell Parallel Data Warehouse Appliance
- HP Enterprise Database Consolidation Appliance
- HP Enterprise Data Warehouse Appliance
- HP Business Decision Appliance
- HP Business Data Warehouse Appliance

Note: While SQL Server appliances sold by hardware partners are delivered pre-installed with SQL Server software, customers must acquire the necessary software licenses through a Microsoft Volume Licensing agreement before actually deploying the appliance for use.

- ➔ For more information on the complete portfolio of available appliance offerings for SQL Server, visit: <http://www.microsoft.com/sqlserver/en/us/solutions-technologies/appliances.aspx>

Additional Product Information

Upgrades, Downgrades and Step-Ups

When licensing SQL Server 2012 software, several deployment options are available to support a variety of customer upgrade scenarios.

- **Version Upgrade Rights** are offered as a Software Assurance benefit for qualified licenses and allow customers access to upgrade their deployments released at no additional cost. Existing SQL Server 2008 R2 software licenses covered by SA are automatically upgraded to the corresponding SQL Server 2012 edition. In cases where prior version editions have been discontinued, the SQL Server 2012 upgrade path may be to another product edition.

Software Upgrade Path for SQL Server 2008 R2	
SQL Server 2008 R2	Upgrade to SQL Server 2012
Enterprise Edition processor licenses Datacenter Edition processor licenses	Enterprise Edition core licenses
Enterprise Edition server licenses	Enterprise Edition server licenses (subject to 20-core limit)
Standard Edition processor licenses	Standard Edition core licenses
Standard Edition server licenses	Standard Edition server licenses

*This table shows upgrade options available to customers with SQL Server licenses. **SQL Server 2012 use rights apply.***

- **Cross Edition Rights** are currently available for certain SQL Server products only and allow customers to deploy an alternate (usually lower) edition in place of the currently licensed edition. SQL Server cross edition rights can be combined with the version downgrade rights available for all products offered under a volume licensing agreement that allow customers to deploy prior versions of the software in place of the currently licensed version. In some cases, rights to deploy prior versions of product editions other than the edition currently licensed may also be allowed.
- Note: When utilizing version downgrade or cross edition deployment rights, the product use rights for the originally licensed version and edition still apply.

Software Deployment Options for SQL Server 2012		
Customers Licensed for:	Can Choose to Deploy:	
	Software Edition	Software Version
SQL Server 2012 Standard Edition Server	SQL Server Standard Server SQL Server Workgroup SQL Server for Small Business	2012 or earlier 2008 R2 or earlier 2008 R2 or earlier
SQL Server 2012 Standard Edition Core	SQL Server Standard Core SQL Server Web (non-SPLA only) SQL Server Workgroup	2012 or earlier 2008 R2 or earlier 2008 R2 or earlier
SQL Server 2012 Business Intelligence Edition	SQL Server Business Intelligence SQL Server Standard Server	2012 2012 or earlier
SQL Server 2012 Enterprise Edition Core	SQL Server Enterprise Core SQL Server Business Intelligence SQL Server Standard Core SQL Server Datacenter	2012 or earlier 2012 2012 or earlier 2008 R2 or earlier

*This table shows deployment options available to customers with SQL Server licenses. **SQL Server 2012 use rights apply.***

- **Edition Step-Ups** are offered as a Software Assurance benefit in certain volume licensing programs only and allow customers to move from a lower product edition. SQL Server 2012 Standard Edition server licenses can step-up to the SQL Server 2012 Business Intelligence Edition and SQL Server 2012 Standard Edition core licenses can step-up to the SQL Server 2012 Enterprise Edition. To be eligible to step-up to a higher edition, the lower edition license must be covered by SA. Step-ups between licensing models are not allowed.

SQL Server 2012 Migration Options for Software Assurance Customers

In order to facilitate a smooth transition to the new SQL Server 2012 product edition and licensing model changes, Microsoft is offering migrations designed to help customers who have invested in Software Assurance (SA) benefits to protect their current software investments.

- ➔ For full details on the migration options and additional license grants available to current SA customers with eligible SQL Server 2008 R2 licenses, refer to the Microsoft Product List for Volume Licensing at: <http://www.microsoft.com/licensing/about-licensing/product-licensing.aspx#tab=2>

For SQL Server Processor Licenses with Software Assurance

SQL Server 2008 R2 is the last version of SQL Server software to be licensed under the Per Processor licensing model. Customers with active SA coverage on qualifying SQL Server 2008 R2 processor licenses (as of April 1 2012) will be eligible to run SQL Server 2012 during their agreement term under processor use rights, and to renew into core licenses at their first subsequent SA expiration.

During Current Agreement Term: During the current term of SA coverage (effective on or before April 1, 2012), customers who are licensing SQL Server under the processor licensing model can, for a given deployment, upgrade to and use the equivalent edition of SQL Server 2012 core-based software (in place of the licensed SQL Server 2008 R2 edition), subject to current SQL Server 2008 R2 processor license product use rights. SQL Server Datacenter Edition customers can run the SQL Server 2012 Enterprise Edition core-based software.

Customers with Enterprise Agreements effective on or before April 1, 2012 can also continue to acquire additional SQL Server 2008 R2 processor licenses—and upgrade those licenses to SQL Server 2012—through the end of their agreement.

Renewing Processor Licenses into Cores: The number of core licenses a customer is eligible to renew is based on the edition of SQL Server currently licensed and the number of cores in use at expiration of SA:

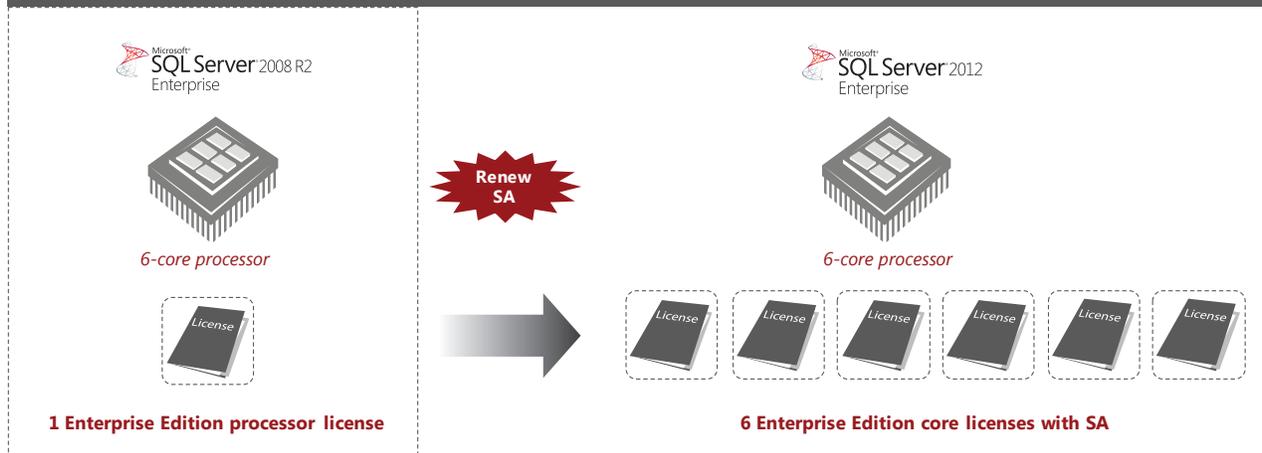

Renewing Processor Licenses into Core Licenses at the End of the SA Term	
Qualified perpetual license under SA as of April 1st, 2012	Eligible to renew into minimum number of cores
SQL Server Datacenter Edition processor license	8 SQL Server Enterprise Edition core licenses
SQL Server Enterprise Edition processor license	4 SQL Server Enterprise Edition core licenses
SQL Server Standard Edition processor license	4 SQL Server Standard Edition core licenses

This table shows the renewal of SQL Server licenses by edition

If the number of core licenses required exceeds the minimum eligibility defined above, the customer can take an inventory to document their actual core license needs. (Core license needs are equivalent to the cores in a physical processor multiplied by the core factor for that processor.)

Eligible processor licenses can then be exchanged as part of an SA renewal into an appropriate number of core licenses based on the above inventory and eligibility criteria. (See the product list for full details and restrictions.)

Processor license migration path at SA renewal

In this figure, a SQL Server 2008 R2 processor license is exchanged for SQL Server 2012 core licenses at SA renewal

Some restrictions apply:

When processor licenses are renewed into core licenses, they are exchanged. This exchange process supports customers' eligibility to renew into a number of cores based on actual need at the time of renewal.

- To exchange a SQL Server processor license for core licenses, SA coverage must be renewed based on the number of core licenses required to license all of the physical cores in the processor.
- To be eligible for more than the minimum exchange, the total number of processor licenses assigned to a given server cannot exceed the total number of physical processors in the server.
- An inventory performed by the end of the first SA term ending after April 1, 2012 must be recorded to demonstrate core license needs. Customers that do not maintain a record will receive a core equivalence for only the minimum number of core licenses noted for each edition in the figure above.

➔ Customers are encouraged to use the Microsoft Assessment and Planning (MAP) Toolkit or other equivalent software to acquire their record of configuration. For more information on the MAP Toolkit, visit: <http://www.microsoft.com/download/en/details.aspx?displaylang=en&id=7826>

For Customers Who Do Not Renew: Customers choosing not to renew SA coverage on SQL Server 2008 R2 processor licenses may continue to run SQL Server 2012 core-based software (including prior versions), subject to the following restrictions:

- When running SQL Server 2008 R2 software, customers must follow SQL Server 2008 R2 use rights. Note: Customers who do not renew SA coverage for their existing processor licenses are no longer eligible for SA-only benefits such as unlimited virtualization and License Mobility rights. For more information on these and other benefits, refer to the Software Assurance Benefits section of this guide.
- When running SQL Server 2012 software, customers must follow SQL Server 2012 use rights, subject to the additional restrictions listed below. Note: As stated above, for customers running SQL Server 2008 R2 version software, customers who do not renew SA coverage for their existing SQL Server 2012 processor licenses are no longer eligible for SA-only benefits.

Processor license migration path *when not renewing SA*

In this figure, a processor license is retained when migrating to SQL Server 2012 without SA renewal

Additional Restrictions:

- For purposes of calculating on-going use rights, customers who upgrade to SQL Server 2012 core-based software will receive a fixed (perpetual) "core equivalence" value for each existing SQL Server 2008 R2 processor license with expiring SA. This core equivalence value is equal to either:
 - » The minimum number of core licenses defined in the license renewal section above; or
 - » The actual number of cores in a physical processor, multiplied by the applicable core factor for that processor type. As stated above, customers must record an inventory of the actual number of cores in use to document core license needs.
- The total number of processor licenses eligible to receive more than the minimum core equivalency cannot exceed the total number of physical processors in the licensed server.
- When deploying SQL Server 2012, existing processor licenses cannot be re-assigned to servers with higher core license requirements than the core equivalency value initially assigned to that processor license.

SQL Server Enterprise Edition Customers Licensed Under the Server+CAL Model

As of July 1, 2012, Microsoft will no longer be offering SQL Server Enterprise Edition under the Server+CAL license model. Current customers with active SA coverage for existing SQL Server 2008 R2 Enterprise Edition server licenses should consider the following when transitioning to SQL Server 2012:

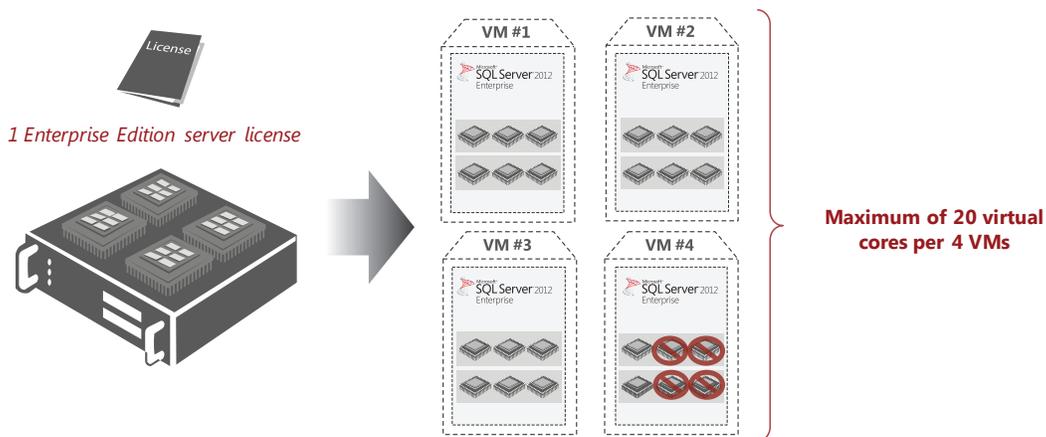

- SQL Server 2012 Enterprise Edition server licenses will be available on price lists through June 30, 2012. EA and EAP customers with active agreements on this date can continue purchasing new licenses until the end of their current term.
- After their current term expires, SA coverage can be renewed and maintained on SQL Server Enterprise Edition server licenses to provide continued access to SA benefits, including License Mobility rights and access to future releases.
- SQL Server 2012 Enterprise Edition software licensed under the Server+CAL model is restricted to only run on servers with a total of twenty cores or less:
 - » There are now two versions of SQL Server 2012 Enterprise Edition software: a server-based version and a core-based version. Customers must run the software version for which they are licensed.
 - » For customers running SQL Server 2012 Enterprise Edition server-based software instances in a physical environment, that OSE is only permitted to access a maximum of twenty physical cores. A per instance technical limit is also enforced.

- » For customers running SQL Server 2012 Enterprise Edition server licenses in virtual environments, each set of VMs associated with a single server license (up to four per server license) can only access up to twenty hardware threads of combined power at any time.
- Existing SQL Server 2012 Enterprise Edition server licenses continue to have tremendous value, and with the availability of ongoing SA coverage, customers licensed under the Server+CAL model can retain access to the latest product enhancements and advanced capabilities of the Enterprise Edition. As such, there are no programmatic conversions to core licenses.

Additional Considerations When Licensing Virtual Environments:

Each SQL Server 2012 Enterprise Edition server license allows customers the ability to run instances of the software in up to four VMs on the licensed server.

- SQL Server Enterprise Edition server licenses—with or without SA coverage—do not have unlimited virtualization rights. This applies to new SQL Server 2012 deployments, as well as all SQL 2008 R2 deployments.
- If needed, customers can assign additional SQL Server Enterprise Edition server licenses to a physical server to license additional VMs on that server. Note: Each group of four VMs is subject to the 20-thread technical limit noted above.
- License Mobility rights are allowed for SQL Server 2012 Enterprise Edition server licenses with active SA coverage only. Note: When reassigning a server license, all VMs associated with that server license (up to four per license) must move to another server together.

This figure depicts the deployment of four virtual machines with an Enterprise Edition server license. The four VMs can use a maximum of 20 virtual cores of computing power.

Software Assurance Benefits

Software Assurance (SA) for Volume Licensing helps boost IT productivity by enabling customers to get the most from Microsoft software products. SA benefits—including 24x7 support, deployment planning services, end-user and technical training, and the latest software releases and unique technologies—are combined in one cost-effective program. Using these benefits can help customers improve productivity and help IT efficiently deploy and manage SQL Server. SQL Server customers with active SA coverage for their SQL Server 2012 software licenses can enjoy these additional benefits:

Software Assurance Benefits Overview

Benefit	Description
Unlimited Virtualization	Allows customers to run any number of instances of SQL Server 2012 Enterprise Edition software in an unlimited number of VMs
License Mobility in Server Farm	Allows reassignment of SQL Server 2012 licenses within a server farm more than once every 90 days
License Mobility through SA	Allows license reassignment of SQL Server 2012 to third party shared servers
Cold Back Ups	Allows backup instances of SQL Server 2012 software for temporary use in a server dedicated to disaster recovery
Special Migration Offers	Provides license grants and additional use terms for SQL Server 2008 R2 migrating to SQL Server 2012 product editions and license models
Additional Benefits for EAP Customers	In addition to the benefits noted above, Enrollment for Application Platform (EAP) customers may also be eligible to receive unlimited phone hours for problem resolution support

This table provides an overview of the benefits of Software Assurance.

Refer to the PUR and Product List for more details on these benefits and additional license grants available to SQL Server customers with SA, including additional terms and conditions that may apply.

- For more information on the full set of Software Assurance benefits available to help customers deploy, manage, and maximize their SQL Server volume licensing purchases, visit: <http://www.microsoft.com/licensing/software-assurance/default.aspx>

Additional Product Licensing Resources
