Enabling logging for the Visio Services data provider for the Visio 2010 add-in for System Center 2012 - Operations Manager

Creating the config file

Logging can be configured for the data provider by simply including a config file for the data adapter assembly in the same location as the data provider assembly that defines the log location as shown here:

```xml
<?xml version="1.0"?>
<configuration>
 <appSettings>
   <add key="EnableLog" value="True" />
   <add key="LogPath" value="\\test\logs\opsmgradapter" />
 </appSettings>
</configuration>
```

1. Create a new text file named Microsoft.Office.Visio.Server.OperationsManager.dll.config.
2. Copy the XML defined above into the text file and save it.
3. Make sure to specify the LogPath attribute to a location that is public or that the Visio Services application pool has write access to. This can be a local path or a network share. This location must exist prior to enabling logging.

Copy the config file to the installation location

1. Open a command prompt with administrator privileges.
2. Copy the Microsoft.Office.Visio.Server.OperationsManager.dll.config file to the same location in the GAC as the **Microsoft.Office.Visio.Server.OperationsManager.dll**.

   ex. copy Microsoft.Office.Visio.Server.OperationsManager.dll.config
   C:\Windows\assembly\gac_msil\Microsoft.Office.Visio.Server.OperationsManager\1.0.0.1122___31bf3856ad364e35

3. Restart the server or run the iisreset command.
