# Microsoft.HostIntegration.DataAccessLibrary Namespace

The **Microsoft.HostIntegration.DataAccessLibrary** namespace grants access to the programmatic interface of the Data Access Tool (DAT).

## Classes

Class	Description
 <a href="#">BasicConnectionString</a>	Describes a basic connection string.
 <a href="#">ConnectionException</a>	Represents the exception that is thrown when an error occurs during a test connection.
 <a href="#">ConnectionKeyLookupTable</a>	Represents the table for the connection key lookup.
 <a href="#">CustomTextBox</a>	Represents a custom textbox associated with the data access library.
 <a href="#">DataAccessControl</a>	Represents a facade that can be used to programmatically execute commands exposed by the Data Access Tool.
 <a href="#">DataAccessHelp</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Supports Data Access Help.
 <a href="#">DataAccessSettings</a>	Controls the computer settings for the Data Access Tool and Data Access Library.
 <a href="#">DB2OleDbConnectionString</a>	Contains the DB2 OLEDB connection string.
 <a href="#">Db2OleDbManager</a>	Manages the DB2 OLEDB provider.
 <a href="#">FileSysOleDbConnectionString</a>	Contains a file system OLEDB connection string.
 <a href="#">HcdColumn</a>	Describes a host column description (HCD) column.
 <a href="#">HcdDataTypes</a>	Allows for the manipulation of groups of Host Column Descriptors (HCD).
 <a href="#">HcdFile</a>	Describes a host column descriptor (HCD) file.
 <a href="#">HcdTable</a>	Describes a host column description (HCD) table.
 <a href="#">HisOleDbManager</a>	Describes the HIS OLEDB manager.
 <a href="#">HisProviderFactory</a>	Describes the HIS provider factory.
 <a href="#">HostFileHcdControl</a>	Describes the host file HCD control.
 <a href="#">HostFileMetadataControl</a>	Provides access to the host file Metadata control.
 <a href="#">IConnectionString</a>	Represents a generic connection string.
 <a href="#">IHcdItem</a>	
 <a href="#">MessageDialog</a>	Represents the message dialog.
 <a href="#">OleDbConnectionString</a>	Describes an OLE DB connection string.
 <a href="#">OutputPane</a>	Represents a pane that displays command results issued by the user.
 <a href="#">SNANLS</a>	Helper class that provides methods for populating locale information in the Data Access Wizard.
 <a href="#">SnaOleDbManager</a>	Represents the Sna OLE DB manager.
 <a href="#">WizardProductImage</a>	Represents the wizard product image.

## Structures

Structure	Description
-----------	-------------

 <a href="#">HcdDataType</a>	Describes the host column descriptor (HCD) data type.
 <a href="#">SnaNlsCodePage</a>	Represents the SNANLS code page.

#### Interfaces

	Interface	Description
 <a href="#">IDataAccessControl</a>		Represents an interface for the control of data accesses.
 <a href="#">IHisProviderManager</a>		Represents the HIS provider manager.

#### Delegates

	Delegate	Description
 <a href="#">CreatePackagesStatus</a>		Creates a package status.

#### Enumerations

	Enumeration	Description
 <a href="#">DataSourcePlatform</a>		Describes the type of platform the data is stored on.

[Return to top](#)

# BasicConnectionString Class

Describes a basic connection string.

**Namespace:** [Microsoft.HostIntegration.DataAccessLibrary](#)

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in Microsoft.HostIntegration.DataAccessLibrary.dll)

Inheritance Hierarchy [System.Object](#)

[Microsoft.HostIntegration.DataAccessLibrary.IConnectionString](#)

**Microsoft.HostIntegration.DataAccessLibrary.BasicConnectionString**

Syntax

```
C#  
  
[SerializableAttribute]  
public class BasicConnectionString : IConnectionString
```

```
C++  
  
[SerializableAttribute]  
public ref class BasicConnectionString : IConnectionString
```

```
F#  
  
[<SerializableAttribute>]  
type BasicConnectionString =  
    class  
        inherit IConnectionString  
    end
```

```
VB  
  
<SerializableAttribute>  
Public Class BasicConnectionString  
    Inherits IConnectionString
```

Constructors

	Name	Description
	<a href="#">BasicConnectionString()</a>	Initializes a new instance of the <b>BasicConnectionString</b> class.
	<a href="#">BasicConnectionString(IConnectionString)</a>	Initializes a new instance of the <b>BasicConnectionString</b> class using the specified connection string.

Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">Authentication</a>	Gets or sets the authentication.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object.(Inherited from <a href="#">IConnectionString</a> .)

 BinaryCodepage	Gets or sets the binary codepage.(Inherited from <a href="#">IConnectionString</a> .)
 CacheAuthentication	Gets or sets a value that indicates whether a cache authentication is used.(Inherited from <a href="#">IConnectionString</a> .)
 CertificateCN	Gets or sets the certificate CN.(Inherited from <a href="#">IConnectionString</a> .)
 ClientAccounting	Gets or sets the client accounting.(Inherited from <a href="#">IConnectionString</a> .)
 ClientApplicationName	Gets or sets the client application name.(Inherited from <a href="#">IConnectionString</a> .)
 ClientUserID	Gets or sets the client user identification.(Inherited from <a href="#">IConnectionString</a> .)
 ClientWorkstationName	Gets or sets the client workstation name.(Inherited from <a href="#">IConnectionString</a> .)
 Comment	Gets or sets the additional information about the connection string.(Inherited from <a href="#">IConnectionString</a> .)
 ConnectionPooling	Gets or sets a value that determines if connection pooling is active.(Inherited from <a href="#">IConnectionString</a> .)
 ConnectionTimeout	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.(Inherited from <a href="#">IConnectionString</a> .)
 DatabaseName	Gets or sets the database name.(Inherited from <a href="#">IConnectionString</a> .)
 DataSourceName	Gets or sets the name of the data source.(Inherited from <a href="#">IConnectionString</a> .)
 DateModified	Get or sets the date and time the connection string was modified.(Inherited from <a href="#">IConnectionString</a> .)
 DateTimeAsChar	Gets or sets a value that indicates whether date time is interpreted as a character.(Inherited from <a href="#">IConnectionString</a> .)
 DateTimeAsDate	Gets or sets a value that indicates whether the date time is interpreted as date.(Inherited from <a href="#">IConnectionString</a> .)
 DBMSPlatform	Gets or sets the type of database to which the connection string connects.(Inherited from <a href="#">IConnectionString</a> .)
 DecimalAsNumeric	(Inherited from <a href="#">IConnectionString</a> .)
 DefaultLibrary	Gets or sets the default library for the connection string.(Inherited from <a href="#">IConnectionString</a> .)
 DefaultQualifier	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names.(Inherited from <a href="#">IConnectionString</a> .)
 DefaultSchema	Gets or sets the name of the collection where the system looks for catalog information.(Inherited from <a href="#">IConnectionString</a> .)
 DeferPrepare	Gets or sets a value that indicates whether to defer preparation.(Inherited from <a href="#">IConnectionString</a> .)
 DeriveParameters	Gets or sets a value that determines if you can derive parameters.(Inherited from <a href="#">IConnectionString</a> .)
 EarlyMetadata	Gets or sets a value that indicates whether early metadata is defined.(Inherited from <a href="#">IConnectionString</a> .)
 ExtendedProperties	Gets or sets the extended properties.(Inherited from <a href="#">IConnectionString</a> .)
 HcdFileName	Gets or sets the host column description file name.(Inherited from <a href="#">IConnectionString</a> .)
 HostCCSID	Gets or sets the character code set identifier (CCSID) for the host.(Inherited from <a href="#">IConnectionString</a> .)

	HostName	Gets the name of the host.(Inherited from <a href="#">IConnectionString</a> .)
	InitialCatalog	Gets or sets the initial catalog name.(Inherited from <a href="#">IConnectionString</a> .)
	IntegratedSecurity	Gets or sets the integrated security.(Inherited from <a href="#">IConnectionString</a> .)
	LoadBalancing	(Inherited from <a href="#">IConnectionString</a> .)
	LocalFolder	Gets or sets the local folder.(Inherited from <a href="#">IConnectionString</a> .)
	LocalLU	Gets or sets the local logical unit (LU) name.(Inherited from <a href="#">IConnectionString</a> .)
	Location	Gets or sets the location.(Inherited from <a href="#">IConnectionString</a> .)
	MaxPoolSize	Gets or sets the maximum pool size.(Inherited from <a href="#">IConnectionString</a> .)
	MetadataAssembly	Gets or sets the metadata assembly.(Inherited from <a href="#">IConnectionString</a> .)
	Name	Gets or sets the name of the connection string.(Inherited from <a href="#">IConnectionString</a> .)
	NetworkAddress	Gets or sets the IP network address.(Inherited from <a href="#">IConnectionString</a> .)
	NetworkLibrary	Gets or sets the type of network over which the connection transmits.(Inherited from <a href="#">IConnectionString</a> .)
	NetworkPort	Gets or sets the network port ID.(Inherited from <a href="#">IConnectionString</a> .)
	NewPassword	Gets or sets the new password.(Inherited from <a href="#">IConnectionString</a> .)
	PackageCollection	Gets or sets the name of the target collection.(Inherited from <a href="#">IConnectionString</a> .)
	Password	Gets or sets the user password.(Inherited from <a href="#">IConnectionString</a> .)
	PCCodepage	Gets or sets the client PC code page.(Inherited from <a href="#">IConnectionString</a> .)
	ReadOnly	Gets or sets a value that determines if the connection string is read-only.(Inherited from <a href="#">IConnectionString</a> .)
	RemoteLU	Gets or sets the remote logical unit (LU).(Inherited from <a href="#">IConnectionString</a> .)
	RepairHostKeys	Gets or sets a value that determines if the host keys should be repaired.(Inherited from <a href="#">IConnectionString</a> .)
	RowsetCacheSize	Gets or sets the rowset cache size.(Inherited from <a href="#">IConnectionString</a> .)
	SecurityPrinciple	Gets or set the security principle.(Inherited from <a href="#">IConnectionString</a> .)
	ShadowCatalog	(Inherited from <a href="#">IConnectionString</a> .)
	StrictValidation	Gets or sets a value that determines if strict validation is enabled.(Inherited from <a href="#">IConnectionString</a> .)
	UnitsOfWork	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source.(Inherited from <a href="#">IConnectionString</a> .)
	UseKerberos	Gets or sets a value that indicates whether a Kerberos is used.(Inherited from <a href="#">IConnectionString</a> .)
	UserName	Gets or sets the name of the user.(Inherited from <a href="#">IConnectionString</a> .)
	UseSingleSignOn	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO).(Inherited from <a href="#">IConnectionString</a> .)

#### Methods

	Name	Description
	Clone()	Creates a deep copy of the current instance.(Overrides <a href="#">IConnectionString.Clone()</a> .)

 <a href="#">CopyFrom(IConnectionString)</a>	Copies the connection string from the specified object.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">Delete(Boolean)</a>	Deletes the current instance.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Exists()</a>	Determines if the current instance is abstract or actually represents a connection string.(Overrides <a href="#">IConnectionString.Exists()</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetString()</a>	Returns the connection string of the current instance.(Overrides <a href="#">IConnectionString.GetString()</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">InternalDelete()</a>	Deletes the connection string.(Overrides <a href="#">IConnectionString.InternalDelete()</a> .)
 <a href="#">InternalRename(String)</a>	Renames the connection string.(Overrides <a href="#">IConnectionString.InternalRename(String)</a> .)
 <a href="#">Load()</a>	Loads the current instance.(Overrides <a href="#">IConnectionString.Load()</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Rename(String)</a>	Renames the connection string.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">Save()</a>	Saves the connection string.(Overrides <a href="#">IConnectionString.Save()</a> .)
 <a href="#">SetString(String)</a>	Sets the connection string.(Overrides <a href="#">IConnectionString.SetString(String)</a> .)
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# BasicConnectionString Members

Describes a basic connection string.

The following tables list the members exposed by the [BasicConnectionString](#) type.

## Public Constructors

Name	Description
<a href="#">BasicConnectionString</a>	Overloaded. Creates a new instance of the <a href="#">BasicConnectionString</a> class.

## Top

## Public Fields

	Name	Description
	<a href="#">CONNECT_TIMEOUT</a>	The CONNECT_TIMEOUT. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MAX_DATABASENAME_LENGTH</a>	The MAX_DATABASENAME_LENGTH. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MAX_POOL_SIZE</a>	The MAX_POOL_SIZE. (inherited from <a href="#">IConnectionString</a> )

## Top

## Public Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Authentication</a>	Gets or sets the authentication. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryAsChar</a>	Gets or sets a value that determines if the system should interpret the information received as a character string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientUserID</a>	Gets or sets the client user identification. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientWorkstationName</a>	Gets or sets the client workstation name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Comment</a>	Gets or sets the additional information about the connection string. (inherited from <a href="#">IConnectionString</a> )

	<a href="#">ConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DatabaseName</a>	Gets or sets the database name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DataSourceName</a>	Gets or sets the name of the data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateModified</a>	Get or sets the date and time the connection string was modified. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether date time is interpreted as a character. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether the date time is interpreted as date. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DBMSPlatform</a>	Gets or sets the type of database to which the connection string connects. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DefaultLibrary</a>	Gets or sets the default library for the connection string. (inherited from <a href="#">IConnectionString</a> )

	DefaultQualifier	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names. (inherited from <a href="#">IConnectionString</a> )
	DefaultSchema	Gets or sets the name of the collection where the system looks for catalog information. (inherited from <a href="#">IConnectionString</a> )
	DeferPrepare	Gets or sets a value that indicates whether to defer preparation. (inherited from <a href="#">IConnectionString</a> )
	DeriveParameters	Gets or sets a value that determines if you can derive parameters. (inherited from <a href="#">IConnectionString</a> )
	EarlyMetadata	Gets or sets a value that indicates whether early metadata is defined. (inherited from <a href="#">IConnectionString</a> )
	ExtendedProperties	Gets or sets the extended properties. (inherited from <a href="#">IConnectionString</a> )
	Format	Gets the format for the string. (inherited from <a href="#">IConnectionString</a> )
	HcdFileName	Gets or sets the host column description file name. (inherited from <a href="#">IConnectionString</a> )
	HostCCSID	Gets or sets the character code set identifier (CCSID) for the host. (inherited from <a href="#">IConnectionString</a> )
	HostName	Gets the name of the host. (inherited from <a href="#">IConnectionString</a> )
	InitialCatalog	Gets or sets the initial catalog name. (inherited from <a href="#">IConnectionString</a> )
	IntegratedSecurity	Gets or sets the integrated security. (inherited from <a href="#">IConnectionString</a> )
	LocalFolder	Gets or sets the local folder. (inherited from <a href="#">IConnectionString</a> )
	LocalLU	Gets or sets the local logical unit (LU) name. (inherited from <a href="#">IConnectionString</a> )
	Location	Gets or sets the location. (inherited from <a href="#">IConnectionString</a> )
	MaxPoolSize	Gets or sets the maximum pool size. (inherited from <a href="#">IConnectionString</a> )
	MetadataAssembly	Gets or sets the metadata assembly. (inherited from <a href="#">IConnectionString</a> )
	Name	Gets or sets the name of the connection string. (inherited from <a href="#">IConnectionString</a> )
	NetworkAddress	Gets or sets the IP network address. (inherited from <a href="#">IConnectionString</a> )
	NetworkLibrary	Gets or sets the type of network over which the connection transmits. (inherited from <a href="#">IConnectionString</a> )
	NetworkPort	Gets or sets the network port ID. (inherited from <a href="#">IConnectionString</a> )
	NewPassword	Gets or sets the new password. (inherited from <a href="#">IConnectionString</a> )
	PackageCollection	Gets or sets the name of the target collection. (inherited from <a href="#">IConnectionString</a> )
	Password	Gets or sets the user password. (inherited from <a href="#">IConnectionString</a> )
	PCCodepage	Gets or sets the client PC code page. (inherited from <a href="#">IConnectionString</a> )
	ReadOnly	Gets or sets a value that determines if the connection string is read-only. (inherited from <a href="#">IConnectionString</a> )
	RemoteLU	Gets or sets the remote logical unit (LU). (inherited from <a href="#">IConnectionString</a> )
	RepairHostKeys	Gets or sets a value that determines if the host keys should be repaired. (inherited from <a href="#">IConnectionString</a> )
	RowsetCacheSize	Gets or sets the rowset cache size. (inherited from <a href="#">IConnectionString</a> )
	SecurityPrinciple	Gets or set the security principle. (inherited from <a href="#">IConnectionString</a> )
	StrictValidation	Gets or sets a value that determines if strict validation is enabled. (inherited from <a href="#">IConnectionString</a> )
	UnitsOfWork	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source. (inherited from <a href="#">IConnectionString</a> )
	UseKerberos	Gets or sets a value that indicates whether a Kerberos is used. (inherited from <a href="#">IConnectionString</a> )
	UserName	Gets or sets the name of the user. (inherited from <a href="#">IConnectionString</a> )
	UseSingleSignOn	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO). (inherited from <a href="#">IConnectionString</a> )

[Top](#)

Public Methods (see also [Protected Methods](#))

	Name	Description
	Clone	Overridden. Creates a deep copy of the current instance.
	CopyFrom	(inherited from <a href="#">IConnectionString</a> )
	Delete	(inherited from <a href="#">IConnectionString</a> )
	Equals	Overloaded. (inherited from <a href="#">Object</a> )
	Exists	Overridden. Determines if the current instance is abstract or actually represents a connection string.
	GetHashCode	(inherited from <a href="#">Object</a> )

	<a href="#">GetString</a>	Overridden. Returns the connection string of the current instance.
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 	<a href="#">IsKerberos</a>	(inherited from <a href="#">IConnectionString</a> )
 	<a href="#">IsSSO</a>	(inherited from <a href="#">IConnectionString</a> )
	<a href="#">Load</a>	Overridden. Loads the current instance.
 	<a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Rename</a>	(inherited from <a href="#">IConnectionString</a> )
	<a href="#">Save</a>	Overridden. Saves the connection string.
	<a href="#">SetString</a>	Overridden. Sets the connection string.
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )

[Top](#)

#### Protected Methods

	<b>Name</b>	<b>Description</b>
	<a href="#">Finalize</a>	(inherited from <a href="#">Object</a> )
	<a href="#">InternalDelete</a>	Overridden. Deletes the connection string.
	<a href="#">InternalRename</a>	Overridden. Renames the connection string.
	<a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )

# BasicConnectionString Constructor

Creates a new instance of the [BasicConnectionString](#) class.

**Namespace:** [Microsoft.HostIntegration.DataAccessLibrary](#)

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in Microsoft.HostIntegration.DataAccessLibrary.dll)

## Overload List

Name	Description
 <a href="#">BasicConnectionString()</a>	Initializes a new instance of the <a href="#">BasicConnectionString</a> class.
 <a href="#">BasicConnectionString(IConnectionString)</a>	Initializes a new instance of the <a href="#">BasicConnectionString</a> class using the specified connection string.

## See Also

[BasicConnectionString Class](#)

[Microsoft.HostIntegration.DataAccessLibrary Namespace](#)

[Return to top](#)

### BasicConnectionString Constructor ()

Initializes a new instance of the [BasicConnectionString](#) class.

## Syntax

C#

```
public BasicConnectionString()
```

C++

```
public:  
BasicConnectionString()
```

F#

```
new : unit -> BasicConnectionString
```

VB

```
Public Sub New
```

## Remarks

The default constructor initializes any fields to their default values.

[Return to top](#)

### BasicConnectionString Constructor (IConnectionString)

Initializes a new instance of the [BasicConnectionString](#) class using the specified connection string.

## Syntax

C#

```
public BasicConnectionString(  
    IConnectionString connStr  
)
```

C++

```
public:  
BasicConnectionString(  
    IConnectionString^ connStr  
)
```

F#

```
new :  
    connStr:ConnectionString -> BasicConnectionString
```

VB

```
Public Sub New (  
    connStr As IConnectionString  
)
```

#### Parameters

*connStr*

Type: [Microsoft.HostIntegration.DataAccessLibrary.IConnectionString](#)

Connection string for the new instance.

[Return to top](#)

# BasicConnectionString Constructor ()

Initializes a new instance of the [BasicConnectionString](#) class.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public BasicConnectionString ()
```

C++

```
public:  
BasicConnectionString ()
```

J#

```
public BasicConnectionString ()
```

JScript

```
public function BasicConnectionString ()
```

Remarks

The default constructor initializes any fields to their default values.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

J#

```
public BasicConnectionString (
    IConnectionString connStr
)
```

JScript

```
public function BasicConnectionString (
    connStr : IConnectionString
)
```

## Parameters

connStr

Connection string for the new instance.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Reference

[BasicConnectionString Class](#)

[Microsoft.HostIntegration.DataAccessLibrary Namespace](#)

# BasicConnectionString.Clone Method

Creates a deep copy of the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function Clone As IConnectionString
```

C#

```
public override IConnectionString Clone ()
```

C++

```
public:
virtual IConnectionString^ Clone () override
```

J#

```
public IConnectionString Clone ()
```

JScript

```
public override function Clone () : IConnectionString
```

## Return Value

A clone of the current instance.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# BasicConnectionString.Exists Method

Determines if the current instance is abstract or actually represents a connection string.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Function Exists As Boolean
```

C#

```
public override bool Exists ()
```

C++

```
public:  
virtual bool Exists () override
```

J#

```
public boolean Exists ()
```

JScript

```
public override function Exists () : boolean
```

## Return Value

**true** if the current instance is a connection string; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# BasicConnectionString.InternalRename Method

Renames the connection string.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Sub InternalRename ( _
    destIdentifier As String _
)
```

C#

```
protected override void InternalRename (
    string destIdentifier
)
```

C++

```
protected:
virtual void InternalRename (
    String^ destIdentifier
) override
```

J#

```
protected void InternalRename (
    String destIdentifier
)
```

JScript

```
protected override function InternalRename (
    destIdentifier : String
)
```

## Parameters

destIdentifier

New name of the connection string.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# BasicConnectionString Properties

## Public Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Authentication</a>	Gets or sets the authentication. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryAsChar</a>	Gets or sets a value that determines if the system should interpret the information received as a character string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientUserID</a>	Gets or sets the client user identification. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientWorkstationName</a>	Gets or sets the client workstation name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Comment</a>	Gets or sets the additional information about the connection string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionPooling</a>	Gets or sets a value that determines if connection pooling is active. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DatabaseName</a>	Gets or sets the database name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DataSourceName</a>	Gets or sets the name of the data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateModified</a>	Get or sets the date and time the connection string was modified. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether date time is interpreted as a character. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether the date time is interpreted as date. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DBMSPlatform</a>	Gets or sets the type of database to which the connection string connects. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DefaultLibrary</a>	Gets or sets the default library for the connection string. (inherited from <a href="#">IConnectionString</a> )

 <a href="#">DefaultQualifier</a>	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">DefaultSchema</a>	Gets or sets the name of the collection where the system looks for catalog information. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">DeferPrepare</a>	Gets or sets a value that indicates whether to defer preparation. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">DeriveParameters</a>	Gets or sets a value that determines if you can derive parameters. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">EarlyMetadata</a>	Gets or sets a value that indicates whether early metadata is defined. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">ExtendedProperties</a>	Gets or sets the extended properties. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">Format</a>	Gets the format for the string. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">HcdFileName</a>	Gets or sets the host column description file name. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">HostCCSID</a>	Gets or sets the character code set identifier (CCSID) for the host. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">HostName</a>	Gets the name of the host. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">InitialCatalog</a>	Gets or sets the initial catalog name. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">IntegratedSecurity</a>	Gets or sets the integrated security. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">LocalFolder</a>	Gets or sets the local folder. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">LocalLU</a>	Gets or sets the local logical unit (LU) name. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">Location</a>	Gets or sets the location. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">MaxPoolSize</a>	Gets or sets the maximum pool size. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">MetadataAssembly</a>	Gets or sets the metadata assembly. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">Name</a>	Gets or sets the name of the connection string. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">NetworkAddress</a>	Gets or sets the IP network address. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">NetworkLibrary</a>	Gets or sets the type of network over which the connection transmits. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">NetworkPort</a>	Gets or sets the network port ID. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">NewPassword</a>	Gets or sets the new password. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">PackageCollection</a>	Gets or sets the name of the target collection. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">Password</a>	Gets or sets the user password. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">PCCodepage</a>	Gets or sets the client PC code page. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">ReadOnly</a>	Gets or sets a value that determines if the connection string is read-only. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">RemoteLU</a>	Gets or sets the remote logical unit (LU). (inherited from <a href="#">IConnectionString</a> )
 <a href="#">RepairHostKeys</a>	Gets or sets a value that determines if the host keys should be repaired. (inherited from <a href="#">IConnectionString</a> )

	<a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">SecurityPrinciple</a>	Gets or set the security principle. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UserName</a>	Gets or sets the name of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseSingleSignOn</a>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO). (inherited from <a href="#">IConnectionString</a> )

[Return to top](#)

### ConnectionException Constructor ()

Initializes a new instance of the [ConnectionException](#) class.

Syntax

C#

```
public ConnectionException()
```

C++

```
public:  
ConnectionException()
```

F#

```
new : unit -> ConnectionException
```

VB

```
Public Sub New
```

Remarks

The default constructor initializes any fields to their default values.

[Return to top](#)

### ConnectionException Constructor (String)

Initializes a new instance of the [ConnectionException](#) class using the specified error message.

Syntax

C#

```
public ConnectionException(  
    string s  
)
```

C++

```
public:  
ConnectionException(  
    String^ s  
)
```

F#

```
new :  
    s:string -> ConnectionException
```

VB

```
Public Sub New (  
    s As String  
)
```

#### Parameters

s

Type: [System.String](#)

The message that describes the error.

[Return to top](#)

#### ConnectionException Constructor (String, Exception)

Initializes a new instance of the [ConnectionException](#) class with a specified error message and a reference to the inner exception that is the cause of this exception.

Syntax

C#

```
public ConnectionException(  
    string s,  
    Exception e  
)
```

C++

```
public:  
    ConnectionException(  
        String^ s,  
        Exception^ e  
    )
```

F#

```
new :  
    s:string *  
    e:Exception -> ConnectionException
```

VB

```
Public Sub New (  
    s As String,  
    e As Exception  
)
```

#### Parameters

s

Type: [System.String](#)

The error message that explains the reason for the exception.

e

Type: [System.Exception](#)

The exception that is the cause of the current exception.

[Return to top](#)

# ConnectionException Constructor ()

Initializes a new instance of the [ConnectionException](#) class.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public ConnectionException ()
```

C++

```
public:
    ConnectionException ()
```

J#

```
public ConnectionException ()
```

JScript

```
public function ConnectionException ()
```

Remarks

The default constructor initializes any fields to their default values.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Initializes a new instance of the [ConnectionException](#) class using the specified error message.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    s As String _
)
```

C#

```
public ConnectionException (
    string s
)
```

C++

```
public:
    ConnectionException (
        String^ s
    )
```

J#

```
public ConnectionException (
    String s
)
```

JScript

```
public function ConnectionException (
    s : String
)
```

## Parameters

s

The message that describes the error.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

See Also

## Reference

[ConnectionException Class](#)

[ConnectionException Members](#)

[Microsoft.HostIntegration.DataAccessLibrary Namespace](#)

# ConnectionException Constructor (String, Exception)

Initializes a new instance of the [ConnectionException](#) class with a specified error message and a reference to the inner exception that is the cause of this exception.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    s As String, _
    e As Exception _
)
```

C#

```
public ConnectionException (
    string s,
    Exception e
)
```

C++

```
public:
    ConnectionException (
        String^ s,
        Exception^ e
    )
```

J#

```
public ConnectionException (
    String s,
    Exception e
)
```

JScript

```
public function ConnectionException (
    s : String,
    e : Exception
)
```

## Parameters

s

The error message that explains the reason for the exception.

e

The exception that is the cause of the current exception.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# CreatePackagesStatus Delegate

Creates a package status.

**Namespace:** [Microsoft.HostIntegration.DataAccessLibrary](#)

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in Microsoft.HostIntegration.DataAccessLibrary.dll)

Syntax

C#

```
public delegate void CreatePackagesStatus(  
    string status,  
    IntPtr state  
)
```

C++

```
public delegate void CreatePackagesStatus(  
    String^ status,  
    IntPtr state  
)
```

F#

```
type CreatePackagesStatus =  
    delegate of  
        status:string *  
        state:nativeint -> unit
```

VB

```
Public Delegate Sub CreatePackagesStatus (  
    status As String,  
    state As IntPtr  
)
```

## Parameters

*status*

Type: [System.String](#)

The status to create the package with.

Inheritance Hierarchy [System.Object](#)

**Microsoft.HostIntegration.DataAccessLibrary.DataAccessControl**

Syntax

C#

```
[ComVisibleAttribute(true)]
public class DataAccessControl : IDataAccessControl
```

C++

```
[ComVisibleAttribute(true)]
public ref class DataAccessControl : IDataAccessControl
```

F#

```
[<ComVisibleAttribute(true)>]
type DataAccessControl =
    class
        interface IDataAccessControl
    end
```

VB

```
<ComVisibleAttribute(True)>
Public Class DataAccessControl
    Implements IDataAccessControl
```

Constructors

	Name	Description
	<a href="#">DataAccessControl()</a>	Initializes a new instance of the <b>DataAccessControl</b> class.

Methods

	Name	Description
	<a href="#">ChangePasswordUI(IConnectionString, String)</a>	Creates the Change Password UI.
	<a href="#">CreateCustomPackages(IConnectionString, XmlReader, CreatePackagesStatus)</a>	Creates a custom package.

 	CreatePackages(IConnectionString, CreatePackagesStatus)	Creates DB2 packages for a specific DB2 data source.
 	CreatePackagesUI(IConnectionString, CreatePackagesStatus)	Brings up the Create Packages UI.
 	DisplayDataSourceWizard(ArrayList, Boolean, DataSourcePlatform, IConnectionString, Boolean, String, Boolean, Boolean)	Describes the Data Access control.
 	DisplayDataSourceWizard(ArrayList, Boolean, DataSourcePlatform, IConnectionString, String)	Displays the Data Source Wizard using the specified parameters.
	DisplayDataSourceWizard(String, String)	
 	DisplayDataSourceWizardForDb2(Boolean, IConnectionString)	Displays the Data Source Wizard for DB2.
 	DisplayDataSourceWizardForHostFiles(Boolean, IConnectionString)	Displays the Data Source Wizard for Host Files.
 	DisplayDb2ConnectImportWizard()	Displays the DB2 Connect Import Wizard.

	<code>DisplayDb2ConnectImportWizard(IConnectionString)</code>	Displays the DB2 Connect Import Wizard.
	<code>Equals(Object)</code>	(Inherited from <a href="#">Object</a> .)
	<code>Finalize()</code>	(Inherited from <a href="#">Object</a> .)
	<code>GetHashCode()</code>	(Inherited from <a href="#">Object</a> .)
	<code>GetType()</code>	(Inherited from <a href="#">Object</a> .)
	<code>MemberwiseClone()</code>	(Inherited from <a href="#">Object</a> .)
	<code>RunDataSourceWizardAsApplication()</code>	Runs the DataSource Wizard as an application.
	<code>SampleQuery(IConnectionString)</code>	Performs a sample query that fetches a list of available tables or files from a data source.

 	<a href="#">SampleQueryUI(IConnectionString, String)</a>	Activates the Sample Query UI.
 	<a href="#">TestConnection(IConnectionString, String, String)</a>	Performs a test connection on a data source.
 	<a href="#">TestConnectionUI(IConnectionString, String)</a>	Exposes the test connection UI.
	<a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

**Thread Safety**  
Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# DataAccessControl.ChangePasswordUI Method

Creates the Change Password UI.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Sub ChangePasswordUI ( _
    connStr As IConnectionString, _
    <OutAttribute> ByRef output As String _
)
```

C#

```
public static void ChangePasswordUI (
    IConnectionString connStr,
    out string output
)
```

C++

```
public:
static void ChangePasswordUI (
    IConnectionString^ connStr,
    [OutAttribute] String^% output
)
```

J#

```
public static void ChangePasswordUI (
    IConnectionString connStr,
    /** @attribute OutAttribute() */ /** @ref */ String output
)
```

JScript

## Parameters

connStr

The connection string to change.

output

On a return, contains the output string.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**DataAccessControl.DisplayDataSourceWizard Method**

**(ArrayList, Boolean, DataSourcePlatform, IConnectionString, Boolean, String, Boolean, Boolean)**

Describes the Data Access control.

Syntax

C#

```
public static DialogResult DisplayDataSourceWizard(
    ArrayList providers,
    bool showWelcome,
    ref DataSourcePlatform platform,
    ref IConnectionString connString,
    bool allowPersistence,
    out string dataSourceName,
    out bool createdUdl,
    out bool createdOleDbText
)
```

C++

```

public:
static DialogResult DisplayDataSourceWizard(
    ArrayList^ providers,
    bool showWelcome,
    DataSourcePlatform% platform,
    IConnectionString^% connString,
    bool allowPersistence,
    [OutAttribute] String^% dataSourceName,
    [OutAttribute] bool% createdUdl,
    [OutAttribute] bool% createdOleDbText
)

```

F#

```

static member DisplayDataSourceWizard :
    providers:ArrayList *
    showWelcome:bool *
    platform:DataSourcePlatform byref *
    connString:IConnectionString byref *
    allowPersistence:bool *
    dataSourceName:string byref *
    createdUdl:bool byref *
    createdOleDbText:bool byref -> DialogResult

```

VB

```

Public Shared Function DisplayDataSourceWizard (
    providers As ArrayList,
    showWelcome As Boolean,
    ByRef platform As DataSourcePlatform,
    ByRef connString As IConnectionString,
    allowPersistence As Boolean,
    <OutAttribute> ByRef dataSourceName As String,
    <OutAttribute> ByRef createdUdl As Boolean,
    <OutAttribute> ByRef createdOleDbText As Boolean
) As DialogResult

```

#### Parameters

*providers*

Type: [System.Collections.ArrayList](#)

A list of arrays containing the valid provider names.

*showWelcome*

Type: [System.Boolean](#)

**True** to show the welcome screen; otherwise, **false**.

*platform*

Type: [Microsoft.HostIntegration.DataAccessLibrary.DataSourcePlatform](#)

A reference to the list of data source platforms.

*connString*

Type: [Microsoft.HostIntegration.DataAccessLibrary.IConnectionString](#)

The connection string to use.

*allowPersistence*

Type: [System.Boolean](#)

**True** to allow persistence; otherwise, **false**.

*dataSourceName*

Type: [System.String](#)

Returns the data source name.

*createdUdl*

Type: [System.Boolean](#)

Returns the created UDL.

*createdOleDbText*

Type: [System.Boolean](#)

Returns the created Ole Db Text.

#### Return Value

Type: [System.Windows.Forms.DialogResult](#)

A DialogResult containing the result of the dialog.

[Return to top](#)

#### DataAccessControl.DisplayDataSourceWizard Method (ArrayList, Boolean, DataSourcePlatform, IConnectionString, String)

Displays the Data Source Wizard using the specified parameters.

Syntax

C#

```
public static DialogResult DisplayDataSourceWizard(
    ArrayList providers,
    bool showWelcome,
    ref DataSourcePlatform platform,
    ref IConnectionString connString,
    out string dataSourceName
)
```

C++

```
public:
static DialogResult DisplayDataSourceWizard(
    ArrayList^ providers,
    bool showWelcome,
    DataSourcePlatform% platform,
    IConnectionString^% connString,
    [OutAttribute] String% dataSourceName
)
```

F#

```
static member DisplayDataSourceWizard :
    providers:ArrayList *
    showWelcome:bool *
    platform:DataSourcePlatform byref *
    connString:IConnectionString byref *
    dataSourceName:string byref -> DialogResult
```

VB

```
Public Shared Function DisplayDataSourceWizard (
    providers As ArrayList,
    showWelcome As Boolean,
    ByRef platform As DataSourcePlatform,
    ByRef connString As IConnectionString,
    <OutAttribute> ByRef dataSourceName As String
) As DialogResult
```

#### Parameters

*providers*

Type: [System.Collections.ArrayList](#)

A list of arrays containing the valid provider names.

*showWelcome*

Type: [System.Boolean](#)

**true** to show the welcome screen; otherwise, **false**.

*platform*

Type: [Microsoft.HostIntegration.DataAccessLibrary.DataSourcePlatform](#)

A reference to the list of data source platforms.

*connString*

Type: [Microsoft.HostIntegration.DataAccessLibrary.IConnectionString](#)

The connection string to use.

*dataSourceName*

Type: [System.String](#)

Returns the data source name.

#### Return Value

Type: [System.Windows.Forms.DialogResult](#)

A DialogResult containing the result of the dialog.

[Return to top](#)

#### DataAccessControl.DisplayDataSourceWizard Method (String, String)

Syntax

C#

```
public int DisplayDataSourceWizard(  
    string inConnString,  
    out string outConnString  
)
```

C++

```
public:  
virtual int DisplayDataSourceWizard(  
    String^ inConnString,  
    [OutAttribute] String^% outConnString  
) sealed
```

F#

```
abstract DisplayDataSourceWizard :  
    inConnString:string *  
    outConnString:string byref -> int  
override DisplayDataSourceWizard :  
    inConnString:string *  
    outConnString:string byref -> int
```

VB

```
Public Function DisplayDataSourceWizard (  
    inConnString As String,  
    <OutAttribute> ByRef outConnString As String  
) As Integer
```

#### Parameters

*inConnString*

Type: [System.String](#)

*outConnString*

Type: [System.String](#)

#### Return Value

Type: [System.Int32](#)

#### Implements

[IDataAccessControl.DisplayDataSourceWizard\(String, String\)](#)

[Return to top](#)

# DataAccessControl.DisplayDataSourceWizard Method (ArrayList, Boolean, ref DataSourcePlatform, ref IConnectionString, out String)

Displays the Data Source Wizard using the specified parameters.

    ArrayList^ providers,
    bool showWelcome,
    DataSourcePlatform% platform,
    IConnectionString^% connString,
    [OutAttribute] String^% dataSourceName
)
```

J#

```
public static DialogResult DisplayDataSourceWizard (
    ArrayList providers,
    boolean showWelcome,
    /** @ref */ DataSourcePlatform platform,
    /** @ref */ IConnectionString connString,
    /** @attribute OutAttribute() */ /** @ref */ String dataSourceName
)
```

JScript

## Parameters

providers

A list of arrays containing the valid provider names.

showWelcome

**true** to show the welcome screen; otherwise, **false**.

platform

A reference to the list of data source platforms.

connString

The connection string to use.

dataSourceName

Returns the data source name.

#### **Return Value**

A DialogResult containing the result of the dialog.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

#### **Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

#### **Target Platforms**

Describes the Data Access control.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Function DisplayDataSourceWizard ( _
    providers As ArrayList, _
    showWelcome As Boolean, _
    ByRef platform As DataSourcePlatform, _
    ByRef connString As IConnectionString, _
    allowPersistence As Boolean, _
    <OutAttribute> ByRef dataSourceName As String, _
    <OutAttribute> ByRef createdUdl As Boolean, _
    <OutAttribute> ByRef createdOleDbText As Boolean _
) As DialogResult
```

C#

```
public static DialogResult DisplayDataSourceWizard (
    ArrayList providers,
    bool showWelcome,
    ref DataSourcePlatform platform,
    ref IConnectionString connString,
    bool allowPersistence,
    out string dataSourceName,
    out bool createdUdl,
    out bool createdOleDbText
)
```

C++

```
public:
static DialogResult DisplayDataSourceWizard (
    ArrayList^ providers,
    bool showWelcome,
    DataSourcePlatform% platform,
    IConnectionString^% connString,
    bool allowPersistence,
    [OutAttribute] String^% dataSourceName,
    [OutAttribute] bool% createdUdl,
    [OutAttribute] bool% createdOleDbText
)
```

J#

```
public static DialogResult DisplayDataSourceWizard (
    ArrayList providers,
    boolean showWelcome,
    /** @ref */ DataSourcePlatform platform,
    /** @ref */ IConnectionString connString,
    boolean allowPersistence,
    /** @attribute OutAttribute() */ /** @ref */ String dataSourceName,
    /** @attribute OutAttribute() */ /** @ref */ boolean createdUdl,
```

```
/** @attribute OutAttribute() */ /** @ref */ boolean createdOleDbText  
)
```

## JScript

### Parameters

providers

A list of arrays containing the valid provider names.

showWelcome

**True** to show the welcome screen; otherwise, **false**.

platform

A reference to the list of data source platforms.

connString

The connection string to use.

allowPersistence

**True** to allow persistence; otherwise, **false**.

dataSourceName

Returns the data source name.

createdUdl

Returns the created UDL.

createdOleDbText

Returns the created Ole Db Text.

### Return Value

A DialogResult containing the result of the dialog.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Constructors

	Name	Description
	<a href="#">DB2OleDbConnectionString(String, Boolean)</a>	Initializes a new instance of the <b>DB2OleDbConnectionString</b> class.
	<a href="#">DB2OleDbConnectionString(String, Boolean, IConnectionString)</a>	Initializes a new instance of the <b>DB2OleDbConnectionString</b> class using the specified name and connection string.

Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">Authentication</a>	Gets or sets the authentication.(Inherited from <a href="#">IConnectionString</a> .)

 AutoCommit	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object.(Inherited from <a href="#">IConnectionString</a> .)
 BinaryCodepage	Gets or sets the binary codepage.(Inherited from <a href="#">IConnectionString</a> .)
 CacheAuthentication	Gets or sets a value that indicates whether a cache authentication is used.(Inherited from <a href="#">IConnectionString</a> .)
 CertificateCN	Gets or sets the certificate CN.(Inherited from <a href="#">IConnectionString</a> .)
 ClientAccounting	Gets or sets the client accounting.(Inherited from <a href="#">IConnectionString</a> .)
 ClientApplicationName	Gets or sets the client application name.(Inherited from <a href="#">IConnectionString</a> .)
 ClientUserID	Gets or sets the client user identification.(Inherited from <a href="#">IConnectionString</a> .)
 ClientWorkstationName	Gets or sets the client workstation name.(Inherited from <a href="#">IConnectionString</a> .)
 Comment	Gets or sets the additional information about the connection string.(Inherited from <a href="#">IConnectionString</a> .)
 ConnectionPooling	Gets or sets a value that determines if connection pooling is active.(Inherited from <a href="#">IConnectionString</a> .)
 ConnectionTimeout	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.(Inherited from <a href="#">IConnectionString</a> .)
 DatabaseName	Gets or sets the database name.(Inherited from <a href="#">IConnectionString</a> .)
 DataSourceName	Gets or sets the name of the data source.(Inherited from <a href="#">IConnectionString</a> .)
 DateModified	Get or sets the date and time the connection string was modified.(Inherited from <a href="#">IConnectionString</a> .)
 DateTimeAsChar	Gets or sets a value that indicates whether date time is interpreted as a character.(Inherited from <a href="#">IConnectionString</a> .)
 DateTimeAsDate	Gets or sets a value that indicates whether the date time is interpreted as date.(Inherited from <a href="#">IConnectionString</a> .)
 DBMSPlatform	Gets or sets the type of database to which the connection string connects.(Inherited from <a href="#">IConnectionString</a> .)
 DecimalAsNumeric	(Inherited from <a href="#">IConnectionString</a> .)
 DefaultLibrary	Gets or sets the default library for the connection string.(Inherited from <a href="#">IConnectionString</a> .)
 DefaultQualifier	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names.(Inherited from <a href="#">IConnectionString</a> .)
 DefaultSchema	Gets or sets the name of the collection where the system looks for catalog information.(Inherited from <a href="#">IConnectionString</a> .)
 DeferPrepare	Gets or sets a value that indicates whether to defer preparation.(Inherited from <a href="#">IConnectionString</a> .)
 DeriveParameters	Gets or sets a value that determines if you can derive parameters.(Inherited from <a href="#">IConnectionString</a> .)
 EarlyMetadata	Gets or sets a value that indicates whether early metadata is defined.(Inherited from <a href="#">IConnectionString</a> .)
 ExtendedProperties	Gets or sets the extended properties.(Inherited from <a href="#">IConnectionString</a> .)

 <a href="#">FilePath</a>	Gets the file path of the current instance.(Inherited from <a href="#">OleDbConnectionString</a> .)
 <a href="#">HcdFileName</a>	Gets or sets the host column description file name.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">HostCCSID</a>	Gets or sets the character code set identifier (CCSID) for the host.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">HostName</a>	Gets the name of the host.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">InitialCatalog</a>	Gets or sets the initial catalog name.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">IntegratedSecurity</a>	Gets or sets the integrated security.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">LoadBalancing</a>	(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">LocalFolder</a>	Gets or sets the local folder.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">LocalLU</a>	Gets or sets the local logical unit (LU) name.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">Location</a>	Gets or sets the location.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">MaxPoolSize</a>	Gets or sets the maximum pool size.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">MetadataAssembly</a>	Gets or sets the metadata assembly.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">Name</a>	Gets or sets the name of the current instance.(Inherited from <a href="#">OleDbConnectionString</a> .)
 <a href="#">NetworkAddress</a>	Gets or sets the IP network address.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">NetworkLibrary</a>	Gets or sets the type of network over which the connection transmits.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">NetworkPort</a>	Gets or sets the network port ID.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">NewPassword</a>	Gets or sets the new password.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">PackageCollection</a>	Gets or sets the name of the target collection.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">Password</a>	Gets or sets the user password.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">PCCodepage</a>	Gets or sets the client PC code page.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">ReadOnly</a>	Gets or sets a value that determines if the connection string is read-only.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">RemoteLU</a>	Gets or sets the remote logical unit (LU).(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">RepairHostKeys</a>	Gets or sets a value that determines if the host keys should be repaired.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">SecurityPrinciple</a>	Gets or set the security principle.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">ShadowCatalog</a>	(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">UserName</a>	Gets or sets the name of the user.(Inherited from <a href="#">IConnectionString</a> .)

 <b>UseSingleSignOn</b>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO).(Inherited from <a href="#">IConnectionString</a> .)
--	--

#### Methods

	<b>Name</b>	<b>Description</b>
	<a href="#">Clone()</a>	Creates a deep copy of the current instance.(Overrides <a href="#">IConnectionString.Clone()</a> .)
	<a href="#">CopyFrom(IConnectionString)</a>	Copies the connection string from the specified object.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">Delete(Boolean)</a>	Deletes the current instance.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">DeleteAsText()</a>	Determines if the connection string will be deleted as text.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Exists()</a>	Determines if the current instance is abstract or actually represents a connection string.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">ExistsAsText()</a>	Determines if the connection string exists as text.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetKey(Int32)</a>	Retrieves the key from the current instance.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">GetString()</a>	Retrieves the connection string.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">InternalDelete()</a>	Retrieves a value that indicates whether it deletes the current instance.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">InternalRename(String)</a>	Renames the current instance. (Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">IsSupported(Int32)</a>	Determines if the specified connection string type is supported.(Inherited from <a href="#">OleDbConnectionString</a> .)
	 <a href="#">IsUDL(String)</a>	Returns a value that describes if the specified file is a universal data link (UDL) file.
	<a href="#">Load()</a>	Retrieves the current instance. (Inherited from <a href="#">OleDbConnectionString</a> .)
	 <a href="#">MakePathFromIdentifier(String)</a>	Makes a path from the specified identifier.(Inherited from <a href="#">OleDbConnectionString</a> .)
	 <a href="#">MakeTextPathFromIdentifier(String)</a>	Creates a text path using the specified identifier.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
	 <a href="#">ReadUDL(String)</a>	Returns a connection string for the specified file.
	<a href="#">Rename(String)</a>	Renames the connection string.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">Save()</a>	Saves the current instance.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">SaveAsText()</a>	Saves the current instance as a text file.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">SetString(String)</a>	Sets the current string.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# DB2OleDbConnectionString Members

Contains the DB2 OLEDB connection string.

The following tables list the members exposed by the [DB2OleDbConnectionString](#) type.

## Public Constructors

Name	Description
<a href="#">DB2OleDbConnectionString</a>	Overloaded. Initializes a new instance of the <a href="#">DB2OleDbConnectionString</a> class.

## Top

## Public Fields

	Name	Description
	<a href="#">CONNECT_TIMEOUT</a>	The CONNECT_TIMEOUT. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MAX_DATABASENAME_LENGTH</a>	The MAX_DATABASENAME_LENGTH. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MAX_POOL_SIZE</a>	The MAX_POOL_SIZE. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">OLEDBExtension</a>	Represents the type of file extension. This field is constant. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">OLEDBExtensionTXT</a>	Represents the type of file extension as text. (inherited from <a href="#">OleDbConnectionString</a> )

## Top

## Public Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Authentication</a>	Gets or sets the authentication. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryAsChar</a>	Gets or sets a value that determines if the system should interpret the information received as a character string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientUserID</a>	Gets or sets the client user identification. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientWorkstationName</a>	Gets or sets the client workstation name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Comment</a>	Gets or sets the additional information about the connection string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionPooling</a>	Gets or sets a value that determines if connection pooling is active. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DatabaseName</a>	Gets or sets the database name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DataSourceName</a>	Gets or sets the name of the data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateModified</a>	Get or sets the date and time the connection string was modified. (inherited from <a href="#">IConnectionString</a> )

 <a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether date time is interpreted as a character. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether the date time is interpreted as date. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">DBMSPlatform</a>	Gets or sets the type of database to which the connection string connects. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">DefaultLibrary</a>	Gets or sets the default library for the connection string. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">DefaultQualifier</a>	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">DefaultSchema</a>	Gets or sets the name of the collection where the system looks for catalog information. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">DeferPrepare</a>	Gets or sets a value that indicates whether to defer preparation. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">DeriveParameters</a>	Gets or sets a value that determines if you can derive parameters. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">EarlyMetadata</a>	Gets or sets a value that indicates whether early metadata is defined. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">ExtendedProperties</a>	Gets or sets the extended properties. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">FilePath</a>	Gets the file path of the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
 <a href="#">Format</a>	Gets the format for the string. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">HcdFileName</a>	Gets or sets the host column description file name. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">HostCCSID</a>	Gets or sets the character code set identifier (CCSID) for the host. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">HostName</a>	Gets the name of the host. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">InitialCatalog</a>	Gets or sets the initial catalog name. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">IntegratedSecurity</a>	Gets or sets the integrated security. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">LocalFolder</a>	Gets or sets the local folder. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">LocalLU</a>	Gets or sets the local logical unit (LU) name. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">Location</a>	Gets or sets the location. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">MaxPoolSize</a>	Gets or sets the maximum pool size. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">MetadataAssembly</a>	Gets or sets the metadata assembly. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">Name</a>	Gets or sets the name of the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
 <a href="#">NetworkAddress</a>	Gets or sets the IP network address. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">NetworkLibrary</a>	Gets or sets the type of network over which the connection transmits. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">NetworkPort</a>	Gets or sets the network port ID. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">NewPassword</a>	Gets or sets the new password. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">PackageCollection</a>	Gets or sets the name of the target collection. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">Password</a>	Gets or sets the user password. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">PCCodepage</a>	Gets or sets the client PC code page. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">ReadOnly</a>	Gets or sets a value that determines if the connection string is read-only. (inherited from <a href="#">IConnectionString</a> )
 <a href="#">RemoteLU</a>	Gets or sets the remote logical unit (LU). (inherited from <a href="#">IConnectionString</a> )
 <a href="#">RepairHostKeys</a>	Gets or sets a value that determines if the host keys should be repaired. (inherited from <a href="#">IConnectionString</a> )
<a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size. (inherited from <a href="#">IConnectionString</a> )
<a href="#">SecurityPrinciple</a>	Gets or set the security principle. (inherited from <a href="#">IConnectionString</a> )
<a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled. (inherited from <a href="#">IConnectionString</a> )
<a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source. (inherited from <a href="#">IConnectionString</a> )
<a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used. (inherited from <a href="#">IConnectionString</a> )
<a href="#">UserName</a>	Gets or sets the name of the user. (inherited from <a href="#">IConnectionString</a> )
<a href="#">UseSingleSignOn</a>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO). (inherited from <a href="#">IConnectionString</a> )

[Top](#)

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Clone</a>	Overridden. Creates a deep copy of the current instance.

# DB2OleDbConnectionString Constructor

Initializes a new instance of the [DB2OleDbConnectionString](#) class.

**Namespace:** [Microsoft.HostIntegration.DataAccessLibrary](#)

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in Microsoft.HostIntegration.DataAccessLibrary.dll)

## Overload List

Name	Description
 <a href="#">DB2OleDbConnectionString(String, Boolean)</a>	Initializes a new instance of the <a href="#">DB2OleDbConnectionString</a> class.
 <a href="#">DB2OleDbConnectionString(String, Boolean, IConnectionString)</a>	Initializes a new instance of the <a href="#">DB2OleDbConnectionString</a> class using the specified name and connection string.

[Return to top](#)

### DB2OleDbConnectionString Constructor (String, Boolean)

Initializes a new instance of the [DB2OleDbConnectionString](#) class.

Syntax

C#

```
public DB2OleDbConnectionString(  
    string name,  
    bool isFullPath  
)
```

C++

```
public:  
DB2OleDbConnectionString(  
    String^ name,  
    bool isFullPath  
)
```

F#

```
new :  
    name:string *  
    isFullPath:bool -> DB2OleDbConnectionString
```

VB

```
Public Sub New (  
    name As String,  
    isFullPath As Boolean  
)
```

### Parameters

*name*

Type: [System.String](#)  
Name of the connection string.

*isFullPath*

Type: [System.Boolean](#)  
**true** if the name contains the full connection string path; otherwise, **false**.

Remarks

If `isFullPath` is false, then the new instance is created using the default path for the connection string.

[Return to top](#)

### **DB2OleDbConnectionString Constructor (String, Boolean, IConnectionString)**

Initializes a new instance of the [DB2OleDbConnectionString](#) class using the specified name and connection string.

Syntax

C#

```
public DB2OleDbConnectionString(  
    string name,  
    bool isFullPath,  
    IConnectionString connStr  
)
```

C++

```
public:  
DB2OleDbConnectionString(  
    String^ name,  
    bool isFullPath,  
    IConnectionString^ connStr  
)
```

F#

```
new :  
    name:string *  
    isFullPath:bool *  
    connStr:IConnectionString -> DB2OleDbConnectionString
```

VB

```
Public Sub New (  
    name As String,  
    isFullPath As Boolean,  
    connStr As IConnectionString  
)
```

### **Parameters**

*name*

Type: [System.String](#)

Name of the connection string.

*isFullPath*

Type: [System.Boolean](#)

true if the name contains the full connection string; otherwise, false.

*connStr*

Type: [Microsoft.HostIntegration.DataAccessLibrary.IConnectionString](#)

The connection string.

Remarks

This constructor is designed as a copy constructor. Using `connStr`, you can create a new instance of an existing connection string and give it a new friendly name.

[Return to top](#)

# DB2OleDbConnectionString Constructor (String, Boolean)

Initializes a new instance of the [DB2OleDbConnectionString](#) class.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    name As String, _
    isFullPath As Boolean _
)
```

C#

```
public DB2OleDbConnectionString (
    string name,
    bool isFullPath
)
```

C++

```
public:
    DB2OleDbConnectionString (
        String^ name,
        bool isFullPath
    )
```

J#

```
public DB2OleDbConnectionString (
    String name,
    boolean isFullPath
)
```

JScript

```
public function DB2OleDbConnectionString (
    name : String,
    isFullPath : boolean
)
```

## Parameters

name

Name of the connection string.

isFullPath

**true** if the name contains the full connection string path; otherwise, **false**.

Remarks

If isFullPath is false, then the new instance is created using the default path for the connection string.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Clone</a>	Overridden. Creates a deep copy of the current instance.
	<a href="#">CopyFrom</a>	(inherited from <a href="#">IConnectionString</a> )
	<a href="#">Delete</a>	(inherited from <a href="#">IConnectionString</a> )
	<a href="#">DeleteAsText</a>	Determines if the connection string will be deleted as text. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">Exists</a>	Determines if the current instance is abstract or actually represents a connection string. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">ExistsAsText</a>	Determines if the connection string exists as text. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetString</a>	Retrieves the connection string. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
	 <a href="#">IsKerberos</a>	(inherited from <a href="#">IConnectionString</a> )
	 <a href="#">IsSSO</a>	(inherited from <a href="#">IConnectionString</a> )
	 <a href="#">IsUDL</a>	Returns a value that describes if the specified file is a universal data link (UDL) file.
	<a href="#">Load</a>	Retrieves the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
	 <a href="#">ReadUDL</a>	Returns a connection string for the specified file.
	 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Rename</a>	(inherited from <a href="#">IConnectionString</a> )
	<a href="#">Save</a>	Saves the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">SaveAsText</a>	Saves the current instance as a text file. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">SetString</a>	(inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )
	 <a href="#">ValidateAndRetrieveConnectionString</a>	(inherited from <a href="#">OleDbConnectionString</a> )

Protected Methods

## Reference

[DB2OleDbConnectionString Class](#)

[Microsoft.HostIntegration.DataAccessLibrary Namespace](#)

# DB2OleDbConnectionString.Clone Method

Creates a deep copy of the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function Clone As IConnectionString
```

C#

```
public override IConnectionString Clone ()
```

C++

```
public:
virtual IConnectionString^ Clone () override
```

J#

```
public IConnectionString Clone ()
```

JScript

```
public override function Clone () : IConnectionString
```

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

[Microsoft.HostIntegration.DataAccessLibrary Namespace](#)

# DB2OleDbConnectionString.IsUDL Method

Returns a value that describes if the specified file is a universal data link (UDL) file.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Function IsUDL ( _
    file As String _
) As Boolean
```

C#

```
public static bool IsUDL (
    string file
)
```

C++

```
public:
static bool IsUDL (
    String^ file
)
```

J#

```
public static boolean IsUDL (
    String file
)
```

JScript

```
public static function IsUDL (
    file : String
) : boolean
```

## Parameters

file

Name of the specified file.

## Return Value

**true** if the file is a UDL file; otherwise, **false**.

**Thread Safety** Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# DB2OleDbConnectionString.ReadUDL Method

Returns a connection string for the specified file.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Function ReadUDL ( _
    file As String _
) As IConnectionString
```

C#

```
public static IConnectionString ReadUDL (
    string file
)
```

C++

```
public:
static IConnectionString^ ReadUDL (
    String^ file
)
```

J#

```
public static IConnectionString ReadUDL (
    String file
)
```

JScript

```
public static function ReadUDL (
    file : String
) : IConnectionString
```

## Parameters

file

Name of the file to return a connection string for.

## Return Value

An IConnectionString containing the connection string for the file in question.

Remarks

In addition to creating a connection string for the specified file, ReadUDL will load the file into active memory.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# DB2OleDbConnectionString Properties

## Public Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Authentication</a>	Gets or sets the authentication. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryAsChar</a>	Gets or sets a value that determines if the system should interpret the information received as a character string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientUserID</a>	Gets or sets the client user identification. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientWorkstationName</a>	Gets or sets the client workstation name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Comment</a>	Gets or sets the additional information about the connection string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionPooling</a>	Gets or sets a value that determines if connection pooling is active. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DatabaseName</a>	Gets or sets the database name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DataSourceName</a>	Gets or sets the name of the data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateModified</a>	Get or sets the date and time the connection string was modified. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether date time is interpreted as a character. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether the date time is interpreted as date. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DBMSPlatform</a>	Gets or sets the type of database to which the connection string connects. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DefaultLibrary</a>	Gets or sets the default library for the connection string. (inherited from <a href="#">IConnectionString</a> )

	DefaultQualifier	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names. (inherited from <a href="#">IConnectionString</a> )
	DefaultSchema	Gets or sets the name of the collection where the system looks for catalog information. (inherited from <a href="#">IConnectionString</a> )
	DeferPrepare	Gets or sets a value that indicates whether to defer preparation. (inherited from <a href="#">IConnectionString</a> )
	DeriveParameters	Gets or sets a value that determines if you can derive parameters. (inherited from <a href="#">IConnectionString</a> )
	EarlyMetadata	Gets or sets a value that indicates whether early metadata is defined. (inherited from <a href="#">IConnectionString</a> )
	ExtendedProperties	Gets or sets the extended properties. (inherited from <a href="#">IConnectionString</a> )
	FilePath	Gets the file path of the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
	Format	Gets the format for the string. (inherited from <a href="#">IConnectionString</a> )
	HcdFileName	Gets or sets the host column description file name. (inherited from <a href="#">IConnectionString</a> )
	HostCCSID	Gets or sets the character code set identifier (CCSID) for the host. (inherited from <a href="#">IConnectionString</a> )
	HostName	Gets the name of the host. (inherited from <a href="#">IConnectionString</a> )
	InitialCatalog	Gets or sets the initial catalog name. (inherited from <a href="#">IConnectionString</a> )
	IntegratedSecurity	Gets or sets the integrated security. (inherited from <a href="#">IConnectionString</a> )
	LocalFolder	Gets or sets the local folder. (inherited from <a href="#">IConnectionString</a> )
	LocalLU	Gets or sets the local logical unit (LU) name. (inherited from <a href="#">IConnectionString</a> )
	Location	Gets or sets the location. (inherited from <a href="#">IConnectionString</a> )
	MaxPoolSize	Gets or sets the maximum pool size. (inherited from <a href="#">IConnectionString</a> )
	MetadataAssembly	Gets or sets the metadata assembly. (inherited from <a href="#">IConnectionString</a> )
	Name	Gets or sets the name of the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
	NetworkAddress	Gets or sets the IP network address. (inherited from <a href="#">IConnectionString</a> )
	NetworkLibrary	Gets or sets the type of network over which the connection transmits. (inherited from <a href="#">IConnectionString</a> )
	NetworkPort	Gets or sets the network port ID. (inherited from <a href="#">IConnectionString</a> )
	NewPassword	Gets or sets the new password. (inherited from <a href="#">IConnectionString</a> )
	PackageCollection	Gets or sets the name of the target collection. (inherited from <a href="#">IConnectionString</a> )
	Password	Gets or sets the user password. (inherited from <a href="#">IConnectionString</a> )
	PCCodepage	Gets or sets the client PC code page. (inherited from <a href="#">IConnectionString</a> )
	ReadOnly	Gets or sets a value that determines if the connection string is read-only. (inherited from <a href="#">IConnectionString</a> )
	RemoteLU	Gets or sets the remote logical unit (LU). (inherited from <a href="#">IConnectionString</a> )

	<a href="#">RepairHostKeys</a>	Gets or sets a value that determines if the host keys should be repaired. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">SecurityPrinciple</a>	Gets or set the security principle. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UserName</a>	Gets or sets the name of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseSingleSignOn</a>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO). (inherited from <a href="#">IConnectionString</a> )

 ConnectionPooling	Gets or sets a value that determines if connection pooling is active.(Inherited from <a href="#">IConnectionString</a> .)
 ConnectionTimeout	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.(Inherited from <a href="#">IConnectionString</a> .)
 DatabaseName	Gets or sets the database name.(Inherited from <a href="#">IConnectionString</a> .)
 DataSourceName	Gets or sets the name of the data source.(Inherited from <a href="#">IConnectionString</a> .)
 DateModified	Get or sets the date and time the connection string was modified.(Inherited from <a href="#">IConnectionString</a> .)
 DateTimeAsChar	Gets or sets a value that indicates whether date time is interpreted as a character.(Inherited from <a href="#">IConnectionString</a> .)
 DateTimeAsDate	Gets or sets a value that indicates whether the date time is interpreted as date.(Inherited from <a href="#">IConnectionString</a> .)
 DBMSPlatform	Gets or sets the type of database to which the connection string connects.(Inherited from <a href="#">IConnectionString</a> .)
 DecimalAsNumeric	(Inherited from <a href="#">IConnectionString</a> .)
 DefaultLibrary	Gets or sets the default library for the connection string.(Inherited from <a href="#">IConnectionString</a> .)
 DefaultQualifier	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names.(Inherited from <a href="#">IConnectionString</a> .)
 DefaultSchema	Gets or sets the name of the collection where the system looks for catalog information.(Inherited from <a href="#">IConnectionString</a> .)
 DeferPrepare	Gets or sets a value that indicates whether to defer preparation.(Inherited from <a href="#">IConnectionString</a> .)
 DeriveParameters	Gets or sets a value that determines if you can derive parameters.(Inherited from <a href="#">IConnectionString</a> .)
 EarlyMetadata	Gets or sets a value that indicates whether early metadata is defined.(Inherited from <a href="#">IConnectionString</a> .)
 ExtendedProperties	Gets or sets the extended properties.(Inherited from <a href="#">IConnectionString</a> .)

 <a href="#">FilePath</a>	Gets the file path of the current instance.(Inherited from <a href="#">OleDbConnectionString</a> .)
 <a href="#">HcdFileName</a>	Gets or sets the host column description file name.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">HostCCSID</a>	Gets or sets the character code set identifier (CCSID) for the host.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">HostName</a>	Gets the name of the host.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">InitialCatalog</a>	Gets or sets the initial catalog name.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">IntegratedSecurity</a>	Gets or sets the integrated security.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">LoadBalancing</a>	(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">LocalFolder</a>	Gets or sets the local folder.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">LocalLU</a>	Gets or sets the local logical unit (LU) name.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">Location</a>	Gets or sets the location.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">MaxPoolSize</a>	Gets or sets the maximum pool size.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">MetadataAssembly</a>	Gets or sets the metadata assembly.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">Name</a>	Gets or sets the name of the current instance.(Inherited from <a href="#">OleDbConnectionString</a> .)
 <a href="#">NetworkAddress</a>	Gets or sets the IP network address.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">NetworkLibrary</a>	Gets or sets the type of network over which the connection transmits.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">NetworkPort</a>	Gets or sets the network port ID.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">NewPassword</a>	Gets or sets the new password.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">PackageCollection</a>	Gets or sets the name of the target collection.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">Password</a>	Gets or sets the user password.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">PCCodepage</a>	Gets or sets the client PC code page.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">ReadOnly</a>	Gets or sets a value that determines if the connection string is read-only.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">RemoteLU</a>	Gets or sets the remote logical unit (LU).(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">RepairHostKeys</a>	Gets or sets a value that determines if the host keys should be repaired.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">SecurityPrinciple</a>	Gets or set the security principle.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">ShadowCatalog</a>	(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used.(Inherited from <a href="#">IConnectionString</a> .)
 <a href="#">UserName</a>	Gets or sets the name of the user.(Inherited from <a href="#">IConnectionString</a> .)

 <b>UseSingleSignOn</b>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO).(Inherited from <a href="#">IConnectionString</a> .)
--	--

#### Methods

	<b>Name</b>	<b>Description</b>
	<a href="#">Clone()</a>	Creates a deep copy of the current instance.(Overrides <a href="#">IConnectionString.Clone()</a> .)
	<a href="#">CopyFrom(IConnectionString)</a>	Copies the connection string from the specified object.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">Delete(Boolean)</a>	Deletes the current instance.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">DeleteAsText()</a>	Determines if the connection string will be deleted as text.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Exists()</a>	Determines if the current instance is abstract or actually represents a connection string.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">ExistsAsText()</a>	Determines if the connection string exists as text.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetKey(Int32)</a>	Retrieves the key.(Overrides <a href="#">OleDbConnectionString.GetKey(Int32)</a> .)
	<a href="#">GetString()</a>	Retrieves the connection string.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">InternalDelete()</a>	Retrieves a value that indicates whether it deletes the current instance.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">InternalRename(String)</a>	Renames the current instance. (Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">IsSupported(Int32)</a>	Determines whether the specified key is supported.(Overrides <a href="#">OleDbConnectionString.IsSupported(Int32)</a> .)
	 <a href="#">IsUDL(String)</a>	Determines if the specified file name describes a universal data link (UDL).
	<a href="#">Load()</a>	Retrieves the current instance. (Inherited from <a href="#">OleDbConnectionString</a> .)
	 <a href="#">MakePathFromIdentifier(String)</a>	Makes a path from the specified identifier.(Inherited from <a href="#">OleDbConnectionString</a> .)
	 <a href="#">MakeTextPathFromIdentifier(String)</a>	Creates a text path using the specified identifier.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
	 <a href="#">ReadUDL(String)</a>	Returns a connection string for the specified file.
	<a href="#">Rename(String)</a>	Renames the connection string.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">Save()</a>	Saves the current instance.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">SaveAsText()</a>	Saves the current instance as a text file.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">SetString(String)</a>	Sets the current string.(Inherited from <a href="#">OleDbConnectionString</a> .)
	<a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# FileSysOleDbConnectionString Members

Contains a file system OLEDB connection string.

The following tables list the members exposed by the [FileSysOleDbConnectionString](#) type.

## Public Constructors

Name	Description
<a href="#">FileSysOleDbConnectionString</a>	Overloaded. Initializes a new instance of the <a href="#">FileSysOleDbConnectionString</a> class.

## Top

## Public Fields

	Name	Description
	<a href="#">CONNECT_TIMEOUT</a>	The CONNECT_TIMEOUT. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MAX_DATABASENAME_LENGTH</a>	The MAX_DATABASENAME_LENGTH. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MAX_POOL_SIZE</a>	The MAX_POOL_SIZE. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">OLEDBExtension</a>	Represents the type of file extension. This field is constant. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">OLEDBExtensionTXT</a>	Represents the type of file extension as text. (inherited from <a href="#">OleDbConnectionString</a> )

## Top

## Public Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Authentication</a>	Gets or sets the authentication. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryAsChar</a>	Gets or sets a value that determines if the system should interpret the information received as a character string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientUserID</a>	Gets or sets the client user identification. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientWorkstationName</a>	Gets or sets the client workstation name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Comment</a>	Gets or sets the additional information about the connection string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionPooling</a>	Gets or sets a value that determines if connection pooling is active. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DatabaseName</a>	Gets or sets the database name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DataSourceName</a>	Gets or sets the name of the data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateModified</a>	Get or sets the date and time the connection string was modified. (inherited from <a href="#">IConnectionString</a> )

	<a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether date time is interpreted as a character. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether the date time is interpreted as date. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DBMSPlatform</a>	Gets or sets the type of database to which the connection string connects. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DefaultLibrary</a>	Gets or sets the default library for the connection string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DefaultQualifier</a>	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DefaultSchema</a>	Gets or sets the name of the collection where the system looks for catalog information. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DeferPrepare</a>	Gets or sets a value that indicates whether to defer preparation. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DeriveParameters</a>	Gets or sets a value that determines if you can derive parameters. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">EarlyMetadata</a>	Gets or sets a value that indicates whether early metadata is defined. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ExtendedProperties</a>	Gets or sets the extended properties. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">FilePath</a>	Gets the file path of the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">Format</a>	Gets the format for the string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">HcdFileName</a>	Gets or sets the host column description file name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">HostCCSID</a>	Gets or sets the character code set identifier (CCSID) for the host. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">HostName</a>	Gets the name of the host. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">InitialCatalog</a>	Gets or sets the initial catalog name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">IntegratedSecurity</a>	Gets or sets the integrated security. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">LocalFolder</a>	Gets or sets the local folder. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">LocalLU</a>	Gets or sets the local logical unit (LU) name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Location</a>	Gets or sets the location. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MaxPoolSize</a>	Gets or sets the maximum pool size. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MetadataAssembly</a>	Gets or sets the metadata assembly. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Name</a>	Gets or sets the name of the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">NetworkAddress</a>	Gets or sets the IP network address. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">NetworkLibrary</a>	Gets or sets the type of network over which the connection transmits. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">NetworkPort</a>	Gets or sets the network port ID. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">NewPassword</a>	Gets or sets the new password. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">PackageCollection</a>	Gets or sets the name of the target collection. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Password</a>	Gets or sets the user password. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">PCCodepage</a>	Gets or sets the client PC code page. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ReadOnly</a>	Gets or sets a value that determines if the connection string is read-only. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">RemoteLU</a>	Gets or sets the remote logical unit (LU). (inherited from <a href="#">IConnectionString</a> )
	<a href="#">RepairHostKeys</a>	Gets or sets a value that determines if the host keys should be repaired. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">SecurityPrinciple</a>	Gets or set the security principle. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UserName</a>	Gets or sets the name of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseSingleSignOn</a>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO). (inherited from <a href="#">IConnectionString</a> )

[Top](#)

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Clone</a>	Overridden. Creates a deep copy of the current instance.

[Microsoft.HostIntegration.DataAccessLibrary Namespace](#)

[Return to top](#)

### FileSysOleDbConnectionString Constructor (String, Boolean)

Initializes a new instance of the [FileSysOleDbConnectionString](#) class using the specified name.

## Syntax

C#

```
public FileSysOleDbConnectionString(  
    string name,  
    bool isFullPath  
)
```

C++

```
public:  
FileSysOleDbConnectionString(  
    String^ name,  
    bool isFullPath  
)
```

F#

```
new :  
    name:string *  
    isFullPath:bool -> FileSysOleDbConnectionString
```

VB

```
Public Sub New (  
    name As String,  
    isFullPath As Boolean  
)
```

## Parameters

*name*

Type: [System.String](#)

Name of the connection string.

*isFullPath*

Type: [System.Boolean](#)

**true** if the connection string contains the full path; otherwise, **false**.

## Remarks

If `isFullPath` is false, then the instance is created using the default file path.

[Return to top](#)

### **FileSysOleDbConnectionString Constructor (String, Boolean, IConnectionString)**

Initializes a new instance of the [FileSysOleDbConnectionString](#) class.

Syntax

C#

```
public FileSysOleDbConnectionString(  
    string name,  
    bool isFullPath,  
    IConnectionString connStr  
)
```

C++

```
public:  
FileSysOleDbConnectionString(  
    String^ name,  
    bool isFullPath,  
    IConnectionString^ connStr  
)
```

F#

```
new :  
    name:string *  
    isFullPath:bool *  
    connStr:IConnectionString -> FileSysOleDbConnectionString
```

VB

```
Public Sub New (  
    name As String,  
    isFullPath As Boolean,  
    connStr As IConnectionString  
)
```

### **Parameters**

*name*

Type: [System.String](#)

Name of the connection string.

*isFullPath*

Type: [System.Boolean](#)

**true** if the connection string contains the full path; otherwise, **false**.

*connStr*

Type: [Microsoft.HostIntegration.DataAccessLibrary.IConnectionString](#)

An [IConnectionString](#) containing an existing connection string.

Remarks

If `isFullPath` is false, then the instance is created using the default file path.

This constructor is designed as a copy constructor. Using `connStr`, you can create a new instance of an existing connection string and give it a new friendly name.

[Return to top](#)

# FileSysOleDbConnectionString Constructor (String, Boolean)

Initializes a new instance of the [FileSysOleDbConnectionString](#) class using the specified name.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    name As String, _
    isFullPath As Boolean _
)
```

C#

```
public FileSysOleDbConnectionString (
    string name,
    bool isFullPath
)
```

C++

```
public:
FileSysOleDbConnectionString (
    String^ name,
    bool isFullPath
)
```

J#

```
public FileSysOleDbConnectionString (
    String name,
    boolean isFullPath
)
```

JScript

```
public function FileSysOleDbConnectionString (
    name : String,
    isFullPath : boolean
)
```

## Parameters

name

Name of the connection string.

isFullPath

**true** if the connection string contains the full path; otherwise, **false**.

Remarks

If isFullPath is false, then the instance is created using the default file path.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

```

JScript

```
public function FileSysOleDbConnectionString (
    name : String,
    isFullPath : boolean,
    connStr : IConnectionString
)
```

## Parameters

name

Name of the connection string.

isFullPath

**true** if the connection string contains the full path; otherwise, **false**.

connStr

An IConnectionString containing an existing connection string.

Remarks

If `isFullPath` is false, then the instance is created using the default file path.

This constructor is designed as a copy constructor. Using `connStr`, you can create a new instance of an existing connection string and give it a new friendly name.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# FileSysOleDbConnectionString Methods

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Clone</a>	Overridden. Creates a deep copy of the current instance.
	<a href="#">CopyFrom</a>	(inherited from <a href="#">IConnectionString</a> )
	<a href="#">Delete</a>	(inherited from <a href="#">IConnectionString</a> )
	<a href="#">DeleteAsText</a>	Determines if the connection string will be deleted as text. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">Exists</a>	Determines if the current instance is abstract or actually represents a connection string. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">ExistsAsText</a>	Determines if the connection string exists as text. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetString</a>	Retrieves the connection string. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 	<a href="#">IsKerberos</a>	(inherited from <a href="#">IConnectionString</a> )
 	<a href="#">IsSSO</a>	(inherited from <a href="#">IConnectionString</a> )
 	<a href="#">IsUDL</a>	Determines if the specified file name describes a universal data link (UDL).
	<a href="#">Load</a>	Retrieves the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
 	<a href="#">ReadUDL</a>	Returns a connection string for the specified file.
 	<a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Rename</a>	(inherited from <a href="#">IConnectionString</a> )
	<a href="#">Save</a>	Saves the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">SaveAsText</a>	Saves the current instance as a text file. (inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">SetString</a>	(inherited from <a href="#">OleDbConnectionString</a> )
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )
 	<a href="#">ValidateAndRetrieveConnectionString</a>	(inherited from <a href="#">OleDbConnectionString</a> )

Protected Methods

	Name	Description
 	<a href="#">Finalize</a>	(inherited from <a href="#">Object</a> )
 	<a href="#">GetKey</a>	Overridden. Retrieves the key.
 	<a href="#">InternalDelete</a>	Retrieves a value that indicates whether it deletes the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
 	<a href="#">InternalRename</a>	(inherited from <a href="#">OleDbConnectionString</a> )
 	<a href="#">IsSupported</a>	Overridden. Determines whether the specified key is supported.
 	<a href="#">MakePathFromIdentifier</a>	(inherited from <a href="#">OleDbConnectionString</a> )
 	<a href="#">MakeTextPathFromIdentifier</a>	(inherited from <a href="#">OleDbConnectionString</a> )
 	<a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )
 	<a href="#">ValidateLine1</a>	(inherited from <a href="#">OleDbConnectionString</a> )
 	<a href="#">ValidateLine2</a>	(inherited from <a href="#">OleDbConnectionString</a> )

# FileSysOleDbConnectionString.Clone Method

Creates a deep copy of the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function Clone As IConnectionString
```

C#

```
public override IConnectionString Clone ()
```

C++

```
public:
virtual IConnectionString^ Clone () override
```

J#

```
public IConnectionString Clone ()
```

JScript

```
public override function Clone () : IConnectionString
```

## Return Value

A deep copy of the current instance.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# FileSysOleDbConnectionString.GetKey Method

Retrieves the key.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Function GetKey ( _
    key As Integer _
) As String
```

C#

```
protected override string GetKey (
    int key
)
```

C++

```
protected:
virtual String^ GetKey (
    int key
) override
```

J#

```
protected String GetKey (
    int key
)
```

JScript

```
protected override function GetKey (
    key : int
) : String
```

## Parameters

key

The number of the key to retrieve.

## Return Value

The key.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# FileSysOleDbConnectionString.IsSupported Method

Determines whether the specified key is supported.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Function IsSupported ( _
    key As Integer _
) As Boolean
```

C#

```
protected override bool IsSupported (
    int key
)
```

C++

```
protected:
virtual bool IsSupported (
    int key
) override
```

J#

```
protected boolean IsSupported (
    int key
)
```

JScript

```
protected override function IsSupported (
    key : int
) : boolean
```

## Parameters

key

Number of the specified key.

## Return Value

**true** if the key is supported; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

# FileSysOleDbConnectionString Properties

## Public Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Authentication</a>	Gets or sets the authentication. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryAsChar</a>	Gets or sets a value that determines if the system should interpret the information received as a character string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientUserID</a>	Gets or sets the client user identification. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientWorkstationName</a>	Gets or sets the client workstation name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Comment</a>	Gets or sets the additional information about the connection string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionPooling</a>	Gets or sets a value that determines if connection pooling is active. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DatabaseName</a>	Gets or sets the database name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DataSourceName</a>	Gets or sets the name of the data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateModified</a>	Get or sets the date and time the connection string was modified. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether date time is interpreted as a character. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether the date time is interpreted as date. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DBMSPlatform</a>	Gets or sets the type of database to which the connection string connects. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DefaultLibrary</a>	Gets or sets the default library for the connection string. (inherited from <a href="#">IConnectionString</a> )

	DefaultQualifier	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names. (inherited from <a href="#">IConnectionString</a> )
	DefaultSchema	Gets or sets the name of the collection where the system looks for catalog information. (inherited from <a href="#">IConnectionString</a> )
	DeferPrepare	Gets or sets a value that indicates whether to defer preparation. (inherited from <a href="#">IConnectionString</a> )
	DeriveParameters	Gets or sets a value that determines if you can derive parameters. (inherited from <a href="#">IConnectionString</a> )
	EarlyMetadata	Gets or sets a value that indicates whether early metadata is defined. (inherited from <a href="#">IConnectionString</a> )
	ExtendedProperties	Gets or sets the extended properties. (inherited from <a href="#">IConnectionString</a> )
	FilePath	Gets the file path of the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
	Format	Gets the format for the string. (inherited from <a href="#">IConnectionString</a> )
	HcdFileName	Gets or sets the host column description file name. (inherited from <a href="#">IConnectionString</a> )
	HostCCSID	Gets or sets the character code set identifier (CCSID) for the host. (inherited from <a href="#">IConnectionString</a> )
	HostName	Gets the name of the host. (inherited from <a href="#">IConnectionString</a> )
	InitialCatalog	Gets or sets the initial catalog name. (inherited from <a href="#">IConnectionString</a> )
	IntegratedSecurity	Gets or sets the integrated security. (inherited from <a href="#">IConnectionString</a> )
	LocalFolder	Gets or sets the local folder. (inherited from <a href="#">IConnectionString</a> )
	LocalLU	Gets or sets the local logical unit (LU) name. (inherited from <a href="#">IConnectionString</a> )
	Location	Gets or sets the location. (inherited from <a href="#">IConnectionString</a> )
	MaxPoolSize	Gets or sets the maximum pool size. (inherited from <a href="#">IConnectionString</a> )
	MetadataAssembly	Gets or sets the metadata assembly. (inherited from <a href="#">IConnectionString</a> )
	Name	Gets or sets the name of the current instance. (inherited from <a href="#">OleDbConnectionString</a> )
	NetworkAddress	Gets or sets the IP network address. (inherited from <a href="#">IConnectionString</a> )
	NetworkLibrary	Gets or sets the type of network over which the connection transmits. (inherited from <a href="#">IConnectionString</a> )
	NetworkPort	Gets or sets the network port ID. (inherited from <a href="#">IConnectionString</a> )
	NewPassword	Gets or sets the new password. (inherited from <a href="#">IConnectionString</a> )
	PackageCollection	Gets or sets the name of the target collection. (inherited from <a href="#">IConnectionString</a> )
	Password	Gets or sets the user password. (inherited from <a href="#">IConnectionString</a> )
	PCCodepage	Gets or sets the client PC code page. (inherited from <a href="#">IConnectionString</a> )
	ReadOnly	Gets or sets a value that determines if the connection string is read-only. (inherited from <a href="#">IConnectionString</a> )
	RemoteLU	Gets or sets the remote logical unit (LU). (inherited from <a href="#">IConnectionString</a> )

	<a href="#">RepairHostKeys</a>	Gets or sets a value that determines if the host keys should be repaired. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">SecurityPrinciple</a>	Gets or set the security principle. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UserName</a>	Gets or sets the name of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseSingleSignOn</a>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO). (inherited from <a href="#">IConnectionString</a> )

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in Microsoft.HostIntegration.DataAccessLibrary.dll)

Inheritance Hierarchy [System.Object](#)

[Microsoft.HostIntegration.DataAccessLibrary.IHcdItem](#)

**Microsoft.HostIntegration.DataAccessLibrary.HcdColumn**

Syntax

C#

```
[SerializableAttribute]
public sealed class HcdColumn : IHcdItem
```

C++

```
[SerializableAttribute]
public ref class HcdColumn sealed : IHcdItem
```

F#

```
[<Sealed>]
[<SerializableAttribute>]
type HcdColumn =
    class
        inherit IHcdItem
    end
```

VB

```
<SerializableAttribute>
Public NotInheritable Class HcdColumn
    Inherits IHcdItem
```

Properties

	Name	Description
	<a href="#">ColumnNumber</a>	Gets or sets the column number.
	<a href="#">Comment</a>	Gets or sets the comment associated with the column.
	<a href="#">HostCCSID</a>	Gets or sets the host CCSID.
	<a href="#">Label</a>	Gets or sets the column label.
	<a href="#">Length</a>	Gets or sets the column length.
	<a href="#">Name</a>	Gets or sets the column name.(Overrides <a href="#">IHcdItem.Name</a> .)
	<a href="#">Nullable</a>	Determines if the column can be <b>null</b> .
	<a href="#">Precision</a>	Gets or sets the precision of the column.
	<a href="#">Scale</a>	Gets or sets the scale of the column.
	<a href="#">SqlTypeHost</a>	Gets or sets the type of the SQL host.
	<a href="#">SqlTypeLocal</a>	Gets or sets the SQL type of the local host.
	<a href="#">UseQualifier</a>	Determines whether the column uses qualifiers.

## Methods

	Name	Description
	<a href="#">Delete(Boolean)</a>	Deletes the current instance.(Inherited from <a href="#">IHcdItem</a> .)
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Load()</a>	Loads the current instance.(Inherited from <a href="#">IHcdItem</a> .)
	<a href="#">MoveDown()</a>	Moves the column down.
	<a href="#">MoveUp()</a>	Moves the column up.
	<a href="#">Rename(String)</a>	Renames the column to the specified name.(Overrides <a href="#">IHcdItem.Rename(String)</a> .)
	<a href="#">Save()</a>	Saves the current instance.(Inherited from <a href="#">IHcdItem</a> .)
	<a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

## Fields

	Name	Description
	<a href="#">Format</a>	The format of the column.

# HcdColumn.MoveUp Method

Moves the column up.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub MoveUp
```

C#

```
public void MoveUp ()
```

C++

```
public:  
void MoveUp ()
```

J#

```
public void MoveUp ()
```

JScript

```
public function MoveUp ()
```

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HcdColumn.Rename Method

Renames the column to the specified name.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Sub Rename ( _
    newName As String _
)
```

C#

```
public override void Rename (
    string newName
)
```

C++

```
public:
virtual void Rename (
    String^ newName
) override
```

J#

```
public void Rename (
    String newName
)
```

JScript

```
public override function Rename (
    newName : String
)
```

## Parameters

newName

The new name of the column.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HcdColumn.ColumnNumber Property

Gets or sets the column number.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public ReadOnly Property ColumnNumber As Integer
```

C#

```
public int ColumnNumber { get; }
```

C++

```
public:  
property int ColumnNumber {  
    int get ();  
}
```

J#

```
/** @property */  
public int get_ColumnNumber ()
```

JScript

```
public function get ColumnNumber () : int
```

## Property Value

The column number.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

VB

```
'Declaration
Public Property EditableLength As Boolean
```

C#

```
public bool EditableLength { get; set; }
```

C++

```
public:
property bool EditableLength {
    bool get ();
    void set (bool value);
}
```

J#

```
/** @property */
public boolean get_EditableLength ()

/** @property */
public void set_EditableLength (boolean value)
```

JScript

```
public function get EditableLength () : boolean

public function set EditableLength (value : boolean)
```

## Property Value

The editable length of the data.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HcdDataType.EditablePrecision Property

Determines if the precision is editable.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property EditablePrecision As Boolean
```

C#

```
public bool EditablePrecision { get; set; }
```

C++

```
public:
property bool EditablePrecision {
    bool get ();
    void set (bool value);
}
```

J#

```
/** @property */
public boolean get_EditablePrecision ()

/** @property */
public void set_EditablePrecision (boolean value)
```

JScript

```
public function get EditablePrecision () : boolean

public function set EditablePrecision (value : boolean)
```

## Property Value

**true** if the precision is editable; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**HcdFile.AddTable Method ()**

Adds an empty table to the file.

Syntax

C#

```
public HcdTable AddTable()
```

C++

```
public:  
HcdTable^ AddTable()
```

F#

```
member AddTable : unit -> HcdTable
```

VB

```
Public Function AddTable As HcdTable
```

**Return Value**

Type: [Microsoft.HostIntegration.DataAccessLibrary.HcdTable](#)

An HcdTable describing the added file.

[Return to top](#)

**HcdFile.AddTable Method (HcdTable)**

Adds the specified table to the file.

Syntax

C#

```
public HcdTable AddTable(  
    HcdTable table  
)
```

C++

```
public:  
HcdTable^ AddTable(  
    HcdTable^ table  
)
```

F#

```
member AddTable :  
    table:HcdTable -> HcdTable
```

VB

```
Public Function AddTable (  
    table As HcdTable  
) As HcdTable
```

#### Parameters

*table*

Type: [Microsoft.HostIntegration.DataAccessLibrary.HcdTable](#)

The table to add to the file.

#### Return Value

Type: [Microsoft.HostIntegration.DataAccessLibrary.HcdTable](#)

An HcdTable containing the added table.

[Return to top](#)

#### HcdFile.AddTable Method (String)

Adds an empty table to the file, using the specified name.

Syntax

C#

```
public HcdTable AddTable(  
    string name  
)
```

C++

```
public:  
HcdTable^ AddTable(  
    String^ name  
)
```

F#

```
member AddTable :  
    name:string -> HcdTable
```

VB

```
Public Function AddTable (  
    name As String  
) As HcdTable
```

#### Parameters

*name*

Type: [System.String](#)

The name of the new table.

#### Return Value

Type: [Microsoft.HostIntegration.DataAccessLibrary.HcdTable](#)

An HcdTable containing the added table.

[Return to top](#)

# HcdFile.AddTable Method ()

Adds an empty table to the file.

	<a href="#">DelimiterField</a>	Gets or sets the delimiter field of the current instance.
	<a href="#">DelimiterRecord</a>	Gets or sets the delimiter record of the current instance.
	<a href="#">KeyLength</a>	Gets or sets the key length of the current instance.
	<a href="#">KeyPosition</a>	Gets or sets the key position of the current instance.
	<a href="#">KeySort</a>	Gets or sets the key sort of the current instance.
	<a href="#">Name</a>	Gets or sets the name of the current instance.(Overrides <a href="#">IHcdItem.Name</a> .)
	<a href="#">TextQualifier</a>	Gets or sets the text qualifier of the current instance.
	<a href="#">UseForFileTransfer</a>	Determines whether or not the current HCD file is used for file transfers.

## Methods

Name	Description
------	-------------

 <a href="#">AddColumn(HcdColumn)</a>	Adds a column to the current instance.
 <a href="#">AddNewColumn()</a>	Adds a new column to the current instance.
 <a href="#">AddNewColumn(String)</a>	Adds a new column to the current instance, using the specified column name.
 <a href="#">ColumnExists(String)</a>	Determines whether the specified column exists in the current instance.
 <a href="#">Delete(Boolean)</a>	Deletes the current instance.(Inherited from <a href="#">IHcdItem</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetColumnAt(Int32)</a>	Retrieves the column in the current instance specified by the index number.
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Load()</a>	Loads the current instance.(Inherited from <a href="#">IHcdItem</a> .)
 <a href="#">RemoveColumn(HcdColumn)</a>	Removes the specified column.
 <a href="#">Rename(String)</a>	Renames the current instance.(Overrides <a href="#">IHcdItem.Rename(String)</a> .)
 <a href="#">Save()</a>	Saves the current instance.(Inherited from <a href="#">IHcdItem</a> .)
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Fields

	Name	Description
	<a href="#">Format</a>	Reformats the current instance.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HcdTable.KeySort Property

Gets or sets the key sort of the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property KeySort As Integer
```

C#

```
public int KeySort { get; set; }
```

C++

```
public:
property int KeySort {
    int get ();
    void set (int value);
}
```

J#

```
/** @property */
public int get_KeySort ()

/** @property */
public void set_KeySort (int value)
```

JScript

```
public function get KeySort () : int

public function set KeySort (value : int)
```

## Property Value

The key sort of the current instance.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HisOleDbManager.GetDataSources Method

Retrieves a data source, based on the specified index.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Function GetDataSources ( _
    i As Integer _
) As ArrayList
```

C#

```
public ArrayList GetDataSources (
    int i
)
```

C++

```
public:
virtual ArrayList^ GetDataSources (
    int i
) sealed
```

J#

```
public final ArrayList GetDataSources (
    int i
)
```

JScript

```
public final function GetDataSources (
    i : int
) : ArrayList
```

## Parameters

i

The index of the data source to retrieve.

## Return Value

An ArrayList describing the types of data sources, based on the index.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

```
'Declaration
Public Shared Function IsDb2OleDbInstalled As Boolean
```

C#

```
public static bool IsDb2OleDbInstalled ()
```

C++

```
public:
static bool IsDb2OleDbInstalled ()
```

J#

```
public static boolean IsDb2OleDbInstalled ()
```

JScript

```
public static function IsDb2OleDbInstalled () : boolean
```

## Return Value

**True** if DB2 OLEDB is installed; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# HisProviderFactory.IsDUWInstalled Method

Determines if DUW is installed.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Function IsDUWInstalled As Boolean
```

C#

```
public static bool IsDUWInstalled ()
```

C++

```
public:
static bool IsDUWInstalled ()
```

J#

```
public static boolean IsDUWInstalled ()
```

JScript

```
public static function IsDUWInstalled () : boolean
```

## Return Value

**True** if DUW is installed; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileHcdControl Members

Describes the host file HCD control.

The following tables list the members exposed by the [HostFileHcdControl](#) type.

## Public Constructors

Name	Description
<a href="#">HostFileHcdControl</a>	Creates a new instance of the <a href="#">HostFileHcdControl</a> class.

## Top

## Protected Fields

	Name	Description
 	<a href="#">ScrollStateAutoScrolling</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateFullDrag</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateHScrollVisible</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateUserHasScrolled</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateVScrollVisible</a>	(inherited from <a href="#">ScrollableControl</a> )

# HostFileHcdControl Constructor

Creates a new instance of the [HostFileHcdControl](#) class.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public HostFileHcdControl ()
```

C++

```
public:  
HostFileHcdControl ()
```

J#

```
public HostFileHcdControl ()
```

JScript

```
public function HostFileHcdControl ()
```

**Remarks**The default constructor initializes any fields to their default values.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

# HostFileHcdControl.CanContinue Method

Determines if the user can continue.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public Function CanContinue As Boolean
```

C#

```
public bool CanContinue ()
```

C++

```
public:  
bool CanContinue ()
```

J#

```
public boolean CanContinue ()
```

JScript

```
public function CanContinue () : boolean
```

## Return Value

**true** if the user can continue; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## HostFileHcdControl.Dispose Method (Boolean)

Disposes system resources associated with the current instance.

## Syntax

C#

```
protected override void Dispose(  
    bool disposing  
)
```

C++

```
protected:  
virtual void Dispose(  
    bool disposing  
) override
```

F#

```
override Dispose :  
    disposing:bool -> unit
```

VB

```
Protected Overrides Sub Dispose (  
    disposing As Boolean  
)
```

## Parameters

*disposing*

Type: [System.Boolean](#)

**True** if the system is currently disposing; otherwise, **false**.

[Return to top](#)

# HostFileHcdControl.Dispose Method (Boolean)

Disposes system resources associated with the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Sub Dispose ( _
    disposing As Boolean _
)
```

C#

```
protected override void Dispose (
    bool disposing
)
```

C++

```
protected:
virtual void Dispose (
    bool disposing
) override
```

J#

```
protected void Dispose (
    boolean disposing
)
```

JScript

```
protected override function Dispose (
    disposing : boolean
)
```

## Parameters

disposing

**True** if the system is currently disposing; otherwise, **false**.

# HostFileHcdControl.ValidateInput Method

Determines if the system will validate the input to the control.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public Function ValidateInput As Boolean
```

C#

```
public bool ValidateInput ()
```

C++

```
public:  
bool ValidateInput ()
```

J#

```
public boolean ValidateInput ()
```

JScript

```
public function ValidateInput () : boolean
```

## Return Value

**True** if the system should validate the input; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileHcdControl.HcdFile Property

Gets and sets the HCD file.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property HcdFile As String
```

C#

```
public string HcdFile { get; set; }
```

C++

```
public:
property String^ HcdFile {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_HcdFile ()

/** @property */
public void set_HcdFile (String value)
```

JScript

```
public function get HcdFile () : String

public function set HcdFile (value : String)
```

## Property Value

The name of the HCD file.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileHcdControl.TextChangedHandler Property

Sets the text changed handler.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public WriteOnly Property TextChangedHandler As EventHandler
```

C#

```
public EventHandler TextChangedHandler { set; }
```

C++

```
public:  
property EventHandler^ TextChangedHandler {  
    void set (EventHandler^ value);  
}
```

J#

```
/** @property */  
public void set_TextChangedHandler (EventHandler value)
```

JScript

```
public function set TextChangedHandler (value : EventHandler)
```

## Property Value

The new handler for the TextChanged event.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileMetadataControl Class

Provides access to the host file Metadata control.

**Namespace:** [Microsoft.HostIntegration.DataAccessLibrary](#)  
**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in Microsoft.HostIntegration.DataAccessLibrary.dll)

Inheritance Hierarchy

- [System.Object](#)
- [System.MarshalByRefObject](#)
- [System.ComponentModel.Component](#)
- [System.Windows.Forms.Control](#)
- [System.Windows.Forms.ScrollableControl](#)
- [System.Windows.Forms.ContainerControl](#)
- [System.Windows.Forms.UserControl](#)
- Microsoft.HostIntegration.DataAccessLibrary.HostFileMetadataControl**

Syntax  
C#

```
public class HostFileMetadataControl : UserControl
```

C++

```
public ref class HostFileMetadataControl : UserControl
```

F#

```
type HostFileMetadataControl =  
    class  
        inherit UserControl  
    end
```

VB

```
Public Class HostFileMetadataControl  
    Inherits UserControl
```

Constructors

	Name	Description
	<a href="#">HostFileMetadataControl()</a>	Creates a new instance of the <b>HostFileMetadataControl</b> class.

Properties

	Name	Description
	<a href="#">AccessibilityObject</a>	(Inherited from <a href="#">Control</a> .)
	<a href="#">AccessibleDefaultActionDescription</a>	(Inherited from <a href="#">Control</a> .)
	<a href="#">AccessibleDescription</a>	(Inherited from <a href="#">Control</a> .)
	<a href="#">AccessibleName</a>	(Inherited from <a href="#">Control</a> .)
	<a href="#">AccessibleRole</a>	(Inherited from <a href="#">Control</a> .)
	<a href="#">ActiveControl</a>	(Inherited from <a href="#">ContainerControl</a> .)
	<a href="#">AllowDrop</a>	(Inherited from <a href="#">Control</a> .)

# HostFileMetadataControl Members

Provides access to the host file Metadata control.

The following tables list the members exposed by the [HostFileMetadataControl](#) type.

Public Constructors

Name	Description
<a href="#">HostFileMetadataControl</a>	Creates a new instance of the <a href="#">HostFileMetadataControl</a> class.

[Top](#)

Protected Fields

	Name	Description
	<a href="#">ScrollStateAutoScrolling</a>	(inherited from <a href="#">ScrollableControl</a> )
	<a href="#">ScrollStateFullDrag</a>	(inherited from <a href="#">ScrollableControl</a> )

# HostFileMetadataControl Constructor

Creates a new instance of the [HostFileMetadataControl](#) class.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public HostFileMetadataControl ()
```

C++

```
public:  
HostFileMetadataControl ()
```

J#

```
public HostFileMetadataControl ()
```

JScript

```
public function HostFileMetadataControl ()
```

**Remarks**The default constructor initializes any fields to their default values.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileMetadataControl.CanContinue Method

Determines if the user can continue.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public Function CanContinue As Boolean
```

C#

```
public bool CanContinue ()
```

C++

```
public:  
bool CanContinue ()
```

J#

```
public boolean CanContinue ()
```

JScript

```
public function CanContinue () : boolean
```

## Return Value

**true** if the user can continue; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[Return to top](#)  
**HostFileMetadataControl.Dispose Method (Boolean)**  
Disposes of resources associated with the current instance.

## Syntax

C#

```
protected override void Dispose(  
    bool disposing  
)
```

C++

```
protected:  
virtual void Dispose(  
    bool disposing  
) override
```

F#

```
override Dispose :  
    disposing:bool -> unit
```

VB

```
Protected Overrides Sub Dispose (  
    disposing As Boolean  
)
```

**Parameters**  
*disposing*  
Type: [System.Boolean](#)  
**true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

[Return to top](#)

# HostFileMetadataControl.Dispose Method (Boolean)

Disposes of resources associated with the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Sub Dispose ( _
    disposing As Boolean _
)
```

C#

```
protected override void Dispose (
    bool disposing
)
```

C++

```
protected:
virtual void Dispose (
    bool disposing
) override
```

J#

```
protected void Dispose (
    boolean disposing
)
```

JScript

```
protected override function Dispose (
    disposing : boolean
)
```

## Parameters

disposing

**true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileMetadataControl.ValidateInput Method

Determines if the system will validate user input.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public Function ValidateInput As Boolean
```

C#

```
public bool ValidateInput ()
```

C++

```
public:  
bool ValidateInput ()
```

J#

```
public boolean ValidateInput ()
```

JScript

```
public function ValidateInput () : boolean
```

## Return Value

**True** if the system validates user input; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

# HostFileMetadataControl.Metadata Property

Gets or sets the metadata of the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Metadata As String
```

C#

```
public string Metadata { get; set; }
```

C++

```
public:
property String^ Metadata {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_Metadata ()

/** @property */
public void set_Metadata (String value)
```

JScript

```
public function get Metadata () : String

public function set Metadata (value : String)
```

## Property Value

The metadata of the current instance.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileMetadataControl.TextChangedHandler Property

Sets the handler for the TextChanged event.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public WriteOnly Property TextChangedHandler As EventHandler
```

C#

```
public EventHandler TextChangedHandler { set; }
```

C++

```
public:  
property EventHandler^ TextChangedHandler {  
    void set (EventHandler^ value);  
}
```

J#

```
/** @property */  
public void set_TextChangedHandler (EventHandler value)
```

JScript

```
public function set TextChangedHandler (value : EventHandler)
```

## Property Value

The event handler for the TextChanged event.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# IConnectionString Class

Represents a generic connection string.

**Namespace:** [Microsoft.HostIntegration.DataAccessLibrary](#)

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in Microsoft.HostIntegration.DataAccessLibrary.dll)

Inheritance Hierarchy [System.Object](#)

**Microsoft.HostIntegration.DataAccessLibrary.IConnectionString**

[Microsoft.HostIntegration.DataAccessLibrary.BasicConnectionString](#)

[Microsoft.HostIntegration.DataAccessLibrary.OleDbConnectionString](#)

Syntax

C#

```
[SerializableAttribute]
public abstract class IConnectionString
```

C++

```
[SerializableAttribute]
public ref class IConnectionString abstract
```

F#

```
[<AbstractClass>]
[<SerializableAttribute>]
type IConnectionString = class end
```

VB

```
<SerializableAttribute>
Public MustInherit Class IConnectionString
```

Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application.
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user.
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode.
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security.
	<a href="#">Authentication</a>	Gets or sets the authentication.
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object.
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage.
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used.
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN.
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting.
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name.

	ClientUserID	Gets or sets the client user identification.
	ClientWorkstationName	Gets or sets the client workstation name.
	Comment	Gets or sets the additional information about the connection string.
	ConnectionPooling	Gets or sets a value that determines if connection pooling is active.
	ConnectionTimeout	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.
	DatabaseName	Gets or sets the database name.
	DataSourceName	Gets or sets the name of the data source.
	DateModified	Get or sets the date and time the connection string was modified.
	DateTimeAsChar	Gets or sets a value that indicates whether date time is interpreted as a character.
	DateTimeAsDate	Gets or sets a value that indicates whether the date time is interpreted as date.
	DBMSPlatform	Gets or sets the type of database to which the connection string connects.
	DecimalAsNumeric	
	DefaultLibrary	Gets or sets the default library for the connection string.
	DefaultQualifier	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names.
	DefaultSchema	Gets or sets the name of the collection where the system looks for catalog information.
	DeferPrepare	Gets or sets a value that indicates whether to defer preparation.
	DeriveParameters	Gets or sets a value that determines if you can derive parameters.
	EarlyMetadata	Gets or sets a value that indicates whether early metadata is defined.
	ExtendedProperties	Gets or sets the extended properties.
 S	Format	Gets the format for the string.
	HcdFileName	Gets or sets the host column description file name.
	HostCCSID	Gets or sets the character code set identifier (CCSID) for the host.
	HostName	Gets the name of the host.
	InitialCatalog	Gets or sets the initial catalog name.
	IntegratedSecurity	Gets or sets the integrated security.
	LoadBalancing	
	LocalFolder	Gets or sets the local folder.
	LocalLU	Gets or sets the local logical unit (LU) name.
	Location	Gets or sets the location.
	MaxPoolSize	Gets or sets the maximum pool size.
	MetadataAssembly	Gets or sets the metadata assembly.
	Name	Gets or sets the name of the connection string.
	NetworkAddress	Gets or sets the IP network address.

	NetworkLibrary	Gets or sets the type of network over which the connection transmits.
	NetworkPort	Gets or sets the network port ID.
	NewPassword	Gets or sets the new password.
	PackageCollection	Gets or sets the name of the target collection.
	Password	Gets or sets the user password.
	PCCodepage	Gets or sets the client PC code page.
	ReadOnly	Gets or sets a value that determines if the connection string is read-only.
	RemoteLU	Gets or sets the remote logical unit (LU).
	RepairHostKeys	Gets or sets a value that determines if the host keys should be repaired.
	RowsetCacheSize	Gets or sets the rowset cache size.
	SecurityPrinciple	Gets or set the security principle.
	ShadowCatalog	
	StrictValidation	Gets or sets a value that determines if strict validation is enabled.
	UnitsOfWork	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source.
	UseKerberos	Gets or sets a value that indicates whether a Kerberos is used.
	UserName	Gets or sets the name of the user.
	UseSingleSignOn	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO).

#### Methods

	Name	Description
	Clone()	Creates a deep copy of the current instance.
	CopyFrom(IConnectionString)	Copies the connection string from the specified object.
	Delete(Boolean)	Deletes the current instance.
	Equals(Object)	(Inherited from <a href="#">Object</a> .)
	Exists()	Determines if the current instance is abstract or actually represents a connection string.
	Finalize()	(Inherited from <a href="#">Object</a> .)
	GetHashCode()	(Inherited from <a href="#">Object</a> .)
	GetString()	Retrieves the connection string.
	GetType()	(Inherited from <a href="#">Object</a> .)
	InternalDelete()	Indicates a value whether the connection string is deleted.
	InternalRename(String)	Renames the connection string.
	IsKerberos(String, String)	Indicates a value whether the Kerberos is used.
	IsSSO(String, String)	Returns a value that determines if the specified user name and password uses Single Sign-On (SSO).
	Load()	Retrieves the current instance.

	<a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Rename(String)</a>	Renames the connection string.
	<a href="#">Save()</a>	Saves the connection string.
	<a href="#">SetString(String)</a>	Sets the connection string.
	<a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Fields

	<b>Name</b>	<b>Description</b>
	<a href="#">CONNECT_TIMEOUT</a>	The CONNECT_TIMEOUT.
	<a href="#">MAX_DATABASENAME_LENGTH</a>	The MAX_DATABASENAME_LENGTH.
	<a href="#">MAX_POOL_SIZE</a>	The MAX_POOL_SIZE.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# IConnectionString Members

Represents a generic connection string.

The following tables list the members exposed by the [IConnectionString](#) type.

## Public Fields

	Name	Description
	<a href="#">CONNECT_TIMEOUT</a>	The CONNECT_TIMEOUT.
	<a href="#">MAX_DATABASENAME_LENGTH</a>	The MAX_DATABASENAME_LENGTH.
	<a href="#">MAX_POOL_SIZE</a>	The MAX_POOL_SIZE.

## Top

## Public Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application.
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user.
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode.
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security.
	<a href="#">Authentication</a>	Gets or sets the authentication.
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object.
	<a href="#">BinaryAsChar</a>	Gets or sets a value that determines if the system should interpret the information received as a character string.
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage.
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used.
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN.
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting.
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name.
	<a href="#">ClientUserID</a>	Gets or sets the client user identification.
	<a href="#">ClientWorkstationName</a>	Gets or sets the client workstation name.
	<a href="#">Comment</a>	Gets or sets the additional information about the connection string.
	<a href="#">ConnectionPooling</a>	Gets or sets a value that determines if connection pooling is active.
	<a href="#">ConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.
	<a href="#">DatabaseName</a>	Gets or sets the database name.
	<a href="#">DataSourceName</a>	Gets or sets the name of the data source.
	<a href="#">DateModified</a>	Get or sets the date and time the connection string was modified.
	<a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether date time is interpreted as a character.
	<a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether the date time is interpreted as date.
	<a href="#">DBMSPlatform</a>	Gets or sets the type of database to which the connection string connects.
	<a href="#">DefaultLibrary</a>	Gets or sets the default library for the connection string.
	<a href="#">DefaultQualifier</a>	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names.
	<a href="#">DefaultSchema</a>	Gets or sets the name of the collection where the system looks for catalog information.
	<a href="#">DeferPrepare</a>	Gets or sets a value that indicates whether to defer preparation.
	<a href="#">DeriveParameters</a>	Gets or sets a value that determines if you can derive parameters.
	<a href="#">EarlyMetadata</a>	Gets or sets a value that indicates whether early metadata is defined.
	<a href="#">ExtendedProperties</a>	Gets or sets the extended properties.
	<a href="#">Format</a>	Gets the format for the string.
	<a href="#">HcdFileName</a>	Gets or sets the host column description file name.
	<a href="#">HostCCSID</a>	Gets or sets the character code set identifier (CCSID) for the host.
	<a href="#">HostName</a>	Gets the name of the host.
	<a href="#">InitialCatalog</a>	Gets or sets the initial catalog name.

	<a href="#">IntegratedSecurity</a>	Gets or sets the integrated security.
	<a href="#">LocalFolder</a>	Gets or sets the local folder.
	<a href="#">LocalLU</a>	Gets or sets the local logical unit (LU) name.
	<a href="#">Location</a>	Gets or sets the location.
	<a href="#">MaxPoolSize</a>	Gets or sets the maximum pool size.
	<a href="#">MetadataAssembly</a>	Gets or sets the metadata assembly.
	<a href="#">Name</a>	Gets or sets the name of the connection string.
	<a href="#">NetworkAddress</a>	Gets or sets the IP network address.
	<a href="#">NetworkLibrary</a>	Gets or sets the type of network over which the connection transmits.
	<a href="#">NetworkPort</a>	Gets or sets the network port ID.
	<a href="#">NewPassword</a>	Gets or sets the new password.
	<a href="#">PackageCollection</a>	Gets or sets the name of the target collection.
	<a href="#">Password</a>	Gets or sets the user password.
	<a href="#">PCCodepage</a>	Gets or sets the client PC code page.
	<a href="#">ReadOnly</a>	Gets or sets a value that determines if the connection string is read-only.
	<a href="#">RemoteLU</a>	Gets or sets the remote logical unit (LU).
	<a href="#">RepairHostKeys</a>	Gets or sets a value that determines if the host keys should be repaired.
	<a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size.
	<a href="#">SecurityPrinciple</a>	Gets or set the security principle.
	<a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled.
	<a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source.
	<a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used.
	<a href="#">UserName</a>	Gets or sets the name of the user.
	<a href="#">UseSingleSignOn</a>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO).

[Top](#)

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Clone</a>	Creates a deep copy of the current instance.
	<a href="#">CopyFrom</a>	Copies the connection string from the specified object.
	<a href="#">Delete</a>	Deletes the current instance.
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">Exists</a>	Determines if the current instance is abstract or actually represents a connection string.

# IConnectionString.Clone Method

Creates a deep copy of the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration  
Public MustOverride Function Clone As IConnectionString
```

C#

```
public abstract IConnectionString Clone ()
```

C++

```
public:  
virtual IConnectionString^ Clone () abstract
```

J#

```
public abstract IConnectionString Clone ()
```

JScript

```
public abstract function Clone () : IConnectionString
```

## Return Value

A deep copy of the current instance.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# IConnectionString.CopyFrom Method

Copies the connection string from the specified object.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub CopyFrom ( _
    rhs As IConnectionString _
)
```

C#

```
public void CopyFrom (
    IConnectionString rhs
)
```

C++

```
public:
void CopyFrom (
    IConnectionString^ rhs
)
```

J#

```
public void CopyFrom (
    IConnectionString rhs
)
```

JScript

```
public function CopyFrom (
    rhs : IConnectionString
)
```

## Parameters

rhs

The object to copy the connection string from.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# IConnectionString Properties

## Public Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application.
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user.
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode.
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security.
	<a href="#">Authentication</a>	Gets or sets the authentication.
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object.
	<a href="#">BinaryAsChar</a>	Gets or sets a value that determines if the system should interpret the information received as a character string.
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage.
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used.
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN.
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting.
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name.
	<a href="#">ClientUserID</a>	Gets or sets the client user identification.
	<a href="#">ClientWorkstationName</a>	Gets or sets the client workstation name.
	<a href="#">Comment</a>	Gets or sets the additional information about the connection string.
	<a href="#">ConnectionPooling</a>	Gets or sets a value that determines if connection pooling is active.
	<a href="#">ConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.
	<a href="#">DatabaseName</a>	Gets or sets the database name.
	<a href="#">DataSourceName</a>	Gets or sets the name of the data source.
	<a href="#">DateModified</a>	Get or sets the date and time the connection string was modified.
	<a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether date time is interpreted as a character.
	<a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether the date time is interpreted as date.
	<a href="#">DBMSPlatform</a>	Gets or sets the type of database to which the connection string connects.
	<a href="#">DefaultLibrary</a>	Gets or sets the default library for the connection string.
	<a href="#">DefaultQualifier</a>	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names.
	<a href="#">DefaultSchema</a>	Gets or sets the name of the collection where the system looks for catalog information.
	<a href="#">DeferPrepare</a>	Gets or sets a value that indicates whether to defer preparation.
	<a href="#">DeriveParameters</a>	Gets or sets a value that determines if you can derive parameters.
	<a href="#">EarlyMetadata</a>	Gets or sets a value that indicates whether early metadata is defined.
	<a href="#">ExtendedProperties</a>	Gets or sets the extended properties.
	<a href="#">Format</a>	Gets the format for the string.
	<a href="#">HcdFileName</a>	Gets or sets the host column description file name.
	<a href="#">HostCCSID</a>	Gets or sets the character code set identifier (CCSID) for the host.
	<a href="#">HostName</a>	Gets the name of the host.
	<a href="#">InitialCatalog</a>	Gets or sets the initial catalog name.
	<a href="#">IntegratedSecurity</a>	Gets or sets the integrated security.
	<a href="#">LocalFolder</a>	Gets or sets the local folder.
	<a href="#">LocalLU</a>	Gets or sets the local logical unit (LU) name.
	<a href="#">Location</a>	Gets or sets the location.
	<a href="#">MaxPoolSize</a>	Gets or sets the maximum pool size.
	<a href="#">MetadataAssembly</a>	Gets or sets the metadata assembly.
	<a href="#">Name</a>	Gets or sets the name of the connection string.
	<a href="#">NetworkAddress</a>	Gets or sets the IP network address.
	<a href="#">NetworkLibrary</a>	Gets or sets the type of network over which the connection transmits.

 <a href="#">NetworkPort</a>	Gets or sets the network port ID.
 <a href="#">NewPassword</a>	Gets or sets the new password.
 <a href="#">PackageCollection</a>	Gets or sets the name of the target collection.
 <a href="#">Password</a>	Gets or sets the user password.
 <a href="#">PCCodepage</a>	Gets or sets the client PC code page.
 <a href="#">ReadOnly</a>	Gets or sets a value that determines if the connection string is read-only.
 <a href="#">RemotelU</a>	Gets or sets the remote logical unit (LU).
 <a href="#">RepairHostKeys</a>	Gets or sets a value that determines if the host keys should be repaired.
 <a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size.
 <a href="#">SecurityPrinciple</a>	Gets or set the security principle.
 <a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled.
 <a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source.
 <a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used.
 <a href="#">UserName</a>	Gets or sets the name of the user.
 <a href="#">UseSingleSignOn</a>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO).

# IConnectionString.AffiliatedApplication Property

Gets or sets the name of the affiliated application.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property AffiliatedApplication As String
```

C#

```
public string AffiliatedApplication { get; set; }
```

C++

```
public:
property String^ AffiliatedApplication {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_AffiliatedApplication ()

/** @property */
public void set_AffiliatedApplication (String value)
```

JScript

```
public function get AffiliatedApplication () : String

public function set AffiliatedApplication (value : String)
```

## Property Value

The name of the affiliated application.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# IConnectionString.ConnectionTimeout Property

Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property ConnectionTimeout As Integer
```

C#

```
public int ConnectionTimeout { get; set; }
```

C++

```
public:
property int ConnectionTimeout {
    int get ();
    void set (int value);
}
```

J#

```
/** @property */
public int get_ConnectionTimeout ()

/** @property */
public void set_ConnectionTimeout (int value)
```

JScript

```
public function get ConnectionTimeout () : int

public function set ConnectionTimeout (value : int)
```

## Property Value

The time (in seconds) to wait for a connection to open.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# IConnectionString.DatabaseName Property

Gets or sets the database name.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property DatabaseName As String
```

C#

```
public string DatabaseName { get; set; }
```

C++

```
public:
property String^ DatabaseName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_DatabaseName ()

/** @property */
public void set_DatabaseName (String value)
```

JScript

```
public function get DatabaseName () : String

public function set DatabaseName (value : String)
```

## Property Value

The database name.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# IConnectionString.DataSourceName Property

Gets or sets the name of the data source.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property DataSourceName As String
```

C#

```
public string DataSourceName { get; set; }
```

C++

```
public:
property String^ DataSourceName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_DataSourceName ()

/** @property */
public void set_DataSourceName (String value)
```

JScript

```
public function get DataSourceName () : String

public function set DataSourceName (value : String)
```

## Property Value

The name of the data source.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# IConnectionString.DateModified Property

Get or sets the date and time the connection string was modified.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property DateModified As DateTime
```

C#

```
public DateTime DateModified { get; set; }
```

C++

```
public:
property DateTime DateModified {
    DateTime get ();
    void set (DateTime value);
}
```

J#

```
/** @property */
public DateTime get_DateModified ()

/** @property */
public void set_DateModified (DateTime value)
```

JScript

```
public function get DateModified () : DateTime

public function set DateModified (value : DateTime)
```

## Property Value

The date and time the connection string was modified.

Remarks

DateModified applies only to connection strings that connect to a file.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

# IConnectionString.DBMSPlatform Property

Gets or sets the type of database to which the connection string connects.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property DBMSPlatform As String
```

C#

```
public string DBMSPlatform { get; set; }
```

C++

```
public:
property String^ DBMSPlatform {
    String^ get ();
    void set (String^ value);
}

/** @property */
public void set_DBMSPlatform (String value)
```

JScript

```
public function get DBMSPlatform () : String

public function set DBMSPlatform (value : String)
```

## Property Value

The type of database to which the connection string connects.

Remarks

**Value**

The following list describes the possible values for DBMSPlatform.

- DB2/MVS
- DB2/AS400
- DB2/NT
- DB2/6000

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# IConnectionString.Location Property

Gets or sets the location.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Location As String
```

C#

```
public string Location { get; set; }
```

C++

```
public:
property String^ Location {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_Location ()

/** @property */
public void set_Location (String value)
```

JScript

```
public function get Location () : String

public function set Location (value : String)
```

## Property Value

The location.

## Reference

[IHcdItem Class](#)

[Microsoft.HostIntegration.DataAccessLibrary Namespace](#)

# IHcdItem.ChildExists Method

Determines whether the specified child element exists in the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Protected Function ChildExists ( _
    name As String _
) As Boolean
```

C#

```
protected bool ChildExists (
    string name
)
```

C++

```
protected:
bool ChildExists (
    String^ name
)
```

J#

```
protected boolean ChildExists (
    String name
)
```

JScript

```
protected function ChildExists (
    name : String
) : boolean
```

## Parameters

name

The name of the child element to search for.

## Return Value

**True** if the child element exists; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# IHcdItem.Delete Method

Deletes the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Function Delete ( _
    force As Boolean _
) As Boolean
```

C#

```
public bool Delete (
    bool force
)
```

C++

```
public:
bool Delete (
    bool force
)
```

J#

```
public boolean Delete (
    boolean force
)
```

JScript

```
public function Delete (
    force : boolean
) : boolean
```

## Parameters

force

## Return Value

**True** if the deletion was successful; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

# IHcdItem.GetChild Method

Retrieves the child element based on the specified index.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Protected Function GetChild ( _
    i As Integer _
) As IHcdItem
```

C#

```
protected IHcdItem GetChild (
    int i
)
```

C++

```
protected:
IHcdItem^ GetChild (
    int i
)
```

J#

```
protected IHcdItem GetChild (
    int i
)
```

JScript

```
protected function GetChild (
    i : int
) : IHcdItem
```

## Parameters

i

The index of the child element to retrieve.

## Return Value

The child element.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# MessageDialog Members

Represents the message dialog.

The following tables list the members exposed by the [MessageDialog](#) type.

## Public Constructors

Name	Description
<a href="#">MessageDialog</a>	Overloaded. Creates a new instance of the <a href="#">MessageDialog</a> class.

## Top

## Protected Fields

	Name	Description
 	<a href="#">ScrollStateAutoScrolling</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateFullDrag</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateHScrollVisible</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateUserHasScrolled</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateVScrollVisible</a>	(inherited from <a href="#">ScrollableControl</a> )

# MessageDialog Constructor

Creates a new instance of the [MessageDialog](#) class.

**Namespace:** [Microsoft.HostIntegration.DataAccessLibrary](#)

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in Microsoft.HostIntegration.DataAccessLibrary.dll)

## Overload List

Name	Description
 <a href="#">MessageDialog(String, String, String, String, MessageBoxIcon, Boolean, String)</a>	Creates a new instance of the <a href="#">MessageDialog</a> using the specified parameters.
 <a href="#">MessageDialog(String, String, String, String, MessageBoxIcon, Boolean, String, Int32)</a>	Creates a new instance of the <a href="#">MessageDialog</a> class, using the specified parameters.

[Return to top](#)

**MessageDialog Constructor (String, String, String, String, MessageBoxIcon, Boolean, String)**

Creates a new instance of the [MessageDialog](#) using the specified parameters.

Syntax

C#

```
public MessageDialog(  
    string messageText,  
    string captionText,  
    string okText,  
    string cancelText,  
    MessageBoxIcon iconStyle,  
    bool showCheck,  
    string showCheckText  
)
```

C++

```
public:  
MessageDialog(  
    String^ messageText,  
    String^ captionText,  
    String^ okText,  
    String^ cancelText,  
    MessageBoxIcon iconStyle,  
    bool showCheck,  
    String^ showCheckText  
)
```

F#

```
new :  
    messageText:string *  
    captionText:string *  
    okText:string *  
    cancelText:string *  
    iconStyle:MessageBoxIcon *  
    showCheck:bool *  
    showCheckText:string -> MessageDialog
```

VB

```
Public Sub New (  
    messageText As String,  
    captionText As String,  
    okText As String,  
    cancelText As String,  
    iconStyle As MessageBoxIcon,  
    showCheck As Boolean,  
    showCheckText As String  
)
```

#### Parameters

*messageText*

Type: [System.String](#)

The message text.

*captionText*

Type: [System.String](#)

The caption text.

*okText*

Type: [System.String](#)

The OK text.

*cancelText*

Type: [System.String](#)

The cancel text.

*iconStyle*

Type: [System.Windows.Forms.MessageBoxIcon](#)

The style of icon.

*showCheck*

Type: [System.Boolean](#)

**True** to show the check; otherwise, **false**.

*showCheckText*

Type: [System.String](#)

**True** to show the check text; otherwise, **false**.

[Return to top](#)

**MessageBoxDialog Constructor (String, String, String, String, MessageBoxIcon, Boolean, String, Int32)**

Creates a new instance of the [MessageBoxDialog](#) class, using the specified parameters.

Syntax

C#

```
public MessageBoxDialog(  
    string messageText,  
    string captionText,  
    string okText,  
    string cancelText,  
    MessageBoxIcon iconStyle,  
    bool showCheck,  
    string showCheckText,  
    int extraHeight  
)
```

C++

```
public:  
    MessageBoxDialog(  
        String^ messageText,  
        String^ captionText,  
        String^ okText,  
        String^ cancelText,  
        MessageBoxIcon iconStyle,  
        bool showCheck,
```

```
String^ showCheckText,  
int extraHeight  
)
```

F#

```
new :  
    messageText:string *  
    captionText:string *  
    okText:string *  
    cancelText:string *  
    iconStyle:MessageBoxIcon *  
    showCheck:bool *  
    showCheckText:string *  
    extraHeight:int -> MessageDialog
```

VB

```
Public Sub New (  
    messageText As String,  
    captionText As String,  
    okText As String,  
    cancelText As String,  
    iconStyle As MessageBoxIcon,  
    showCheck As Boolean,  
    showCheckText As String,  
    extraHeight As Integer  
)
```

#### Parameters

*messageText*

Type: [System.String](#)

The message text.

*captionText*

Type: [System.String](#)

The caption text.

*okText*

Type: [System.String](#)

The OK text.

*cancelText*

Type: [System.String](#)

The cancel text.

*iconStyle*

Type: [System.Windows.Forms.MessageBoxIcon](#)

The style of icon.

*showCheck*

Type: [System.Boolean](#)

**True** to show the check; otherwise, **false**.

*showCheckText*

Type: [System.String](#)

The check text.

*extraHeight*

Type: [System.Int32](#)

Extra height to add.

[Return to top](#)

# MessageDialog Constructor (String, String, String, String, MessageBoxIcon, Boolean, String)

Creates a new instance of the [MessageDialog](#) using the specified parameters.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    messageText As String, _
    captionText As String, _
    okText As String, _
    cancelText As String, _
    iconStyle As MessageBoxIcon, _
    showCheck As Boolean, _
    showCheckText As String _
)
```

C#

```
public MessageDialog (
    string messageText,
    string captionText,
    string okText,
    string cancelText,
    MessageBoxIcon iconStyle,
    bool showCheck,
    string showCheckText
)
```

C++

```
public:
    MessageDialog (
        String^ messageText,
        String^ captionText,
        String^ okText,
        String^ cancelText,
        MessageBoxIcon iconStyle,
        bool showCheck,
        String^ showCheckText
    )
```

J#

```
public MessageDialog (
    String messageText,
    String captionText,
    String okText,
    String cancelText,
    MessageBoxIcon iconStyle,
    boolean showCheck,
    String showCheckText
)
```

JScript

```
public function MessageDialog (
    messageText : String,
    captionText : String,
```

```
    okText : String,  
    cancelText : String,  
    iconStyle : MessageBoxIcon,  
    showCheck : boolean,  
    showCheckText : String  
)
```

#### Parameters

messageText

The message text.

captionText

The caption text.

okText

The OK text.

cancelText

The cancel text.

iconStyle

The style of icon.

showCheck

**True** to show the check; otherwise, **false**.

showCheckText

**True** to show the check text; otherwise, **false**.

Platforms

#### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

```

```
public function MessageDialog (  
    messageText : String,  
    captionText : String,  
    okText : String,  
    cancelText : String,  
    iconStyle : MessageBoxIcon,  
    showCheck : boolean,  
    showCheckText : String,  
    extraHeight : int  
)
```

#### Parameters

messageText

The message text.

captionText

The caption text.

okText

The OK text.

cancelText

The cancel text.

iconStyle

The style of icon.

showCheck

**True** to show the check; otherwise, **false**.

showCheckText

The check text.

extraHeight

Extra height to add.

Platforms

#### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MessageDialog.AdjustControls Method

Adjusts the controls on the message dialog.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub AdjustControls ( _
    messageText As String, _
    captionText As String, _
    okText As String, _
    cancelText As String, _
    iconStyle As MessageBoxIcon, _
    showCheck As Boolean, _
    showCheckText As String, _
    extraHeight As Integer _
)
```

C#

```
public void AdjustControls (
    string messageText,
    string captionText,
    string okText,
    string cancelText,
    MessageBoxIcon iconStyle,
    bool showCheck,
    string showCheckText,
    int extraHeight
)
```

C++

```
public:
void AdjustControls (
    String^ messageText,
    String^ captionText,
    String^ okText,
    String^ cancelText,
    MessageBoxIcon iconStyle,
    bool showCheck,
    String^ showCheckText,
    int extraHeight
)
```

J#

```
public void AdjustControls (
    String messageText,
    String captionText,
    String okText,
    String cancelText,
    MessageBoxIcon iconStyle,
    boolean showCheck,
    String showCheckText,
    int extraHeight
)
```

JScript

```
public function AdjustControls (
```

```
messageText : String,  
captionText : String,  
okText : String,  
cancelText : String,  
iconStyle : MessageBoxIcon,  
showCheck : boolean,  
showCheckText : String,  
extraHeight : int  
)
```

#### Parameters

messageText

The message text.

captionText

The caption text.

okText

The OK text.

cancelText

The cancel text.

iconStyle

The style of icon.

showCheck

**True** to show the check; otherwise, **false**.

showCheckText

The check text.

extraHeight

Extra height to add.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

#### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## MessageDialog.Dispose Method (Boolean)

Disposes of resources associated with the current instance.

Syntax

C#

```
protected override void Dispose(  
    bool disposing  
)
```

C++

```
protected:  
virtual void Dispose(  
    bool disposing  
) override
```

F#

```
override Dispose :  
    disposing:bool -> unit
```

VB

```
Protected Overrides Sub Dispose (  
    disposing As Boolean  
)
```

## Parameters

*disposing*

Type: [System.Boolean](#)

**true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

[Return to top](#)

# MessageDialog.Dispose Method (Boolean)

Disposes of resources associated with the current instance.

[MessageBox Class](#)

[Microsoft.HostIntegration.DataAccessLibrary Namespace](#)

# MessageDialog.CheckState Property

Gets a value that determines if the check has been selected.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property CheckState As Boolean
```

C#

```
public bool CheckState { get; }
```

C++

```
public:
property bool CheckState {
    bool get ();
}
```

J#

```
/** @property */
public boolean get_CheckState ()
```

JScript

```
public function get CheckState () : boolean
```

## Property Value

**true** if the check has been selected; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Syntax

C#

```
[SerializableAttribute]
public abstract class OleDbConnectionString : IConnectionString
```

C++

```
[SerializableAttribute]
public ref class OleDbConnectionString abstract : IConnectionString
```

F#

```
[<AbstractClass>]
[<SerializableAttribute>]
type OleDbConnectionString =
    class
        inherit IConnectionString
    end
```

VB

```
<SerializableAttribute>
Public MustInherit Class OleDbConnectionString
    Inherits IConnectionString
```

Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">Authentication</a>	Gets or sets the authentication.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object.(Inherited from <a href="#">IConnectionString</a> .)
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage.(Inherited from <a href="#">IConnectionString</a> .)

 CacheAuthentication	Gets or sets a value that indicates whether a cache authentication is used.(Inherited from <a href="#">IConnectionString</a> .)
 CertificateCN	Gets or sets the certificate CN.(Inherited from <a href="#">IConnectionString</a> .)
 ClientAccounting	Gets or sets the client accounting.(Inherited from <a href="#">IConnectionString</a> .)
 ClientApplicationName	Gets or sets the client application name.(Inherited from <a href="#">IConnectionString</a> .)
 ClientUserID	Gets or sets the client user identification.(Inherited from <a href="#">IConnectionString</a> .)
 ClientWorkstationName	Gets or sets the client workstation name.(Inherited from <a href="#">IConnectionString</a> .)
 Comment	Gets or sets the additional information about the connection string.(Inherited from <a href="#">IConnectionString</a> .)
 ConnectionPooling	Gets or sets a value that determines if connection pooling is active.(Inherited from <a href="#">IConnectionString</a> .)
 ConnectionTimeout	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.(Inherited from <a href="#">IConnectionString</a> .)
 DatabaseName	Gets or sets the database name.(Inherited from <a href="#">IConnectionString</a> .)
 DataSourceName	Gets or sets the name of the data source.(Inherited from <a href="#">IConnectionString</a> .)
 DateModified	Get or sets the date and time the connection string was modified.(Inherited from <a href="#">IConnectionString</a> .)
 DateTimeAsChar	Gets or sets a value that indicates whether date time is interpreted as a character.(Inherited from <a href="#">IConnectionString</a> .)
 DateTimeAsDate	Gets or sets a value that indicates whether the date time is interpreted as date.(Inherited from <a href="#">IConnectionString</a> .)
 DBMSPlatform	Gets or sets the type of database to which the connection string connects.(Inherited from <a href="#">IConnectionString</a> .)
 DecimalAsNumeric	(Inherited from <a href="#">IConnectionString</a> .)
 DefaultLibrary	Gets or sets the default library for the connection string.(Inherited from <a href="#">IConnectionString</a> .)
 DefaultQualifier	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names.(Inherited from <a href="#">IConnectionString</a> .)
 DefaultSchema	Gets or sets the name of the collection where the system looks for catalog information.(Inherited from <a href="#">IConnectionString</a> .)
 DeferPrepare	Gets or sets a value that indicates whether to defer preparation.(Inherited from <a href="#">IConnectionString</a> .)
 DeriveParameters	Gets or sets a value that determines if you can derive parameters.(Inherited from <a href="#">IConnectionString</a> .)
 EarlyMetadata	Gets or sets a value that indicates whether early metadata is defined.(Inherited from <a href="#">IConnectionString</a> .)
 ExtendedProperties	Gets or sets the extended properties.(Inherited from <a href="#">IConnectionString</a> .)
 FilePath	Gets the file path of the current instance.
 HcdFileName	Gets or sets the host column description file name.(Inherited from <a href="#">IConnectionString</a> .)
 HostCCSID	Gets or sets the character code set identifier (CCSID) for the host.(Inherited from <a href="#">IConnectionString</a> .)

	HostName	Gets the name of the host.(Inherited from <a href="#">IConnectionString</a> .)
	InitialCatalog	Gets or sets the initial catalog name.(Inherited from <a href="#">IConnectionString</a> .)
	IntegratedSecurity	Gets or sets the integrated security.(Inherited from <a href="#">IConnectionString</a> .)
	LoadBalancing	(Inherited from <a href="#">IConnectionString</a> .)
	LocalFolder	Gets or sets the local folder.(Inherited from <a href="#">IConnectionString</a> .)
	LocalLU	Gets or sets the local logical unit (LU) name.(Inherited from <a href="#">IConnectionString</a> .)
	Location	Gets or sets the location.(Inherited from <a href="#">IConnectionString</a> .)
	MaxPoolSize	Gets or sets the maximum pool size.(Inherited from <a href="#">IConnectionString</a> .)
	MetadataAssembly	Gets or sets the metadata assembly.(Inherited from <a href="#">IConnectionString</a> .)
	Name	Gets or sets the name of the current instance.(Overrides <a href="#">IConnectionString.Name</a> .)
	NetworkAddress	Gets or sets the IP network address.(Inherited from <a href="#">IConnectionString</a> .)
	NetworkLibrary	Gets or sets the type of network over which the connection transmits.(Inherited from <a href="#">IConnectionString</a> .)
	NetworkPort	Gets or sets the network port ID.(Inherited from <a href="#">IConnectionString</a> .)
	NewPassword	Gets or sets the new password.(Inherited from <a href="#">IConnectionString</a> .)
	PackageCollection	Gets or sets the name of the target collection.(Inherited from <a href="#">IConnectionString</a> .)
	Password	Gets or sets the user password.(Inherited from <a href="#">IConnectionString</a> .)
	PCCodepage	Gets or sets the client PC code page.(Inherited from <a href="#">IConnectionString</a> .)
	ReadOnly	Gets or sets a value that determines if the connection string is read-only.(Inherited from <a href="#">IConnectionString</a> .)
	RemoteLU	Gets or sets the remote logical unit (LU).(Inherited from <a href="#">IConnectionString</a> .)
	RepairHostKeys	Gets or sets a value that determines if the host keys should be repaired.(Inherited from <a href="#">IConnectionString</a> .)
	RowsetCacheSize	Gets or sets the rowset cache size.(Inherited from <a href="#">IConnectionString</a> .)
	SecurityPrinciple	Gets or set the security principle.(Inherited from <a href="#">IConnectionString</a> .)
	ShadowCatalog	(Inherited from <a href="#">IConnectionString</a> .)
	StrictValidation	Gets or sets a value that determines if strict validation is enabled.(Inherited from <a href="#">IConnectionString</a> .)
	UnitsOfWork	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source.(Inherited from <a href="#">IConnectionString</a> .)
	UseKerberos	Gets or sets a value that indicates whether a Kerberos is used.(Inherited from <a href="#">IConnectionString</a> .)
	UserName	Gets or sets the name of the user.(Inherited from <a href="#">IConnectionString</a> .)
	UseSingleSignOn	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO).(Inherited from <a href="#">IConnectionString</a> .)

#### Methods

Name	Description
------	-------------

	Clone()	Creates a deep copy of the current instance.(Inherited from <a href="#">IConnectionString</a> .)
	CopyFrom(IConnectionString)	Copies the connection string from the specified object.(Inherited from <a href="#">IConnectionString</a> .)
	Delete(Boolean)	Deletes the current instance.(Inherited from <a href="#">IConnectionString</a> .)
	DeleteAsText()	Determines if the connection string will be deleted as text.
	Equals(Object)	(Inherited from <a href="#">Object</a> .)
	Exists()	Determines if the current instance is abstract or actually represents a connection string.(Overrides <a href="#">IConnectionString.Exists()</a> .)
	ExistsAsText()	Determines if the connection string exists as text.
	Finalize()	(Inherited from <a href="#">Object</a> .)
	GetHashCode()	(Inherited from <a href="#">Object</a> .)
	GetKey(Int32)	Retrieves the key from the current instance.
	GetString()	Retrieves the connection string.(Overrides <a href="#">IConnectionString.GetString()</a> .)
	GetType()	(Inherited from <a href="#">Object</a> .)
	InternalDelete()	Retrieves a value that indicates whether it deletes the current instance.(Overrides <a href="#">IConnectionString.InternalDelete()</a> .)
	InternalRename(String)	Renames the current instance. (Overrides <a href="#">IConnectionString.InternalRename(String)</a> .)
	IsSupported(Int32)	Determines if the specified connection string type is supported.
	Load()	Retrieves the current instance. (Overrides <a href="#">IConnectionString.Load()</a> .)
	MakePathFromIdentifier(String)	Makes a path from the specified identifier.
	MakeTextPathFromIdentifier(String)	Creates a text path using the specified identifier.
	MemberwiseClone()	(Inherited from <a href="#">Object</a> .)
	Rename(String)	Renames the connection string.(Inherited from <a href="#">IConnectionString</a> .)
	Save()	Saves the current instance.(Overrides <a href="#">IConnectionString.Save()</a> .)
	SaveAsText()	Saves the current instance as a text file.
	SetString(String)	Sets the current string.(Overrides <a href="#">IConnectionString.SetString(String)</a> .)
	ToString()	(Inherited from <a href="#">Object</a> .)
	ValidateAndRetrieveConnectionString(String)	Validates and retrieves the connection string.
	ValidateLine1(String)	Validates the first line.
	ValidateLine2(String)	Validates the second line.

#### Fields

	Name	Description
	<a href="#">OLEDBExtension</a>	Represents the type of file extension. This field is constant.
	<a href="#">OLEDBExtensionTXT</a>	Represents the type of file extension as text.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# OleDbConnectionString Members

Describes an OLE DB connection string.

The following tables list the members exposed by the [OleDbConnectionString](#) type.

## Public Fields

	Name	Description
	<a href="#">CONNECT_TIMEOUT</a>	The CONNECT_TIMEOUT. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MAX_DATABASENAME_LENGTH</a>	The MAX_DATABASENAME_LENGTH. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MAX_POOL_SIZE</a>	The MAX_POOL_SIZE. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">OLEDBExtension</a>	Represents the type of file extension. This field is constant.
	<a href="#">OLEDBExtensionTXT</a>	Represents the type of file extension as text.

## Top

## Public Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Authentication</a>	Gets or sets the authentication. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryAsChar</a>	Gets or sets a value that determines if the system should interpret the information received as a character string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientUserID</a>	Gets or sets the client user identification. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientWorkstationName</a>	Gets or sets the client workstation name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Comment</a>	Gets or sets the additional information about the connection string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionPooling</a>	Gets or sets a value that determines if connection pooling is active. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DatabaseName</a>	Gets or sets the database name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DataSourceName</a>	Gets or sets the name of the data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateModified</a>	Get or sets the date and time the connection string was modified. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether date time is interpreted as a character. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether the date time is interpreted as date. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DBMSPlatform</a>	Gets or sets the type of database to which the connection string connects. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DefaultLibrary</a>	Gets or sets the default library for the connection string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DefaultQualifier</a>	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names. (inherited from <a href="#">IConnectionString</a> )

	<a href="#">DefaultSchema</a>	Gets or sets the name of the collection where the system looks for catalog information. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DeferPrepare</a>	Gets or sets a value that indicates whether to defer preparation. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DeriveParameters</a>	Gets or sets a value that determines if you can derive parameters. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">EarlyMetadata</a>	Gets or sets a value that indicates whether early metadata is defined. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ExtendedProperties</a>	Gets or sets the extended properties. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">FilePath</a>	Gets the file path of the current instance.
	<a href="#">Format</a>	Gets the format for the string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">HcdFileName</a>	Gets or sets the host column description file name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">HostCCSID</a>	Gets or sets the character code set identifier (CCSID) for the host. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">HostName</a>	Gets the name of the host. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">InitialCatalog</a>	Gets or sets the initial catalog name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">IntegratedSecurity</a>	Gets or sets the integrated security. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">LocalFolder</a>	Gets or sets the local folder. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">LocalLU</a>	Gets or sets the local logical unit (LU) name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Location</a>	Gets or sets the location. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MaxPoolSize</a>	Gets or sets the maximum pool size. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">MetadataAssembly</a>	Gets or sets the metadata assembly. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Name</a>	Overridden. Gets or sets the name of the current instance.
	<a href="#">NetworkAddress</a>	Gets or sets the IP network address. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">NetworkLibrary</a>	Gets or sets the type of network over which the connection transmits. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">NetworkPort</a>	Gets or sets the network port ID. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">NewPassword</a>	Gets or sets the new password. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">PackageCollection</a>	Gets or sets the name of the target collection. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Password</a>	Gets or sets the user password. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">PCCodepage</a>	Gets or sets the client PC code page. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ReadOnly</a>	Gets or sets a value that determines if the connection string is read-only. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">RemoteLU</a>	Gets or sets the remote logical unit (LU). (inherited from <a href="#">IConnectionString</a> )
	<a href="#">RepairHostKeys</a>	Gets or sets a value that determines if the host keys should be repaired. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">SecurityPrinciple</a>	Gets or set the security principle. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UserName</a>	Gets or sets the name of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseSingleSignOn</a>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO). (inherited from <a href="#">IConnectionString</a> )

# OleDbConnectionString.DeleteAsText Method

Determines if the connection string will be deleted as text.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Function DeleteAsText As Boolean
```

C#

```
public bool DeleteAsText ()
```

C++

```
public:
bool DeleteAsText ()
```

J#

```
public boolean DeleteAsText ()
```

JScript

```
public function DeleteAsText () : boolean
```

## Return Value

**True** if the connection string will be deleted as text; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

    String^ destIdentifier
) override
```

J#

```
protected void InternalRename (
    String destIdentifier
)
```

JScript

```
protected override function InternalRename (
    destIdentifier : String
)
```

## Parameters

destIdentifier

The new name of the current instance.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# OleDbConnectionString.IsSupported Method

Determines if the specified connection string type is supported.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overridable Function IsSupported ( _
    i As Integer _
) As Boolean
```

C#

```
protected virtual bool IsSupported (
    int i
)
```

C++

```
protected:
virtual bool IsSupported (
    int i
)
```

J#

```
protected boolean IsSupported (
    int i
)
```

JScript

```
protected function IsSupported (
    i : int
) : boolean
```

## Parameters

i

Index of the connection string type.

## Return Value

**true** if the connection string type is supported; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# OleDbConnectionString Properties

## Public Properties

	Name	Description
	<a href="#">AffiliatedApplication</a>	Gets or sets the name of the affiliated application. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AllowSavingPassword</a>	Gets or sets a value that determines if the system saves the password of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCMode</a>	Gets or sets the APPC Mode. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">APPCSecurity</a>	Gets or sets the APPC security. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Authentication</a>	Gets or sets the authentication. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made to the commit method for all site control file classes using the <b>SiteCode</b> property of the current object. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryAsChar</a>	Gets or sets a value that determines if the system should interpret the information received as a character string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">BinaryCodepage</a>	Gets or sets the binary codepage. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CacheAuthentication</a>	Gets or sets a value that indicates whether a cache authentication is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">CertificateCN</a>	Gets or sets the certificate CN. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientApplicationName</a>	Gets or sets the client application name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientUserID</a>	Gets or sets the client user identification. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ClientWorkstationName</a>	Gets or sets the client workstation name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">Comment</a>	Gets or sets the additional information about the connection string. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionPooling</a>	Gets or sets a value that determines if connection pooling is active. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">ConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DatabaseName</a>	Gets or sets the database name. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DataSourceName</a>	Gets or sets the name of the data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateModified</a>	Get or sets the date and time the connection string was modified. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether date time is interpreted as a character. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether the date time is interpreted as date. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DBMSPlatform</a>	Gets or sets the type of database to which the connection string connects. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">DefaultLibrary</a>	Gets or sets the default library for the connection string. (inherited from <a href="#">IConnectionString</a> )

	DefaultQualifier	Gets or sets the name of the schema (collection/owner) with which to fully qualify unqualified object names. (inherited from <a href="#">IConnectionString</a> )
	DefaultSchema	Gets or sets the name of the collection where the system looks for catalog information. (inherited from <a href="#">IConnectionString</a> )
	DeferPrepare	Gets or sets a value that indicates whether to defer preparation. (inherited from <a href="#">IConnectionString</a> )
	DeriveParameters	Gets or sets a value that determines if you can derive parameters. (inherited from <a href="#">IConnectionString</a> )
	EarlyMetadata	Gets or sets a value that indicates whether early metadata is defined. (inherited from <a href="#">IConnectionString</a> )
	ExtendedProperties	Gets or sets the extended properties. (inherited from <a href="#">IConnectionString</a> )
	FilePath	Gets the file path of the current instance.
	Format	Gets the format for the string. (inherited from <a href="#">IConnectionString</a> )
	HcdFileName	Gets or sets the host column description file name. (inherited from <a href="#">IConnectionString</a> )
	HostCCSID	Gets or sets the character code set identifier (CCSID) for the host. (inherited from <a href="#">IConnectionString</a> )
	HostName	Gets the name of the host. (inherited from <a href="#">IConnectionString</a> )
	InitialCatalog	Gets or sets the initial catalog name. (inherited from <a href="#">IConnectionString</a> )
	IntegratedSecurity	Gets or sets the integrated security. (inherited from <a href="#">IConnectionString</a> )
	LocalFolder	Gets or sets the local folder. (inherited from <a href="#">IConnectionString</a> )
	LocalLU	Gets or sets the local logical unit (LU) name. (inherited from <a href="#">IConnectionString</a> )
	Location	Gets or sets the location. (inherited from <a href="#">IConnectionString</a> )
	MaxPoolSize	Gets or sets the maximum pool size. (inherited from <a href="#">IConnectionString</a> )
	MetadataAssembly	Gets or sets the metadata assembly. (inherited from <a href="#">IConnectionString</a> )
	Name	Overridden. Gets or sets the name of the current instance.
	NetworkAddress	Gets or sets the IP network address. (inherited from <a href="#">IConnectionString</a> )
	NetworkLibrary	Gets or sets the type of network over which the connection transmits. (inherited from <a href="#">IConnectionString</a> )
	NetworkPort	Gets or sets the network port ID. (inherited from <a href="#">IConnectionString</a> )
	NewPassword	Gets or sets the new password. (inherited from <a href="#">IConnectionString</a> )
	PackageCollection	Gets or sets the name of the target collection. (inherited from <a href="#">IConnectionString</a> )
	Password	Gets or sets the user password. (inherited from <a href="#">IConnectionString</a> )
	PCCodepage	Gets or sets the client PC code page. (inherited from <a href="#">IConnectionString</a> )
	ReadOnly	Gets or sets a value that determines if the connection string is read-only. (inherited from <a href="#">IConnectionString</a> )
	RemoteLU	Gets or sets the remote logical unit (LU). (inherited from <a href="#">IConnectionString</a> )
	RepairHostKeys	Gets or sets a value that determines if the host keys should be repaired. (inherited from <a href="#">IConnectionString</a> )

	<a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">SecurityPrinciple</a>	Gets or set the security principle. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">StrictValidation</a>	Gets or sets a value that determines if strict validation is enabled. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UnitsOfWork</a>	Gets or sets the two-phase commit (distributed unit of work) used for transactions supported for this data source. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseKerberos</a>	Gets or sets a value that indicates whether a Kerberos is used. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UserName</a>	Gets or sets the name of the user. (inherited from <a href="#">IConnectionString</a> )
	<a href="#">UseSingleSignOn</a>	Gets or sets a value that determines if the connection string uses Single Sign-On (SSO). (inherited from <a href="#">IConnectionString</a> )

# SNANLS.PopulateHostCCSIDs Method

Populates the host CCSID.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub PopulateHostCCSIDs ( _
    hostCCSID As ComboBox, _
    currentHostCCSID As Integer _
)
```

C#

```
public void PopulateHostCCSIDs (
    ComboBox hostCCSID,
    int currentHostCCSID
)
```

C++

```
public:
void PopulateHostCCSIDs (
    ComboBox^ hostCCSID,
    int currentHostCCSID
)
```

J#

```
public void PopulateHostCCSIDs (
    ComboBox hostCCSID,
    int currentHostCCSID
)
```

JScript

```
public function PopulateHostCCSIDs (
    hostCCSID : ComboBox,
    currentHostCCSID : int
)
```

## Parameters

hostCCSID

The host CCSID combo box.

currentHostCCSID

The current host CCSID.

[Microsoft.HostIntegration.DataAccessLibrary Namespace](#)

# SNANLS.Instance Property

Gets the instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared ReadOnly Property Instance As SNANLS
```

C#

```
public static SNANLS Instance { get; }
```

C++

```
public:
static property SNANLS^ Instance {
    SNANLS^ get ();
}
```

J#

```
/** @property */
public static SNANLS get_Instance ()
```

JScript

```
public static function get Instance () : SNANLS
```

## Property Value

The instance.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

See Also

## Reference

[SNANLS Class](#)

[SNANLS Members](#)

[Microsoft.HostIntegration.DataAccessLibrary Namespace](#)

# SnaNlsCodePage Structure

Represents the SNANLS code page.

**Namespace:** [Microsoft.HostIntegration.DataAccessLibrary](#)

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in Microsoft.HostIntegration.DataAccessLibrary.dll)

Syntax

C#

```
[SerializableAttribute]
public struct SnaNlsCodePage : IComparable<SnaNlsCodePage>
```

C++

```
[SerializableAttribute]
public value struct SnaNlsCodePage : IComparable<SnaNlsCodePage>
```

F#

```
[<Sealed>]
[<SerializableAttribute>]
type SnaNlsCodePage =
    struct
        interface IComparable<SnaNlsCodePage>
    end
```

VB

```
<SerializableAttribute>
Public Structure SnaNlsCodePage
    Implements IComparable(Of SnaNlsCodePage)
```

Constructors

Name	Description
 <a href="#">SnaNlsCodePage(String, Int32)</a>	Creates a new instance of the <b>SnaNlsCodePage</b> class.

Methods

Name	Description
 <a href="#">CompareTo(SnaNlsCodePage)</a>	Compares the current instance with the other object of the same type and returns an integer.
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">ValueType</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">ValueType</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">ToString()</a>	Translates the current instance to a string.(Overrides <a href="#">ValueType.ToString()</a> .)

Fields

Name	Description
 <a href="#">CodePage</a>	The code page value of the current instance.
 <a href="#">Name</a>	The name of the current instance.

Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# SnaNlsCodePage Constructor

Creates a new instance of the [SnaNlsCodePage](#) class.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    name As String, _
    codePage As Integer _
)
```

C#

```
public SnaNlsCodePage (
    string name,
    int codePage
)
```

C++

```
public:
SnaNlsCodePage (
    String^ name,
    int codePage
)
```

J#

```
public SnaNlsCodePage (
    String name,
    int codePage
)
```

JScript

```
public function SnaNlsCodePage (
    name : String,
    codePage : int
)
```

## Parameters

name

Name of the new code page.

codePage

Specific code page to use.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SnaNlsCodePage.CompareTo Method

Compares the current instance with the other object of the same type and returns an integer.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Function CompareTo ( _
    other As SnaNlsCodePage _
) As Integer
```

C#

```
public int CompareTo (
    SnaNlsCodePage other
)
```

C++

```
public:
virtual int CompareTo (
    SnaNlsCodePage other
) sealed
```

J#

```
public final int CompareTo (
    SnaNlsCodePage other
)
```

JScript

```
public final function CompareTo (
    other : SnaNlsCodePage
) : int
```

## Parameters

other

The other object to compare.

## Return Value

The current instance with the other object of the same type.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# SnaOleDbManager.IsUDL Method

Determines if the specified file is a UDL file.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function IsUDL ( _
    path As String _
) As Boolean
```

C#

```
public override bool IsUDL (
    string path
)
```

C++

```
public:
virtual bool IsUDL (
    String^ path
) override
```

J#

```
public boolean IsUDL (
    String path
)
```

JScript

```
public override function IsUDL (
    path : String
) : boolean
```

## Parameters

path

Path to the file to check.

## Return Value

**true** if the file is a UDL file; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# WizardProductImage Members

Represents the wizard product image.

The following tables list the members exposed by the [WizardProductImage](#) type.

## Public Constructors

Name	Description
<a href="#">WizardProductImage</a>	Creates a new instance of the <a href="#">WizardProductImage</a> class.

## Top

## Protected Fields

	Name	Description
 	<a href="#">ScrollStateAutoScrolling</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateFullDrag</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateHScrollVisible</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateUserHasScrolled</a>	(inherited from <a href="#">ScrollableControl</a> )
 	<a href="#">ScrollStateVScrollVisible</a>	(inherited from <a href="#">ScrollableControl</a> )

### WizardProductImage.Dispose Method (Boolean)

Disposes resources associated with the current instance.

Syntax

C#

```
protected override void Dispose(  
    bool disposing  
)
```

C++

```
protected:  
virtual void Dispose(  
    bool disposing  
) override
```

F#

```
override Dispose :  
    disposing:bool -> unit
```

VB

```
Protected Overrides Sub Dispose (  
    disposing As Boolean  
)
```

### Parameters

*disposing*

Type: [System.Boolean](#)

**True** if currently disposing; otherwise, **false**.

[Return to top](#)

# WizardProductImage.Dispose Method (Boolean)

Disposes resources associated with the current instance.

**Namespace:** Microsoft.HostIntegration.DataAccessLibrary

**Assembly:** Microsoft.HostIntegration.DataAccessLibrary (in microsoft.hostintegration.dataaccesslibrary.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Sub Dispose ( _
    disposing As Boolean _
)
```

C#

```
protected override void Dispose (
    bool disposing
)
```

C++

```
protected:
virtual void Dispose (
    bool disposing
) override
```

J#

```
protected void Dispose (
    boolean disposing
)
```

JScript

```
protected override function Dispose (
    disposing : boolean
)
```

## Parameters

disposing

**True** if currently disposing; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# Microsoft.HostIntegration.MsDb2Client Namespace

The Microsoft.HostIntegration.MsDb2Client namespace grants access to DB2 databases on remote servers.

## Classes

Class	Description
 <a href="#">MsDb2BulkCopy</a>	Represents the bulk copy of the MsDb2 client.
 <a href="#">MsDb2BulkCopyColumnMapping</a>	Represents the mapping between in a <a href="#">MsDb2BulkCopy</a> instances data source and a column in the instances destination table.
 <a href="#">MsDb2BulkCopyColumnMappingCollection</a>	Represents the collection of <a href="#">MsDb2BulkCopyColumnMapping</a> objects that inherits from collection base.
 <a href="#">MsDb2Command</a>	Represents a SQL statement or stored procedure to execute against a DB2 database.
 <a href="#">MsDb2CommandBuilder</a>	Automatically generates single-table commands used to reconcile changes made to a DataSet with the associated database.
 <a href="#">MsDb2Connection</a>	Opens, closes, and maintains a connection to a DB2 host.
 <a href="#">MsDb2ConnectionStringBuilder</a>	Provides a simple way to create and manage the contents of connection strings used by the MsDb2Connection class.
 <a href="#">MsDb2DataAdapter</a>	Represents a set of data commands and a database connection used to fill the DataSet and update a DB2 database
 <a href="#">MsDb2DataReader</a>	Describes a server-side forward-only cursor implementation that inherits from the IDataReader and IDataRecord interfaces.
 <a href="#">MsDb2Exception</a>	The exception that is thrown when a DB2 error occurs.
 <a href="#">MsDb2Factory</a>	Represents new instances of MsDb2Client objects, such as MsDb2Connection and MsDb2Command objects.
 <a href="#">MsDb2NetworkProperties</a>	<b>Obsolete.</b> Represents abstract base class for defining network-specific connection properties to a DB2 host.
 <a href="#">MsDb2NetworkPropertiesAPPC</a>	<b>Obsolete.</b> Defines the network-specific connection properties for connection to a DB2 host using the APPC protocol.
 <a href="#">MsDb2NetworkPropertiesTCP</a>	<b>Obsolete.</b> Defines the network-specific connection properties for connection to a DB2 host using the TCP protocol.
 <a href="#">MsDb2Parameter</a>	Represents a placeholder for a parameter in an SQL command.
 <a href="#">MsDb2ParameterCollection</a>	Represents a strongly typed collection of MsDb2Parameters.
 <a href="#">MsDb2Permission</a>	Enables the Managed Provider for DB2 to help ensure that a user has a security level adequate for accessing data.
 <a href="#">MsDb2PermissionAttribute</a>	Associates a security action with a security attribute for the MsDb2 data access provider.
 <a href="#">MsDb2RowsCopiedEventArgs</a>	Represents the set of arguments passed to the <a href="#">MsDb2RowsCopiedEventHandler</a> .
 <a href="#">MsDb2RowUpdatedEventArgs</a>	Provides data for the RowUpdated event.
 <a href="#">MsDb2RowUpdatingEventArgs</a>	Provides data for the RowUpdating event.

 <a href="#">MsDb2Transaction</a>	Describes a transaction to be performed at a data source.
--	---

#### Delegates

<b>Delegate</b>	<b>Description</b>
 <a href="#">MsDb2RowsCopiedEventHandler</a>	Represents the method that handles the <a href="#">RowsCopied</a> event of a <a href="#">MsDb2BulkCopy</a> .
 <a href="#">MsDb2RowUpdatedEventHandler</a>	Represents the method that will handle the <a href="#">MsDb2RowUpdatedEvent</a> of the <a href="#">MsDb2DataAdapter</a> .
 <a href="#">MsDb2RowUpdatingEventHandler</a>	Represents the method that handles the <a href="#">RowUpdating</a> event of the <a href="#">MsDb2DataAdapter</a> .
 <a href="#">TimeoutCallback</a>	Represents the method that handles call from a Timeout.

#### Enumerations

<b>Enumeration</b>	<b>Description</b>
 <a href="#">AppcSecurity</a>	Describes the APPC security settings.
 <a href="#">DBMSPlatform</a>	Specifies the target DB2 platform to optimize the Managed Provider when executing operations, such as data conversions.
 <a href="#">MsDb2Type</a>	Specifies the data type of a field, a property, or an <a href="#">MsDb2Parameter</a> .
 <a href="#">UnitsOfWorkType</a>	Specifies the type of transaction supported by the provider.

Constructors

	Name	Description
	<a href="#">MsDb2Command()</a>	Initializes a new instance of the <b>MsDb2Command</b> class.
	<a href="#">MsDb2Command(String)</a>	Initializes a new instance of the <b>MsDb2Command</b> class.
	<a href="#">MsDb2Command(String, MsDb2Connection)</a>	Initializes a new instance of the <b>MsDb2Command</b> class using the specified command text and connection.
	<a href="#">MsDb2Command(String, MsDb2Connection, MsDb2Transaction)</a>	Initializes a new instance of the <b>MsDb2Command</b> class using the specified command text, connection, and transaction.

Properties

	Name	Description
	<a href="#">CommandText</a>	Gets or sets the text command to run against the data source.(Overrides <a href="#">DbCommand.CommandText</a> .)
	<a href="#">CommandTimeout</a>	Gets or sets the wait time before terminating the attempt to execute a command and generating an error.(Overrides <a href="#">DbCommand.CommandTimeout</a> .)
	<a href="#">CommandType</a>	Indicates or specifies how the CommandText property is interpreted.(Overrides <a href="#">DbCommand.CommandType</a> .)
	<a href="#">Connection</a>	Gets or sets the MsDb2Connection used by this instance of the MsDb2Command.

 <b>Container</b>	(Inherited from <a href="#">Component</a> .)
 <b>Parameters</b>	Gets the MsDb2ParameterCollection.
 <b>Site</b>	(Inherited from <a href="#">Component</a> .)
 <b>Transaction</b>	Gets or sets the transaction within which the MsDb2Command object executes.
 <b>UpdatedRowSource</b>	Gets or sets how command results are applied to the DataRow when used by the Update method of a MsDb2DataAdapter.(Overrides <a href="#">DbCommand.UpdatedRowSource</a> .)

#### Methods

<b>Name</b>	<b>Description</b>
 <a href="#">Cancel()</a>	Attempts to cancels the execution of an MsDb2Command.(Overrides <a href="#">DbCommand.Cancel()</a> .)
 <a href="#">Clone()</a>	Creates a deep clone of the current instance.
 <a href="#">CreateObjRef(Type)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">CreateParameter()</a>	Creates a new instance of an IDbDataParameter object.
 <a href="#">Dispose()</a>	(Inherited from <a href="#">Component</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">ExecuteNonQuery()</a>	Executes an SQL statement against the MsDb2Connection object, and returns the number of rows affected.(Overrides <a href="#">DbCommand.ExecuteNonQuery()</a> .)
 <a href="#">ExecuteNonQueryAsync()</a>	(Inherited from <a href="#">DbCommand</a> .)
 <a href="#">ExecuteNonQueryAsync(CancellationTok</a>	(Inherited from <a href="#">DbCommand</a> .)
 <a href="#">ExecuteReader()</a>	Executes the CommandText against the Connection and builds an MsDb2DataReader.
 <a href="#">ExecuteReader(CommandBehavior)</a>	Executes the CommandText against the MsDb2Connection, and builds an MsDb2DataReader using one of the CommandBehavior values.
 <a href="#">ExecuteReaderAsync()</a>	(Inherited from <a href="#">DbCommand</a> .)
 <a href="#">ExecuteReaderAsync(CancellationTok</a>	(Inherited from <a href="#">DbCommand</a> .)
 <a href="#">ExecuteReaderAsync(CommandBehavior)</a>	(Inherited from <a href="#">DbCommand</a> .)
 <a href="#">ExecuteReaderAsync(CommandBehavior, CancellationTok</a>	(Inherited from <a href="#">DbCommand</a> .)
 <a href="#">ExecuteScalar()</a>	Executes the query, and returns the first column of the first row in the resultset returned by the query. Extra columns or rows are ignored(Overrides <a href="#">DbCommand.ExecuteScalar()</a> .)
 <a href="#">ExecuteScalarAsync()</a>	(Inherited from <a href="#">DbCommand</a> .)
 <a href="#">ExecuteScalarAsync(CancellationTok</a>	(Inherited from <a href="#">DbCommand</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">InitializeLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)

 <a href="#">Prepare()</a>	Creates a prepared (or compiled) version of the command on the data source.(Overrides <a href="#">DbCommand.Prepare()</a> .)
 <a href="#">ToString()</a>	(Inherited from <a href="#">Component</a> .)

#### Events

Name	Description
 <a href="#">Disposed</a>	(Inherited from <a href="#">Component</a> .)

#### Explicit Interface Implementations

	Name	Description
	<a href="#">IDbCommand.CreateParameter()</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">IDbCommand.ExecuteReader()</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">IDbCommand.ExecuteReader(CommandBehavior)</a>	(Inherited from <a href="#">DbCommand</a> .)

#### Remarks

MsDB2Command is an implementation of the IDbCommand interface. An MsDb2Command represents a single query to a DB2 host system. These queries can be any DML, DDL, or stored procedure statement formatted for the specific DB2 platform. The MsDb2Command class does not perform any pre-parsing to verify the SQL statement. As MsDb2Command is a single SQL statement per command, there is no batch mode.

An MsDB2Command instance belongs to a single transaction running on a single connection.

An Ms2Db2Command can become "dirty" if it has been prepared, and there is a change to a piece of the command structure. If a change is made, the command must be re-prepared to account for the changes. MsDb2Command has a private dirty flag that will determine when to re-prepare a command. Events that make a command dirty include:

- All changes to parameters, excluding the value (such as precision, scale, type, and so on)
- Changes to the number of parameters
- Changes to the CommandText
- Changes to the CommandType

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# MsDb2Command Members

Represents a SQL statement or stored procedure to execute against a DB2 database.

The following tables list the members exposed by the [MsDb2Command](#) type.

## Public Constructors

Name	Description
<a href="#">MsDb2Command</a>	Overloaded. Initializes a new instance of the <a href="#">MsDb2Command</a> class.

## Top

Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">CommandText</a>	Overridden. Gets or sets the text command to run against the data source.
 <a href="#">CommandTimeout</a>	Overridden. Gets or sets the wait time before terminating the attempt to execute a command and generating an error.
 <a href="#">CommandType</a>	Overridden. Indicates or specifies how the CommandText property is interpreted.
 <a href="#">Connection</a>	Gets or sets the MsDb2Connection used by this instance of the MsDb2Command.
 <a href="#">Container</a>	(inherited from <a href="#">Component</a> )
 <a href="#">DesignTimeVisible</a>	Overridden. Gets or sets a value indicating whether the command object should be visible in a Windows Forms Designer control.
 <a href="#">Parameters</a>	Gets the MsDb2ParameterCollection.
 <a href="#">Site</a>	(inherited from <a href="#">Component</a> )
 <a href="#">Transaction</a>	Gets or sets the transaction within which the MsDb2Command object executes.
 <a href="#">UpdatedRowSource</a>	Overridden. Gets or sets how command results are applied to the DataRow when used by the Update method of a MsDb2DataAdapter.

[Return to top](#)

## MsDb2Command Constructor ()

Initializes a new instance of the [MsDb2Command](#) class.

Syntax

C#

```
public MsDb2Command()
```

C++

```
public:  
MsDb2Command()
```

F#

```
new : unit -> MsDb2Command
```

VB

```
Public Sub New
```

Remarks

The default constructor initializes any fields to their default values. The following table describes the initial values for an instance of MsDb2Command.

Properties	Initial Value
CommandText	Empty string ("")
CommandTimeout	30
CommandType	Text
Connection	null

[Return to top](#)

## MsDb2Command Constructor (String)

Initializes a new instance of the [MsDb2Command](#) class.

Syntax

C#

```
public MsDb2Command(  
    string commandText  
)
```

C++

```
public:  
MsDb2Command(  
    String^ commandText  
)
```

F#

```
new :  
    commandText:string -> MsDb2Command
```

VB

```
Public Sub New (  
    commandText As String  
)
```

#### Parameters

*commandText*

Type: [System.String](#)

The text of the query.

Remarks

The following table describes the initial values for an instance of [MsDb2Command](#).

Properties	Initial Value
CommandText	cmdText
CommandTimeout	30
CommandType	Text
Connection	null

[Return to top](#)

#### **MsDb2Command Constructor (String, MsDb2Connection)**

Initializes a new instance of the [MsDb2Command](#) class using the specified command text and connection.

Syntax

C#

```
public MsDb2Command(  
    string commandText,  
    MsDb2Connection connection  
)
```

C++

```
public:  
MsDb2Command(  
    String^ commandText,  
    MsDb2Connection^ connection  
)
```

F#

```
new :  
    commandText:string *  
    connection:MsDb2Connection -> MsDb2Command
```

VB

```
Public Sub New (  
    commandText As String,  
    connection As MsDb2Connection  
)
```

#### Parameters

*commandText*

Type: [System.String](#)

The text of the query.

*connection*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Connection](#)

The MsDb2Connection that represents a connection to the database source.

#### Remarks

The following table describes the initial values for an instance of MsDb2Command.

Properties	Initial Value
CommandText	cmdText
CommandTimeout	30
CommandType	Text
Connection	The value contained in the connection parameter.

[Return to top](#)

#### MsDb2Command Constructor (String, MsDb2Connection, MsDb2Transaction)

Initializes a new instance of the [MsDb2Command](#) class using the specified command text, connection, and transaction.

#### Syntax

C#

```
public MsDb2Command(  
    string commandText,  
    MsDb2Connection connection,  
    MsDb2Transaction tx  
)
```

C++

```
public:  
    MsDb2Command(  
        String^ commandText,  
        MsDb2Connection^ connection,  
        MsDb2Transaction^ tx  
    )
```

F#

```
new :  
    commandText:string *  
    connection:MsDb2Connection *  
    tx:MsDb2Transaction -> MsDb2Command
```

VB

```
Public Sub New (  
    commandText As String,  
    connection As MsDb2Connection,  
    tx As MsDb2Transaction  
)
```

#### Parameters

*commandText*

Type: [System.String](#)

The text of the query.

*connection*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Connection](#)

An MsDb2Connection representing a connection to the data source.

*tx*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Transaction](#)

The transaction in which the command executes.

#### Remarks

The following table describes the initial values for an instance of MsDb2Command.

Properties	Initial Value
CommandText	cmdText
CommandTimeout	30
CommandType	Text
Connection	The value contained in the connection parameter.

[Return to top](#)

# MsDb2Command Constructor ()

Initializes a new instance of the [MsDb2Command](#) class.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public MsDb2Command ()
```

C++

```
public:
    MsDb2Command ()
```

J#

```
public MsDb2Command ()
```

JScript

```
public function MsDb2Command ()
```

Remarks

The default constructor initializes any fields to their default values. The following table describes the initial values for an instance of MsDb2Command.

Properties	Initial Value
CommandText	Empty string ("")
CommandTimeout	30
CommandType	Text
Connection	null

# MsDb2Command.Cancel Method

Attempts to cancel the execution of an MsDb2Command.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Sub Cancel
```

C#

```
public override void Cancel ()
```

C++

```
public:  
virtual void Cancel () override
```

J#

```
public void Cancel ()
```

JScript

```
public override function Cancel ()
```

Remarks

If there is nothing to cancel, nothing happens. However, if there is a command in process, and the attempt to cancel fails, no exception is generated.

**Implements**

IDbCommand.Cancel

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2Command.Clone Method

Creates a deep clone of the current instance.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Function Clone As Object
```

C#

```
public Object Clone ()
```

C++

```
public:  
virtual Object^ Clone () sealed
```

J#

```
public final Object Clone ()
```

JScript

```
public final function Clone () : Object
```

## Return Value

A deep clone of the current instance.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# MsDb2Command.CreateParameter Method

Creates a new instance of an IDbDataParameter object.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Function CreateParameter As MsDb2Parameter
```

C#

```
public MsDb2Parameter CreateParameter ()
```

C++

```
public:  
MsDb2Parameter^ CreateParameter ()
```

J#

```
public MsDb2Parameter CreateParameter ()
```

JScript

```
public function CreateParameter () : MsDb2Parameter
```

## Return Value

An IDbDataParameter object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Reference

[MsDb2Command Class](#)

[MsDb2Command Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2Command.ExecuteNonQuery Method

Executes an SQL statement against the MsDb2Connection object, and returns the number of rows affected.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function ExecuteNonQuery As Integer
```

C#

```
public override int ExecuteNonQuery ()
```

C++

```
public:
virtual int ExecuteNonQuery () override
```

J#

```
public int ExecuteNonQuery ()
```

JScript

```
public override function ExecuteNonQuery () : int
```

## Return Value

The number of rows affected.

Remarks

You can use the ExecuteNonQuery to perform catalog operations (for example, querying the structure of a database or creating database objects such as tables), or to change the data in a database without using a DataSet by executing UPDATE, INSERT, or DELETE statements.

Although the ExecuteNonQuery does not return any rows, any output parameters or return values mapped to parameters are populated with data.

For UPDATE, INSERT, and DELETE statements, the return value is the number of rows affected by the command. For all other types of statements, the return value is -1.

## Exceptions

Exception Type	Condition
InvalidOperationException	The connection does not exist, or the connection is not open.

## Implements

IDbCommand.ExecuteNonQuery

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[Return to top](#)

## MsDb2Command.ExecuteReader Method ()

Executes the CommandText against the Connection and builds an MsDb2DataReader.

Syntax

C#

```
public MsDb2DataReader ExecuteReader()
```

C++

```
public:  
MsDb2DataReader^ ExecuteReader()
```

F#

```
member ExecuteReader : unit -> MsDb2DataReader
```

VB

```
Public Function ExecuteReader As MsDb2DataReader
```

## Return Value

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2DataReader](#)

An MsDb2DataReader object.

[Return to top](#)

## MsDb2Command.ExecuteReader Method (CommandBehavior)

Executes the CommandText against the MsDb2Connection, and builds an MsDb2DataReader using one of the CommandBehavior values.

Syntax

C#

```
public MsDb2DataReader ExecuteReader(  
    CommandBehavior behavior  
)
```

C++

```
public:  
MsDb2DataReader^ ExecuteReader(  
    CommandBehavior behavior  
)
```

F#

```
member ExecuteReader :  
    behavior:CommandBehavior -> MsDb2DataReader
```

VB

```
Public Function ExecuteReader (  
    behavior As CommandBehavior  
) As MsDb2DataReader
```

#### Parameters

*behavior*

Type: [System.Data.CommandBehavior](#)

The command behavior of the execution.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2DataReader](#)

Remarks

The caller must call the Open method of the Connection property.

When the CommandType property is set to StoredProcedure, the CommandText property should be set to the name of the stored procedure. The command executes this stored procedure when you call ExecuteReader.

The MsDb2DataReader supports a special mode that enables large binary values to be read efficiently. For more information, see the SequentialAccess setting for CommandBehavior.

While the MsDb2DataReader is in use, the associated MsDb2Connection is busy serving the MsDb2DataReader. While in this state, no other operations can be performed on the MsDb2Connection other than closing it. This is the case until the Close method of the MsDb2DataReader is called. If the MsDb2DataReader is created with CommandBehavior set to CloseConnection, closing the MsDb2DataReader closes the connection automatically.

[Return to top](#)

# MsDb2Command.ExecuteReader Method ()

Executes the CommandText against the Connection and builds an MsDb2DataReader.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Function ExecuteReader As MsDb2DataReader
```

C#

```
public MsDb2DataReader ExecuteReader ()
```

C++

```
public:  
MsDb2DataReader^ ExecuteReader ()
```

J#

```
public MsDb2DataReader ExecuteReader ()
```

JScript

```
public function ExecuteReader () : MsDb2DataReader
```

## Return Value

An MsDb2DataReader object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Function ExecuteReader ( _
    behavior As CommandBehavior _
) As MsDb2DataReader
```

C#

```
public MsDb2DataReader ExecuteReader (
    CommandBehavior behavior
)
```

C++

```
public:
    MsDb2DataReader^ ExecuteReader (
        CommandBehavior behavior
    )
```

J#

```
public MsDb2DataReader ExecuteReader (
    CommandBehavior behavior
)
```

JScript

```
public function ExecuteReader (
    behavior : CommandBehavior
) : MsDb2DataReader
```

## Parameters

behavior

The command behavior of the execution.

## Remarks

The caller must call the Open method of the Connection property.

When the CommandType property is set to StoredProcedure, the CommandText property should be set to the name of the stored procedure. The command executes this stored procedure when you call ExecuteReader.

The MsDb2DataReader supports a special mode that enables large binary values to be read efficiently. For more information, see the SequentialAccess setting for CommandBehavior.

While the MsDb2DataReader is in use, the associated MsDb2Connection is busy serving the MsDb2DataReader. While in this state, no other operations can be performed on the MsDb2Connection other than closing it. This is the case until the Close method of the MsDb2DataReader is called. If the MsDb2DataReader is created with CommandBehavior set to CloseConnection, closing the MsDb2DataReader closes the connection automatically.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

**Reference**

[MsDb2Command Class](#)

[MsDb2Command Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2Command.ExecuteScalar Method

Executes the query, and returns the first column of the first row in the resultset returned by the query. Extra columns or rows are ignored

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function ExecuteScalar As Object
```

C#

```
public override Object ExecuteScalar ()
```

C++

```
public:
virtual Object^ ExecuteScalar () override
```

J#

```
public Object ExecuteScalar ()
```

JScript

```
public override function ExecuteScalar () : Object
```

## Return Value

The first column of the first row in the resultset.

Remarks

Use the ExecuteScalar method to retrieve a single value (for example, an aggregate value) from a database. This requires less code than using the ExecuteReader method, and then performing the operations necessary to generate the single value using the data returned by an MsDb2DataReader.

## Implements

IDbCommand.ExecuteScalar

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2Command.Prepare Method

Creates a prepared (or compiled) version of the command on the data source.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Sub Prepare
```

C#

```
public override void Prepare ()
```

C++

```
public:
virtual void Prepare () override
```

J#

```
public void Prepare ()
```

JScript

```
public override function Prepare ()
```

Remarks

If the CommandType property is set to TableDirect, Prepare does nothing. If CommandType is set to StoredProcedure, the call to Prepare should succeed, although it may result in a no-op.

## Exceptions

Exception Type	Condition
InvalidOperationException	The connection does not exist, or the connection is not open.

## Implements

IDbCommand.Prepare

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

## Reference

[MsDb2Command Class](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2Command.CommandText Property

Gets or sets the text command to run against the data source.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
<RefreshPropertiesAttribute(RefreshProperties.All)> _
<DefaultValueAttribute("")> _
Public Overrides Property CommandText As String
```

C#

```
[RefreshPropertiesAttribute(RefreshProperties.All)]
[DefaultValueAttribute("")]
public override string CommandText { get; set; }
```

C++

```
[RefreshPropertiesAttribute(RefreshProperties::All)]
[DefaultValueAttribute(L"")]
public:
virtual property String^ CommandText {
    String^ get () override;
    void set (String^ value) override;
}
```

J#

```
/** @property */
public String get_CommandText ()

/** @property */
public void set_CommandText (String value)
```

JScript

```
public override function get CommandText () : String

public override function set CommandText (value : String)
```

## Property Value

The text command to execute. The default value is an empty string ("").

Remarks

When the CommandType property is set to StoredProcedure, set the CommandText property to the name of the stored procedure. The user may be required to use escape character syntax if the stored procedure name contains any special characters. The command will call this stored procedure when you call one of the Execute methods.

## Implements

IDbCommand.CommandText

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2Command.CommandTimeout Property

Gets or sets the wait time before terminating the attempt to execute a command and generating an error.

**Namespace:** Microsoft.HostIntegration.MsDb2Client  
**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)  
Usage  
Syntax  
VB

```
'Declaration
Public Overrides Property CommandTimeout As Integer
```

C#

```
public override int CommandTimeout { get; set; }
```

C++

```
public:
virtual property int CommandTimeout {
    int get () override;
    void set (int value) override;
}
```

J#

```
/** @property */
public int get_CommandTimeout ()

/** @property */
public void set_CommandTimeout (int value)
```

JScript

```
public override function get CommandTimeout () : int

public override function set CommandTimeout (value : int)
```

## Property Value

The time (in seconds) to wait for the command to execute. The default value is 30 seconds.

Remarks

## Implements

IDbCommand.CommandTimeout

## Exceptions

Exception Type	Condition
ArgumentException	The property value assigned is less than 0.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2Command.CommandType Property

Indicates or specifies how the CommandText property is interpreted.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
<RefreshPropertiesAttribute(RefreshProperties.All)> _
<DefaultValueAttribute(CommandType.Text)> _
Public Overrides Property CommandType As CommandType
```

C#

```
[RefreshPropertiesAttribute(RefreshProperties.All)]
[DefaultValueAttribute(CommandType.Text)]
public override CommandType CommandType { get; set; }
```

C++

```
[RefreshPropertiesAttribute(RefreshProperties::All)]
[DefaultValueAttribute(CommandType::Text)]
public:
virtual property CommandType CommandType {
    CommandType get () override;
    void set (CommandType value) override;
}
```

J#

```
/** @property */
public CommandType get_CommandType ()

/** @property */
public void set_CommandType (CommandType value)
```

JScript

```
public override function get CommandType () : CommandType

public override function set CommandType (value : CommandType)
```

## Property Value

One of the CommandType values. The default is Text.

Remarks

When you set the CommandType property to StoredProcedure, you should set the CommandText property to the name of the stored procedure. The command executes this stored procedure when you call one of the Execute methods.

## Implements

IDbCommand.CommandType

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

### MsDb2CommandBuilder Constructor ()

Initializes a new [MsDb2CommandBuilder](#) class.

Syntax

C#

```
public MsDb2CommandBuilder()
```

C++

```
public:  
MsDb2CommandBuilder()
```

F#

```
new : unit -> MsDb2CommandBuilder
```

VB

```
Public Sub New
```

[Return to top](#)

### MsDb2CommandBuilder Constructor (Boolean)

Initializes a new [MsDb2CommandBuilder](#) class using the specified Boolean value.

Syntax

C#

```
public MsDb2CommandBuilder(  
    bool disableOptimisticConcurrency  
)
```

C++

```
public:  
MsDb2CommandBuilder(  
    bool disableOptimisticConcurrency  
)
```

F#

```
new :  
    disableOptimisticConcurrency:bool -> MsDb2CommandBuilder
```

VB

```
Public Sub New (  
    disableOptimisticConcurrency As Boolean  
)
```

#### Parameters

*disableOptimisticConcurrency*

Type: [System.Boolean](#)

**true** to disable optimistic concurrency; otherwise, **false**.

[Return to top](#)

#### MsDb2CommandBuilder Constructor (MsDb2DataAdapter)

Initializes a new [MsDb2CommandBuilder](#) class using the specified adapter.

Syntax

C#

```
public MsDb2CommandBuilder(  
    MsDb2DataAdapter adapter  
)
```

C++

```
public:  
    MsDb2CommandBuilder(  
        MsDb2DataAdapter^ adapter  
    )
```

F#

```
new :  
    adapter:MsDb2DataAdapter -> MsDb2CommandBuilder
```

VB

```
Public Sub New (  
    adapter As MsDb2DataAdapter  
)
```

#### Parameters

*adapter*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2DataAdapter](#)

The MsDb2 data adapter to create a command for.

[Return to top](#)

#### MsDb2CommandBuilder Constructor (MsDb2DataAdapter, Boolean)

Initializes a new [MsDb2CommandBuilder](#) class using the specified data adapter and Boolean value.

Syntax

C#

```
public MsDb2CommandBuilder(  
    MsDb2DataAdapter adapter,  
    bool disableOptimisticConcurrency  
)
```

C++

```
public:
    MsDb2CommandBuilder(
        MsDb2DataAdapter^ adapter,
        bool disableOptimisticConcurrency
    )
```

F#

```
new :
    adapter:MsDb2DataAdapter *
    disableOptimisticConcurrency:bool -> MsDb2CommandBuilder
```

VB

```
Public Sub New (
    adapter As MsDb2DataAdapter,
    disableOptimisticConcurrency As Boolean
)
```

#### Parameters

*adapter*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2DataAdapter](#)

The MsDb2 data adapter to create a command for.

*disableOptimisticConcurrency*

Type: [System.Boolean](#)

**true** to disable optimistic concurrency; otherwise, **false**.

[Return to top](#)

# MsDb2CommandBuilder Constructor ()

Initializes a new [MsDb2CommandBuilder](#) class.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public MsDb2CommandBuilder ()
```

C++

```
public:  
MsDb2CommandBuilder ()
```

J#

```
public MsDb2CommandBuilder ()
```

JScript

```
public function MsDb2CommandBuilder ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

# MsDb2CommandBuilder.DisableOptimisticConcurrency Property

Gets or sets a value that determines whether optimistic concurrency is disabled.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Property DisableOptimisticConcurrency As Boolean
```

C#

```
public bool DisableOptimisticConcurrency { get; set; }
```

C++

```
public:
property bool DisableOptimisticConcurrency {
    bool get ();
    void set (bool value);
}
```

J#

```
/** @property */
public boolean get_DisableOptimisticConcurrency ()

/** @property */
public void set_DisableOptimisticConcurrency (boolean value)
```

JScript

```
public function get DisableOptimisticConcurrency () : boolean

public function set DisableOptimisticConcurrency (value : boolean)
```

## Property Value

**true** if optimistic concurrency disabled; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2CommandBuilder.QuotePrefix Property

Gets or sets the beginning character or characters to use when specifying database objects (for example, tables or columns) whose names contain characters such as spaces or reserved tokens.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property QuotePrefix As String
```

C#

```
public override string QuotePrefix { get; set; }
```

C++

```
public:
virtual property String^ QuotePrefix {
    String^ get () override;
    void set (String^ value) override;
}
```

J#

```
/** @property */
public String get_QuotePrefix ()

/** @property */
public void set_QuotePrefix (String value)
```

JScript

```
public override function get QuotePrefix () : String

public override function set QuotePrefix (value : String)
```

## Property Value

The beginning character or characters to use. The default is an empty string.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Reference

[MsDb2CommandBuilder Class](#)

[MsDb2CommandBuilder Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2CommandBuilder.QuoteSuffix Property

Gets or sets the ending character or characters to use when specifying database objects (for example, tables or columns) whose names contain characters such as spaces or reserved tokens.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property QuoteSuffix As String
```

C#

```
public override string QuoteSuffix { get; set; }
```

C++

```
public:
virtual property String^ QuoteSuffix {
    String^ get () override;
    void set (String^ value) override;
}
```

J#

```
/** @property */
public String get_QuoteSuffix ()

/** @property */
public void set_QuoteSuffix (String value)
```

JScript

```
public override function get QuoteSuffix () : String

public override function set QuoteSuffix (value : String)
```

## Property Value

The ending character or characters to use. The default is an empty string.

Remarks

Although you cannot change the QuotePrefix or QuoteSuffix properties after an insert, update, or delete command has been generated, you can change their settings after calling the Update method.

```

Constructors

	Name	Description
	<a href="#">MsDb2Connection()</a>	Initializes a new instance of the <b>MsDb2Connection</b> class.
	<a href="#">MsDb2Connection(MsDb2Connection)</a>	Initializes a new instance of the <b>MsDb2Connection</b> class using the specified connection.
	<a href="#">MsDb2Connection(String)</a>	Initializes a new instance of the <b>MsDb2Connection</b> class using the specified connection string.

Properties

	Name	Description
	<a href="#">AffiliateApplication</a>	<b>Obsolete.</b> Gets or sets the name of the affiliate application attempting to connect to the DB2 database.
	<a href="#">ClientAccounting</a>	<b>Obsolete.</b> Gets or sets the name of client accounting.
	<a href="#">ClientApplicationName</a>	<b>Obsolete.</b> Gets or sets the name of the client application.
	<a href="#">ClientUserID</a>	<b>Obsolete.</b> Gets or sets the client user ID.
	<a href="#">ClientWorkstationName</a>	<b>Obsolete.</b> Gets or sets the name of the client's workstation.
	<a href="#">ConnectionPooling</a>	<b>Obsolete.</b> Gets or sets the value that determines if connection pooling is active.

 <a href="#">ConnectionString</a>	Gets or sets the connection string to connect to the data source.(Overrides <a href="#">DbConnection.ConnectionString</a> .)
 <a href="#">ConnectionTimeout</a>	(Inherited from <a href="#">DbConnection</a> .)
 <a href="#">Container</a>	(Inherited from <a href="#">Component</a> .)
 <a href="#">Database</a>	Gets or sets the name of the database to which MsDb2Connection connects.(Overrides <a href="#">DbConnection.Database</a> .)
 <a href="#">DatabaseName</a>	Gets or sets the name of the database.
 <a href="#">DataSource</a>	Gets the data source.(Overrides <a href="#">DbConnection.DataSource</a> .)
 <a href="#">DBMSPlatform</a>	<b>Obsolete.</b> Gets or sets the target DB2 platform for which the Managed Provider is optimized.
 <a href="#">DefaultQualifier</a>	<b>Obsolete.</b> Gets or sets the default qualifier.
 <a href="#">DefaultSchema</a>	<b>Obsolete.</b> Gets or sets the default database schema to be used.
 <a href="#">DeferPrepare</a>	<b>Obsolete.</b> Gets or sets a value that determines whether to defer preparation.
 <a href="#">HostCCSID</a>	<b>Obsolete.</b> Gets or sets the character code set identifier (CCSID) that must match the data in the file as represented on the remote host computer.
 <a href="#">InitialCatalog</a>	Gets or sets the initial catalog.
 <a href="#">IntegratedSecurity</a>	<b>Obsolete.</b> Gets or sets the type of integrated security.
 <a href="#">MaxPoolSize</a>	<b>Obsolete.</b> Gets or sets the maximum number of connection in a connection pool.
 <a href="#">NetworkProperties</a>	<b>Obsolete.</b> Gets or sets the network properties.
 <a href="#">NewPassword</a>	<b>Obsolete.</b> Gets or sets the new password.
 <a href="#">PackageCollection</a>	<b>Obsolete.</b> Gets or sets the name of the DRDA target collection (AS/400 library) where the Managed Provider should store and bind DB2 packages.
 <a href="#">Password</a>	<b>Obsolete.</b> Gets or sets the password used to connect to the database.
 <a href="#">PCCodepage</a>	<b>Obsolete.</b> Gets or sets the code page to be used on the local computer.
 <a href="#">ServerClass</a>	Gets the server class.
 <a href="#">ServerVersion</a>	Gets the server version.(Overrides <a href="#">DbConnection.ServerVersion</a> .)
 <a href="#">ShadowCatalog</a>	<b>Obsolete.</b>
 <a href="#">Site</a>	(Inherited from <a href="#">Component</a> .)
 <a href="#">State</a>	Gets the status of the MsDb2Connection.(Overrides <a href="#">DbConnection.State</a> .)
 <a href="#">UnitsOfWork</a>	<b>Obsolete.</b> Gets or sets the type of transaction supported by the Managed Provider.
 <a href="#">UseEarlyMetaData</a>	<b>Obsolete.</b> Gets or sets a value that determines if you use the early metadata.
 <a href="#">UserName</a>	<b>Obsolete.</b> Gets or sets the name of the user connecting to the database.

#### Methods

Name	Description
 <a href="#">BeginTransaction()</a>	Begins a transaction context using the default isolation level.
 <a href="#">BeginTransaction(IsolationLevel)</a>	Begins a transaction context using the specified isolation level.

 <a href="#">ChangeDatabase(String)</a>	Enables users to change the database that the connection is accessing using the specified database name.(Overrides <a href="#">DbConnection.ChangeDatabase(String)</a> .)
 <a href="#">ClearSchemaCache()</a>	Clears the schema cache.
 <a href="#">Close()</a>	Closes the connection with the remote host.(Overrides <a href="#">DbConnection.Close()</a> .)
 <a href="#">CreateCommand()</a>	Creates a new command that can be executed.
 <a href="#">CreateObjRef(Type)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">Dispose()</a>	(Inherited from <a href="#">Component</a> .)
 <a href="#">EnlistDistributedTransaction(ITransaction)</a>	Enlists a distributed transaction.
 <a href="#">EnlistTransaction(Transaction)</a>	Enlists a transaction.(Overrides <a href="#">DbConnection.EnlistTransaction(Transaction)</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">GetSchema()</a>	Retrieves the schema.(Overrides <a href="#">DbConnection.GetSchema()</a> .)
 <a href="#">GetSchema(String)</a>	Retrieves the schema based on the collection name.(Overrides <a href="#">DbConnection.GetSchema(String)</a> .)
 <a href="#">GetSchema(String, String[])</a>	Retrieves the schema for the associated collection name and restriction values.(Overrides <a href="#">DbConnection.GetSchema(String, String[])</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">InitializeLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">Open()</a>	Opens the connection with the remote host.(Overrides <a href="#">DbConnection.Open()</a> .)
 <a href="#">OpenAsync()</a>	(Inherited from <a href="#">DbConnection</a> .)
 <a href="#">OpenAsync(Cancellation_token)</a>	(Inherited from <a href="#">DbConnection</a> .)
 <a href="#">SetCustomPackageData(XmlReader)</a>	Sets custom package data.
 <a href="#">ToString()</a>	(Inherited from <a href="#">Component</a> .)

#### Events

Name	Description
 <a href="#">Disposed</a>	(Inherited from <a href="#">Component</a> .)
 <a href="#">StateChange</a>	(Inherited from <a href="#">DbConnection</a> .)

#### Explicit Interface Implementations

Name	Description
 <a href="#">IDbConnection.BeginTransaction()</a>	(Inherited from <a href="#">DbConnection</a> .)
 <a href="#">IDbConnection.BeginTransaction(IsolationLevel)</a>	(Inherited from <a href="#">DbConnection</a> .)
 <a href="#">IDbConnection.CreateCommand()</a>	(Inherited from <a href="#">DbConnection</a> .)
 <a href="#">ICloneable.Clone()</a>

# MsDb2Connection Members

Opens, closes, and maintains a connection to a DB2 host.

The following tables list the members exposed by the [MsDb2Connection](#) type.

## Public Constructors

Name	Description
<a href="#">MsDb2Connection</a>	Overloaded. Initializes a new instance of the <a href="#">MsDb2Connection</a> class.

## Top

Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">AffiliateApplication</a>	Gets or sets the name of the affiliate application attempting to connect to the DB2 database. <b>Obsolete.</b>
 <a href="#">BinaryAsCharacter</a>	Gets or sets a value that determines if the provider treats binary data type fields (with a character code set identifier (CCSID) of 65535) as character data type fields on a per-data source basis. <b>Obsolete.</b>
 <a href="#">ClientAccounting</a>	Gets or sets the name of client accounting. <b>Obsolete.</b>
 <a href="#">ClientApplicationName</a>	Gets or sets the name of the client application. <b>Obsolete.</b>
 <a href="#">ClientUserID</a>	Gets or sets the client user ID. <b>Obsolete.</b>
 <a href="#">ClientWorkstationName</a>	Gets or sets the name of the client's workstation. <b>Obsolete.</b>
 <a href="#">ConnectionPooling</a>	Gets or sets the value that determines if connection pooling is active. <b>Obsolete.</b>
 <a href="#">ConnectionString</a>	Overridden. Gets or sets the connection string to connect to the data source.
 <a href="#">ConnectionTimeout</a>	Overridden. Gets or sets the connection timeout.
 <a href="#">Container</a>	(inherited from <a href="#">Component</a> )
 <a href="#">Database</a>	Overridden. Gets or sets the name of the database to which MsDb2Connection connects.
 <a href="#">DatabaseName</a>	Gets or sets the name of the database.
 <a href="#">DataSource</a>	Overridden. Gets the data source.
 <a href="#">DBMSPlatform</a>	Gets or sets the target DB2 platform for which the Managed Provider is optimized. <b>Obsolete.</b>
 <a href="#">DefaultQualifier</a>	Gets or sets the default qualifier. <b>Obsolete.</b>
 <a href="#">DefaultSchema</a>	Gets or sets the default database schema to be used. <b>Obsolete.</b>
 <a href="#">DeferPrepare</a>	Gets or sets a value that determines whether to defer preparation. <b>Obsolete.</b>

 <a href="#">NetworkProperties</a>	Gets or sets the network properties. <b>Obsolete.</b>
 <a href="#">NewPassword</a>	Gets or sets the new password. <b>Obsolete.</b>
 <a href="#">PackageCollection</a>	Gets or sets the name of the DRDA target collection (AS/400 library) where the Managed Provider should store and bind DB2 packages. <b>Obsolete.</b>
<a href="#">Password</a>	Gets or sets the password used to connect to the database. <b>Obsolete.</b>
<a href="#">PCCodepage</a>	Gets or sets the code page to be used on the local computer. <b>Obsolete.</b>
<a href="#">ServerClass</a>	Gets the server class.
<a href="#">ServerVersion</a>	Overridden. Gets the server version.
<a href="#">Site</a>	(inherited from <a href="#">Component</a> )
<a href="#">State</a>	Overridden. Gets the status of the MsDb2Connection.
<a href="#">UnitsOfWork</a>	Gets or sets the type of transaction supported by the Managed Provider. <b>Obsolete.</b>
<a href="#">UseEarlyMetaData</a>	Gets or sets a value that determines if you use the early metadata. <b>Obsolete.</b>
<a href="#">UserName</a>	Gets or sets the name of the user connecting to the database. <b>Obsolete.</b>

## MsDb2Connection Constructor ()

Initializes a new instance of the [MsDb2Connection](#) class.

Syntax

C#

```
public MsDb2Connection()
```

C++

```
public:  
MsDb2Connection()
```

F#

```
new : unit -> MsDb2Connection
```

VB

```
Public Sub New
```

Remarks

The default constructor initializes any fields to their default values. The following table describes the default values for a new instance of MsDb2Connection.

Properties	Initial Values
ConnectionString	Empty string ("")
Database	Empty string ("")
DataSource	Empty string ("")

You can change the value for these properties only by using ConnectionString.

[Return to top](#)

## MsDb2Connection Constructor (MsDb2Connection)

Initializes a new instance of the [MsDb2Connection](#) class using the specified connection.

Syntax

C#

```
public MsDb2Connection(  
    MsDb2Connection connection  
)
```

C++

```
public:  
MsDb2Connection(  
    MsDb2Connection^ connection  
)
```

F#

```
new :  
    connection:MsDb2Connection -> MsDb2Connection
```

VB

```
Public Sub New (  
    connection As MsDb2Connection  
)
```

#### Parameters

*connection*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Connection](#)

The connection to use to create the object.

[Return to top](#)

#### MsDb2Connection Constructor (String)

Initializes a new instance of the [MsDb2Connection](#) class using the specified connection string.

Syntax

C#

```
public MsDb2Connection(  
    string connectionString  
)
```

C++

```
public:  
MsDb2Connection(  
    String^ connectionString  
)
```

F#

```
new :  
    connectionString:string -> MsDb2Connection
```

VB

```
Public Sub New (  
    connectionString As String  
)
```

#### Parameters

*connectionString*

Type: [System.String](#)

The connection string that provides the parameters for the connection.

Remarks

The default constructor initializes any fields to their default values. The following table describes the default values for a new instance of [MsDb2Connection](#).

Properties	Initial Values
ConnectionString	connectionString
Database	Empty string ("")
DataSource	Empty string ("")

You can change the value for these properties only by using ConnectionString.

#### Exceptions

Exception Type	Condition
InvalidPropertyValue	The connection string is invalid.

[Return to top](#)

# MsDb2Connection Constructor ()

Initializes a new instance of the [MsDb2Connection](#) class.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public MsDb2Connection ()
```

C++

```
public:
MsDb2Connection ()
```

J#

```
public MsDb2Connection ()
```

JScript

```
public function MsDb2Connection ()
```

Remarks

The default constructor initializes any fields to their default values. The following table describes the default values for a new instance of MsDb2Connection.

Properties	Initial Values
ConnectionString	Empty string ("")
Database	Empty string ("")
DataSource	Empty string ("")

You can change the value for these properties only by using ConnectionString.

**MsDb2Connection.BeginTransaction Method ()**

Begins a transaction context using the default isolation level.

Syntax

C#

```
public MsDb2Transaction BeginTransaction()
```

C++

```
public:  
MsDb2Transaction^ BeginTransaction()
```

F#

```
member BeginTransaction : unit -> MsDb2Transaction
```

VB

```
Public Function BeginTransaction As MsDb2Transaction
```

**Return Value**

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Transaction](#)

The exception value.

Remarks

Exceptions

Exception Type	Condition
OpenConnectionRequired	Connection is not yet open.
ParallelTransactionNotSupport	Attempt to begin two transactions at once.

[Return to top](#)

**MsDb2Connection.BeginTransaction Method (IsolationLevel)**

Begins a transaction context using the specified isolation level.

Syntax

C#

```
public MsDb2Transaction BeginTransaction(  
    IsolationLevel il  
)
```

C++

```
public:
    MsDb2Transaction^ BeginTransaction(
        IsolationLevel il
    )
```

F#

```
member BeginTransaction :
    il:IsolationLevel -> MsDb2Transaction
```

VB

```
Public Function BeginTransaction (
    il As IsolationLevel
) As MsDb2Transaction
```

#### Parameters

*il*

Type: [System.Data.IsolationLevel](#)

The wanted IsolationLevel.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Transaction](#)

IsolationLevel describing the current isolation level.

#### Remarks

The following table describes the possible values for IsolationLevel and the associated DRDA AR values and ConnectionAttribute values.

.NET Isolation level	DRDA AR Value	ConnectionAttribute
Chaos	n/a	n/a
ReadCommitted	IsolationCS	SQL_TXN_READ_COMMITTED
ReadUncommitted	IsolationCHG	SQL_TXN_READ_UNCOMMITTED
RepeatableRead	IsolationALL	SQL_TXN_REPEATABLE_READ
Serializable	IsolationRR	SQL_TXN_SERIALIZABLE
Unspecified	n/a	n/a
n/a	IsolationNC	n/a Must be AS/400 + AutoCommit = TRUE to get this.

#### Exceptions

Exception Type	Condition
OpenConnectionRequired	Connection is not yet open.
InvalidIsolationLevel	The isolation level is invalid. Some levels are invalid because there is no .NET to Distributed Data Management (DDM) conversion, and some because some isolation levels are not permitted on certain platforms. Isolation Level UR is forbidden on OS/390.

[Return to top](#)

# MsDb2Connection.BeginTransaction Method ()

Public Overridable Sub EnlistTransaction ( _
    transaction As Transaction _
)
```

C#

```
public virtual void EnlistTransaction (
    Transaction transaction
)
```

C++

```
public:
virtual void EnlistTransaction (
    Transaction^ transaction
)
```

J#

```
public void EnlistTransaction (
    Transaction transaction
)
```

JScript

```
public function EnlistTransaction (
    transaction : Transaction
)
```

## Parameters

transaction

The transaction to enlist.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

## MsDb2Connection.GetSchema Method ()

Retrieves the schema.

Syntax

C#

```
public override DataTable GetSchema()
```

C++

```
public:  
virtual DataTable^ GetSchema() override
```

F#

```
override GetSchema : unit -> DataTable
```

VB

```
Public Overrides Function GetSchema As DataTable
```

## Return Value

Type: [System.Data.DataTable](#)

The schema.

[Return to top](#)

## MsDb2Connection.GetSchema Method (String)

Retrieves the schema based on the collection name.

Syntax

C#

```
public override DataTable GetSchema(  
    string collectionName  
)
```

C++

```
public:  
virtual DataTable^ GetSchema(  
    String^ collectionName
```

```
) override
```

F#

```
override GetSchema :  
    collectionName:string -> DataTable
```

VB

```
Public Overrides Function GetSchema (  
    collectionName As String  
) As DataTable
```

#### Parameters

*collectionName*

Type: [System.String](#)

The collection name.

#### Return Value

Type: [System.Data.DataTable](#)

The associated schema.

[Return to top](#)

#### MsDb2Connection.GetSchema Method (String, String[])

Retrieves the schema for the associated collection name and restriction values.

Syntax

C#

```
public override DataTable GetSchema(  
    string collectionName,  
    string[] restrictionValues  
)
```

C++

```
public:  
virtual DataTable^ GetSchema(  
    String^ collectionName,  
    array<String^>^ restrictionValues  
) override
```

F#

```
override GetSchema :  
    collectionName:string *  
    restrictionValues:string[] -> DataTable
```

VB

```
Public Overrides Function GetSchema (  
    collectionName As String,  
    restrictionValues As String()  
) As DataTable
```

#### Parameters

*collectionName*

Type: [System.String](#)

The name of the collection.

*restrictionValues*

Type: [System.String](#)

The restriction values on the collection.

#### Return Value

Type: [System.Data.DataTable](#)  
[Return to top](#)

# MsDb2Connection.GetSchema Method ()

Retrieves the schema.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Function GetSchema As DataTable
```

C#

```
public override DataTable GetSchema ()
```

C++

```
public:  
virtual DataTable^ GetSchema () override
```

J#

```
public DataTable GetSchema ()
```

JScript

```
public override function GetSchema () : DataTable
```

## Return Value

The schema.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2Connection Properties

Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">AffiliateApplication</a>	Gets or sets the name of the affiliate application attempting to connect to the DB2 database. <b>Obsolete.</b>
 <a href="#">BinaryAsCharacter</a>	Gets or sets a value that determines if the provider treats binary data type fields (with a character code set identifier (CCSID) of 65535) as character data type fields on a per-data source basis. <b>Obsolete.</b>
 <a href="#">ClientAccounting</a>	Gets or sets the name of client accounting. <b>Obsolete.</b>
 <a href="#">ClientApplicationName</a>	Gets or sets the name of the client application. <b>Obsolete.</b>
 <a href="#">ClientUserID</a>	Gets or sets the client user ID. <b>Obsolete.</b>
 <a href="#">ClientWorkstationName</a>	Gets or sets the name of the client's workstation. <b>Obsolete.</b>
 <a href="#">ConnectionPooling</a>	Gets or sets the value that determines if connection pooling is active. <b>Obsolete.</b>
 <a href="#">ConnectionString</a>	Overridden. Gets or sets the connection string to connect to the data source.
 <a href="#">ConnectionTimeout</a>	Overridden. Gets or sets the connection timeout.
 <a href="#">Container</a>	(inherited from <a href="#">Component</a> )
 <a href="#">Database</a>	Overridden. Gets or sets the name of the database to which MsDb2Connection connects.
 <a href="#">DatabaseName</a>	Gets or sets the name of the database.
 <a href="#">DataSource</a>	Overridden. Gets the data source.
 <a href="#">DBMSPlatform</a>	Gets or sets the target DB2 platform for which the Managed Provider is optimized. <b>Obsolete.</b>
 <a href="#">DefaultQualifier</a>	Gets or sets the default qualifier. <b>Obsolete.</b>
 <a href="#">DefaultSchema</a>	Gets or sets the default database schema to be used. <b>Obsolete.</b>
 <a href="#">DeferPrepare</a>	Gets or sets a value that determines whether to defer preparation. <b>Obsolete.</b>
 <a href="#">HostCCSID</a>	Gets or sets the character code set identifier (CCSID) that must match the data in the file as represented on the remote host computer. <b>Obsolete.</b>
 <a href="#">InitialCatalog</a>	Gets or sets the initial catalog.
 <a href="#">IntegratedSecurity</a>	Gets or sets the type of integrated security. <b>Obsolete.</b>
 <a href="#">MaxPoolSize</a>	Gets or sets the maximum number of connection in a connection pool. <b>Obsolete.</b>
 <a href="#">NetworkProperties</a>	Gets or sets the network properties. <b>Obsolete.</b>
 <a href="#">NewPassword</a>	Gets or sets the new password. <b>Obsolete.</b>
 <a href="#">PackageCollection</a>	Gets or sets the name of the DRDA target collection (AS/400 library) where the Managed Provider should store and bind DB2 packages. <b>Obsolete.</b>
 <a href="#">Password</a>	Gets or sets the password used to connect to the database. <b>Obsolete.</b>
 <a href="#">PCCodepage</a>	Gets or sets the code page to be used on the local computer. <b>Obsolete.</b>
 <a href="#">ServerClass</a>	Gets the server class.
 <a href="#">ServerVersion</a>	Overridden. Gets the server version.
 <a href="#">Site</a>	(inherited from <a href="#">Component</a> )
 <a href="#">State</a>	Overridden. Gets the status of the MsDb2Connection.
 <a href="#">UnitsOfWork</a>	Gets or sets the type of transaction supported by the Managed Provider. <b>Obsolete.</b>
 <a href="#">UseEarlyMetaData</a>	Gets or sets a value that determines if you use the early metadata. <b>Obsolete.</b>
 <a href="#">UserName</a>	Gets or sets the name of the user connecting to the database. <b>Obsolete.</b>

Protected Properties

Name	Description
 <a href="#">CanRaiseEvents</a>	(inherited from <a href="#">Component</a> )

```
[RefreshPropertiesAttribute(RefreshProperties::All)]
[DefaultValueAttribute(L"")]
[RecommendedAsConfigurableAttribute(true)]
public:
virtual property String^ ConnectionString {
    String^ get () override;
    void set (String^ value) override;
}
```

J#

```
/** @property */
public String get_ConnectionString ()

/** @property */
public void set_ConnectionString (String value)
```

JScript

```
public override function get ConnectionString () : String

public override function set ConnectionString (value : String)
```

## Remarks

The format of the connection string follows the attribute=value pair listing similar to Open Database Connectivity (ODBC) and OLE DB connection strings. The connection string is parsed in the managed environment so that the proper fields can be extracted for a uniform call to the distributed relational database architecture (DRDA AR). The default value is an empty string.

## Value

The connection string to connect to the data source.

## Exceptions

Exception type	Condition
InvalidPropertyException	A property name/value pair is invalid.

InvalidConnectionPropertySet	User tried to set the value while the connection was not closed.
------------------------------	--

#### Implements

IDbConnection.ConnectionString

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

#### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

#### Target Platforms

/** @property */
public int get_PCCodepage ()

/** @property */
public void set_PCCodepage (int value)
```

JScript

```
public function get PCCodepage () : int

public function set PCCodepage (value : int)
```

## Property Value

The code page.

Remarks

**Value**

The code page for the local computer.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2Connection.ServerClass Property

Gets the server class.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property ServerClass As String
```

C#

```
public string ServerClass { get; }
```

C++

```
public:
property String^ ServerClass {
    String^ get ();
}
```

J#

```
/** @property */
public String get_ServerClass ()
```

JScript

```
public function get ServerClass () : String
```

## Property Value

The server class.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

}
```

J#

```
/** @property */
public ConnectionState get_State ()
```

JScript

```
public override function get State () : ConnectionState
```

## Property Value

The status of the MsDb2Connection.

Remarks

State is set in the connection string.

## Implements

IDbConnection.State

## Value

The duration in seconds to wait before the connection times out.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Constructors

	Name	Description
	<a href="#">MsDb2ConnectionStringBuilder()</a>	Initializes a new instance of the <b>MsDb2ConnectionStringBuilder</b> class.
	<a href="#">MsDb2ConnectionStringBuilder(String)</a>	Initializes a new instance of the <b>MsDb2ConnectionStringBuilder</b> class using the specified connection string.

Properties

	Name	Description
	<a href="#">AffiliateApplication</a>	Gets or sets the affiliate application.
	<a href="#">AllowNullChars</a>	
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.
	<a href="#">AppcMode</a>	Gets or sets the APPC mode.
	<a href="#">AppcSecurityType</a>	Gets or sets the APPC security type.
	<a href="#">Authentication</a>	Gets or sets the authentication name.
	<a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made.
	<a href="#">BinaryCodePage</a>	Gets or sets the binary code page.
	<a href="#">CertificateCN</a>	Gets or sets the certificate common name.
	<a href="#">ClientAccounting</a>	Gets or sets the client accounting.

 <a href="#">ClientApplicationName</a>	Gets or sets the client application name.
 <a href="#">ClientUserID</a>	Gets or sets the client user ID.
 <a href="#">ClientWorkstationName</a>	Gets or sets the name of the client's workstation.
 <a href="#">ConnectionString</a>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
 <a href="#">ConnectTimeout</a>	Gets or sets the connection timeout.
 <a href="#">Count</a>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
 <a href="#">DatabaseName</a>	Gets or sets the name of the database used.
 <a href="#">DataSource</a>	Gets or sets the connection data source.
 <a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether the date/time value is a character value.
 <a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether DateTime is specified as Date.
 <a href="#">DBMSPlatform</a>	Gets or sets the DBMS platform.
 <a href="#">DecimalAsNumeric</a>	
 <a href="#">DefaultQualifier</a>	Gets or sets the default qualifier.
 <a href="#">DefaultSchema</a>	Gets or sets the default schema of the connection.
 <a href="#">DeferPrepare</a>	Gets or sets a value that indicates whether preparation should be deferred.
 <a href="#">DeriveParameters</a>	Gets or sets a value that indicates whether derive parameters are specified.
 <a href="#">ExtendedProperties</a>	Gets or sets the extended properties.
 <a href="#">FileName</a>	Gets or sets the connection file name.
 <a href="#">HostCCSID</a>	Gets or sets the host CCSID.
 <a href="#">InitialCatalog</a>	Gets or sets the initial catalog.
 <a href="#">IntegratedSecurity</a>	Gets or sets the integrated security.
 <a href="#">IsFixedSize</a>	Gets a value that indicates whether the data is of fixed size.(Overrides <a href="#">DbConnectionStringBuilder.IsFixedSize</a> .)
 <a href="#">IsReadOnly</a>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
 <a href="#">Item(String)</a>	Gets or sets the connection key, based on the specified keyword.(Overrides <a href="#">DbConnectionStringBuilder.Item(String)</a> .)
 <a href="#">Keys</a>	Gets the keys of the current instance.(Overrides <a href="#">DbConnectionStringBuilder.Keys</a> .)
 <a href="#">LoadBalancing</a>	
 <a href="#">LocalLU</a>	Gets or sets the local LU.
 <a href="#">MaxPoolSize</a>	Gets or sets the maximum number of connections allowed in the connection pool for this specific connection string.
 <a href="#">NetworkAddress</a>	Gets or sets the network address.
 <a href="#">NetworkPort</a>	Gets or sets the network port.
 <a href="#">NetworkTransportLibrary</a>	Gets or sets the network transport library.
 <a href="#">PackageCollection</a>	Gets or sets the package collection.

 Password	Gets or sets the password.
 PCCodePage	Gets or sets the PC code page.
 PersistSecurityInfo	Gets or sets a value that indicates whether the application should persist security information.
 Pooling	Gets or sets a value that indicates whether pooling is used.
 PrincipleName	Gets the principle name.
 Provider	Gets or sets the provider.
 RemoteLU	Gets or sets the remote LU.
 RowsetCacheSize	Gets or sets the rowset cache size.
 ShadowCatalog	Gets or sets the shadow catalog.
 UnitsOfWork	Gets or sets the units of work.
 UseEarlyMetadata	Gets or sets a value that indicates whether early metadata is used.
 UserId	Gets or sets the user ID.
 Values	Gets a collection of values.(Overrides <a href="#">DbConnectionStringBuilder.Values.</a> )

#### Methods

Name	Description
 <a href="#">Add(String, Object)</a>	(Inherited from <a href="#">DbConnectionStringBuilder.</a> )
 <a href="#">Clear()</a>	Clears the connection.(Overrides <a href="#">DbConnectionStringBuilder.Clear().</a> )
 <a href="#">ClearPropertyDescriptors()</a>	(Inherited from <a href="#">DbConnectionStringBuilder.</a> )
 <a href="#">ContainsKey(String)</a>	Indicates whether the connection string contains the specified key.(Overrides <a href="#">DbConnectionStringBuilder.ContainsKey(String).</a> )
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object.</a> )
 <a href="#">EquivalentTo(DbConnectionStringBuilder)</a>	(Inherited from <a href="#">DbConnectionStringBuilder.</a> )
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object.</a> )
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object.</a> )
 <a href="#">Remove(String)</a>	Indicates whether the data was removed.(Overrides <a href="#">DbConnectionStringBuilder.Remove(String).</a> )
 <a href="#">ShouldSerialize(String)</a>	(Inherited from <a href="#">DbConnectionStringBuilder.</a> )
 <a href="#">ToString()</a>	(Inherited from <a href="#">DbConnectionStringBuilder.</a> )
 <a href="#">TryGetValue(String, Object)</a>	(Inherited from <a href="#">DbConnectionStringBuilder.</a> )

#### Explicit Interface Implementations

Name	Description
 <a href="#">ICollection.CopyTo(Array, Int32)</a>	(Inherited from <a href="#">DbConnectionStringBuilder.</a> )
 <a href="#">IDictionary.Add(Object, Object)</a>	(Inherited from <a href="#">DbConnectionStringBuilder.</a> )
 <a href="#">IDictionary.Contains(Object)</a>	(Inherited from <a href="#">DbConnectionStringBuilder.</a> )

# MsDb2ConnectionStringBuilder Members

Provides a simple way to create and manage the contents of connection strings used by the `MsDb2Connection` class.

The following tables list the members exposed by the [MsDb2ConnectionStringBuilder](#) type.

## Public Constructors

Name	Description
<a href="#">MsDb2ConnectionStringBuilder</a>	Overloaded. Initializes a new instance of the <a href="#">MsDb2ConnectionStringBuilder</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">AffiliateApplication</a>	Gets or sets the affiliate application.
 <a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.
 <a href="#">AppcMode</a>	Gets or sets the APPC mode.
 <a href="#">AppcSecurityType</a>	Gets or sets the APPC security type.
 <a href="#">Authentication</a>	Gets or sets the authentication name.
 <a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made.
 <a href="#">BinaryAsCharacter</a>	Gets or sets a value that indicates whether binary data should be interpreted as character data.
 <a href="#">BinaryCodePage</a>	Gets or sets the binary code page.
 <a href="#">BrowsableConnectionString</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">CertificateCN</a>	Gets or sets the certificate common name.
 <a href="#">ClientAccounting</a>	Gets or sets the client accounting.
 <a href="#">ClientApplicationName</a>	Gets or sets the client application name.
 <a href="#">ClientUserID</a>	Gets or sets the client user ID.
 <a href="#">ClientWorkstationName</a>	Gets or sets the name of the client's workstation.
 <a href="#">ConnectionString</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">ConnectTimeout</a>	Gets or sets the connection timeout.
 <a href="#">Count</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">DatabaseName</a>	Gets or sets the name of the database used.
 <a href="#">DataSource</a>	Gets or sets the connection data source.
 <a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether the date/time value is a character value.
 <a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether DateTime is specified as Date.
 <a href="#">DBMSPlatform</a>	Gets or sets the DBMS platform.
 <a href="#">DefaultQualifier</a>	Gets or sets the default qualifier.
 <a href="#">DefaultSchema</a>	Gets or sets the default schema of the connection.
 <a href="#">DeferPrepare</a>	Gets or sets a value that indicates whether preparation should be deferred.
 <a href="#">DeriveParameters</a>	Gets or sets a value that indicates whether derive parameters are specified.
 <a href="#">ExtendedProperties</a>	Gets or sets the extended properties.
 <a href="#">FileName</a>	Gets or sets the connection file name.
 <a href="#">HostCCSID</a>	Gets or sets the host CCSID.
 <a href="#">InitialCatalog</a>	Gets or sets the initial catalog.
 <a href="#">IntegratedSecurity</a>	Gets or sets the integrated security.
 <a href="#">IsFixedSize</a>	Overridden. Gets a value that indicates whether the data is of fixed size.
 <a href="#">IsReadOnly</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">Item</a>	Overridden. Gets or sets the connection key, based on the specified keyword.
 <a href="#">Keys</a>	Overridden. Gets the keys of the current instance.
 <a href="#">LocalLU</a>	Gets or sets the local LU.
 <a href="#">MaxPoolSize</a>	Gets or sets the maximum number of connections allowed in the connection pool for this specific connection string.
 <a href="#">NetworkAddress</a>	Gets or sets the network address.
 <a href="#">NetworkPort</a>	Gets or sets the network port.
<a href="#">NetworkTransportLibrary</a>	Gets or sets the network transport library.

 <a href="#">PackageCollection</a>	Gets or sets the package collection.
 <a href="#">Password</a>	Gets or sets the password.
 <a href="#">PCCodePage</a>	Gets or sets the PC code page.
 <a href="#">PersistSecurityInfo</a>	Gets or sets a value that indicates whether the application should persist security information.
 <a href="#">Pooling</a>	Gets or sets a value that indicates whether pooling is used.
 <a href="#">PrincipleName</a>	Gets the principle name.
 <a href="#">Provider</a>	Gets or sets the provider.
 <a href="#">RemoteLU</a>	Gets or sets the remote LU.
 <a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size.
 <a href="#">ShadowCatalog</a>	Gets or sets the shadow catalog.
 <a href="#">UnitsOfWork</a>	Gets or sets the units of work.
 <a href="#">UseEarlyMetadata</a>	Gets or sets a value that indicates whether early metadata is used.
 <a href="#">UserId</a>	Gets or sets the user ID.
 <a href="#">Values</a>	Overridden. Gets a collection of values.

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2ConnectionStringBuilder Constructor

Initializes a new instance of the [MsDb2ConnectionStringBuilder](#) class.

**Namespace:** [Microsoft.HostIntegration.MsDb2Client](#)

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in Microsoft.HostIntegration.MsDb2Client.dll)

## Overload List

Name	Description
 <a href="#">MsDb2ConnectionStringBuilder()</a>	Initializes a new instance of the <a href="#">MsDb2ConnectionStringBuilder</a> class.
 <a href="#">MsDb2ConnectionStringBuilder(String)</a>	Initializes a new instance of the <a href="#">MsDb2ConnectionStringBuilder</a> class using the specified connection string.

## MsDb2ConnectionStringBuilder Constructor ()

Initializes a new instance of the [MsDb2ConnectionStringBuilder](#) class.

Syntax

C#

```
public MsDb2ConnectionStringBuilder()
```

C++

```
public:  
MsDb2ConnectionStringBuilder()
```

F#

```
new : unit -> MsDb2ConnectionStringBuilder
```

VB

```
Public Sub New
```

[Return to top](#)

## MsDb2ConnectionStringBuilder Constructor (String)

Initializes a new instance of the [MsDb2ConnectionStringBuilder](#) class using the specified connection string.

Syntax

C#

```
public MsDb2ConnectionStringBuilder(  
    string connectionString  
)
```

C++

```
public:  
MsDb2ConnectionStringBuilder(  
    String^ connectionString  
)
```

F#

```
new :  
    connectionString:string -> MsDb2ConnectionStringBuilder
```

VB

```
Public Sub New (  
    connectionString As String  
)
```

**Parameters**

*connectionString*

Type: [System.String](#)

The connection string to initialize the class with.

[Return to top](#)

# MsDb2ConnectionStringBuilder Constructor ()

Initializes a new instance of the [MsDb2ConnectionStringBuilder](#) class.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public MsDb2ConnectionStringBuilder ()
```

C++

```
public:  
MsDb2ConnectionStringBuilder ()
```

J#

```
public MsDb2ConnectionStringBuilder ()
```

JScript

```
public function MsDb2ConnectionStringBuilder ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2ConnectionStringBuilder Constructor (String)

Initializes a new instance of the [MsDb2ConnectionStringBuilder](#) class using the specified connection string.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    connectionString As String _
)
```

C#

```
public MsDb2ConnectionStringBuilder (
    string connectionString
)
```

C++

```
public:
    MsDb2ConnectionStringBuilder (
        String^ connectionString
    )
```

J#

```
public MsDb2ConnectionStringBuilder (
    String connectionString
)
```

JScript

```
public function MsDb2ConnectionStringBuilder (
    connectionString : String
)
```

## Parameters

connectionString

The connection string to initialize the class with.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2ConnectionStringBuilder Properties

## Public Properties

Name	Description
 <a href="#">AffiliateApplication</a>	Gets or sets the affiliate application.
 <a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.
 <a href="#">AppcMode</a>	Gets or sets the APPC mode.
 <a href="#">AppcSecurityType</a>	Gets or sets the APPC security type.
 <a href="#">Authentication</a>	Gets or sets the authentication name.
 <a href="#">AutoCommit</a>	Gets or sets a value that indicates whether automatic calls are made.
 <a href="#">BinaryAsCharacter</a>	Gets or sets a value that indicates whether binary data should be interpreted as character data.
 <a href="#">BinaryCodePage</a>	Gets or sets the binary code page.
 <a href="#">BrowsableConnectionString</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">CertificateCN</a>	Gets or sets the certificate common name.
 <a href="#">ClientAccounting</a>	Gets or sets the client accounting.
 <a href="#">ClientApplicationName</a>	Gets or sets the client application name.
 <a href="#">ClientUserID</a>	Gets or sets the client user ID.
 <a href="#">ClientWorkstationName</a>	Gets or sets the name of the client's workstation.
 <a href="#">ConnectionString</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">ConnectTimeout</a>	Gets or sets the connection timeout.
 <a href="#">Count</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">DatabaseName</a>	Gets or sets the name of the database used.
 <a href="#">DataSource</a>	Gets or sets the connection data source.
 <a href="#">DateTimeAsChar</a>	Gets or sets a value that indicates whether the date/time value is a character value.
 <a href="#">DateTimeAsDate</a>	Gets or sets a value that indicates whether DateTime is specified as Date.
 <a href="#">DBMSPlatform</a>	Gets or sets the DBMS platform.
 <a href="#">DefaultQualifier</a>	Gets or sets the default qualifier.
 <a href="#">DefaultSchema</a>	Gets or sets the default schema of the connection.
 <a href="#">DeferPrepare</a>	Gets or sets a value that indicates whether preparation should be deferred.
 <a href="#">DeriveParameters</a>	Gets or sets a value that indicates whether derive parameters are specified.
 <a href="#">ExtendedProperties</a>	Gets or sets the extended properties.
 <a href="#">FileName</a>	Gets or sets the connection file name.
 <a href="#">HostCCSID</a>	Gets or sets the host CCSID.
 <a href="#">InitialCatalog</a>	Gets or sets the initial catalog.
 <a href="#">IntegratedSecurity</a>	Gets or sets the integrated security.
 <a href="#">IsFixedSize</a>	Overridden. Gets a value that indicates whether the data is of fixed size.
 <a href="#">IsReadOnly</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">Item</a>	Overridden. Gets or sets the connection key, based on the specified keyword.
 <a href="#">Keys</a>	Overridden. Gets the keys of the current instance.
 <a href="#">LocalLU</a>	Gets or sets the local LU.
 <a href="#">MaxPoolSize</a>	Gets or sets the maximum number of connections allowed in the connection pool for this specific connection string.
 <a href="#">NetworkAddress</a>	Gets or sets the network address.
 <a href="#">NetworkPort</a>	Gets or sets the network port.
 <a href="#">NetworkTransportLibrary</a>	Gets or sets the network transport library.
 <a href="#">PackageCollection</a>	Gets or sets the package collection.
 <a href="#">Password</a>	Gets or sets the password.
 <a href="#">PCCodePage</a>	Gets or sets the PC code page.
 <a href="#">PersistSecurityInfo</a>	Gets or sets a value that indicates whether the application should persist security information.
 <a href="#">Pooling</a>	Gets or sets a value that indicates whether pooling is used.

 <a href="#">PrincipleName</a>	Gets the principle name.
 <a href="#">Provider</a>	Gets or sets the provider.
 <a href="#">RemoteLU</a>	Gets or sets the remote LU.
 <a href="#">RowsetCacheSize</a>	Gets or sets the rowset cache size.
 <a href="#">ShadowCatalog</a>	Gets or sets the shadow catalog.
 <a href="#">UnitsOfWork</a>	Gets or sets the units of work.
 <a href="#">UseEarlyMetadata</a>	Gets or sets a value that indicates whether early metadata is used.
 <a href="#">UserId</a>	Gets or sets the user ID.
 <a href="#">Values</a>	Overridden. Gets a collection of values.

#### Explicit Interface Implementations

Name	Description
<a href="#">System.Collections.ICollection.IsSynchronized</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
<a href="#">System.Collections.ICollection.SyncRoot</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
<a href="#">System.Collections.IDictionary.Item</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )

Gets or sets the rowset cache size.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
<RefreshPropertiesAttribute(RefreshProperties.All)> _
<DisplayNameAttribute("Rowset Cache Size")> _
Public Property RowsetCacheSize As Integer
```

C#

```
[RefreshPropertiesAttribute(RefreshProperties.All)]
[DisplayNameAttribute("Rowset Cache Size")]
public int RowsetCacheSize { get; set; }
```

C++

```
[RefreshPropertiesAttribute(RefreshProperties::All)]
[DisplayNameAttribute(L"Rowset Cache Size")]
public:
property int RowsetCacheSize {
    int get ();
    void set (int value);
}
```

J#

```
/** @property */
public int get_RowsetCacheSize ()

/** @property */
public void set_RowsetCacheSize (int value)
```

JScript

```
public function get RowsetCacheSize () : int

public function set RowsetCacheSize (value : int)
```

## Property Value

The rowset cache size.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Constructors

	Name	Description
	<a href="#">MsDb2DataAdapter()</a>	Initializes a new instance of the <b>MsDb2DataAdapter</b> class.
	<a href="#">MsDb2DataAdapter(MsDb2Command)</a>	Initializes a new instance of the <b>MsDb2DataAdapter</b> class.
	<a href="#">MsDb2DataAdapter(String, MsDb2Connection)</a>	Initializes a new instance of the <b>MsDb2DataAdapter</b> class.
	<a href="#">MsDb2DataAdapter(String, String)</a>	Initializes a new instance of the <b>MsDb2DataAdapter</b> class.

Properties

	Name	Description
	<a href="#">AcceptChangesDuringFill</a>	(Inherited from <a href="#">DataAdapter</a> .)
	<a href="#">AcceptChangesDuringUpdate</a>	(Inherited from <a href="#">DataAdapter</a> .)
	<a href="#">Container</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">ContinueUpdateOnError</a>	(Inherited from <a href="#">DataAdapter</a> .)
	<a href="#">DeleteCommand</a>	Gets or sets an SQL statement or stored procedure for deleting records from the data set.
	<a href="#">FillCommandBehavior</a>	(Inherited from <a href="#">DbDataAdapter</a> .)

 FillLoadOption	(Inherited from <a href="#">DataAdapter</a> .)
 InsertCommand	Gets or sets an SQL statement or stored procedure used to insert new records into the data source.
 MissingMappingAction	(Inherited from <a href="#">DataAdapter</a> .)
 MissingSchemaAction	(Inherited from <a href="#">DataAdapter</a> .)
 ReturnProviderSpecificTypes	(Inherited from <a href="#">DataAdapter</a> .)
 SelectCommand	Gets or sets an SQL statement or stored procedure used to select records in the data source.
 Site	(Inherited from <a href="#">Component</a> .)
 TableMappings	(Inherited from <a href="#">DataAdapter</a> .)
 UpdateBatchSize	Gets or sets a value that enables or disables batch processing support, and specifies the number of commands that can be executed in a batch.(Overrides <a href="#">DbDataAdapter.UpdateBatchSize</a> .)
 UpdateCommand	Gets or sets an SQL statement or stored procedure used to update records in the data source.

#### Methods

Name	Description
 CreateObjRef(Type)	(Inherited from <a href="#">MarshalByRefObject</a> .)
 Dispose()	(Inherited from <a href="#">Component</a> .)
 Equals(Object)	(Inherited from <a href="#">Object</a> .)
 Fill(DataSet)	(Inherited from <a href="#">DbDataAdapter</a> .)
 Fill(DataSet, Int32, Int32, String)	(Inherited from <a href="#">DbDataAdapter</a> .)
 Fill(DataSet, String)	(Inherited from <a href="#">DbDataAdapter</a> .)
 Fill(DataTable)	(Inherited from <a href="#">DbDataAdapter</a> .)
 Fill(Int32, Int32, DataTable[])	(Inherited from <a href="#">DbDataAdapter</a> .)
 FillSchema(DataSet, SchemaType)	(Inherited from <a href="#">DbDataAdapter</a> .)
 FillSchema(DataSet, SchemaType, String)	(Inherited from <a href="#">DbDataAdapter</a> .)
 FillSchema(DataTable, SchemaType)	(Inherited from <a href="#">DbDataAdapter</a> .)
 GetFillParameters()	(Inherited from <a href="#">DbDataAdapter</a> .)
 GetHashCode()	(Inherited from <a href="#">Object</a> .)
 GetLifetimeService()	(Inherited from <a href="#">MarshalByRefObject</a> .)
 GetType()	(Inherited from <a href="#">Object</a> .)
 InitializeLifetimeService()	(Inherited from <a href="#">MarshalByRefObject</a> .)
 ToString()	(Inherited from <a href="#">Component</a> .)
 Update(DataRow[])	(Inherited from <a href="#">DbDataAdapter</a> .)
 Update(DataSet)	(Inherited from <a href="#">DbDataAdapter</a> .)
 Update(DataSet, String)	(Inherited from <a href="#">DbDataAdapter</a> .)

 <a href="#">Update(DataTable)</a>	(Inherited from <a href="#">DbDataAdapter</a> .)
---	--

#### Events

Name	Description
 <a href="#">Disposed</a>	(Inherited from <a href="#">Component</a> .)
 <a href="#">FillError</a>	(Inherited from <a href="#">DataAdapter</a> .)
 <a href="#">RowUpdated</a>	Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.
 <a href="#">RowUpdating</a>	Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

#### Explicit Interface Implementations

Name	Description
 <a href="#">ICloneable.Clone()</a>	

#### Remarks

The `MsDb2DataAdapter` serves as a bridge between a `DataSet` and data source for retrieving and saving data. The `MsDb2DataAdapter` provides this bridge by using `Fill` to load data from the data source into the `DataSet`, and using `Update` to send changes made in the `DataSet` back to the data source.

When the `MsDb2DataAdapter` fills a `DataSet`, it creates the necessary tables and columns for the returned data if they do not already exist. However, primary key information is not included in the implicitly created schema unless the `MissingSchemaAction` property is set to `AddWithKey`. You may also have the `MsDb2DataAdapter` create the schema of the `DataSet`, including primary key information, before filling it with data using `FillSchema`. Note that some OLE DB providers, including the `MSDataShape` provider, do not return base table or primary key information. As a result, the `MsDb2DataAdapter` cannot properly set the `PrimaryKey` property on any created `DataTable`. In such cases you should explicitly specify primary keys for tables in the `DataSet`.

The `MsDb2DataAdapter` also includes the `SelectCommand`, `InsertCommand`, `DeleteCommand`, `UpdateCommand`, and `TableMappings` properties to facilitate the loading and updating of data.

When you create an instance of `MsDb2DataAdapter`, properties are set to their initial values. For a list of these values, see the `MsDb2DataAdapter` constructor.

#### Note

Do not use double or real columns when specifying UPDATE or DELETE statements on the `MsDb2DataAdapter`: These rows will not be found and will throw the concurrency violation exception.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

[MsDb2DataAdapter Class](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

[Return to top](#)

### MsDb2DataAdapter Constructor ()

Initializes a new instance of the [MsDb2DataAdapter](#) class.

Syntax

C#

```
public MsDb2DataAdapter()
```

C++

```
public:  
MsDb2DataAdapter()
```

F#

```
new : unit -> MsDb2DataAdapter
```

VB

```
Public Sub New
```

Remarks

The default constructor initializes any fields to their default values. The following table describes the default values of MsDb2DataAdapter.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the relevant property.

[Return to top](#)

### MsDb2DataAdapter Constructor (MsDb2Command)

Initializes a new instance of the [MsDb2DataAdapter](#) class.

Syntax

C#

```
public MsDb2DataAdapter(  

```

```
MsDb2Command selectCommand
)
```

C++

```
public:
MsDb2DataAdapter(
    MsDb2Command^ selectCommand
)
```

F#

```
new :
    selectCommand:MsDb2Command -> MsDb2DataAdapter
```

VB

```
Public Sub New (
    selectCommand As MsDb2Command
)
```

### Parameters

*selectCommand*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Command](#)

An MsDb2Command that is a SELECT statement or stored procedure. This MsDb2Command is set as the SelectCommand property of the MsDb2DataAdapter.

### Remarks

This version of the constructor sets the SelectCommand property to the value specified in the selectCommand parameter.

The following table describes the default values of MsDb2DataAdapter.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the relevant property.

[Return to top](#)

### MsDb2DataAdapter Constructor (String, MsDb2Connection)

Initializes a new instance of the [MsDb2DataAdapter](#) class.

### Syntax

C#

```
public MsDb2DataAdapter(
    string selectCommandText,
    MsDb2Connection selectConnection
)
```

C++

```
public:
MsDb2DataAdapter(
    String^ selectCommandText,
    MsDb2Connection^ selectConnection
)
```

F#

```
new :
    selectCommandText:string *
    selectConnection:MsDb2Connection -> MsDb2DataAdapter
```

VB

```
Public Sub New (  
    selectCommandText As String,  
    selectConnection As MsDb2Connection  
)
```

#### Parameters

*selectCommandText*

Type: [System.String](#)

A String that is an SQL SELECT statement or stored procedure to be used as the CommandText of the SelectCommand property of the MsDb2DataAdapter.

*selectConnection*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Connection](#)

An MsDb2Connection that represents the connection.

#### Remarks

This implementation of the **MsDb2DataAdapter** opens and closes an MsDb2Connection if it is not already open. This can be useful in an application that must call the Fill method for two or more MsDb2DataAdapter objects. If the MsDb2Connection is already open, you must explicitly call Close or Dispose to close it.

The following table describes the default values of MsDb2DataAdapter.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the relevant property.

[Return to top](#)

#### MsDb2DataAdapter Constructor (String, String)

Initializes a new instance of the [MsDb2DataAdapter](#) class.

#### Syntax

C#

```
public MsDb2DataAdapter(  
    string selectCommandText,  
    string selectConnectionString  
)
```

C++

```
public:  
MsDb2DataAdapter(  
    String^ selectCommandText,  
    String^ selectConnectionString  
)
```

F#

```
new :  
    selectCommandText:string *  
    selectConnectionString:string -> MsDb2DataAdapter
```

VB

```
Public Sub New (  
    selectCommandText As String,  
    selectConnectionString As String  
)
```

#### Parameters

*selectCommandText*

Type: [System.String](#)

A String that is a SQL SELECT statement or stored procedure to be used as the CommandText of the SelectCommand property of the MsDb2DataAdapter.

*selectConnectionString*

Type: [System.String](#)

The connection string.

Remarks

The following table describes the default values of MsDb2DataAdapter.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the relevant property.

[Return to top](#)

# MsDb2DataAdapter Constructor ()

Initializes a new instance of the [MsDb2DataAdapter](#) class.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public MsDb2DataAdapter ()
```

C++

```
public:  
MsDb2DataAdapter ()
```

J#

```
public MsDb2DataAdapter ()
```

JScript

```
public function MsDb2DataAdapter ()
```

Remarks

The default constructor initializes any fields to their default values. The following table describes the default values of MsDb2DataAdapter.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the relevant property.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2DataAdapter Constructor (MsDb2Command)

Initializes a new instance of the [MsDb2DataAdapter](#) class.

**Namespace:** Microsoft.HostIntegration.MsDb2Client  
**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage  
Syntax  
VB

```
'Declaration
Public Sub New ( _
    selectCommand As MsDb2Command _
)
```

C#

```
public MsDb2DataAdapter (
    MsDb2Command selectCommand
)
```

C++

```
public:
MsDb2DataAdapter (
    MsDb2Command^ selectCommand
)
```

J#

```
public MsDb2DataAdapter (
    MsDb2Command selectCommand
)
```

JScript

```
public function MsDb2DataAdapter (
    selectCommand : MsDb2Command
)
```

**Parameters**

selectCommand

An MsDb2Command that is a SELECT statement or stored procedure. This MsDb2Command is set as the SelectCommand property of the MsDb2DataAdapter.

Remarks

This version of the constructor sets the SelectCommand property to the value specified in the selectCommand parameter.

The following table describes the default values of MsDb2DataAdapter.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the relevant property.

Platforms

[MsDb2DataAdapter Class](#)

[MsDb2DataAdapter Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2DataAdapter Constructor (String, MsDb2Connection)

Initializes a new instance of the [MsDb2DataAdapter](#) class.

**Namespace:** Microsoft.HostIntegration.MsDb2Client  
**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage  
Syntax  
VB

```
'Declaration
Public Sub New ( _
    selectCommandText As String, _
    selectConnection As MsDb2Connection _
)
```

C#

```
public MsDb2DataAdapter (
    string selectCommandText,
    MsDb2Connection selectConnection
)
```

C++

```
public:
MsDb2DataAdapter (
    String^ selectCommandText,
    MsDb2Connection^ selectConnection
)
```

J#

```
public MsDb2DataAdapter (
    String selectCommandText,
    MsDb2Connection selectConnection
)
```

JScript

```
public function MsDb2DataAdapter (
    selectCommandText : String,
    selectConnection : MsDb2Connection
)
```

**Parameters**

selectCommandText

A String that is an SQL SELECT statement or stored procedure to be used as the CommandText of the SelectCommand property of the MsDb2DataAdapter.

selectConnection

An MsDb2Connection that represents the connection.

**Remarks**

This implementation of the **MsDb2DataAdapter** opens and closes an MsDb2Connection if it is not already open. This can be useful in an application that must call the Fill method for two or more MsDb2DataAdapter objects. If the MsDb2Connection is already open, you must explicitly call Close or Dispose to close it.

The following table describes the default values of MsDb2DataAdapter.

Properties	Initial Value
------------	---------------

MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the relevant property.

Platforms

**Development Platforms**

## Reference

[MsDb2DataAdapter Class](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2DataAdapter.DeleteCommand Property

Gets or sets an SQL statement or stored procedure for deleting records from the data set.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
<DefaultValueAttribute(Nothing)> _
Public Property DeleteCommand As MsDb2Command
```

C#

```
[DefaultValueAttribute(null)]
public MsDb2Command DeleteCommand { get; set; }
```

C++

```
[DefaultValueAttribute(nullptr)]
public:
property MsDb2Command^ DeleteCommand {
    MsDb2Command^ get ();
    void set (MsDb2Command^ value);
}
```

J#

```
/** @property */
public MsDb2Command get_DeleteCommand ()

/** @property */
public void set_DeleteCommand (MsDb2Command value)
```

JScript

```
public function get DeleteCommand () : MsDb2Command

public function set DeleteCommand (value : MsDb2Command)
```

## Property Value

An MsDb2Command used during Update to delete records in the data source that correspond to deleted rows in the DataSet. Remarks

During Update, if this property is not set and primary key information is present in the DataSet, the DeleteCommand can be generated automatically if you set the SelectCommand property and use the MsDb2CommandBuilder. Then, any additional commands that you do not set are generated by the MsDb2CommandBuilder. This generation logic requires key column information to be present in the DataSet.

When DeleteCommand is assigned to a previously created MsDb2Command, the MsDb2Command is not cloned. The DeleteCommand maintains a reference to the previously created MsDb2Command object.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2DataAdapter.InsertCommand Property

Gets or sets an SQL statement or stored procedure used to insert new records into the data source.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
<DefaultValueAttribute(Nothing)> _
Public Property InsertCommand As MsDb2Command
```

C#

```
[DefaultValueAttribute(null)]
public MsDb2Command InsertCommand { get; set; }
```

C++

```
[DefaultValueAttribute(nullptr)]
public:
property MsDb2Command^ InsertCommand {
    MsDb2Command^ get ();
    void set (MsDb2Command^ value);
}
```

J#

```
/** @property */
public MsDb2Command get_InsertCommand ()

/** @property */
public void set_InsertCommand (MsDb2Command value)
```

JScript

```
public function get InsertCommand () : MsDb2Command

public function set InsertCommand (value : MsDb2Command)
```

## Property Value

An MsDb2Command used during Update to insert records in the data source that correspond to new rows in the DataSet. Remarks

During Update, if this property is not set and primary key information is present in the DataSet, the InsertCommand can be generated automatically if you set the SelectCommand property and use the MsDb2CommandBuilder. Then, any additional commands that you do not set are generated by the MsDb2CommandBuilder. This generation logic requires key column information to be present in the DataSet.

When InsertCommand is assigned to a previously created MsDb2Command, the MsDb2Command is not cloned. The InsertCommand maintains a reference to the previously created MsDb2Command object.

If execution of this command returns rows, these rows may be added to the DataSet depending on how you set the UpdatedRowSource property of the MsDb2Command object.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

/** @property */
public void set_SelectCommand (MsDb2Command value)
```

JScript

```
public function get SelectCommand () : MsDb2Command

public function set SelectCommand (value : MsDb2Command)
```

## Property Value

An MsDb2Command that is used during Fill to select records from data source for placement in the DataSet.

Remarks

When SelectCommand is assigned to a previously created MsDb2Command, the MsDb2Command is not cloned. The SelectCommand maintains a reference to the previously created MsDb2Command object.

If the SelectCommand does not return any rows, no tables are added to the DataSet, and no exception is raised.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

/** @property */
public void set_UpdateCommand (MsDb2Command value)
```

JScript

```
public function get UpdateCommand () : MsDb2Command

public function set UpdateCommand (value : MsDb2Command)
```

## Property Value

An MsDb2Command used during Update to update records in the data source that correspond to modified rows in the DataSet.

Remarks

During Update, if this property is not set and primary key information is present in the DataSet, the UpdateCommand can be generated automatically if you set the SelectCommand property and use the MsDb2CommandBuilder. Then, any additional commands that you do not set are generated by the MsDb2CommandBuilder. This generation logic requires key column information to be present in the DataSet.

When UpdateCommand is assigned to a previously created MsDb2Command, the MsDb2Command is not cloned. The UpdateCommand maintains a reference to the previously created MsDb2Command object.

If execution of this command returns rows, these rows may be merged with the DataSet depending on how you set the UpdatedRowSource property of the MsDb2Command object.

# MsDb2DataAdapter Events

## Public Events

	Name	Description
	<a href="#">Disposed</a>	(inherited from <a href="#">Component</a> )
	<a href="#">FillError</a>	(inherited from <a href="#">DataAdapter</a> )
	<a href="#">RowUpdated</a>	Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.
	<a href="#">RowUpdating</a>	Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

See Also

### Reference

[MsDb2DataAdapter Class](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2DataAdapter.RowUpdated Event

Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.

**Namespace:** [Microsoft.HostIntegration.MsDb2Client](#)  
**Assembly:** Microsoft.HostIntegration.MsDb2Client (in Microsoft.HostIntegration.MsDb2Client.dll)

Syntax  
C#

```
public event MsDb2RowUpdatedEventHandler RowUpdated
```

C++

```
public:  
event MsDb2RowUpdatedEventHandler^ RowUpdated {  
    void add(MsDb2RowUpdatedEventHandler^ value);  
    void remove(MsDb2RowUpdatedEventHandler^ value);  
}
```

F#

```
member RowUpdated : IEvent<MsDb2RowUpdatedEventHandler,  
    MsDb2RowUpdatedEventArgs>
```

VB

```
Public Event RowUpdated As MsDb2RowUpdatedEventHandler
```

Remarks  
In JScript, you can handle the events defined by a class, but you cannot define your own.

When using Update, there are two events that occur per data row updated. The order of execution is as follows:

1. The values in the DataRow are moved to the parameter values.
2. The OnRowUpdating event is raised.
3. The command executes.
4. If the command is set to FirstReturnedRecord, then the first returned result is placed in the DataRow.
5. If there are output parameters, they are placed in the DataRow.
6. The OnRowUpdated event is raised.
7. AcceptChanges is called.

Event Data  
The event handler receives an argument of type MsDb2RowUpdatedEventArgs containing data related to this event. The following MsDb2RowUpdatedEventArgs properties provide information specific to this event.

Property	Description
Command	Gets the MsDb2Command executed when Update is called.
Errors (inherited from System.Data.Common.RowUpdatedEventArgs)	Gets any errors generated by the .NET data provider when the Command was executed.
RecordsAffected (inherited from System.Data.Common.RowUpdatedEventArgs)	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

Row (inherited from System.Data.Common.RowUpdatedEventArgs)	Gets the DataRow sent through an Update.
StatementType (inherited from System.Data.Common.RowUpdatedEventArgs)	Gets the type of SQL statement executed.
Status (inherited from System.Data.Common.RowUpdatedEventArgs)	Gets the UpdateStatus of the Command.
TableMapping (inherited from System.Data.Common.RowUpdatedEventArgs)	Gets the DataTableMapping sent through an Update.

C#

```
public event MsDb2RowUpdatingEventHandler RowUpdating
```

C++

```
public:  
event MsDb2RowUpdatingEventHandler^ RowUpdating {  
    void add(MsDb2RowUpdatingEventHandler^ value);  
    void remove(MsDb2RowUpdatingEventHandler^ value);  
}
```

F#

```
member RowUpdating : IEvent<MsDb2RowUpdatingEventHandler,  
    MsDb2RowUpdatingEventArgs>
```

VB

```
Public Event RowUpdating As MsDb2RowUpdatingEventHandler
```

Remarks  
In JScript, you can handle the events defined by a class, but you cannot define your own.

When using Update, there are two events that occur per data row updated. The order of execution is as follows:

1. The values in the DataRow are moved to the parameter values.
2. The OnRowUpdating event is raised.
3. The command executes.
4. If the command is set to FirstReturnedRecord, then the first returned result is placed in the DataRow.
5. If there are output parameters, they are placed in the DataRow.
6. The OnRowUpdated event is raised.
7. AcceptChanges is called.

Event Data  
The event handler receives an argument of type MsDb2RowUpdatingEventArgs containing data related to this event. The following MsDb2RowUpdatingEventArgs properties provide information specific to this event.

Property	Description
Command	Gets or sets the MsDb2Command to execute when performing the Update.
Errors (inherited from System.Data.Common.RowUpdatingEventArgs)	Gets any errors generated by the .NET data provider when the Command executes.
Row (inherited from System.Data.Common.RowUpdatingEventArgs)	Gets the DataRow to send through an Update.

StatementType (inherited from System.Data.Common.RowUpdatingEventArgs)	Gets the type of SQL statement to execute.
Status (inherited from System.Data.Common.RowUpdatingEventArgs)	Gets the UpdateStatus of the Command.
TableMapping (inherited from System.Data.Common.RowUpdatingEventArgs)	Gets the DataTableMapping to send through the Update.

# MsDb2DataReader Class

Describes a server-side forward-only cursor implementation that inherits from the `IDataReader` and `IDataRecord` interfaces.

**Namespace:** `Microsoft.HostIntegration.MsDb2Client`  
**Assembly:** `Microsoft.HostIntegration.MsDb2Client` (in `Microsoft.HostIntegration.MsDb2Client.dll`)

Inheritance Hierarchy  
`System.Object`  
`System.MarshalByRefObject`  
`System.Data.Common.DbDataReader`  
**`Microsoft.HostIntegration.MsDb2Client.MsDb2DataReader`**

Syntax  
C#

```
public sealed class MsDb2DataReader : DbDataReader
```

C++

```
public ref class MsDb2DataReader sealed : DbDataReader
```

F#

```
[<Sealed>]  
type MsDb2DataReader =  
    class  
        inherit DbDataReader  
    end
```

VB

```
Public NotInheritable Class MsDb2DataReader  
    Inherits DbDataReader
```

## Properties

	Name	Description
	Depth	Gets a value indicating the depth of nesting for the current row.(Overrides <a href="#">DbDataReader.Depth</a> .)
	FieldCount	Gets the number of columns in the current row.(Overrides <a href="#">DbDataReader.FieldCount</a> .)
	HasRows	Gets a value that indicates whether the current data has rows.(Overrides <a href="#">DbDataReader.HasRows</a> .)
	IsClosed	Gets a value that indicates whether the data reader is closed.(Overrides <a href="#">DbDataReader.IsClosed</a> .)
	Item(Int32)	Gets the data described by the specified index.(Overrides <a href="#">DbDataReader.Item(Int32)</a> .)
	Item(String)	Gets the data that has the specified name.(Overrides <a href="#">DbDataReader.Item(String)</a> .)
	RecordsAffected	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.(Overrides <a href="#">DbDataReader.RecordsAffected</a> .)
	VisibleFieldCount	(Inherited from <a href="#">DbDataReader</a> .)

## Methods

	Name	Description
	Close()	Closes the <code>MsDb2DataReader</code> object.(Overrides <a href="#">DbDataReader.Close()</a> .)
	CreateObjRef(Type)	(Inherited from <a href="#">MarshalByRefObject</a> .)
	Equals(Object)	(Inherited from <a href="#">Object</a> .)

 <a href="#">GetBoolean(Int32)</a>	Returns the value of the specified column as a Boolean.(Overrides <a href="#">DbDataReader.GetBoolean(Int32)</a> .)
 <a href="#">GetByte(Int32)</a>	Returns the value of the specified column as a byte.(Overrides <a href="#">DbDataReader.GetByte(Int32)</a> .)
 <a href="#">GetBytes(Int32, Int64, Byte[], Int32, Int32)</a>	Reads a stream of bytes from the specified column offset into the buffer as an array starting at the given buffer offset.(Overrides <a href="#">DbDataReader.GetBytes(Int32, Int64, Byte[], Int32, Int32)</a> .)
 <a href="#">GetChar(Int32)</a>	Returns the value of the specified column as a character.(Overrides <a href="#">DbDataReader.GetChar(Int32)</a> .)
 <a href="#">GetChars(Int32, Int64, Char[], Int32, Int32)</a>	Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.(Overrides <a href="#">DbDataReader.GetChars(Int32, Int64, Char[], Int32, Int32)</a> .)
 <a href="#">GetDataTypeName(Int32)</a>	Returns the name of the source data type.(Overrides <a href="#">DbDataReader.GetDataTypeName(Int32)</a> .)
 <a href="#">GetDateTime(Int32)</a>	Returns the value of the specified column as a DateTime object.(Overrides <a href="#">DbDataReader.GetDateTime(Int32)</a> .)
 <a href="#">GetDecimal(Int32)</a>	Returns the value of the specified column as a Decimal object.(Overrides <a href="#">DbDataReader.GetDecimal(Int32)</a> .)
 <a href="#">GetDouble(Int32)</a>	Returns the value of the specified column as a double-precision floating point number.(Overrides <a href="#">DbDataReader.GetDouble(Int32)</a> .)
 <a href="#">GetEnumerator()</a>	Returns an enumerator that iterates through a collection.(Overrides <a href="#">DbDataReader.GetEnumerator()</a> .)
 <a href="#">GetFieldType(Int32)</a>	Returns the Type that is the data type of the object.(Overrides <a href="#">DbDataReader.GetFieldType(Int32)</a> .)
 <a href="#">GetFieldValue&lt;T&gt;(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFieldValueAsync&lt;T&gt;(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFieldValueAsync&lt;T&gt;(Int32, CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFloat(Int32)</a>	Returns the value of the specified column as a single-precision floating point number.(Overrides <a href="#">DbDataReader.GetFloat(Int32)</a> .)
 <a href="#">GetGuid(Int32)</a>	Returns the value of the specified column as a globally unique identifier (GUID).(Overrides <a href="#">DbDataReader.GetGuid(Int32)</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetInt16(Int32)</a>	Returns the value of the specified column as a 16-bit signed integer.(Overrides <a href="#">DbDataReader.GetInt16(Int32)</a> .)
 <a href="#">GetInt32(Int32)</a>	Returns the value of the specified column as a 32-bit signed integer.(Overrides <a href="#">DbDataReader.GetInt32(Int32)</a> .)
 <a href="#">GetInt64(Int32)</a>	Returns the value of the specified column as a 64-bit signed integer.(Overrides <a href="#">DbDataReader.GetInt64(Int32)</a> .)
 <a href="#">GetLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
<a href="#">GetName(Int32)</a>	Returns the name of the specified column.(Overrides <a href="#">DbDataReader.GetName(Int32)</a> .)

 <a href="#">GetOrdinal(String)</a>	Returns the column ordinal, given the name of the column.(Overrides <a href="#">DbDataReader.GetOrdinal(String)</a> .)
 <a href="#">GetSchemaTable()</a>	Returns a data table that describes the column metadata of the MsDb2DataReader.(Overrides <a href="#">DbDataReader.GetSchemaTable()</a> .)
 <a href="#">GetSchemaTable(Boolean)</a>	Returns a data table that describes the column metadata of the MsDb2DataReader in addition to the keys.
 <a href="#">GetStream(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetString(Int32)</a>	Retrieves the value of the specified column as a string.(Overrides <a href="#">DbDataReader.GetString(Int32)</a> .)
 <a href="#">GetTextReader(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetTimeSpan(Int32)</a>	Retrieves the value of the specified column as a TimeSpan object.
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetValue(Int32)</a>	Retrieves the value of the column at the specified ordinal in its native format.(Overrides <a href="#">DbDataReader.GetValue(Int32)</a> .)
 <a href="#">GetValues(Object[])</a>	Retrieves all the attribute columns in the current row.(Overrides <a href="#">DbDataReader.GetValues(Object[])</a> .)
 <a href="#">InitializeLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">IsDBNull(Int32)</a>	Returns a value that indicates whether the column contains nonexistent or missing values.(Overrides <a href="#">DbDataReader.IsDBNull(Int32)</a> .)
 <a href="#">IsDBNullAsync(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">IsDBNullAsync(Int32, CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">NextResult()</a>	Advances the data reader to the next result, when reading the results of batch SQL statements.(Overrides <a href="#">DbDataReader.NextResult()</a> .)
 <a href="#">NextResultAsync()</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">NextResultAsync(CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">Read()</a>	Advances the MsDb2DataReader to the next record.(Overrides <a href="#">DbDataReader.Read()</a> .)
 <a href="#">ReadAsync()</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">ReadAsync(CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Explicit Interface Implementations

	<b>Name</b>	<b>Description</b>
	<a href="#">IDataRecord.GetData(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)

#### Remarks

To create an MsDb2DataReader, you must call MsDb2Command.ExecuteReader, rather than directly using a constructor.

Unlike other .NET providers, the Managed Provider for DB2 allows you to open multiple MsDb2DataReaders on a single MsDb2Connection.

Changes made to a ResultSet by another process or thread while data is being read may be visible to the user of the MsDb2DataReader. However, the precise behavior is timing-dependent.

IsClosed and RecordsAffected are the only properties that you can call after the MsDb2DataReader is closed. Though the

RecordsAffected property may be accessed at any time while the MsDb2DataReader exists, always call Close before returning the value of RecordsAffected to ensure an accurate return value.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# MsDb2DataReader Members

Describes a server-side forward-only cursor implementation that inherits from the [IDataReader](#) and [IDataRecord](#) interfaces.

The following tables list the members exposed by the [MsDb2DataReader](#) type.

## Public Properties

	Name	Description
	<a href="#">Depth</a>	Overridden. Gets a value indicating the depth of nesting for the current row.
	<a href="#">FieldCount</a>	Overridden. Gets the number of columns in the current row.
	<a href="#">HasRows</a>	Overridden. Gets a value that indicates whether the current data has rows.
	<a href="#">IsClosed</a>	Overridden. Gets a value that indicates whether the data reader is closed.
	<a href="#">Item</a>	Overloaded. Overridden. Gets data through the current instance.
	<a href="#">RecordsAffected</a>	Overridden. Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.
	<a href="#">VisibleFieldCount</a>	(inherited from <a href="#">DbDataReader</a> )

## Top

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Close</a>	Overridden. Closes the MsDb2DataReader object.
	<a href="#">CreateObjRef</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">Dispose</a>	Overloaded. (inherited from <a href="#">DbDataReader</a> )
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">GetBoolean</a>	Overridden. Returns the value of the specified column as a Boolean.
	<a href="#">GetByte</a>	Overridden. Returns the value of the specified column as a byte.
	<a href="#">GetBytes</a>	Overridden. Reads a stream of bytes from the specified column offset into the buffer as an array starting at the given buffer offset.
	<a href="#">GetChar</a>	Overridden. Returns the value of the specified column as a character.
	<a href="#">GetChars</a>	Overridden. Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.
	<a href="#">GetData</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">GetDataTypeName</a>	Overridden. Returns the name of the source data type.
	<a href="#">GetDateTime</a>	Overridden. Returns the value of the specified column as a DateTime object.
	<a href="#">GetDecimal</a>	Overridden. Returns the value of the specified column as a Decimal object.
	<a href="#">GetDouble</a>	Overridden. Returns the value of the specified column as a double-precision floating point number.
	<a href="#">GetEnumerator</a>	Overridden. Returns an enumerator that iterates through a collection.
	<a href="#">GetFieldType</a>	Overridden. Returns the Type that is the data type of the object.
	<a href="#">GetFloat</a>	Overridden. Returns the value of the specified column as a single-precision floating point number.
	<a href="#">GetGuid</a>	Overridden. Returns the value of the specified column as a globally unique identifier (GUID).
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetInt16</a>	Overridden. Returns the value of the specified column as a 16-bit signed integer.
	<a href="#">GetInt32</a>	Overridden. Returns the value of the specified column as a 32-bit signed integer.
	<a href="#">GetInt64</a>	Overridden. Returns the value of the specified column as a 64-bit signed integer.
	<a href="#">GetLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">GetName</a>	Overridden. Returns the name of the specified column.
	<a href="#">GetOrdinal</a>	Overridden. Returns the column ordinal, given the name of the column.
	<a href="#">GetProviderSpecificFieldType</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">GetProviderSpecificValue</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">GetProviderSpecificValues</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">GetSchemaTable</a>	Overloaded. Overridden. Retrieves the schema table.
	<a href="#">GetString</a>	Overridden. Retrieves the value of the specified column as a string.
	<a href="#">GetTimeSpan</a>	Retrieves the value of the specified column as a TimeSpan object.

	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetValue</a>	Overridden. Retrieves the value of the column at the specified ordinal in its native format.
	<a href="#">GetValues</a>	Overridden. Retrieves all the attribute columns in the current row.
	<a href="#">InitializeLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">IsDBNull</a>	Overridden. Returns a value that indicates whether the column contains nonexistent or missing values.
	<a href="#">NextResult</a>	Overridden. Advances the data reader to the next result, when reading the results of batch SQL statements.
	<a href="#">Read</a>	Overridden. Advances the MsDb2DataReader to the next record.
	 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )

#### Reference

[MsDb2DataReader Class](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2DataReader.Close Method

Closes the MsDb2DataReader object.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Sub Close
```

C#

```
public override void Close ()
```

C++

```
public:  
virtual void Close () override
```

J#

```
public void Close ()
```

JScript

```
public override function Close ()
```

Remarks

You must explicitly call the Close method when you are through using the MsDb2DataReader to use the associated MsDb2Connection for any other purpose.

**Implements**

IDataReader.Close

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

# MsDb2DataReader.GetBoolean Method

Returns the value of the specified column as a Boolean.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetBoolean ( _
    i As Integer _
) As Boolean
```

C#

```
public override bool GetBoolean (
    int i
)
```

C++

```
public:
virtual bool GetBoolean (
    int i
) override
```

J#

```
public boolean GetBoolean (
    int i
)
```

JScript

```
public override function GetBoolean (
    i : int
) : boolean
```

## Parameters

i

The zero-based column ordinal.

## Return Value

The value of the specified column as a Boolean.

Remarks

No conversions are performed, therefore the data retrieved must already be a Boolean or an exception is generated.

Call IsDBNull to check for **null** values before calling this method.

## Implements

IDataRecord.GetBoolean

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2DataReader.GetByte Method

Returns the value of the specified column as a byte.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetByte ( _
    i As Integer _
) As Byte
```

C#

```
public override byte GetByte (
    int i
)
```

C++

```
public:
virtual unsigned char GetByte (
    int i
) override
```

J#

```
public byte GetByte (
    int i
)
```

JScript

```
public override function GetByte (
    i : int
) : byte
```

## Parameters

i

The zero-based column ordinal.

## Return Value

The value of the specified column as a byte.

Remarks

No conversions are performed; therefore the data retrieved must already be a byte.

Call IsDBNull to check for **null** values before calling this method.

## Implements

IDataRecord.GetByte

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

[MsDb2DataReader Class](#)

[MsDb2DataReader Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2DataReader.GetBytes Method

Reads a stream of bytes from the specified column offset into the buffer as an array starting at the given buffer offset.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetBytes ( _
    i As Integer, _
    fieldOffset As Long, _
    buffer As Byte(), _
    bufferOffset As Integer, _
    length As Integer _
) As Long
```

C#

```
public override long GetBytes (
    int i,
    long fieldOffset,
    byte[] buffer,
    int bufferOffset,
    int length
)
```

C++

```
public:
virtual long long GetBytes (
    int i,
    long long fieldOffset,
    array<unsigned char>^ buffer,
    int bufferOffset,
    int length
) override
```

J#

```
public long GetBytes (
    int i,
    long fieldOffset,
    byte[] buffer,
    int bufferOffset,
    int length
)
```

JScript

```
public override function GetBytes (
    i : int,
    fieldOffset : long,
    buffer : byte[],
    bufferOffset : int,
    length : int
) : long
```

**Parameters**

i

The zero-based column ordinal.

fieldOffset

The index within the field from which to begin the read operation.

buffer

The buffer into which to read the stream of bytes.

bufferOffset

The buffer offset.

length

The maximum length to copy into the buffer.

#### Return Value

The actual number of bytes read.

#### Remarks

GetBytes returns the number of available bytes in the field. In most cases this is the exact length of the field. However, the number returned may be less than the true length of the field if GetBytes has already been used to obtain bytes from the field. This may be the case, for example, when the MsDb2DataReader is reading a large data structure into a buffer. For more information, see the SequentialAccess setting for CommandBehavior.

If you pass a buffer that is **null** reference (Nothing in Visual Basic), GetBytes returns the length of the field in bytes.

No conversions are performed; therefore the data retrieved must already be a byte array.

#### Implements

IDataRecord.GetBytes

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

#### Platforms

##### Development Platforms

# MsDb2DataReader.GetChar Method

Returns the value of the specified column as a character.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetChar ( _
    i As Integer _
) As Char
```

C#

```
public override char GetChar (
    int i
)
```

C++

```
public:
virtual wchar_t GetChar (
    int i
) override
```

J#

```
public char GetChar (
    int i
)
```

JScript

```
public override function GetChar (
    i : int
) : char
```

## Parameters

i

The zero-based column ordinal.

## Return Value

The value of the specified column.

Remarks

No conversions are performed; the data retrieved must already be a character.

Call IsDBNull to check for **null** values before calling this method.

## Implements

IDataRecord.GetChar

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

    int i,
    long fieldOffset,
    char[] buffer,
    int bufferOffset,
    int length
)
```

C++

```
public:
virtual long long GetChars (
    int i,
    long long fieldOffset,
    array<wchar_t>^ buffer,
    int bufferOffset,
    int length
) override
```

J#

```
public long GetChars (
    int i,
    long fieldOffset,
    char[] buffer,
    int bufferOffset,
    int length
)
```

JScript

```
public override function GetChars (
    i : int,
    fieldOffset : long,
    buffer : char[],
    bufferOffset : int,
    length : int
) : long
```

**Parameters**

i

The zero-based column ordinal.

fieldOffset

The field offset.

buffer

The buffer into which to copy data.

bufferOffset

The buffer offset.

length

The number of characters to read.

#### Return Value

The actual number of characters read.

#### Remarks

GetChars returns the number of available characters in the field. In most cases this is the exact length of the field. However, the number returned may be less than the true length of the field if GetChars has already been used to obtain characters from the field. This may be the case, for example, when the MsDb2DataReader is reading a large data structure into a buffer. For more information, see the SequentialAccess setting for CommandBehavior.

If you pass a buffer that is **null** reference (Nothing in Visual Basic), GetChars returns the length of the field in characters.

No conversions are performed; therefore the data retrieved must already be a character array.

## Reference

[MsDb2DataReader Class](#)

[MsDb2DataReader Members](#)

# MsDb2DataReader.GetOrdinal Method

Returns the column ordinal, given the name of the column.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function.GetOrdinal ( _
    name As String _
) As Integer
```

C#

```
public override int.GetOrdinal (
    string name
)
```

C++

```
public:
virtual int.GetOrdinal (
    String^ name
) override
```

J#

```
public int.GetOrdinal (
    String name
)
```

JScript

```
public override function.GetOrdinal (
    name : String
) : int
```

## Parameters

name

The name of the column.

## Return Value

The zero-based column ordinal.

Remarks

GetOrdinal performs a case-sensitive lookup first. If it fails, a second case-insensitive search is made.

GetOrdinal is kana-width insensitive.

Because ordinal-based lookups are more efficient than named lookups, it is inefficient to call GetOrdinal within a loop. Save time by calling GetOrdinal once and assigning the results to an integer variable for use within the loop.

## Implements

IDataRecord.GetOrdinal

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2DataReader.GetSchemaTable Method

Retrieves the schema table.

**Namespace:** [Microsoft.HostIntegration.MsDb2Client](#)  
**Assembly:** Microsoft.HostIntegration.MsDb2Client (in Microsoft.HostIntegration.MsDb2Client.dll)

### Overload List

Name	Description
 <a href="#">GetSchemaTable()</a>	Returns a data table that describes the column metadata of the MsDb2DataReader.(Overrides <a href="#">DbDataReader.GetSchemaTable()</a> .)
 <a href="#">GetSchemaTable(Boolean)</a>	Returns a data table that describes the column metadata of the MsDb2DataReader in addition to the keys.

See Also  
[MsDb2DataReader Class](#)  
[Microsoft.HostIntegration.MsDb2Client Namespace](#)

[Return to top](#)  
**MsDb2DataReader.GetSchemaTable Method ()**  
Returns a data table that describes the column metadata of the MsDb2DataReader.

### Syntax

```
C#  
  
public override DataTable GetSchemaTable()
```

```
C++  
  
public:  
virtual DataTable^ GetSchemaTable() override
```

```
F#  
  
override GetSchemaTable : unit -> DataTable
```

```
VB  
  
Public Overrides Function GetSchemaTable As DataTable
```

**Return Value**  
Type: [System.Data.DataTable](#)  
A data table that describes the column metadata of the MsDb2DataReader.

**Implements**  
[IDataReader.GetSchemaTable\(\)](#)

Remarks  
The GetSchemaTable method maps to the OLE DB IColumnsRowset::GetColumnsRowset method, and returns metadata about each column in the following order:

Data Reader Column	OLE DB Column ID	Description
--------------------	------------------	-------------

Column Name	DBCOLUMN_NAME	The name of the column; this might not be unique. If this cannot be determined, a null value is returned. This name always reflects the most recent renaming of the column in the current view or command text.
Column Ordinal	DBCOLUMN_ordinal	The ordinal of the column. This is zero for the bookmark column of the row, if any. Other columns are numbered starting with one. This column cannot contain a null value.
Column Size	DBCOLUMN_SIZE	The maximum possible length of a value in the column. For columns that use a fixed-length data type, this is the size of the data type.
Numeric Precision	DBCOLUMN_precision	If DbType is a numeric data type, this is the maximum precision of the column. The precision of columns with a data type of DBTYPE_DECIMAL or DBTYPE_NUMERIC depends on the definition of the column. If DbType is not a numeric data type, this is a null value.
Numeric Scale	DBCOLUMN_scale	If DbType is DBTYPE_DECIMAL or DBTYPE_NUMERIC, this is the number of digits to the right of the decimal point. Otherwise, this is a null value.
Data Type	None	Maps to the .NET Framework type of the column.
Provider Type	DBCOLUMN_TYPE	The indicator of the column's data type. If the data type of the column varies from row to row, this must be DBTYPE_VARIANT. This column cannot contain a null value.
Is Long	DBCOLUMNFLAGS_ISLONG	The provider sets DBCOLUMNFLAGS_ISLONG if the column contains a Binary Long Object (BLOB) that contains very long data. The definition of very long data is provider-specific. The setting of this flag corresponds to the value of the IS_LONG column in the PROVIDER_TYPES rowset for the data type.
Allow Null	DBCOLUMNFLAGS_ISNULLABLE	The provider sets DBCOLUMNFLAGS_ISNULLABLE if the consumer can set the column to a null value, or if the provider cannot determine whether or not the consumer can set the column to a null value. A column may contain null values, even if it cannot be set to a null value.
Is Read Only	DBCOLUMNFLAGS_WRITE	true if the column can be modified; otherwise false. The column is assumed to be writable if the provider has set either the DBCOLUMNFLAGS_WRITE or DBCOLUMNFLAGS_WRITEUNKNOWN flag.
Is Row Version	DBCOLUMNFLAGS_ISROWID	The provider sets DBCOLUMNFLAGS_ISROWID if the column contains a persistent row identifier that cannot be written to, and has no meaningful value except to identity the row.
Is Unique	DBCOLUMN_UNIQUE	VARIANT_TRUE: No two rows in the base table-the table returned in BaseTableName-can have the same value in this column. IsUnique is guaranteed to be VARIANT_TRUE if the column constitutes a key by itself or if there is a constraint of type UNIQUE that applies only to this column. VARIANT_FALSE: The column can contain duplicate values in the base table. The default of this column is VARIANT_FALSE.

IsKey	DBCOLUMN_KEYCOLUMN	VARIANT_TRUE: The column is one of a set of columns in the rowset that, taken together, uniquely identify the row. The set of columns with IsKey set to VARIANT_TRUE must uniquely identify a row in the rowset. There is no requirement that this set of columns is a minimal set of columns. This set of columns may be generated from a base table primary key, a unique constraint or a unique index. VARIANT_FALSE-The column is not required to uniquely identify the row.
IsAutoIncrement	DBCOLUMN_AUTOINCREMENT	VARIANT_TRUE: The column assigns values to new rows in fixed increments. VARIANT_FALSE: The column does not assign values to new rows in fixed increments. The default of this column is VARIANT_FALSE.
BaseSchemaName	DBCOLUMN_SCHEMA_NAME	The name of the schema in the data store that contains the column. A null value if the base schema name cannot be determined. The default of this column is a null value.
BaseCatalogName	DBCOLUMN_CATALOG_NAME	The name of the catalog in the data store that contains the column. A null value if the base catalog name cannot be determined. The default of this column is a null value.
BaseTableName	DBCOLUMN_TABLE_NAME	The name of the table or view in the data store that contains the column. A null value if the base table name cannot be determined. The default of this column is a null value.
BaseColumnName	DBCOLUMN_COLUMN_NAME	The name of the column in the data store. This might be different than the column name returned in the Column Name column if an alias was used. A null value if the base column name cannot be determined or if the rowset column is derived, but not identical to, a column in the data store. The default of this column is a null value.

Implements

IDataReader.GetSchemaTable

[Return to top](#)

#### MsDb2DataReader.GetSchemaTable Method (Boolean)

Returns a data table that describes the column metadata of the MsDb2DataReader in addition to the keys.

Syntax

C#

```
public DataTable GetSchemaTable(
    bool retrieveKeys
)
```

C++

```
public:
    DataTable^ GetSchemaTable(
        bool retrieveKeys
    )
```

F#

```
member GetSchemaTable :
    retrieveKeys:bool -> DataTable
```

VB

```
Public Function GetSchemaTable (  
    retrieveKeys As Boolean  
) As DataTable
```

**Parameters**

*retrieveKeys*

Type: [System.Boolean](#)

**True** to retrieve the keys as well; otherwise, **false**.

**Return Value**

Type: [System.Data.DataTable](#)

A datatable containing the column metadata.

[Return to top](#)

# MsDb2DataReader.GetSchemaTable Method ()

Returns a data table that describes the column metadata of the MsDb2DataReader.

**Namespace:** Microsoft.HostIntegration.MsDb2Client  
**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)  
Usage  
Syntax  
VB

```
'Declaration
Public Overrides Function GetSchemaTable As DataTable
```

C#

```
public override DataTable GetSchemaTable ()
```

C++

```
public:
virtual DataTable^ GetSchemaTable () override
```

J#

```
public DataTable GetSchemaTable ()
```

JScript

```
public override function GetSchemaTable () : DataTable
```

**Return Value**

A data table that describes the column metadata of the MsDb2DataReader.

Remarks

The GetSchemaTable method maps to the OLE DB IColumnsRowset::GetColumnsRowset method, and returns metadata about each column in the following order:

Dat aRe ader Col um n	OLE DB Colum n ID	Description
Colu mn Nam e	DBCOL UMN_N AME	The name of the column; this might not be unique. If this cannot be determined, a null value is returned. This name always reflects the most recent renaming of the column in the current view or command text.
Colu mn Ordi nal	DBCOL UMN_N UMBER	The ordinal of the column. This is zero for the bookmark column of the row, if any. Other columns are numbered starting with one. This column cannot contain a null value.
Colu mnS ize	DBCOL UMN_C OLUM NSIZE	The maximum possible length of a value in the column. For columns that use a fixed-length data type, this is the size of the data type.

NumericPrecision	DBCOLUMN_PRECISION	If DbType is a numeric data type, this is the maximum precision of the column. The precision of columns with a data type of DBTYPE_DECIMAL or DBTYPE_NUMERIC depends on the definition of the column. If DbType is not a numeric data type, this is a null value.
NumericScale	DBCOLUMN_SCALE	If DbType is DBTYPE_DECIMAL or DBTYPE_NUMERIC, this is the number of digits to the right of the decimal point. Otherwise, this is a null value.
Data Type	None	Maps to the .NET Framework type of the column.
Provider Type	DBCOLUMN_TYPE	The indicator of the column's data type. If the data type of the column varies from row to row, this must be DBTYPE_VARIANT. This column cannot contain a null value.
IsLong	DBCOLUMNFLAGS_ISLONG	The provider sets DBCOLUMNFLAGS_ISLONG if the column contains a Binary Long Object (BLOB) that contains very long data. The definition of very long data is provider-specific. The setting of this flag corresponds to the value of the IS_LONG column in the PROVIDER_TYPES rowset for the data type.
AllowDBNull	DBCOLUMNFLAGS_ISNULLABLE	The provider sets DBCOLUMNFLAGS_ISNULLABLE if the consumer can set the column to a null value, or if the provider cannot determine whether or not the consumer can set the column to a null value. A column may contain null values, even if it cannot be set to a null value.
IsReadOnly	DBCOLUMNFLAGS_WRITE	true if the column can be modified; otherwise false. The column is assumed to be writable if the provider has set either the DBCOLUMNFLAGS_WRITE or DBCOLUMNFLAGS_WRITEUNKNOWN flag.
IsRowVersion	DBCOLUMNFLAGS_ISROWID	The provider sets DBCOLUMNFLAGS_ISROWID if the column contains a persistent row identifier that cannot be written to, and has no meaningful value except to identity the row.
IsUnique	DBCOLUMN_UNIQUE	VARIANT_TRUE: No two rows in the base table-the table returned in BaseTableName-can have the same value in this column. IsUnique is guaranteed to be VARIANT_TRUE if the column constitutes a key by itself or if there is a constraint of type UNIQUE that applies only to this column. VARIANT_FALSE: The column can contain duplicate values in the base table. The default of this column is VARIANT_FALSE.
IsKey	DBCOLUMN_KEYCOLUMN	VARIANT_TRUE: The column is one of a set of columns in the rowset that, taken together, uniquely identify the row. The set of columns with IsKey set to VARIANT_TRUE must uniquely identify a row in the rowset. There is no requirement that this set of columns is a minimal set of columns. This set of columns may be generated from a base table primary key, a unique constraint or a unique index. VARIANT_FALSE-The column is not required to uniquely identify the row.
IsAutoIncrement	DBCOLUMN_AUTOINCREMENT	VARIANT_TRUE: The column assigns values to new rows in fixed increments. VARIANT_FALSE: The column does not assign values to new rows in fixed increments. The default of this column is VARIANT_FALSE.

Base Schema Name	DBCOLUMN_NAME	The name of the schema in the data store that contains the column. A null value if the base schema name cannot be determined. The default of this column is a null value.
Base Catalog Name	DBCOLUMN_CATALOG_NAME	The name of the catalog in the data store that contains the column. A null value if the base catalog name cannot be determined. The default of this column is a null value.
Base Table Name	DBCOLUMN_TABLE_NAME	The name of the table or view in the data store that contains the column. A null value if the base table name cannot be determined. The default of this column is a null value.
Base Column Name	DBCOLUMN_COLUMN_NAME	The name of the column in the data store. This might be different than the column name returned in the Column Name column if an alias was used. A null value if the base column name cannot be determined or if the rowset column is derived, but not identical to, a column in the data store. The default of this column is a null value.

#### Implements

IDataReader.GetSchemaTable

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

#### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

#### Target Platforms

Returns a data table that describes the column metadata of the MsDb2DataReader in addition to the keys.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Function GetSchemaTable ( _
    retrieveKeys As Boolean _
) As DataTable
```

C#

```
public DataTable GetSchemaTable (
    bool retrieveKeys
)
```

C++

```
public:
    DataTable^ GetSchemaTable (
        bool retrieveKeys
    )
```

J#

```
public DataTable GetSchemaTable (
    boolean retrieveKeys
)
```

JScript

```
public function GetSchemaTable (
    retrieveKeys : boolean
) : DataTable
```

## Parameters

retrieveKeys

**True** to retrieve the keys as well; otherwise, **false**.

## Return Value

A datatable containing the column metadata.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# MsDb2DataReader.GetString Method

Retrieves the value of the specified column as a string.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetString ( _
    i As Integer _
) As String
```

C#

```
public override string GetString (
    int i
)
```

C++

```
public:
virtual String^ GetString (
    int i
) override
```

J#

```
public String GetString (
    int i
)
```

JScript

```
public override function GetString (
    i : int
) : String
```

## Parameters

i

The zero-based column ordinal.

## Return Value

The value of the specified column.

Remarks

No conversions are performed; the data retrieved must already be a string.

Call IsDBNull to check for **null** values before calling this method.

## Implements

IDataRecord.GetString

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

Retrieves the value of the specified column as a TimeSpan object.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Function GetTimeSpan ( _
    i As Integer _
) As TimeSpan
```

C#

```
public TimeSpan GetTimeSpan (
    int i
)
```

C++

```
public:
    TimeSpan GetTimeSpan (
        int i
    )
```

J#

```
public TimeSpan GetTimeSpan (
    int i
)
```

JScript

```
public function GetTimeSpan (
    i : int
) : TimeSpan
```

## Parameters

- i**  
The zero-based column ordinal.

## Return Value

The value of the specified column.

Remarks

No conversions are performed; the data retrieved must already be a TimeSpan object.

Call IsDBNull to check for **null** values before calling this method.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

# MsDb2DataReader.GetValue Method

Retrieves the value of the column at the specified ordinal in its native format.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetValue ( _
    i As Integer _
) As Object
```

C#

```
public override Object GetValue (
    int i
)
```

C++

```
public:
virtual Object^ GetValue (
    int i
) override
```

J#

```
public Object GetValue (
    int i
)
```

JScript

```
public override function GetValue (
    i : int
) : Object
```

## Parameters

i

The zero-based column ordinal.

## Return Value

The value of the specified column.

Remarks

This method returns DBNull for **null** database columns.

## Implements

IDataRecord.GetValue

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Reference

[MsDb2DataReader Class](#)

[MsDb2DataReader Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2DataReader.GetValues Method

Retrieves all the attribute columns in the current row.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetValues ( _
    values As Object() _
) As Integer
```

C#

```
public override int GetValues (
    Object[] values
)
```

C++

```
public:
virtual int GetValues (
    array<Object^>^ values
) override
```

J#

```
public int GetValues (
    Object[] values
)
```

JScript

```
public override function GetValues (
    values : Object[]
) : int
```

## Parameters

values

An array of Object into which to copy the attribute columns.

## Return Value

The number of instances of Object in the array.

Remarks

For most applications, the GetValues method provides an efficient means for retrieving all columns, rather than retrieving each column individually.

You can pass an Object array that contains fewer than the number of columns contained in the resulting row. Only the amount of data the Object array holds is copied to the array. You can also pass an Object array whose length is more than the number of columns contained in the resulting row.

This method returns DBNull for **null** database columns.

## Implements

IDataRecord.GetValues

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

# MsDb2DataReader.IsDBNull Method

Returns a value that indicates whether the column contains nonexistent or missing values.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function IsDBNull ( _
    i As Integer _
) As Boolean
```

C#

```
public override bool IsDBNull (
    int i
)
```

C++

```
public:
virtual bool IsDBNull (
    int i
) override
```

J#

```
public boolean IsDBNull (
    int i
)
```

JScript

```
public override function IsDBNull (
    i : int
) : boolean
```

## Parameters

i

The zero-based column ordinal.

## Return Value

**True** if the specified column value is equivalent to DBNull; otherwise, **false**.

Remarks

Call this method to check for null column values before calling the typed get methods (for example, GetByte, GetChar, and so on) to avoid raising an error.

## Implements

IDataRecord.IsDBNull

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2DataReader.NextResult Method

Advances the data reader to the next result, when reading the results of batch SQL statements.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function NextResult As Boolean
```

C#

```
public override bool NextResult ()
```

C++

```
public:
virtual bool NextResult () override
```

J#

```
public boolean NextResult ()
```

JScript

```
public override function NextResult () : boolean
```

## Return Value

**True** if there are more result sets; otherwise, **false**.

Remarks

Used to process multiple results, which can be generated by executing batch SQL statements.

By default, the data reader is positioned on the first result.

## Implements

IDataReader.NextResult

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

# MsDb2DataReader.Read Method

Advances the MsDb2DataReader to the next record.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Function Read As Boolean
```

C#

```
public override bool Read ()
```

C++

```
public:  
virtual bool Read () override
```

J#

```
public boolean Read ()
```

JScript

```
public override function Read () : boolean
```

## Return Value

**True** if there are more rows; otherwise, **false**.

Remarks

The default position of the MsDb2DataReader is prior to the first record. Therefore, you must call Read to begin accessing any data.

While the MsDb2DataReader is in use, the associated MsDb2Connection is busy serving it until you call Close.

## Implements

IDataReader.Read

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

# MsDb2DataReader.Depth Property

Gets a value indicating the depth of nesting for the current row.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property Depth As Integer
```

C#

```
public override int Depth { get; }
```

C++

```
public:
virtual property int Depth {
    int get () override;
}
```

J#

```
/** @property */
public int get_Depth ()
```

JScript

```
public override function get Depth () : int
```

## Property Value

The depth of nesting for the current row.

Remarks

The outermost table has a length of zero.

## Implements

IDataReader.Depth

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

# MsDb2DataReader.FieldCount Property

Gets the number of columns in the current row.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property FieldCount As Integer
```

C#

```
public override int FieldCount { get; }
```

C++

```
public:
virtual property int FieldCount {
    int get () override;
}
```

J#

```
/** @property */
public int get_FieldCount ()
```

JScript

```
public override function get FieldCount () : int
```

## Property Value

When not positioned in a valid RecordSet, 0; otherwise the number of columns in the current record. The default is -1.

Remarks

After executing a query that does not return rows, FieldCount returns 0.

## Implements

IDataRecord.FieldCount

## MsDb2DataReader.Item Property (Int32)

Gets the data described by the specified index.

Syntax

C#

```
public override object this[
    int i
] { get; }
```

C++

```
public:
property Object^ default[
    int i
] {
    virtual Object^ get(int i) override;
}
```

F#

```
override Item :
    i:int -> Object with get
```

VB

```
Public Overrides ReadOnly Property Item (
    i As Integer
) As Object
```

## Parameters

*i*

Type: [System.Int32](#)

The index of the data to access.

## Property Value

Type: [System.Object](#)

The data described by the specified index.

## Implements

[IDataRecord.Item\(Int32\)](#)

[Return to top](#)

## MsDb2DataReader.Item Property (String)

Gets the data that has the specified name.

## Syntax

### C#

```
public override object this[
    string name
] { get; }
```

### C++

```
public:
property Object^ default[
    String^ name
] {
    virtual Object^ get(String^ name) override;
}
```

### F#

```
override Item :
    name:string -> Object with get
```

### VB

```
Public Overrides ReadOnly Property Item (
    name As String
) As Object
```

## Parameters

*name*

Type: [System.String](#)

The data to retrieve.

## Property Value

Type: [System.Object](#)

The data with the specified name.

## Implements

[IDataRecord.Item\(String\)](#)

[Return to top](#)

# MsDb2DataReader.Item Property (Int32)

Gets the data described by the specified index.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Default Property Item ( _
    i As Integer _
) As Object
```

C#

```
public override Object this [
    int i
] { get; }
```

C++

```
public:
virtual property Object^ default [int] {
    Object^ get (int i) override;
}
```

J#

```
/** @property */
public Object get_Item (int i)
```

JScript

## Parameters

i

The index of the data to access.

## Property Value

The data described by the specified index.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

    end
```

VB

```
<SerializableAttribute>
Public NotInheritable Class MsDb2Exception
    Inherits Exception
```

## Properties

	Name	Description
	<a href="#">Data</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">HelpLink</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">HResult</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">InnerException</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">Message</a>	Gets the DB2 error message in question.(Overrides <a href="#">Exception.Message</a> .)
	<a href="#">Source</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">SqlCode</a>	Gets a value describing if the SQL statement was successfully executed.
	<a href="#">SqlState</a>	Gets a two-character class code describing the execution of an SQL statement.
	<a href="#">StackTrace</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">TargetSite</a>	(Inherited from <a href="#">Exception</a> .)

## Methods

Name	Description
------	-------------

 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetBaseException()</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetObjectData(SerializationInfo, StreamingContext)</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">ToString()</a>	Returns a String that represents the current Object.(Overrides <a href="#">Exception.ToString()</a> .)

#### Remarks

This class is created whenever the DB2 .NET Framework data provider encounters an error generated from the server. (Client side errors are thrown as standard URT exceptions.) MsDb2Exception always contains at least one instance of MsDb2Error.

If the severity of the error is too great, the server may close the MsDb2Connection. However, the user can reopen the connection and continue.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Gets the DB2 error message in question.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property Message As String
```

C#

```
public override string Message { get; }
```

C++

```
public:
virtual property String^ Message {
    String^ get () override;
}
```

J#

```
/** @property */
public String get_Message ()
```

JScript

```
public override function get Message () : String
```

## Property Value

The DB2 error message in question.

Remarks

**Value**

The DB2 error message.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2Exception.SqlCode Property

Gets a value describing if the SQL statement was successfully executed.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property SqlCode As Integer
```

C#

```
public int SqlCode { get; }
```

C++

```
public:
property int SqlCode {
    int get ();
}
```

J#

```
/** @property */
public int get_SqlCode ()
```

JScript

```
public function get SqlCode () : int
```

## Property Value

A value describing if the SQL statement was successfully executed.

Remarks

**Value**

The following table describes the possible value for SqlCode.

SqlCode	Description
0	Execution was successful
>0	Execution was successful, but a warning was generated.
<0	Execution was not successful.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# MsDb2Exception.SqlState Property

Gets a two-character class code describing the execution of an SQL statement.

**Namespace:** Microsoft.HostIntegration.MsDb2Client  
**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)  
Usage  
Syntax  
VB

```
'Declaration
Public ReadOnly Property SqlState As String
```

C#

```
public string SqlState { get; }
```

C++

```
public:
property String^ SqlState {
String^ get ();
}
```

J#

```
/** @property */
public String get_SqlState ()
```

JScript

```
public function get SqlState () : String
```

## Property Value

A two-character class code describing the execution of an SQL statement.

Remarks

### Value

A description of the execution of the previous SQL statement. The following table describes the possible values for SqlState.

Class Code	Description of Error Class
00	Successful completion. Execution of the SQL statement was successful and did not result in any type of warning or exception condition.
01	Warning
02	No Data
07	Dynamic SQL error
08	Connection exception
0A	Feature not supported
0F	Invalid token

21	Cardinality violation
22	Data exception
23	Constraint violation
24	Invalid cursor state
25	Invalid Transaction state
26	Invalid SQL statement identifier
2D	Invalid transaction termination
34	Invalid cursor name
39	External function call exception
40	Transaction rollback
42	Syntax error or access rule violation
44	WITH CHECK OPTION violation
51	Invalid application state
53	Invalid operand or inconsistent specification
54	SQL or product limit exceeded
55	Object not in prerequisite state
56	Miscellaneous SQL or product errors
57	Resource not available or operator intervention
58	System error

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# MsDb2Factory.CreateCommandBuilder Method

Creates a new command builder.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Function CreateCommandBuilder As DbCommandBuilder
```

C#

```
public override DbCommandBuilder CreateCommandBuilder ()
```

C++

```
public:  
virtual DbCommandBuilder^ CreateCommandBuilder () override
```

J#

```
public DbCommandBuilder CreateCommandBuilder ()
```

JScript

```
public override function CreateCommandBuilder () : DbCommandBuilder
```

## Return Value

A DbCommandBuilder representing the new command builder.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2NetworkPropertiesAPPC.TPName Property

Gets or sets the default transaction program name for the DB2 host server.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Property TPName As String
```

C#

```
public string TPName { get; set; }
```

C++

```
public:
property String^ TPName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_TPName ()

/** @property */
public void set_TPName (String value)
```

JScript

```
public function get TPName () : String

public function set TPName (value : String)
```

## Property Value

The default transaction program name for the DB2 host server.

Remarks

**Value**

The default transaction program name.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**MsDb2Parameter Constructor ()**

Initializes a new instance of the [MsDb2Parameter](#) class.

Syntax  
C#

```
public MsDb2Parameter()
```

C++

```
public:  
MsDb2Parameter()
```

F#

```
new : unit -> MsDb2Parameter
```

VB

```
Public Sub New
```

[Return to top](#)

#### **MsDb2Parameter Constructor (String, MsDb2Type)**

Initializes a new instance of the [MsDb2Parameter](#) class using the specified name and type.

Syntax

C#

```
public MsDb2Parameter(  
    string name,  
    MsDb2Type msDb2Type  
)
```

C++

```
public:  
MsDb2Parameter(  
    String^ name,  
    MsDb2Type msDb2Type  
)
```

F#

```
new :  
    name:string *  
    msDb2Type:MsDb2Type -> MsDb2Parameter
```

VB

```
Public Sub New (  
    name As String,  
    msDb2Type As MsDb2Type  
)
```

#### **Parameters**

*name*

Type: [System.String](#)

The name of the parameter to map.

*msDb2Type*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Type](#)

One of the MsDb2Type values.

Remarks

The data type, and if appropriate, Size and Precision are inferred from the value of the Type parameter.

[Return to top](#)

#### **MsDb2Parameter Constructor (String, MsDb2Type, Int32)**

Initializes a new instance of the [MsDb2Parameter](#) class using the specified parameter name, type, and size.

Syntax

C#

```
public MsDb2Parameter(  
    string name,
```

```
    MsDb2Type msDb2Type,  
    int size  
)
```

C++

```
public:  
    MsDb2Parameter(  
        String^ name,  
        MsDb2Type msDb2Type,  
        int size  
    )
```

F#

```
new :  
    name:string *  
    msDb2Type:MsDb2Type *  
    size:int -> MsDb2Parameter
```

VB

```
Public Sub New (  
    name As String,  
    msDb2Type As MsDb2Type,  
    size As Integer  
)
```

#### Parameters

*name*

Type: [System.String](#)

The name of the parameter to map.

*msDb2Type*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Type](#)

One of the MsDb2Type values.

*size*

Type: [System.Int32](#)

The width of the parameter.

Remarks

The Size is inferred from the value of the dataType parameter if it is not explicitly set in the size parameter.

[Return to top](#)

**MsDb2Parameter Constructor (String, MsDb2Type, Int32, ParameterDirection, Boolean, Byte, Byte, String, DataRowVersion, Object)**

Initializes a new instance of the [MsDb2Parameter](#) class using the specified parameters.

Syntax

C#

```
public MsDb2Parameter(  
    string name,  
    MsDb2Type msDb2Type,  
    int size,  
    ParameterDirection direction,  
    bool isNullable,  
    byte precision,  
    byte scale,  
    string srcColumn,  
    DataRowVersion srcVersion,  
    object value  
)
```

C++

```
public:  
    MsDb2Parameter(  
        String^ name,  
        MsDb2Type msDb2Type,  
        int size,
```

```

ParameterDirection direction,
bool isNullable,
unsigned char precision,
unsigned char scale,
String^ srcColumn,
DataRowVersion srcVersion,
Object^ value
)

```

F#

```

new :
    name:string *
    msDb2Type:MsDb2Type *
    size:int *
    direction:ParameterDirection *
    isNullable:bool *
    precision:byte *
    scale:byte *
    srcColumn:string *
    srcVersion:DataRowVersion *
    value:Object -> MsDb2Parameter

```

VB

```

Public Sub New (
    name As String,
    msDb2Type As MsDb2Type,
    size As Integer,
    direction As ParameterDirection,
    isNullable As Boolean,
    precision As Byte,
    scale As Byte,
    srcColumn As String,
    srcVersion As DataRowVersion,
    value As Object
)

```

## Parameters

*name*

Type: [System.String](#)  
The name of the parameter to map.

*msDb2Type*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Type](#)  
One of the MsDb2Type values.

*size*

Type: [System.Int32](#)  
The width of the parameter.

*direction*

Type: [System.Data.ParameterDirection](#)  
One of the ParameterDirection values.

*isNullable*

Type: [System.Boolean](#)  
**true** if the value of the field can be **null**; otherwise, **false**.

*precision*

Type: [System.Byte](#)  
The total number of digits to the left and right of the decimal point to which Value is resolved

*scale*

Type: [System.Byte](#)  
The total number of decimal places to which Value is resolved

*srcColumn*

Type: [System.String](#)  
The name of the source column.

*srcVersion*

Type: [System.Data.DataRowVersion](#)

One of the DataRowVersion values.

*value*

Type: [System.Object](#)

An Object that is the value of the MsDb2Parameter.

Remarks

The Size and Precision are inferred from the value of the dataType parameter if they are not explicitly set in the size and precision parameters

[Return to top](#)

**MsDb2Parameter Constructor (String, MsDb2Type, Int32, ParameterDirection, String, DataRowVersion, Boolean, Object)**

Initializes a new instance of the [MsDb2Parameter](#) class.

Syntax

C#

```
public MsDb2Parameter(  
    string name,  
    MsDb2Type msDb2Type,  
    int size,  
    ParameterDirection direction,  
    string sourceColumn,  
    DataRowVersion sourceVersion,  
    bool sourceColumnNullMapping,  
    object value  
)
```

C++

```
public:  
MsDb2Parameter(  
    String^ name,  
    MsDb2Type msDb2Type,

    bool sourceColumnNullMapping,  
    Object^ value  
)
```

F#

```
new :  
    name:string *  
    msDb2Type:MsDb2Type *  
    size:int *  
    direction:ParameterDirection *  
    sourceColumn:string *  
    sourceVersion:DataRowVersion *  
    sourceColumnNullMapping:bool *  
    value:Object -> MsDb2Parameter
```

VB

```
Public Sub New (  
    name As String,  
    msDb2Type As MsDb2Type,  
    size As Integer,  
    direction As ParameterDirection,  
    sourceColumn As String,  
    sourceVersion As DataRowVersion,  
    sourceColumnNullMapping As Boolean,  
    value As Object  
)
```

**Parameters**

*name*

Type: [System.String](#)

The name of the parameter to map.

*msDb2Type*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Type](#)

One of the MsDb2Type values.

*size*

Type: [System.Int32](#)

The width of the parameter.

*direction*

Type: [System.Data.ParameterDirection](#)

One of the ParameterDirection values.

*sourceColumn*

Type: [System.String](#)

The name of the source column.

*sourceVersion*

Type: [System.Data.DataRowVersion](#)

One of the DataRowVersion values.

*sourceColumnNullMapping*

Type: [System.Boolean](#)

**true** if the value of the column can be **null**; otherwise, **false**.

*value*

Type: [System.Object](#)

An Object that is the value of the MsDb2Parameter.

Remarks

The Size and Precision are inferred from the value of the dataType parameter if they are not explicitly set in the size and precision parameters

[Return to top](#)

**MsDb2Parameter Constructor (String, MsDb2Type, Int32, String)**

Initializes a new instance of the [MsDb2Parameter](#) class using the specified parameter name, type, size, and source column name.

Syntax

C#

```
public MsDb2Parameter(  
    string name,  
    MsDb2Type msDb2Type,  
    int size,  
    string srcColumn  
)
```

C++

```
public:  
    MsDb2Parameter(  
        String^ name,  
        MsDb2Type msDb2Type,  
        int size,  
        String^ srcColumn  
    )
```

F#

```
new :  
    name:string *  
    msDb2Type:MsDb2Type *  
    size:int *  
    srcColumn:string -> MsDb2Parameter
```

VB

```
Public Sub New (  
    name As String,  
    msDb2Type As MsDb2Type,  
    size As Integer,  
    srcColumn As String  
)
```

## Parameters

*name*

Type: [System.String](#)

The name of the parameter to map.

*msDb2Type*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Type](#)

One of the MsDb2Type values.

*size*

Type: [System.Int32](#)

The width of the parameter.

*srcColumn*

Type: [System.String](#)

The name of the source column.

Remarks

The Size is inferred from the value of type if not explicitly set in size.

[Return to top](#)

## MsDb2Parameter Constructor (String, Object)

Initializes a new instance of the [MsDb2Parameter](#) class using the specified name and value.

Syntax

C#

```
public MsDb2Parameter(  
    string name,  
    object value  
)
```

C++

```
public:  
MsDb2Parameter(  
    String^ name,  
    Object^ value  
)
```

F#

```
new :  
    name:string *  
    value:Object -> MsDb2Parameter
```

VB

```
Public Sub New (  
    name As String,  
    value As Object  
)
```

## Parameters

*name*

Type: [System.String](#)

The name of the parameter to map.

*value*

Type: [System.Object](#)

The value of the new MsDb2Parameter object.

Remarks

When you specify an Object in the value parameter, the MsDb2Type is inferred from the .NET Framework type of the Object.

[Return to top](#)

# MsDb2Parameter Constructor ()

Initializes a new instance of the [MsDb2Parameter](#) class.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public MsDb2Parameter ()
```

C++

```
public:  
MsDb2Parameter ()
```

J#

```
public MsDb2Parameter ()
```

JScript

```
public function MsDb2Parameter ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    name As String, _
    msDb2Type As MsDb2Type _
)
```

C#

```
public MsDb2Parameter (
    string name,
    MsDb2Type msDb2Type
)
```

C++

```
public:
    MsDb2Parameter (
        String^ name,
        MsDb2Type msDb2Type
    )
```

J#

```
public MsDb2Parameter (
    String name,
    MsDb2Type msDb2Type
)
```

JScript

```
public function MsDb2Parameter (
    name : String,
    msDb2Type : MsDb2Type
)
```

## Parameters

name

The name of the parameter to map.

msDb2Type

One of the MsDb2Type values.

Remarks

The data type, and if appropriate, Size and Precision are inferred from the value of the Type parameter.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

public function MsDb2Parameter (  
    name : String,  
    msDb2Type : MsDb2Type,  
    size : int,  
    direction : ParameterDirection,  
    isNullable : boolean,  
    precision : byte,  
    scale : byte,  
    srcColumn : String,  
    srcVersion : DataRowVersion,  
    value : Object  
)
```

## Parameters

### name

The name of the parameter to map.

### msDb2Type

One of the MsDb2Type values.

### size

The width of the parameter.

### direction

One of the ParameterDirection values.

### isNullable

**true** if the value of the field can be **null**; otherwise, **false**.

### precision

The total number of digits to the left and right of the decimal point to which Value is resolved

### scale

The total number of decimal places to which Value is resolved

### srcColumn

The name of the source column.

### srcVersion

One of the DataRowVersion values.

### value

An Object that is the value of the MsDb2Parameter.

## Remarks

The Size and Precision are inferred from the value of the dataType parameter if they are not explicitly set in the size and precision parameters

J#

```
/** @property */
public ParameterDirection get_Direction ()

/** @property */
public void set_Direction (ParameterDirection value)
```

JScript

```
public override function get Direction () : ParameterDirection

public override function set Direction (value : ParameterDirection)
```

## Property Value

ParameterDirection containing the direction of the parameter. The default value is Input.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2Parameter.IsNullable Property

Gets or sets a value that indicates whether the parameter can be set to null or not.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property IsNullable As Boolean
```

C#

```
public override bool IsNullable { get; set; }
```

C++

```
public:
virtual property bool IsNullable {
    bool get () override;
    void set (bool value) override;
}
```

J#

```
/** @property */
public boolean get_IsNullable ()

/** @property */
public void set_IsNullable (boolean value)
```

JScript

```
public override function get IsNullable () : boolean

public override function set IsNullable (value : boolean)
```

## Property Value

**True** if null values are accepted; otherwise, **false**. The default is **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[MsDb2Parameter Class](#)

[MsDb2Parameter Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2Parameter.Size Property

Gets or sets the size of the parameter.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property Size As Integer
```

C#

```
public override int Size { get; set; }
```

C++

```
public:
virtual property int Size {
    int get () override;
    void set (int value) override;
}
```

J#

```
/** @property */
public int get_Size ()

/** @property */
public void set_Size (int value)
```

JScript

```
public override function get Size () : int

public override function set Size (value : int)
```

## Property Value

The maximum size, in bytes, of the data within the column. The default value is inferred from the parameter value.

Remarks

Size is used for all types of parameters.

For variable length data types, the Size property describes the maximum amount of data to transmit to the server. For example, the Size property can be used to limit the amount of data sent to the server for a string value to the first one hundred bytes.

For nonstring data types and ANSI string data, the Size property refers to the number of bytes. For Unicode string data, the Size property refers to the number of characters. The count for strings does not include the terminating character.

If not explicitly set, the size is inferred from the actual size of the specified parameter value. For fixed width data types, the value of Size is ignored. It can be retrieved for informational purposes, and returns the maximum amount of bytes the provider uses when transmitting the value of the parameter to the server.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[MsDb2Parameter Class](#)

[MsDb2Parameter Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2Parameter.Value Property

Gets or sets the value of the parameter, or the destination of an output parameter.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property Value As Object
```

C#

```
public override Object Value { get; set; }
```

C++

```
public:
virtual property Object^ Value {
    Object^ get () override;
    void set (Object^ value) override;
}
```

J#

```
/** @property */
public Object get_Value ()

/** @property */
public void set_Value (Object value)
```

JScript

```
public override function get Value () : Object

public override function set Value (value : Object)
```

## Property Value

The value of the parameter, or the destination of an output parameter. The default value is **null**.

Remarks

For input parameters, the value is bound to the MsDb2Command that is sent to the server. For output and return value parameters, the value is set on completion of the MsDb2Command and after the MsDb2DataReader is closed.

When sending a null parameter value to the server, the user must specify DBNull, not null. The null value in the system is an empty object that has no value. DBNull is used to represent null values.

If the application specifies the database type, the bound value is converted to that type when the provider sends the data to the server. The provider attempts to convert any type of value if it supports the IConvertible interface. Conversion errors may result if the specified type is not compatible with the value.

Both the DbType and MsDb2Type properties can be inferred by setting the Value.

## Exceptions

Exception Type	Condition
BadOutputParameter()	The parameter is output and is not specified

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not

guaranteed to be thread safe.

**Microsoft.HostIntegration.MsDb2Client.MsDb2ParameterCollection**

Syntax

C#

```
public sealed class MsDb2ParameterCollection : DbParameterCollection
```

C++

```
public ref class MsDb2ParameterCollection sealed : DbParameterCollection
```

F#

```
[<Sealed>]  
type MsDb2ParameterCollection =  
    class  
        inherit DbParameterCollection  
    end
```

VB

```
Public NotInheritable Class MsDb2ParameterCollection  
    Inherits DbParameterCollection
```

Properties

	Name	Description
	<a href="#">Count</a>	Gets the number of MsDb2Parameter objects in the collection. (Overrides <a href="#">DbParameterCollection.Count</a> .)
	<a href="#">IsFixedSize</a>	Gets a value that indicates whether the collection is a fixed size.(Overrides <a href="#">DbParameterCollection.IsFixedSize</a> .)
	<a href="#">IsReadOnly</a>	Gets a value that indicates whether the collection is read-only.(Overrides <a href="#">DbParameterCollection.IsReadOnly</a> .)
	<a href="#">IsSynchronized</a>	Gets a value that indicates whether the collection is synchronized.(Overrides <a href="#">DbParameterCollection.IsSynchronized</a> .)
	<a href="#">Item(Int32)</a>	Gets or sets an MsDb2Parameter in the specified index.
	<a href="#">Item(String)</a>	Gets or sets the DbParameter with the specified name.
	<a href="#">SyncRoot</a>	Gets the object to be used to synchronize access to the collection.(Overrides <a href="#">DbParameterCollection.SyncRoot</a> .)

Methods

	Name	Description
	<a href="#">Add(MsDb2Parameter)</a>	Adds the specified MsDb2Parameter to the MsDb2ParameterCollection.
	<a href="#">Add(Object)</a>	(Inherited from <a href="#">DbParameterCollection</a> .)

 <a href="#">Add(String, MsDb2Type)</a>	Adds an MsDb2Parameter to the MsDb2ParameterCollection given the parameter name and data type.
 <a href="#">Add(String, MsDb2Type, Int32)</a>	Adds an MsDb2Parameter to the MsDb2ParameterCollection given the parameter name, data type, and column width.
 <a href="#">Add(String, MsDb2Type, Int32, String)</a>	Adds an MsDb2Parameter to the MsDb2ParameterCollection given the parameter name, data type, column width, and source column name.
 <a href="#">AddRange(Array)</a>	Adds an array of items with the specified values to the MsDb2ParameterCollection.(Overrides <a href="#">DbParameterCollection.AddRange(Array)</a> .)
 <a href="#">AddRange(MsDb2Parameter[])</a>	Adds an array of MsDb2Parameter items with the specified values to the MsDb2ParameterCollection.
 <a href="#">AddWithValue(String, Object)</a>	Adds the specified value to the MsDb2ParameterCollection using the specified parameter name.
 <a href="#">Clear()</a>	Removes all items from the collection.(Overrides <a href="#">DbParameterCollection.Clear()</a> .)
 <a href="#">Contains(MsDb2Parameter)</a>	Indicates whether the MsDbParameter with the specified property exists in the collection.
 <a href="#">Contains(Object)</a>	Indicates whether a parameter exists in the collection, based on its name.(Overrides <a href="#">DbParameterCollection.Contains(Object)</a> .)
 <a href="#">Contains(String)</a>	Indicates whether an MsDb2Parameter with the specified parameter name exists in the collection.(Overrides <a href="#">DbParameterCollection.Contains(String)</a> .)
 <a href="#">CopyTo(Array, Int32)</a>	Copies MsDb2Parameter objects from the MsDb2ParameterCollection to the specified array.(Overrides <a href="#">DbParameterCollection.CopyTo(Array, Int32)</a> .)
 <a href="#">CopyTo(MsDb2Parameter[], Int32)</a>	Copies an array of items to the collection starting at the specified index.
 <a href="#">CreateObjRef(Type)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetEnumerator()</a>	Exposes the GetEnumerator method, which supports a simple iteration over a collection by a .NET Framework data provider. (Overrides <a href="#">DbParameterCollection.GetEnumerator()</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">IndexOf(MsDb2Parameter)</a>	Returns the index of the specified MsDb2Parameter object.
 <a href="#">IndexOf(Object)</a>	Returns the location of the MsDb2Parameter in the collection. (Overrides <a href="#">DbParameterCollection.IndexOf(Object)</a> .)
 <a href="#">IndexOf(String)</a>	Returns the location of the MsDb2Parameter in the collection with the specified parameter name. (Overrides <a href="#">DbParameterCollection.IndexOf(String)</a> .)
 <a href="#">InitializeLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">Insert(Int32, MsDb2Parameter)</a>	Inserts an MsDb2Parameter into the collection at the specified index.
 <a href="#">Insert(Int32, Object)</a>	Inserts an MsDb2Parameter into the collection at the specified index.(Overrides <a href="#">DbParameterCollection.Insert(Int32, Object)</a> .)
<a href="#">Remove(MsDb2Parameter)</a>	Removes the specified MsDb2Parameter from the collection.

 <a href="#">Remove(Object)</a>	Removes the specified MsDb2Parameter from the collection.(Overrides <a href="#">DbParameterCollection.Remove(Object).</a> )
 <a href="#">RemoveAt(Int32)</a>	Removes the MsDb2Parameter at the specified index from the collection.(Overrides <a href="#">DbParameterCollection.RemoveAt(Int32).</a> )
 <a href="#">RemoveAt(String)</a>	Removes the MsDb2Parameter at the specified name from the collection.(Overrides <a href="#">DbParameterCollection.RemoveAt(String).</a> )
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object.</a> )

#### Remarks

The number of parameters in the collection must be equal to the number of parameter placeholders within the command text, or the MsDb2 .NET Framework data provider might raise an error.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# MsDb2ParameterCollection Members

Represents a strongly typed collection of MsDb2Parameters.

The following tables list the members exposed by the [MsDb2ParameterCollection](#) type.

## Public Properties

	Name	Description
	<a href="#">Count</a>	Overridden. Gets the number of MsDb2Parameter objects in the collection.
	<a href="#">IsFixedSize</a>	Overridden. Gets a value that indicates whether the collection is a fixed size.
	<a href="#">IsReadOnly</a>	Overridden. Gets a value that indicates whether the collection is read-only.
	<a href="#">IsSynchronized</a>	Overridden. Gets a value that indicates whether the collection is synchronized.
	<a href="#">Item</a>	Overloaded. Gets or sets an MsDb2Parameter in the collection.
	<a href="#">SyncRoot</a>	Overridden. Gets the object to be used to synchronize access to the collection.

## Top

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Add</a>	Overloaded. Adds a DbParameter item with the specified value to the MsDb2ParameterCollection.
	<a href="#">AddRange</a>	Overloaded. Overridden. Adds an array of items with the specified values to the MsDb2ParameterCollection.
	<a href="#">AddWithValue</a>	Adds the specified value to the MsDb2ParameterCollection using the specified parameter name.
	<a href="#">Clear</a>	Overridden. Removes all items from the collection.
	<a href="#">Contains</a>	Overloaded.
	<a href="#">CopyTo</a>	Overloaded. Overridden. Copies an array of items to the collection starting at the specified index.
	<a href="#">CreateObjRef</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">GetEnumerator</a>	Overridden. Exposes the GetEnumerator method, which supports a simple iteration over a collection by a .NET Framework data provider.
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
	<a href="#">IndexOf</a>	Overloaded.
	<a href="#">InitializeLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">Insert</a>	Overloaded. Inserts an MsDb2Parameter into the collection at the specified index.
	<a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Remove</a>	Overloaded. Removes the specified DbParameter object from the collection.
	<a href="#">RemoveAt</a>	Overloaded. Overridden. Removes the MsDb2Parameter at the specified index from the collection.
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )

**MsDb2ParameterCollection.Add Method (MsDb2Parameter)**  
Adds the specified MsDb2Parameter to the MsDb2ParameterCollection.

Syntax  
C#

```
public MsDb2Parameter Add(  
    MsDb2Parameter value  
)
```

C++

```
public:  
MsDb2Parameter^ Add(  
    MsDb2Parameter^ value  
)
```

F#

```
member Add :  
    value:MsDb2Parameter -> MsDb2Parameter
```

VB

```
Public Function Add (  
    value As MsDb2Parameter  
) As MsDb2Parameter
```

**Parameters**  
*value*  
Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)  
The parameter to add to the collection.

**Return Value**  
Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)  
A reference to the new MsDb2Parameter.

[Return to top](#)

### **MsDb2ParameterCollection.Add Method (String, MsDb2Type)**

Adds an MsDb2Parameter to the MsDb2ParameterCollection given the parameter name and data type.

Syntax

C#

```
public MsDb2Parameter Add(  
    string parameterName,  
    MsDb2Type MsDb2Type  
)
```

C++

```
public:  
    MsDb2Parameter^ Add(  
        String^ parameterName,  
        MsDb2Type MsDb2Type  
    )
```

F#

```
member Add :  
    parameterName:string *  
    MsDb2Type:MsDb2Type -> MsDb2Parameter
```

VB

```
Public Function Add (  
    parameterName As String,  
    MsDb2Type As MsDb2Type  
) As MsDb2Parameter
```

#### **Parameters**

*parameterName*

Type: [System.String](#)

The name of the parameter to add.

*MsDb2Type*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Type](#)

The MsDb2 type of the parameter.

#### **Return Value**

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)

A reference to the new MsDb2Parameter object.

[Return to top](#)

### **MsDb2ParameterCollection.Add Method (String, MsDb2Type, Int32)**

Adds an MsDb2Parameter to the MsDb2ParameterCollection given the parameter name, data type, and column width.

Syntax

C#

```
public MsDb2Parameter Add(  
    string parameterName,  
    MsDb2Type MsDb2Type,  
    int size  
)
```

C++

```
public:  
    MsDb2Parameter^ Add(  
        String^ parameterName,  
        MsDb2Type MsDb2Type,  
        int size
```

)

F#

```
member Add :  
    parameterName:string *  
    MsDb2Type:MsDb2Type *  
    size:int -> MsDb2Parameter
```

VB

```
Public Function Add (  
    parameterName As String,  
    MsDb2Type As MsDb2Type,  
    size As Integer  
) As MsDb2Parameter
```

#### Parameters

*parameterName*

Type: [System.String](#)

The name of the parameter to add.

*MsDb2Type*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Type](#)

One of the MsDb2Type values.

*size*

Type: [System.Int32](#)

The width of the column.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)

A reference to the MsDb2Parameter column.

[Return to top](#)

#### MsDb2ParameterCollection.Add Method (String, MsDb2Type, Int32, String)

Adds an MsDb2Parameter to the MsDb2ParameterCollection given the parameter name, data type, column width, and source column name.

Syntax

C#

```
public MsDb2Parameter Add(  
    string parameterName,  
    MsDb2Type MsDb2Type,  
    int size,  
    string sourceColumn  
)
```

C++

```
public:  
    MsDb2Parameter^ Add(  
        String^ parameterName,  
        MsDb2Type MsDb2Type,  
        int size,  
        String^ sourceColumn  
    )
```

F#

```
member Add :  
    parameterName:string *  
    MsDb2Type:MsDb2Type *  
    size:int *  
    sourceColumn:string -> MsDb2Parameter
```

VB

```
Public Function Add (  
    parameterName As String,  
    MsDb2Type As MsDb2Type,  
    size As Integer,  
    sourceColumn As String  
) As MsDb2Parameter
```

#### Parameters

*parameterName*

Type: [System.String](#)

The name of the parameter to add.

*MsDb2Type*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Type](#)

One of the MsDb2Type values.

*size*

Type: [System.Int32](#)

The width of the column.

*sourceColumn*

Type: [System.String](#)

The name of the source column.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)

A reference to the MsDb2Parameter.

[Return to top](#)

# MsDb2ParameterCollection.Add Method (MsDb2Parameter)

Adds the specified MsDb2Parameter to the MsDb2ParameterCollection.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Function Add ( _
    value As MsDb2Parameter _
) As MsDb2Parameter
```

C#

```
public MsDb2Parameter Add (
    MsDb2Parameter value
)
```

C++

```
public:
    MsDb2Parameter^ Add (
        MsDb2Parameter^ value
    )
```

J#

```
public MsDb2Parameter Add (
    MsDb2Parameter value
)
```

JScript

```
public function Add (
    value : MsDb2Parameter
) : MsDb2Parameter
```

## Parameters

value

The parameter to add to the collection.

## Return Value

A reference to the new MsDb2Parameter.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2ParameterCollection.Add Method (Object)

Adds an MsDb2Parameter to the MsDb2ParameterCollection.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides Function Add ( _
    value As Object _
) As Integer
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override int Add (
    Object value
)
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual int Add (
    Object^ value
) override
```

J#

```
/** @attribute EditorBrowsableAttribute(EditorBrowsableState.Never) */
public int Add (
    Object value
)
```

JScript

```
EditorBrowsableAttribute(EditorBrowsableState.Never)
public override function Add (
    value : Object
) : int
```

## Parameters

value

The MsDb2Parameter to add to the collection.

## Return Value

The index of the new MsDb2Parameter in the collection.

Remarks

## Implements

ICollection.Add

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

false)
EditorBrowsableAttribute(EditorBrowsableState.Never)
public function Add (
    parameterName : String,
    value : Object
) : MsDb2Parameter
```

---

## Parameters

parameterName

The name of the parameter.

value

The object value of the MsDb2Parameter to add to the collection.

## Return Value

A reference to the new MsDb2Parameter.

Remarks

When you specify an Object in the value parameter, the MsDb2Type is inferred from the .NET Framework type of the Object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## MsDb2ParameterCollection.Contains Method (MsDb2Parameter)

Indicates whether the MsDb2Parameter with the specified property exists in the collection.

Syntax

C#

```
public bool Contains(  
    MsDb2Parameter value  
)
```

C++

```
public:  
bool Contains(  
    MsDb2Parameter^ value  
)
```

F#

```
member Contains :  
    value:MsDb2Parameter -> bool
```

VB

```
Public Function Contains (  
    value As MsDb2Parameter  
) As Boolean
```

## Parameters

*value*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)

The value of the property to look for in the collection.

## Return Value

Type: [System.Boolean](#)

**True** if MsDb2Parameter with the specified property exists in the collection; otherwise, **false**.

[Return to top](#)

## MsDb2ParameterCollection.Contains Method (Object)

Indicates whether a parameter exists in the collection, based on its name.

Syntax

C#

```
public override bool Contains(  
    object value  
)
```

C++

```
public:  
virtual bool Contains(  
    Object^ value  
) override
```

F#

```
override Contains :  
    value:Object -> bool
```

VB

```
Public Overrides Function Contains (  
    value As Object  
) As Boolean
```

#### Parameters

*value*

Type: [System.Object](#)

The value of the MsDb2Parameter to find.

#### Return Value

Type: [System.Boolean](#)

**True** if the collection contains the MsDb2Parameter; otherwise, **false**.

#### Implements

[IList.Contains\(Object\)](#)

Remarks

Implements

[IList.Contains](#)

[Return to top](#)

#### MsDb2ParameterCollection.Contains Method (String)

Indicates whether an MsDb2Parameter with the specified parameter name exists in the collection.

Syntax

C#

```
public override bool Contains(  
    string value  
)
```

C++

```
public:  
virtual bool Contains(  
    String^ value  
) override
```

F#

```
override Contains :  
    value:string -> bool
```

VB

```
Public Overrides Function Contains (  
    value As String  
) As Boolean
```

#### Parameters

*value*

Type: [System.String](#)

The name of the parameter.

#### Return Value

Type: [System.Boolean](#)

**True** if the collection contains the parameter; otherwise, **false**.

#### Implements

[IDataParameterCollection.Contains\(String\)](#)

Remarks

Implements

[IDataParameterCollection.Contains](#)

[Return to top](#)

# MsDb2ParameterCollection.Contains Method (MsDb2Parameter)

Indicates whether the MsDbParameter with the specified property exists in the collection.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Function Contains ( _
    value As MsDb2Parameter _
) As Boolean
```

C#

```
public bool Contains (
    MsDb2Parameter value
)
```

C++

```
public:
bool Contains (
    MsDb2Parameter^ value
)
```

J#

```
public boolean Contains (
    MsDb2Parameter value
)
```

JScript

```
public function Contains (
    value : MsDb2Parameter
) : boolean
```

## Parameters

value

The value of the property to look for in the collection.

## Return Value

**True** if MsDbParameter with the specified property exists in the collection; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## MsDb2ParameterCollection.CopyTo Method (Array, Int32)

Copies MsDb2Parameter objects from the MsDb2ParameterCollection to the specified array.

Syntax

C#

```
public override void CopyTo(  
    Array array,  
    int index  
)
```

C++

```
public:  
virtual void CopyTo(  
    Array^ array,  
    int index  
) override
```

F#

```
override CopyTo :  
    array:Array *  
    index:int -> unit
```

VB

```
Public Overrides Sub CopyTo (  
    array As Array,  
    index As Integer  
)
```

## Parameters

*array*

Type: [System.Array](#)

The array into which to copy the MsDb2Parameter.

*index*

Type: [System.Int32](#)

The starting index of the array.

## Implements

[ICollection.CopyTo\(Array, Int32\)](#)

Remarks

Implements  
ICollection.CopyTo

[Return to top](#)

### **MsDb2ParameterCollection.CopyTo Method (MsDb2Parameter[], Int32)**

Copies an array of items to the collection starting at the specified index.

Syntax

C#

```
public void CopyTo(  
    MsDb2Parameter[] array,  
    int index  
)
```

C++

```
public:  
void CopyTo(  
    array<MsDb2Parameter^>^ array,  
    int index  
)
```

F#

```
member CopyTo :  
    array:MsDb2Parameter[] *  
    index:int -> unit
```

VB

```
Public Sub CopyTo (  
    array As MsDb2Parameter(),  
    index As Integer  
)
```

### **Parameters**

*array*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)

The array of items to copy to the collection.

*index*

Type: [System.Int32](#)

The index in the collection to copy the items.

[Return to top](#)

# MsDb2ParameterCollection.CopyTo Method (Array, Int32)

Copies MsDb2Parameter objects from the MsDb2ParameterCollection to the specified array.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Sub CopyTo ( _
    array As Array, _
    index As Integer _
)
```

C#

```
public override void CopyTo (
    Array array,
    int index
)
```

C++

```
public:
virtual void CopyTo (
    Array^ array,
    int index
) override
```

J#

```
public void CopyTo (
    Array array,
    int index
)
```

JScript

```
public override function CopyTo (
    array : Array,
    index : int
)
```

## Parameters

array

The array into which to copy the MsDb2Parameter.

index

The starting index of the array.

Remarks

## Implements

ICollection.CopyTo

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

# MsDb2ParameterCollection.GetEnumerator Method

Exposes the GetEnumerator method, which supports a simple iteration over a collection by a .NET Framework data provider.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetEnumerator As IEnumerator
```

C#

```
public override IEnumerator GetEnumerator ()
```

C++

```
public:
virtual IEnumerator^ GetEnumerator () override
```

J#

```
public IEnumerator GetEnumerator ()
```

JScript

```
public override function GetEnumerator () : IEnumerator
```

## Return Value

An enumerator that iterates through a collection.

Remarks

## Implements

IEnumerable.GetEnumerator

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## MsDb2ParameterCollection.IndexOf Method (MsDb2Parameter)

Returns the index of the specified MsDb2Parameter object.

Syntax

C#

```
public int IndexOf(  
    MsDb2Parameter value  
)
```

C++

```
public:  
int IndexOf(  
    MsDb2Parameter^ value  
)
```

F#

```
member IndexOf :  
    value:MsDb2Parameter -> int
```

VB

```
Public Function IndexOf (  
    value As MsDb2Parameter  
) As Integer
```

## Parameters

*value*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)

The value of the MsDb2Parameter object in the collection.

## Return Value

Type: [System.Int32](#)

The index of the specified DbParameter object.

[Return to top](#)

## MsDb2ParameterCollection.IndexOf Method (Object)

Returns the location of the MsDb2Parameter in the collection.

## Syntax

### C#

```
public override int IndexOf(  
    object value  
)
```

### C++

```
public:  
virtual int IndexOf(  
    Object^ value  
) override
```

### F#

```
override IndexOf :  
    value:Object -> int
```

### VB

```
Public Overrides Function IndexOf (  
    value As Object  
) As Integer
```

## Parameters

*value*

Type: [System.Object](#)

The MsDb2Parameter to locate.

## Return Value

Type: [System.Int32](#)

The zero-based location of the MsDb2Parameter in the collection.

## Implements

[IList.IndexOf\(Object\)](#)

Remarks

Implements

[IList.IndexOf](#)

[Return to top](#)

## MsDb2ParameterCollection.IndexOf Method (String)

Returns the location of the MsDb2Parameter in the collection with the specified parameter name.

## Syntax

### C#

```
public override int IndexOf(  
    string parameterName  
)
```

### C++

```
public:  
virtual int IndexOf(  
    String^ parameterName  
) override
```

### F#

```
override IndexOf :  
    parameterName:string -> int
```

### VB

```
Public Overrides Function IndexOf (  
    parameterName As String  
) As Integer
```

**Parameters**

*parameterName*

Type: [System.String](#)

Name of the parameter to return the index of.

**Return Value**

Type: [System.Int32](#)

The location of the MsDb2Parameter in the collection.

**Implements**

[IDataParameterCollection.IndexOf\(String\)](#)

Remarks

Implements

[IDataParameterCollection.IndexOf](#)

[Return to top](#)

# MsDb2ParameterCollection.IndexOf Method (MsDb2Parameter)

Returns the index of the specified MsDb2Parameter object.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Function IndexOf ( _
    value As MsDb2Parameter _
) As Integer
```

C#

```
public int IndexOf (
    MsDb2Parameter value
)
```

C++

```
public:
int IndexOf (
    MsDb2Parameter^ value
)
```

J#

```
public int IndexOf (
    MsDb2Parameter value
)
```

JScript

```
public function IndexOf (
    value : MsDb2Parameter
) : int
```

## Parameters

value

The value of the MsDb2Parameter object in the collection.

## Return Value

The index of the specified DbParameter object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

    value:MsDb2Parameter -> unit
```

VB

```
Public Sub Insert (  
    index As Integer,  
    value As MsDb2Parameter  
)
```

## Parameters

*index*

Type: [System.Int32](#)

The zero-based index where the parameter is to be inserted into the collection.

*value*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)

The MsDb2Parameter to add to the collection.

[Return to top](#)

## MsDb2ParameterCollection.Insert Method (Int32, Object)

Inserts an MsDb2Parameter into the collection at the specified index.

## Syntax

### C#

```
public override void Insert(  
    int index,  
    object value  
)
```

### C++

```
public:  
virtual void Insert(  
    int index,  
    Object^ value  
) override
```

### F#

```
override Insert :  
    index:int *  
    value:Object -> unit
```

### VB

```
Public Overrides Sub Insert (  
    index As Integer,  
    value As Object  
)
```

## Parameters

### *index*

Type: [System.Int32](#)

The zero-based index where the parameter is to be inserted into the collection.

### *value*

Type: [System.Object](#)

The MsDb2Parameter to add to the collection.

## Implements

[IList.Insert\(Int32, Object\)](#)

Remarks

Implements

index

The zero-based index where the parameter is to be inserted into the collection.

value

The MsDb2Parameter to add to the collection.

Remarks

## Implements

ICollection.Insert

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

## MsDb2ParameterCollection.Remove Method (MsDb2Parameter)

Removes the specified MsDb2Parameter from the collection.

Syntax

C#

```
public void Remove(  
    MsDb2Parameter value  
)
```

C++

```
public:  
void Remove(  
    MsDb2Parameter^ value  
)
```

F#

```
member Remove :  
    value:MsDb2Parameter -> unit
```

VB

```
Public Sub Remove (  
    value As MsDb2Parameter  
)
```

## Parameters

*value*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)

Removes the specified MsDb2Parameter from the collection.

[Return to top](#)

## MsDb2ParameterCollection.Remove Method (Object)

Removes the specified MsDb2Parameter from the collection.

Syntax

C#

```
public override void Remove(  
    object value  
)
```

C++

```
public:  
virtual void Remove(  
    Object^ value  
) override
```

F#

```
override Remove :  
    value:Object -> unit
```

VB

```
Public Overrides Sub Remove (  
    value As Object  
)
```

#### Parameters

*value*

Type: [System.Object](#)

Removes the specified MsDb2Parameter from the collection.

#### Implements

[IList.Remove\(Object\)](#)

Remarks

Implements

[IList.Remove](#)

# MsDb2ParameterCollection.Count Property

Gets the number of MsDb2Parameter objects in the collection.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property Count As Integer
```

C#

```
public override int Count { get; }
```

C++

```
public:
virtual property int Count {
    int get () override;
}
```

J#

```
/** @property */
public int get_Count ()
```

JScript

```
public override function get Count () : int
```

## Property Value

The number of MsDb2Parameter objects in the collection.

Remarks

## Implements

ICollection.Count

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

# MsDb2ParameterCollection.IsFixedSize Property

Gets a value that indicates whether the collection is a fixed size.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property IsFixedSize As Boolean
```

C#

```
public override bool IsFixedSize { get; }
```

C++

```
public:
virtual property bool IsFixedSize {
    bool get () override;
}
```

J#

```
/** @property */
public boolean get_IsFixedSize ()
```

JScript

```
public override function get IsFixedSize () : boolean
```

## Property Value

**True** if the collection is a fixed size; otherwise **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

### MsDb2ParameterCollection.Item Property (Int32)

Gets or sets an MsDb2Parameter in the specified index.

Syntax

C#

```
[BrowsableAttribute(false)]
public MsDb2Parameter this[
    int index
] { get; set; }
```

C++

```
public:
[BrowsableAttribute(false)]
property MsDb2Parameter^ default[
    int index
] {
    MsDb2Parameter^ get(int index);
    void set(int index, MsDb2Parameter^ value);
}
```

F#

```
[<BrowsableAttribute(false)>]
member Item :
    index:int -> MsDb2Parameter with get, set
```

VB

```
<BrowsableAttribute(False)>
Public Property Item (
    index As Integer
) As MsDb2Parameter
```

### Parameters

*index*

Type: [System.Int32](#)

The zero-based index of the parameter.

### Property Value

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)

The DbParameter at the specified index.

[Return to top](#)

## MsDb2ParameterCollection.Item Property (String)

Gets or sets the DbParameter with the specified name.

Syntax

C#

```
[BrowsableAttribute(false)]  
public MsDb2Parameter this[  
    string parameterName  
] { get; set; }
```

C++

```
public:  
[BrowsableAttribute(false)]  
property MsDb2Parameter^ default[  
    String^ parameterName  
] {  
    MsDb2Parameter^ get(String^ parameterName);  
    void set(String^ parameterName, MsDb2Parameter^ value);  
}
```

F#

```
[<BrowsableAttribute(false)>]  
member Item :  
    parameterName:string -> MsDb2Parameter with get, set
```

VB

```
<BrowsableAttribute(False)>  
Public Property Item (  
    parameterName As String  
) As MsDb2Parameter
```

### Parameters

*parameterName*

Type: [System.String](#)

The name of the parameter.

### Property Value

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Parameter](#)

The DbParameter with the specified name, or a **null** reference (Nothing in Visual Basic) if the parameter is not found.

[Return to top](#)

# MsDb2ParameterCollection.Item Property (Int32)

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
<BrowsableAttribute(False)> _
<DesignerSerializationVisibilityAttribute(DesignerSerializationVisibility.Hidden)> _
Public Default Property Item ( _
    index As Integer _
) As MsDb2Parameter
```

C#

```
[BrowsableAttribute(false)]
[DesignerSerializationVisibilityAttribute(DesignerSerializationVisibility.Hidden)]
public MsDb2Parameter this [
    int index
] { get; set; }
```

C++

```
[BrowsableAttribute(false)]
[DesignerSerializationVisibilityAttribute(DesignerSerializationVisibility::Hidden)]
public:
    property MsDb2Parameter^ default [int] {
        MsDb2Parameter^ get (int index);
        void set (int index, MsDb2Parameter^ value);
    }
```

J#

```
/** @property */
public MsDb2Parameter get_Item (int index)

/** @property */
public void set_Item (int index, MsDb2Parameter value)
```

JScript

## Parameters

index

The zero-based index of the parameter.

## Property Value

The DbParameter at the specified index.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# MsDb2Permission Constructor

Initializes a new instance of the [MsDb2Permission](#) class using the specified permission state.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    state As PermissionState _
)
```

C#

```
public MsDb2Permission (
    PermissionState state
)
```

C++

```
public:
    MsDb2Permission (
        PermissionState state
    )
```

J#

```
public MsDb2Permission (
    PermissionState state
)
```

JScript

```
public function MsDb2Permission (
    state : PermissionState
)
```

## Parameters

state

The permission state to create the new MsDb2Permission with.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2Permission.Copy Method

Creates and returns an identical copy of the current permission object.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Function Copy As IPermission
```

C#

```
public override IPermission Copy ()
```

C++

```
public:  
virtual IPermission^ Copy () override
```

J#

```
public IPermission Copy ()
```

JScript

```
public override function Copy () : IPermission
```

## Return Value

An IPermission containing a copy of the current object.

Remarks

A copy of a permission object represents the same access to resources as the original permission object.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## Reference

[MsDb2PermissionAttribute Class](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2PermissionAttribute.CreatePermission Method

Creates a permission object that can then be serialized into binary form and persistently stored along with the SecurityAction in an assembly's metadata.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function CreatePermission As IPermission
```

C#

```
public override IPermission CreatePermission ()
```

C++

```
public:
virtual IPermission^ CreatePermission () override
```

J#

```
public IPermission CreatePermission ()
```

JScript

```
public override function CreatePermission () : IPermission
```

## Return Value

An IPermission containing a new permission.

Remarks

At compile time, attributes convert security declarations to a serialized form in metadata. Declarative security data in metadata is created from the permission that this method returns that corresponds to this attribute.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Initializes a new instance of the [MsDb2RowUpdatedEventArgs](#) class.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    row As DataRow, _
    command As IDbCommand, _
    statementType As StatementType, _
    tableMapping As DataTableMapping _
)
```

C#

```
public MsDb2RowUpdatedEventArgs (
    DataRow row,
    IDbCommand command,
    StatementType statementType,
    DataTableMapping tableMapping
)
```

C++

```
public:
    MsDb2RowUpdatedEventArgs (
        DataRow^ row,
        IDbCommand^ command,
        StatementType statementType,
        DataTableMapping^ tableMapping
    )
```

J#

```
public MsDb2RowUpdatedEventArgs (
    DataRow row,
    IDbCommand command,
    StatementType statementType,
    DataTableMapping tableMapping
)
```

JScript

```
public function MsDb2RowUpdatedEventArgs (
    row : DataRow,
    command : IDbCommand,
    statementType : StatementType,
    tableMapping : DataTableMapping
)
```

## Parameters

row

The DataRow sent through an Update.

command

The IDbCommand executed when Update is called.

statementType

One of the StatementType values that specifies the type of query executed.

tableMapping

The DataTableMapping sent through an Update.

# MsDb2RowUpdatedEventArgs.Command Property

Gets the MsDb2Command executed when Update is called.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public ReadOnly Property Command As MsDb2Command
```

C#

```
public MsDb2Command Command { get; }
```

C++

```
public:  
property MsDb2Command^ Command {  
    MsDb2Command^ get ();  
}
```

J#

```
/** @property */  
public MsDb2Command get_Command ()
```

JScript

```
public function get Command () : MsDb2Command
```

## Property Value

The MsDb2Command executed when Update is called.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

[MsDb2RowUpdatedEventArgs Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2RowUpdatedEventHandler Delegate

Represents the method that will handle the MsDb2RowUpdatedEvent of the MsDb2DataAdapter.

**Namespace:** [Microsoft.HostIntegration.MsDb2Client](#)

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in Microsoft.HostIntegration.MsDb2Client.dll)

Syntax

C#

```
public delegate void MsDb2RowUpdatedEventHandler(  
    object sender,  
    MsDb2RowUpdatedEventArgs e  
)
```

C++

```
public delegate void MsDb2RowUpdatedEventHandler(  
    Object^ sender,  
    MsDb2RowUpdatedEventArgs^ e  
)
```

F#

```
type MsDb2RowUpdatedEventHandler =  
    delegate of  
        sender: Object *  
        e: MsDb2RowUpdatedEventArgs -> unit
```

VB

```
Public Delegate Sub MsDb2RowUpdatedEventHandler (  
    sender As Object,  
    e As MsDb2RowUpdatedEventArgs  
)
```

## Parameters

*sender*

Type: [System.Object](#)

The source of the event.

*e*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2RowUpdatedEventArgs](#)

The MsDb2RowUpdatedEvent that contains the event data.

## Remarks

The handler is not required to perform any action, and your code should avoid generating exceptions or allowing exceptions to propagate to the calling method. Any exceptions that do reach the caller are ignored.

When you create an MsDb2RowUpdatedEventArgs delegate, you identify the method that will handle the event. To associate the event with your event handler, add an instance of the delegate to the event. The event handler is called whenever the event occurs, unless you remove the delegate.

 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)

 ToString()	(Inherited from <a href="#">Object.</a> )
--	---

#### Remarks

The RowUpdating event is raised before an Update to a row.

When using Update, there are two events that occur for each data row updated. The order of execution is as follows:

1. The values in the DataRow are moved to the parameter values.
2. The OnRowUpdating event is raised.
3. The command executes.
4. If the command is set to FirstReturnedRecord, then the first returned result is placed in the DataRow.
5. If there are output parameters, they are placed in the DataRow.
6. The OnRowUpdated event is raised.
7. AcceptChanges is called.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

)
```

JScript

```
public function MsDb2RowUpdatingEventArgs (
    row : DataRow,
    command : IDbCommand,
    statementType : StatementType,
    tableMapping : DataTableMapping
)
```

## Parameters

row

The DataRow to Update.

command

The IDbCommand to execute during Update.

statementType

One of the StatementType values that specifies the type of query executed.

tableMapping

The DataTableMapping sent through an Update.

Usage

Syntax

VB

```
'Declaration
Public Property Command As MsDb2Command
```

C#

```
public MsDb2Command Command { get; set; }
```

C++

```
public:
property MsDb2Command^ Command {
    MsDb2Command^ get ();
    void set (MsDb2Command^ value);
}
```

J#

```
/** @property */
public MsDb2Command get_Command ()

/** @property */
public void set_Command (MsDb2Command value)
```

JScript

```
public function get Command () : MsDb2Command

public function set Command (value : MsDb2Command)
```

## Property Value

The MsDb2Command to execute when performing the Update.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

## Reference

[MsDb2RowUpdatingEventArgs Class](#)

[MsDb2RowUpdatingEventArgs Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2RowUpdatingEventHandler Delegate

Represents the method that handles the RowUpdating event of the MsDb2DataAdapter.

**Namespace:** [Microsoft.HostIntegration.MsDb2Client](#)

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in Microsoft.HostIntegration.MsDb2Client.dll)

Syntax

C#

```
public delegate void MsDb2RowUpdatingEventHandler(  
    object sender,  
    MsDb2RowUpdatingEventArgs e  
)
```

C++

```
public delegate void MsDb2RowUpdatingEventHandler(  
    Object^ sender,  
    MsDb2RowUpdatingEventArgs^ e  
)
```

F#

```
type MsDb2RowUpdatingEventHandler =  
    delegate of  
        sender: Object *  
        e: MsDb2RowUpdatingEventArgs -> unit
```

VB

```
Public Delegate Sub MsDb2RowUpdatingEventHandler (  
    sender As Object,  
    e As MsDb2RowUpdatingEventArgs  
)
```

## Parameters

*sender*

Type: [System.Object](#)

The source of the event.

*e*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2RowUpdatingEventArgs](#)

The MsDb2RowUpdatingEventArgs that contains the event data.

## Remarks

The handler is not required to perform any action, and your code should avoid generating exceptions or allowing exceptions to propagate to the calling method. Any exceptions that do reach the caller are ignored.

Use the handler to process MsDb2RowUpdatingEventArgs and to specify how updates are processed. For example, you may opt to skip the update of the current row or skip the update of all remaining rows. Note that the rows are updated in the order that they were received from the data source.

When you create an MsDb2RowUpdatingEventArgs delegate, you identify the method that will handle the event. To associate the event with your event handler, add an instance of the delegate to the event. The event handler is called whenever the event occurs, unless you remove the delegate.

## Reference

[MsDb2Transaction Class](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2Transaction.Commit Method

Commits all of the SQL commands that have been executed since the beginning of the transaction.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Sub Commit
```

C#

```
public override void Commit ()
```

C++

```
public:  
virtual void Commit () override
```

J#

```
public void Commit ()
```

JScript

```
public override function Commit ()
```

Remarks

Calling Commit persists the Insert, Update, Delete, and similar commands on the DB2 system.

**Implements**

IDbTransaction.Commit

**Exceptions**

Exception	Situation
ConnectionNotOpenException	There is no connection.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

See Also

**Reference**

[MsDb2Transaction Class](#)

# MsDb2Transaction.Rollback Method

Rolls back all of the SQL commands that have been executed since the beginning of the transaction.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Sub Rollback
```

C#

```
public override void Rollback ()
```

C++

```
public:  
virtual void Rollback () override
```

J#

```
public void Rollback ()
```

JScript

```
public override function Rollback ()
```

Remarks

Calling Rollback rejects and rolls back the Insert, Update, Delete, and similar commands on the DB2 system.

The transaction can only be rolled back from a pending state (after BeginTransaction has been called, but before Commit is called).

**Implements**

IDbTransaction.Rollback

**Exceptions**

Exception	Situation
ConnectionNotOpenException	There is no connection.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

# MsDb2Transaction.Connection Property

Gets the connection that owns the transaction.

**Namespace:** Microsoft.HostIntegration.MsDb2Client

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property Connection As MsDb2Connection
```

C#

```
public MsDb2Connection Connection { get; }
```

C++

```
public:
property MsDb2Connection^ Connection {
    MsDb2Connection^ get ();
}
```

J#

```
/** @property */
public MsDb2Connection get_Connection ()
```

JScript

```
public function get Connection () : MsDb2Connection
```

## Property Value

An IDbConnection containing the connection that owns the transaction, or a null reference (Nothing in Microsoft Visual Basic) if the transaction is no longer valid.

Remarks

A transaction can have only one parent connection.

A single application may have multiple database connections, each with zero or more transactions. This property enables you to determine the connection object associated with a particular transaction created by BeginTransaction.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

[MsDb2Transaction Class](#)

[MsDb2Transaction Members](#)

[Microsoft.HostIntegration.MsDb2Client Namespace](#)

# MsDb2Transaction.IsolationLevel Property

Gets the isolation level of the transaction as defined by the .NET values.

**Namespace:** Microsoft.HostIntegration.MsDb2Client  
**Assembly:** Microsoft.HostIntegration.MsDb2Client (in microsoft.hostintegration.msdb2client.dll)  
[Usage](#)  
[Syntax](#)  
[VB](#)

```
'Declaration
Public Overrides ReadOnly Property IsolationLevel As IsolationLevel
```

C#

```
public override IsolationLevel IsolationLevel { get; }
```

C++

```
public:
virtual property IsolationLevel IsolationLevel {
    IsolationLevel get () override;
}
```

J#

```
/** @property */
public IsolationLevel get_IsolationLevel ()
```

JScript

```
public override function get IsolationLevel () : IsolationLevel
```

## Property Value

IsolationLevel containing the isolation level of the transaction as defined by the .NET values. The default is ReadCommitted.

The following table describes the possible values for IsolationLevel.

Member name	Description
Chaos	The pending changes from more highly isolated transactions cannot be overwritten.
ReadCommitted	Shared locks are held while the data is being read to avoid dirty reads, but the data can be changed before the end of the transaction, resulting in nonrepeatable reads or phantom data.
ReadUncommitted	A dirty read is possible, meaning that no shared locks are issued, and no exclusive locks are honored.
RepeatableRead	Locks are placed on all data that is used in a query, preventing other users from updating the data. Prevents non-repeatable reads, but phantom rows are still possible.
Serializable	A range lock is placed on the DataSet, preventing other users from updating or inserting rows into the DataSet until the transaction is complete.
Unspecified	A different isolation level than the one specified is being used, but the level cannot be determined.

Remarks

Parallel transactions are not supported. Therefore, the IsolationLevel applies to the entire transaction.

### **Implements**

IDbTransaction.IsolationLevel

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

### **Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2Type Enumeration

Specifies the data type of a field, a property, or an MsDb2Parameter.

**Namespace:** [Microsoft.HostIntegration.MsDb2Client](#)

**Assembly:** Microsoft.HostIntegration.MsDb2Client (in Microsoft.HostIntegration.MsDb2Client.dll)

Syntax

C#

```
public enum MsDb2Type
```

C++

```
public enum class MsDb2Type
```

F#

```
type MsDb2Type
```

VB

```
Public Enumeration MsDb2Type
```

Members

Member name	Description
<b>BigInt</b>	A 64-bit signed integer (DBTYPE_I8). This maps to Int64.
<b>Binary</b>	<b>Obsolete.</b> Variable-length stream of binary data ranging between 1 and 8,000 bytes. (DBTYPE_BYTES). ADO.NET cannot correctly infer the type if the byte array is larger than 8,000 bytes. Explicitly specify the DbType when working with byte arrays larger than 8,000 bytes. This maps to an Array of type Byte.
<b>Bit</b>	<b>Obsolete.</b> A Boolean value (DBTYPE_BOOL). This maps to Boolean.
<b>BLOB</b>	
<b>Char</b>	A character string (DBTYPE_STR). This maps to String.
<b>CharForBit</b>	The CharForBit type.
<b>CLOB</b>	
<b>Date</b>	Date and time data ranging in value from January 1, 1753 to December 31, 9999 to an accuracy of 3.33 milliseconds. This maps to DateTime.
<b>DBCLOB</b>	
<b>Decimal</b>	A simple type representing values ranging from $1.0 \times 10^{-28}$ to approximately $7.9 \times 10^{28}$ with 28-29 significant digits. (DBTYPE_DECIMAL). This maps to Decimal.
<b>Double</b>	A floating point number within the range of $-1.79E+308$ through $1.79E+308$ (DBTYPE_R8). This maps to Double.
<b>Graphic</b>	The Graphic type.
<b>Int</b>	An integral type representing signed 32-bit integers with values between -2147483648 and 2147483647. (DBTYPE_I4). This maps to Int32.
<b>Numeric</b>	An exact numeric value with a fixed precision and scale (DBTYPE_NUMERIC). This maps to Decimal.

<b>Real</b>	Signed, approximate, numeric value with a binary precision 24 (zero or absolute value 10[–38] to 10[38]). (SQL_REAL). This maps to Single.
<b>Small Int</b>	An integral type representing signed 16-bit integers with values between -32768 and 32767. (DBTYPE_I2). This maps to Int16.
<b>Time</b>	Date and time data ranging in value from January 1, 1753 to December 31, 9999 to an accuracy of 3.33 milliseconds. (DBTYPE_DBTIME). This maps to TimeSpan.
<b>Timestamp</b>	Data and time data in the format yyyyymmddhhmmss (DBTYPE_DBTIMESTAMP). This maps to DateTime.
<b>TinyInt</b>	<b>Obsolete.</b> A 8-bit signed integer (DBTYPE_I1). This maps to SByte.
<b>VarBinary</b>	<b>Obsolete.</b> A variable-length stream of binary data (OleDbParameter only). This maps to an Array of type Byte.
<b>VarChar</b>	A variable-length stream of non-Unicode characters (OleDbParameter only). This maps to String.
<b>VarCharForBit</b>	The VarCharForBit type.
<b>VarGraphic</b>	The VarGraphic type.
<b>VarWideChar</b>	<b>Obsolete.</b> The VarWideChar type.
<b>VarWideGraphic</b>	<b>Obsolete.</b> The VarWideGraphic type.
<b>WideChar</b>	<b>Obsolete.</b> A null-terminated stream of Unicode characters (DBTYPE_WSTR). This maps to String.

#### Remarks

The following table shows mappings between MsDb2Type data types, OLE DB data types (shown in parentheses), and .NET Framework types.

# Microsoft.HostIntegration.MsDb2EntityClient Namespace

Describes a server-side forward-only cursor implementation that inherits from the IDataReader and IDataRecord interfaces.

## Classes

	Class	Description
	<a href="#">MsDb2EntityCommand</a>	Represents the entity commands for the entity client.
	<a href="#">MsDb2EntityDataReader</a>	Provides a way of reading a forward-only stream of rows from a database.
	<a href="#">SqlGenerator</a>	Provides ability to automatically generate T-SQL based stored procedures using the SQL Server SMO libraries.
	<a href="#">SqlWriter</a>	Represents the SQL Writer.

## Interfaces

	Interface	Description
	<a href="#">ISqlFragment</a>	Defines a method that represents the sql fragment for any node in the query tree.

[Return to top](#)

# ISqlFragment Interface

Defines a method that represents the sql fragment for any node in the query tree.

**Namespace:** [Microsoft.HostIntegration.MsDb2EntityClient](#)

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in Microsoft.HostIntegration.MsDb2EntityClient.dll)

Syntax

C#

```
public interface ISqlFragment
```

C++

```
public interface class ISqlFragment
```

F#

```
type ISqlFragment = interface end
```

VB

```
Public Interface ISqlFragment
```

Methods

	Name	Description
	<a href="#">WriteSql(SqlWriter, SqlGenerator)</a>	Writes the string represented by this fragment into the stream.

# ISqlFragment.WriteSql Method

Writes the string represented by this fragment into the stream.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Sub WriteSql ( _
    writer As SqlWriter, _
    sqlGenerator As SqlGenerator _
)
```

C#

```
void WriteSql (
    SqlWriter writer,
    SqlGenerator sqlGenerator
)
```

C++

```
void WriteSql (
    SqlWriter^ writer,
    SqlGenerator^ sqlGenerator
)
```

J#

```
void WriteSql (
    SqlWriter writer,
    SqlGenerator sqlGenerator
)
```

JScript

```
function WriteSql (
    writer : SqlWriter,
    sqlGenerator : SqlGenerator
)
```

## Parameters

writer

Provides added functionality for backup and restore the SQL Server.

sqlGenerator

Provides the ability to automatically generate T-SQL based stored procedures using the SQL Server SMO libraries.

Public Class MsDb2EntityCommand  
    Inherits DbCommand  
    Implements ICloneable
```

Constructors

	Name	Description
	<a href="#">MsDb2EntityCommand()</a>	Initializes a new instance of the <b>MsDb2EntityCommand</b> class using default values.
	<a href="#">MsDb2EntityCommand(String)</a>	Initializes a new instance of the <b>MsDb2EntityCommand</b> class with specified command text.
	<a href="#">MsDb2EntityCommand(String, MsDb2Connection)</a>	Initializes a new instance of the <b>MsDb2EntityCommand</b> class with specified command text and connection.
	<a href="#">MsDb2EntityCommand(String, MsDb2Connection, DbTransaction)</a>	Initializes a new instance of the <b>MsDb2EntityCommand</b> class with specified command text, connection, and transaction.

Properties

	Name	Description
	<a href="#">CanRaiseEvents</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">CommandText</a>	Gets or sets the Transact-SQL statement, table name, or stored procedure to execute at the data source.(Overrides <a href="#">DbCommand.CommandText</a> .)
	<a href="#">CommandTimeout</a>	Gets or sets the wait time before terminating the attempt to execute a command and generating an error.(Overrides <a href="#">DbCommand.CommandTimeout</a> .)

	<a href="#">CommandType</a>	Gets or sets a value indicating how the CommandText property is to be interrupted.(Overrides <a href="#">DbCommand.CommandType</a> .)
	<a href="#">Connection</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">Container</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">DbConnection</a>	Gets or sets the DbConnection used by this DbCommand.(Overrides <a href="#">DbCommand.DbConnection</a> .)
	<a href="#">DbParameterCollection</a>	Gets the collection of DbParameter objects.(Overrides <a href="#">DbCommand.DbParameterCollection</a> .)
	<a href="#">DbTransaction</a>	Gets or sets the DbTransaction within which this DbCommand object executes.(Overrides <a href="#">DbCommand.DbTransaction</a> .)
	<a href="#">DesignMode</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">DesignTimeVisible</a>	Gets or sets a value indicating whether the command object should be visible in a customized interface control.(Overrides <a href="#">DbCommand.DesignTimeVisible</a> .)
	<a href="#">Events</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">Log</a>	Gets or sets the destination to write the SQL query or command.
	<a href="#">Parameters</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">Site</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">Transaction</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">UpdatedRowSource</a>	Gets or sets how command results are applied to the DataRow when used by the <b>Update</b> method of the DbDataAdapter.(Overrides <a href="#">DbCommand.UpdatedRowSource</a> .)

#### Methods

	<b>Name</b>	<b>Description</b>
	<a href="#">Cancel()</a>	Tries to cancel the execution of the command.(Overrides <a href="#">DbCommand.Cancel()</a> .)
	<a href="#">CreateDbParameter()</a>	Creates a new instance of a DbParameter object.(Overrides <a href="#">DbCommand.CreateDbParameter()</a> .)
	<a href="#">CreateObjRef(Type)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
	<a href="#">CreateParameter()</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">Dispose()</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">Dispose(Boolean)</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">ExecuteDbDataReader(CommandBehavior)</a>	Executes the command text against the connection.(Overrides <a href="#">DbCommand.ExecuteDbDataReader(CommandBehavior)</a> .)
	<a href="#">ExecuteDbDataReaderAsync(CommandBehavior, CancellationToken)</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">ExecuteNonQuery()</a>	Executes a Transact-SQL statement against the connection and returns the number of rows affected.(Overrides <a href="#">DbCommand.ExecuteNonQuery()</a> .)
	<a href="#">ExecuteNonQueryAsync()</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">ExecuteNonQueryAsync(CancellationToken)</a>	(Inherited from <a href="#">DbCommand</a> .)

 ExecuteReader()	(Inherited from <a href="#">DbCommand.</a> )
 ExecuteReader(CommandBehavior)	(Inherited from <a href="#">DbCommand.</a> )

```
new :  
    commandText:string *  
    connection:MsDb2Connection -> MsDb2EntityCommand
```

VB

```
Public Sub New (  
    commandText As String,  
    connection As MsDb2Connection  
)
```

#### Parameters

*commandText*

Type: [System.String](#)

The command text for the class.

*connection*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Connection](#)

The connection for the class.

[Return to top](#)

#### MsDb2EntityCommand Constructor (String, MsDb2Connection, DbTransaction)

Initializes a new instance of the [MsDb2EntityCommand](#) class with specified command text, connection, and transaction.

## Syntax

### C#

```
public MsDb2EntityCommand(  
    string commandText,  
    MsDb2Connection connection,  
    DbTransaction transaction  
)
```

### C++

```
public:  
    MsDb2EntityCommand(  
        String^ commandText,  
        MsDb2Connection^ connection,  
        DbTransaction^ transaction  
    )
```

### F#

```
new :  
    commandText:string *  
    connection:MsDb2Connection *  
    transaction:DbTransaction -> MsDb2EntityCommand
```

### VB

```
Public Sub New (  
    commandText As String,  
    connection As MsDb2Connection,  
    transaction As DbTransaction  
)
```

## Parameters

### *commandText*

Type: [System.String](#)

The command text for the class.

### *connection*

Type: [Microsoft.HostIntegration.MsDb2Client.MsDb2Connection](#)

The connection for the class.

### *transaction*

Type: [System.Data.Common.DbTransaction](#)

The transaction for the class.

[Return to top](#)

# MsDb2EntityCommand Constructor ()

Initializes a new instance of the [MsDb2EntityCommand](#) class using default values.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public MsDb2EntityCommand ()
```

C++

```
public:  
MsDb2EntityCommand ()
```

J#

```
public MsDb2EntityCommand ()
```

JScript

```
public function MsDb2EntityCommand ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

# MsDb2EntityCommand.DesignTimeVisible Property

Gets or sets a value indicating whether the command object should be visible in a customized interface control.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property DesignTimeVisible As Boolean
```

C#

```
public override bool DesignTimeVisible { get; set; }
```

C++

```
public:
virtual property bool DesignTimeVisible {
    bool get () override;
    void set (bool value) override;
}
```

J#

```
/** @property */
public boolean get_DesignTimeVisible ()

/** @property */
public void set_DesignTimeVisible (boolean value)
```

JScript

```
public override function get DesignTimeVisible () : boolean

public override function set DesignTimeVisible (value : boolean)
```

## Property Value

**true** if the command object should be visible in a control; otherwise **false**. The default is **true**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

See Also

# MsDb2EntityCommand.Log Property

Gets or sets the destination to write the SQL query or command.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Property Log As TextWriter
```

C#

```
public static TextWriter Log { get; set; }
```

C++

```
public:
static property TextWriter^ Log {
    TextWriter^ get ();
    void set (TextWriter^ value);
}
```

J#

```
/** @property */
public static TextWriter get_Log ()

/** @property */
public static void set_Log (TextWriter value)
```

JScript

```
public static function get Log () : TextWriter

public static function set Log (value : TextWriter)
```

## Property Value

The TextReader to use for writing the command.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MsDb2EntityCommand.UpdatedRowSource Property

Gets or sets how command results are applied to the DataRow when used by the **Update** method of the DbDataAdapter.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property UpdatedRowSource As UpdateRowSource
```

C#

```
public override UpdateRowSource UpdatedRowSource { get; set; }
```

C++

```
public:
virtual property UpdateRowSource UpdatedRowSource {
    UpdateRowSource get () override;
    void set (UpdateRowSource value) override;
}
```

J#

```

Properties

Name	Description
 <a href="#">Depth</a>	Gets a value that indicates the depth of nesting for the current row.(Overrides <a href="#">DbDataReader.Depth</a> .)
 <a href="#">FieldCount</a>	Gets the number of columns in the current row.(Overrides <a href="#">DbDataReader.FieldCount</a> .)
 <a href="#">HasRows</a>	Gets a value that indicates whether the <b>MsDb2EntityDataReader</b> contains one or more rows.(Overrides <a href="#">DbDataReader.HasRows</a> .)
 <a href="#">IsClosed</a>	Gets a Boolean value that indicates whether the specified <b>MsDb2EntityDataReader</b> instance has been closed.(Overrides <a href="#">DbDataReader.IsClosed</a> .)
 <a href="#">Item(Int32)</a>	Gets the value of the specified column in its native format given the column ordinal.(Overrides <a href="#">DbDataReader.Item(Int32)</a> .)
 <a href="#">Item(String)</a>	Gets the value of the specified column in its native format given the column name.(Overrides <a href="#">DbDataReader.Item(String)</a> .)
 <a href="#">RecordsAffected</a>	Gets the number of rows changed, inserted, or deleted by execution of the statement.(Overrides <a href="#">DbDataReader.RecordsAffected</a> .)
 <a href="#">VisibleFieldCount</a>	(Inherited from <a href="#">DbDataReader</a> .)

Methods

Name	Description
 <a href="#">Close()</a>	Closes the <b>MsDb2EntityDataReader</b> object.(Overrides <a href="#">DbDataReader.Close()</a> .)

 <a href="#">CreateObjRef(Type)</a>	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.(Overrides <a href="#">MarshalByRefObject.CreateObjRef(Type)</a> .)
 <a href="#">Dispose(Boolean)</a>	Releases all resources used by the <b>MsDb2EntityDataReader</b> and optionally releases the managed resources.(Overrides <a href="#">DbDataReader.Dispose(Boolean)</a> .)
 <a href="#">Equals(Object)</a>	Determines whether the specified Object is equal to the current Object.(Overrides <a href="#">Object.Equals(Object)</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetBoolean(Int32)</a>	Retrieves the value of the specified column as a Boolean.(Overrides <a href="#">DbDataReader.GetBoolean(Int32)</a> .)
 <a href="#">GetByte(Int32)</a>	Retrieves the value of the specified column as a byte.(Overrides <a href="#">DbDataReader.GetByte(Int32)</a> .)
 <a href="#">GetBytes(Int32, Int64, Byte[], Int32, Int32)</a>	Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.(Overrides <a href="#">DbDataReader.GetBytes(Int32, Int64, Byte[], Int32, Int32)</a> .)
 <a href="#">GetChar(Int32)</a>	Retrieves the value of the specified column as a single character.(Overrides <a href="#">DbDataReader.GetChar(Int32)</a> .)
 <a href="#">GetChars(Int32, Int64, Char[], Int32, Int32)</a>	Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.(Overrides <a href="#">DbDataReader.GetChars(Int32, Int64, Char[], Int32, Int32)</a> .)
 <a href="#">GetDataTypeName(Int32)</a>	Retrieves a string representing the data type of the specified column.(Overrides <a href="#">DbDataReader.GetDataTypeName(Int32)</a> .)
 <a href="#">GetDateTime(Int32)</a>	Retrieves the value of the specified column as a <a href="#">DateTime</a> object.(Overrides <a href="#">DbDataReader.GetDateTime(Int32)</a> .)
 <a href="#">GetDbDataReader(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetDecimal(Int32)</a>	Retrieves the value of the specified column as a <a href="#">Decimal</a> object.(Overrides <a href="#">DbDataReader.GetDecimal(Int32)</a> .)
 <a href="#">GetDouble(Int32)</a>	Retrieves the value of the specified column as a double-precision floating point number.(Overrides <a href="#">DbDataReader.GetDouble(Int32)</a> .)
 <a href="#">GetEnumerator()</a>	Returns an <a href="#">T:Systems.Collections.IEnumerator</a> that iterates through the Data Reader.(Overrides <a href="#">DbDataReader.GetEnumerator()</a> .)
 <a href="#">GetFieldType(Int32)</a>	Retrieves the <a href="#">Type</a> that is the data type of the object.(Overrides <a href="#">DbDataReader.GetFieldType(Int32)</a> .)
 <a href="#">GetFieldValue&lt;T&gt;(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFieldValueAsync&lt;T&gt;(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFieldValueAsync&lt;T&gt;(Int32, CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFloat(Int32)</a>	Retrieves the value of the specified column as a single-precision floating point number.(Overrides <a href="#">DbDataReader.GetFloat(Int32)</a> .)
 <a href="#">GetGuid(Int32)</a>	Retrieves the value of the specified column as a globally unique identifier (GUID).(Overrides <a href="#">DbDataReader.GetGuid(Int32)</a> .)

 GetHashCode()	Serves as a hash function for a particular type.(Overrides <a href="#">Object.GetHashCode()</a> .)
 GetInt16(Int32)	Retrieves the value of the specified column as a 16-bit signed integer.(Overrides <a href="#">DbDataReader.GetInt16(Int32)</a> .)
 GetInt32(Int32)	Gets the value of the specified column as a 32-bit signed integer.(Overrides <a href="#">DbDataReader.GetInt32(Int32)</a> .)
 GetInt64(Int32)	Retrieves the value of the specified column as a 64-bit signed integer.(Overrides <a href="#">DbDataReader.GetInt64(Int32)</a> .)
 GetLifetimeService()	(Inherited from <a href="#">MarshalByRefObject</a> .)
 GetName(Int32)	Retrieves the name of the specified column.(Overrides <a href="#">DbDataReader.GetName(Int32)</a> .)
 GetOrdinal(String)	Retrieves the column ordinal, given the name of the column.(Overrides <a href="#">DbDataReader.GetOrdinal(String)</a> .)
 GetSchemaTable()	Returns a <a href="#">DataTable</a> that describes the column metadata of the Data Reader.(Overrides <a href="#">DbDataReader.GetSchemaTable()</a> .)
 GetStream(Int32)	(Inherited from <a href="#">DbDataReader</a> .)
 GetString(Int32)	Retrieves the value of the specified column as a string.(Overrides <a href="#">DbDataReader.GetString(Int32)</a> .)
 GetTextReader(Int32)	(Inherited from <a href="#">DbDataReader</a> .)
 GetType()	(Inherited from <a href="#">Object</a> .)
 GetValue(Int32)	Retrieves the value of the specified column in its native format.(Overrides <a href="#">DbDataReader.GetValue(Int32)</a> .)
 GetValues(Object[])	Populates an array of objects with the column values of the current row.(Overrides <a href="#">DbDataReader.GetValues(Object[])</a> .)
 InitializeLifetimeService()	(Inherited from <a href="#">MarshalByRefObject</a> .)
 IsDBNull(Int32)	Retrieves a value that indicates whether the column contains non-existent or missing values.(Overrides <a href="#">DbDataReader.IsDBNull(Int32)</a> .)
 IsDBNullAsync(Int32)	(Inherited from <a href="#">DbDataReader</a> .)
 IsDBNullAsync(Int32, CancellationToken)	(Inherited from <a href="#">DbDataReader</a> .)
 MemberwiseClone()	(Inherited from <a href="#">Object</a> .)
 MemberwiseClone(Boolean)	(Inherited from <a href="#">MarshalByRefObject</a> .)
 NextResult()	Advances the data reader to the next result, when reading the results of batch statements.(Overrides <a href="#">DbDataReader.NextResult()</a> .)
 NextResultAsync()	(Inherited from <a href="#">DbDataReader</a> .)
 NextResultAsync(CancellationToken)	(Inherited from <a href="#">DbDataReader</a> .)
 Read()	Advances the Data Reader to the next record.(Overrides <a href="#">DbDataReader.Read()</a> .)
 ReadAsync()	(Inherited from <a href="#">DbDataReader</a> .)
 ReadAsync(CancellationToken)	(Inherited from <a href="#">DbDataReader</a> .)

 <a href="#">ToString()</a>	(Inherited from <a href="#">Object.</a> )

# MsDb2EntityDataReader Members

Provides a way of reading a forward-only stream of rows from a database.

The following tables list the members exposed by the [MsDb2EntityDataReader](#) type.

## Public Properties

	Name	Description
	<a href="#">Depth</a>	Overridden. Gets a value that indicates the depth of nesting for the current row.
	<a href="#">FieldCount</a>	Overridden. Gets the number of columns in the current row.
	<a href="#">HasRows</a>	Overridden. Gets a value that indicates whether the <b>MsDb2EntityDataReader</b> contains one or more rows.
	<a href="#">IsClosed</a>	Overridden. Gets a Boolean value that indicates whether the specified <b>MsDb2EntityDataReader</b> instance has been closed.
	<a href="#">Item</a>	Overloaded. Overridden. Retrieves the value of the specified column in its native format.
	<a href="#">RecordsAffected</a>	Overridden. Gets the number of rows changed, inserted, or deleted by execution of the statement.
	<a href="#">VisibleFieldCount</a>	(inherited from <a href="#">DbDataReader</a> )

## Top

## Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Close</a>	Overridden. Closes the <a href="#">MsDb2EntityDataReader</a> object.
	<a href="#">CreateObjRef</a>	Overridden. Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
	<a href="#">Dispose</a>	Overloaded.
	<a href="#">Equals</a>	Overloaded. Overridden.
	<a href="#">GetBoolean</a>	Overridden. Retrieves the value of the specified column as a Boolean.
	<a href="#">GetByte</a>	Overridden. Retrieves the value of the specified column as a byte.
	<a href="#">GetBytes</a>	Overridden. Reads a stream of bytes from the specified column offset into the buffer array starting at the given buffer offset.
	<a href="#">GetChar</a>	Overridden. Retrieves the value of the specified column as a single character.
	<a href="#">GetChars</a>	Overridden. Reads a stream of characters from the specified column offset into the buffer array starting at the given buffer offset.
	<a href="#">GetData</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">GetDataTypeName</a>	Overridden. Retrieves a string representing the data type of the specified column.
	<a href="#">GetDateTime</a>	Overridden. Retrieves the value of the specified column as a <a href="#">DateTime</a> object.
	<a href="#">GetDecimal</a>	Overridden. Retrieves the value of the specified column as a <a href="#">Decimal</a> object.
	<a href="#">GetDouble</a>	Overridden. Retrieves the value of the specified column as a double-precision floating point number.
	<a href="#">GetEnumerator</a>	Overridden. Returns an <a href="#">IEnumerator</a> that iterates through the Data Reader.
	<a href="#">GetFieldType</a>	Overridden. Retrieves the <a href="#">Type</a> that is the data type of the object.
	<a href="#">GetFloat</a>	Overridden. Retrieves the value of the specified column as a single-precision floating point number.
	<a href="#">GetGuid</a>	Overridden. Retrieves the value of the specified column as a globally unique identifier (GUID).
	<a href="#">GetHashCode</a>	Overridden. Serves as a hash function for a particular type.
	<a href="#">GetInt16</a>	Overridden. Retrieves the value of the specified column as a 16-bit signed integer.
	<a href="#">GetInt32</a>	Overridden. Gets the value of the specified column as a 32-bit signed integer.
	<a href="#">GetInt64</a>	Overridden. Retrieves the value of the specified column as a 64-bit signed integer.
	<a href="#">GetLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">GetName</a>	Overridden. Retrieves the name of the specified column.
	<a href="#">GetOrdinal</a>	Overridden. Retrieves the column ordinal, given the name of the column.
	<a href="#">GetProviderSpecificFieldType</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">GetProviderSpecificValue</a>	(inherited from <a href="#">DbDataReader</a> )

	<a href="#">GetProviderSpecificValues</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">GetSchemaTable</a>	Overridden. Returns a <a href="#">DataTable</a> that describes the column metadata of the Data Reader.
	<a href="#">GetString</a>	Overridden. Retrieves the value of the specified column as a string.
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetValue</a>	Overridden. Retrieves the value of the specified column in its native format.
	<a href="#">GetValues</a>	Overridden. Populates an array of objects with the column values of the current row.
	<a href="#">InitializeLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">IsDBNull</a>	Overridden. Retrieves a value that indicates whether the column contains non-existent or missing values.
	<a href="#">NextResult</a>	Overridden. Advances the data reader to the next result, when reading the results of batch statements.
	<a href="#">Read</a>	Overridden. Advances the Data Reader to the next record.
	 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )

# MsDb2EntityDataReader.CreateObjRef Method

Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
<SecurityPermissionAttribute(SecurityAction.LinkDemand, Flags:=SecurityPermissionFlag.Infr
structure)> _
Public Overrides Function CreateObjRef ( _
    requestedType As Type _
) As ObjRef
```

C#

```
[SecurityPermissionAttribute(SecurityAction.LinkDemand, Flags=SecurityPermissionFlag.Infras
tructure)]
public override ObjRef CreateObjRef (
    Type requestedType
)
```

C++

```
[SecurityPermissionAttribute(SecurityAction::LinkDemand, Flags=SecurityPermissionFlag::Infr
astructure)]
public:
virtual ObjRef^ CreateObjRef (
    Type^ requestedType
) override
```

J#

```
/** @attribute SecurityPermissionAttribute(SecurityAction.LinkDemand, Flags=SecurityPermiss
ionFlag.Infrastructure) */
public ObjRef CreateObjRef (
    Type requestedType
)
```

JScript

```
public override function CreateObjRef (
    requestedType : Type
) : ObjRef
```

## Parameters

requestedType

The type of the object that the new ObjRef will reference.

## Return Value

The information required to generate a proxy.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

[Return to top](#)

# MsDb2EntityDataReader.Dispose Method (Boolean)

Releases all resources used by the [MsDb2EntityDataReader](#) and optionally releases the managed resources.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Sub Dispose ( _
    disposing As Boolean _
)
```

C#

```
protected override void Dispose (
    bool disposing
)
```

C++

```
protected:
virtual void Dispose (
    bool disposing
) override
```

J#

```
protected void Dispose (
    boolean disposing
)
```

JScript

```
protected override function Dispose (
    disposing : boolean
)
```

## Parameters

disposing

**True** to release both managed and unmanaged resources; **false** to release only the unmanaged resources.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

```
public override function GetBytes (
    ordinal : int,
    dataOffset : long,
    buffer : byte[],
    bufferOffset : int,
    length : int
) : long
```

## Parameters

ordinal

The zero-based column ordinal.

dataOffset

The index within the field from which to begin the read operation.

buffer

The buffer into which to read the stream of bytes.

bufferOffset

The index within the buffer where the write operation is to start.

length

The maximum length to copy into the buffer.

#### **Return Value**

The actual number of bytes read.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

Retrieves the value of the specified column as a 64-bit signed integer.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetInt64 ( _
    ordinal As Integer _
) As Long
```

C#

```
public override long GetInt64 (
    int ordinal
)
```

C++

```
public:
virtual long long GetInt64 (
    int ordinal
) override
```

J#

```
public long GetInt64 (
    int ordinal
)
```

JScript

```
public override function GetInt64 (
    ordinal : int
) : long
```

## Parameters

ordinal

The zero-based column ordinal.

## Return Value

The value of the specified column as a 64-bit signed integer.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## MsDb2EntityDataReader.Item Property (Int32)

Gets the value of the specified column in its native format given the column ordinal.

Syntax

C#

```
public override object this[
    int ordinal
] { get; }
```

C++

```
public:
property Object^ default[
    int ordinal
] {
    virtual Object^ get(int ordinal) override;
}
```

F#

```
override Item :
    ordinal:int -> Object with get
```

VB

```
Public Overrides ReadOnly Property Item (
    ordinal As Integer
) As Object
```

## Parameters

*ordinal*

Type: [System.Int32](#)

The zero-based column ordinal.

## Property Value

Type: [System.Object](#)

The value of the specified column in its native format.

## Implements

[IDataRecord.Item\(Int32\)](#)

[Return to top](#)

**MsDb2EntityDataReader.Item Property (String)**

Gets the value of the specified column in its native format given the column name.

Syntax

C#

```
public override object this[
    string name
] { get; }
```

C++

```
public:
property Object^ default[
    String^ name
] {
    virtual Object^ get(String^ name) override;
}
```

F#

```
override Item :
    name:string -> Object with get
```

VB

```
Public Overrides ReadOnly Property Item (
    name As String
) As Object
```

#### Parameters

*name*

Type: [System.String](#)

The column name.

#### Property Value

Type: [System.Object](#)

The value of the specified column in its native format.

#### Implements

[IDataRecord.Item\(String\)](#)

[Return to top](#)

# MsDb2EntityDataReader.Item Property (Int32)

Gets the value of the specified column in its native format given the column ordinal.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Default Property Item ( _
    ordinal As Integer _
) As Object
```

C#

```
public override Object this [
    int ordinal
] { get; }
```

C++

```
public:
virtual property Object^ default [int] {
    Object^ get (int ordinal) override;
}
```

J#

```
/** @property */
public Object get_Item (int ordinal)
```

JScript

## Parameters

ordinal

The zero-based column ordinal.

## Property Value

The value of the specified column in its native format.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

 Visit(DbEntityRefExpression)	When overridden in a derived class, implements the visitor pattern for DbEntityRefExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbEntityRefExpression).</a> )
 Visit(DbExceptExpression)	When overridden in a derived class, implements the visitor pattern for DbExceptExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbExceptExpression).</a> )
 Visit(DbExpression)	When overridden in a derived class, implements the visitor pattern for DbExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbExpression).</a> )
 Visit(DbFilterExpression)	When overridden in a derived class, implements the visitor pattern for DbFilterExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbFilterExpression).</a> )
 Visit(DbFunctionExpression)	When overridden in a derived class, implements the visitor pattern for DbFunctionExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbFunctionExpression).</a> )
 Visit(DbGroupByExpression)	When overridden in a derived class, implements the visitor pattern for DbGroupByExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbGroupByExpression).</a> )
 Visit(DbIntersectExpression)	When overridden in a derived class, implements the visitor pattern for DbIntersectExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbIntersectExpression).</a> )
 Visit(DbIsEmptyExpression)	When overridden in a derived class, implements the visitor pattern for DbIsEmptyExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbIsEmptyExpression).</a> )
 Visit(DbIsNullExpression)	When overridden in a derived class, implements the visitor pattern for DbIsNullExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbIsNullExpression).</a> )

 Visit(DblsOfExpression)	When overridden in a derived class, implements the visitor pattern for DblsOfExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DblsOfExpression)</a> .)
 Visit(DbJoinExpression)	When overridden in a derived class, implements the visitor pattern for DbJoinExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbJoinExpression)</a> .)
 Visit(DbLambdaExpression)	(Inherited from <a href="#">DbExpressionVisitor&lt;'TResultType&gt;</a> .)
 Visit(DbLikeExpression)	When overridden in a derived class, implements the visitor pattern for DbLikeExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbLikeExpression)</a> .)
 Visit(DbLimitExpression)	When overridden in a derived class, implements the visitor pattern for DbLimitExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbLimitExpression)</a> .)
 Visit(DbNewInstanceExpression)	When overridden in a derived class, implements the visitor pattern for DbNewInstanceExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbNewInstanceExpression)</a> .)
 Visit(DbNotExpression)	When overridden in a derived class, implements the visitor pattern for DbNotExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbNotExpression)</a> .)
 Visit(DbNullExpression)	When overridden in a derived class, implements the visitor pattern for DbNullExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbNullExpression)</a> .)
 Visit(DbOfTypeExpression)	When overridden in a derived class, implements the visitor pattern for DbOfTypeExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbOfTypeExpression)</a> .)
 Visit(DbOrExpression)	When overridden in a derived class, implements the visitor pattern for DbOrExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbOrExpression)</a> .)
 Visit(DbParameterReferenceExpression)	When overridden in a derived class, implements the visitor pattern for DbParameterReferenceExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbParameterReferenceExpression)</a> .)
 Visit(DbProjectExpression)	When overridden in a derived class, implements the visitor pattern for DbProjectExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbProjectExpression)</a> .)
 Visit(DbPropertyExpression)	When overridden in a derived class, implements the visitor pattern for DbPropertyExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbPropertyExpression)</a> .)
 Visit(DbQuantifierExpression)	When overridden in a derived class, implements the visitor pattern for DbQuantifierExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbQuantifierExpression)</a> .)
 Visit(DbRefExpression)	When overridden in a derived class, implements the visitor pattern for DbRefExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbRefExpression)</a> .)
 Visit(DbRefKeyExpression)	When overridden in a derived class, implements the visitor pattern for DbRefKeyExpression. (Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbRefKeyExpression)</a> .)

 <a href="#">Visit(DbRelationshipNavigationExpression)</a>	When overridden in a derived class, implements the visitor pattern for DbRelationshipNavigationExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbRelationshipNavigationExpression).</a> )
 <a href="#">Visit(DbScanExpression)</a>	When overridden in a derived class, implements the visitor pattern for DbScanExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbScanExpression).</a> )
 <a href="#">Visit(DbSkipExpression)</a>	When overridden in a derived class, implements the visitor pattern for DbSkipExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbSkipExpression).</a> )
 <a href="#">Visit(DbSortExpression)</a>	When overridden in a derived class, implements the visitor pattern for DbSortExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbSortExpression).</a> )
 <a href="#">Visit(DbTreatExpression)</a>	When overridden in a derived class, implements the visitor pattern for DbTreatExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbTreatExpression).</a> )
 <a href="#">Visit(DbUnionAllExpression)</a>	When overridden in a derived class, implements the visitor pattern for DbUnionAllExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbUnionAllExpression).</a> )
 <a href="#">Visit(DbVariableReferenceExpression)</a>	When overridden in a derived class, implements the visitor pattern for DbVariableReferenceExpression.(Overrides <a href="#">DbExpressionVisitor&lt;'TResultType&gt;.Visit(DbVariableReferenceExpression).</a> )

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

#### **SqlGenerator.Visit Method (DbAndExpression)**

When overridden in a derived class, implements the visitor pattern for DbAndExpression.

Syntax

C#

```
public override ISqlFragment Visit(
    DbAndExpression e
```

```
)
```

C++

```
public:
virtual ISqlFragment^ Visit(
    DbAndExpression^ e
) override
```

F#

```
override Visit :
    e:DbAndExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (
    e As DbAndExpression
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbAndExpression](#)  
An expression that has a binary operator.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbAndExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbApplyExpression)

When overridden in a derived class, implements the visitor pattern for DbApplyExpression.

Syntax

C#

```
public override ISqlFragment Visit(
    DbApplyExpression e
)
```

C++

```
public:
virtual ISqlFragment^ Visit(
    DbApplyExpression^ e
) override
```

F#

```
override Visit :
    e:DbApplyExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (
    e As DbApplyExpression
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbApplyExpression](#)  
The expression that is visited.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbApplyExpression.

[Return to top](#)

#### **SqlGenerator.Visit Method (DbArithmeticExpression)**

When overridden in a derived class, implements the visitor pattern for DbArithmeticExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbArithmeticExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbArithmeticExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbArithmeticExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbArithmeticExpression  
) As ISqlFragment
```

#### **Parameters**

e

Type: [System.Data.Common.CommandTrees.DbArithmeticExpression](#)  
Expression supporting basic arithmetic.

#### **Return Value**

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbArithmeticExpression.

[Return to top](#)

#### **SqlGenerator.Visit Method (DbCaseExpression)**

When overridden in a derived class, implements the visitor pattern for DbCaseExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbCaseExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbCaseExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbCaseExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbCaseExpression  
    ) As ISqlFragment
```

#### Parameters

e

Type: [System.Data.Common.CommandTrees.DbCaseExpression](#)

The expression that is visited.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbCaseExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbCastExpression)

When overridden in a derived class, implements the visitor pattern for DbCastExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbCastExpression e  
    )
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbCastExpression^ e  
    ) override
```

F#

```
override Visit :  
    e:DbCastExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbCastExpression  
    ) As ISqlFragment
```

#### Parameters

e

Type: [System.Data.Common.CommandTrees.DbCastExpression](#)

The expression that is visited.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbCastExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbComparisonExpression)

When overridden in a derived class, implements the visitor pattern for DbComparisonExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbComparisonExpression e  
    )
```

C++

```
public:
```

```
virtual ISqlFragment^ Visit(  
    DbComparisonExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbComparisonExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbComparisonExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbComparisonExpression](#)  
A comparison operation applied to two arguments

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbComparisonExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbConstantExpression)

When overridden in a derived class, implements the visitor pattern for DbConstantExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbConstantExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbConstantExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbConstantExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbConstantExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbConstantExpression](#)  
An expression that has a constant value.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbConstantExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbCrossJoinExpression)

When overridden in a derived class, implements the visitor pattern for DbCrossJoinExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbCrossJoinExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbCrossJoinExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbCrossJoinExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbCrossJoinExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbCrossJoinExpression](#)  
An unconditional join operation between the given collection arguments.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbCrossJoinExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbDerefExpression)

When overridden in a derived class, implements the visitor pattern for DbDerefExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbDerefExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbDerefExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbDerefExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbDerefExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbDerefExpression](#)  
An expression that retrieves an entity based on the specified reference.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbDerefExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbDistinctExpression)

When overridden in a derived class, implements the visitor pattern for DbDistinctExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbDistinctExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbDistinctExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbDistinctExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbDistinctExpression  
) As ISqlFragment
```

#### Parameters

e

Type: [System.Data.Common.CommandTrees.DbDistinctExpression](#)  
Removes duplicate elements from the specified set argument.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbDistinctExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbElementExpression)

When overridden in a derived class, implements the visitor pattern for DbElementExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbElementExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbElementExpression^ e  
) override
```

F#

```
override Visit :
```

```
e:DbElementExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbElementExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbElementExpression](#)  
The conversion of the specified set argument to a singleton.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbElementExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbEntityRefExpression)

When overridden in a derived class, implements the visitor pattern for DbEntityRefExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbEntityRefExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbEntityRefExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbEntityRefExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbEntityRefExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbEntityRefExpression](#)  
An expression that extracts a reference from the underlying entity instance.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbEntityRefExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbExceptExpression)

When overridden in a derived class, implements the visitor pattern for DbExceptExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbExceptExpression e  
)
```

C++

```
public:
virtual ISqlFragment^ Visit(
    DbExceptExpression^ e
) override
```

F#

```
override Visit :
    e:DbExceptExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (
    e As DbExceptExpression
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbExceptExpression](#)

The set subtraction operation between the left and right operands.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbExceptExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbExpression)

When overridden in a derived class, implements the visitor pattern for DbExpression.

Syntax

C#

```
public override ISqlFragment Visit(
    DbExpression e
)
```

C++

```
public:
virtual ISqlFragment^ Visit(
    DbExpression^ e
) override
```

F#

```
override Visit :
    e:DbExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (
    e As DbExpression
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbExpression](#)

The basic functionality required by expression types.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbExpression.

[Return to top](#)

### SqlGenerator.Visit Method (DbFilterExpression)

When overridden in a derived class, implements the visitor pattern for DbFilterExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbFilterExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbFilterExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbFilterExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbFilterExpression  
) As ISqlFragment
```

### Parameters

e

Type: [System.Data.Common.CommandTrees.DbFilterExpression](#)

A predicate applied to filter an input set.

### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbFilterExpression.

[Return to top](#)

### SqlGenerator.Visit Method (DbFunctionExpression)

When overridden in a derived class, implements the visitor pattern for DbFunctionExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbFunctionExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbFunctionExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbFunctionExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbFunctionExpression
```

```
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbFunctionExpression](#)

An invocation of a function.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbFunctionExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbGroupByExpression)

When overridden in a derived class, implements the visitor pattern for DbGroupByExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbGroupByExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbGroupByExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbGroupByExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbGroupByExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbGroupByExpression](#)

Represents a group by operation.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbGroupByExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbIntersectExpression)

When overridden in a derived class, implements the visitor pattern for DbIntersectExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbIntersectExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbIntersectExpression^ e
```

```
) override
```

F#

```
override Visit :  
    e:DbIntersectExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbIntersectExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbIntersectExpression](#)

The set intersection operation between the left and right operands.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbIntersectExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbIsEmptyExpression)

When overridden in a derived class, implements the visitor pattern for DbIsEmptyExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbIsEmptyExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbIsEmptyExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbIsEmptyExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbIsEmptyExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbIsEmptyExpression](#)

An empty set determination applied to a single set argument.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbIsEmptyExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbIsNullExpression)

When overridden in a derived class, implements the visitor pattern for DbIsNullExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbIsNullExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbIsNullExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbIsNullExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbIsNullExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbIsNullExpression](#)

A null determination applied to a single argument.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbIsNullExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbIsOfExpression)

When overridden in a derived class, implements the visitor pattern for DbIsOfExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbIsOfExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbIsOfExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbIsOfExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbIsOfExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbIsOfExpression](#)

The type comparison of a single argument against the specified type.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbIsOfExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbJoinExpression)

When overridden in a derived class, implements the visitor pattern for DbJoinExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbJoinExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbJoinExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbJoinExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbJoinExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbJoinExpression](#)

An inner, left outer, or full outer join operation between the given collection arguments on the specified join condition.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbJoinExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbLikeExpression)

When overridden in a derived class, implements the visitor pattern for DbLikeExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbLikeExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbLikeExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbLikeExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbLikeExpression  
) As ISqlFragment
```

#### Parameters

e

Type: [System.Data.Common.CommandTrees.DbLikeExpression](#)

A string comparison against the specified pattern with an optional escape string.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbLikeExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbLimitExpression)

When overridden in a derived class, implements the visitor pattern for DbLimitExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbLimitExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbLimitExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbLimitExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbLimitExpression  
) As ISqlFragment
```

#### Parameters

e

Type: [System.Data.Common.CommandTrees.DbLimitExpression](#)

The restriction of the number of elements in the argument collection to the specified limit value.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbLimitExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbNewInstanceExpression)

When overridden in a derived class, implements the visitor pattern for DbNewInstanceExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbNewInstanceExpression e  
)
```

C++

```
public:
virtual ISqlFragment^ Visit(
    DbNewInstanceExpression^ e
) override
```

F#

```
override Visit :
    e:DbNewInstanceExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (
    e As DbNewInstanceExpression
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbNewInstanceExpression](#)

The construction of a new instance of a given type, including set and record types.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbNewInstanceExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbNotExpression)

When overridden in a derived class, implements the visitor pattern for DbNotExpression.

Syntax

C#

```
public override ISqlFragment Visit(
    DbNotExpression e
)
```

C++

```
public:
virtual ISqlFragment^ Visit(
    DbNotExpression^ e
) override
```

F#

```
override Visit :
    e:DbNotExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (
    e As DbNotExpression
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbNotExpression](#)

The logical NOT of a single Boolean argument.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbNotExpression.

[Return to top](#)

### SqlGenerator.Visit Method (DBNullExpression)

When overridden in a derived class, implements the visitor pattern for DBNullExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DBNullExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DBNullExpression^ e  
) override
```

F#

```
override Visit :  
    e:DBNullExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DBNullExpression  
) As ISqlFragment
```

### Parameters

e

Type: [System.Data.Common.CommandTrees.DbNullExpression](#)

A reference to a typed null literal.

### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DBNullExpression.

[Return to top](#)

### SqlGenerator.Visit Method (DbOfTypeExpression)

When overridden in a derived class, implements the visitor pattern for DbOfTypeExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbOfTypeExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbOfTypeExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbOfTypeExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbOfTypeExpression
```

```
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbOfTypeExpression](#)

The retrieval of elements of the specified type from the given set argument.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbOfTypeExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbOrExpression)

When overridden in a derived class, implements the visitor pattern for DbOrExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbOrExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbOrExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbOrExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbOrExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbOrExpression](#)

The logical OR of two Boolean arguments.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbOrExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbParameterReferenceExpression)

When overridden in a derived class, implements the visitor pattern for DbParameterReferenceExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbParameterReferenceExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbParameterReferenceExpression^ e
```

```
) override
```

F#

```
override Visit :  
    e:DbParameterReferenceExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbParameterReferenceExpression  
) As ISqlFragment
```

#### Parameters

*e*  
Type: [System.Data.Common.CommandTrees.DbParameterReferenceExpression](#)  
A reference to a parameter declared on the command tree that contains this expression.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbParameterReferenceExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbProjectExpression)

When overridden in a derived class, implements the visitor pattern for DbProjectExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbProjectExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbProjectExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbProjectExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbProjectExpression  
) As ISqlFragment
```

#### Parameters

*e*  
Type: [System.Data.Common.CommandTrees.DbProjectExpression](#)  
The projection of a given input set over the specified expression.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)  
The visitor pattern for DbProjectExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbPropertyExpression)

When overridden in a derived class, implements the visitor pattern for DbPropertyExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbPropertyExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbPropertyExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbPropertyExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbPropertyExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbPropertyExpression](#)

Methods and properties for retrieving an instance property

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbPropertyExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbQuantifierExpression)

When overridden in a derived class, implements the visitor pattern for DbQuantifierExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbQuantifierExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbQuantifierExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbQuantifierExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbQuantifierExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbQuantifierExpression](#)

A quantifier operation of the specified kind over the elements of the specified input set.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbQuantifierExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbRefExpression)

When overridden in a derived class, implements the visitor pattern for DbRefExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbRefExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbRefExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbRefExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbRefExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbRefExpression](#)

A strongly typed reference to a specific instance within an entity set.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbRefExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbRefKeyExpression)

When overridden in a derived class, implements the visitor pattern for DbRefKeyExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbRefKeyExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbRefKeyExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbRefKeyExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbRefKeyExpression  
) As ISqlFragment
```

#### Parameters

e

Type: [System.Data.Common.CommandTrees.DbRefKeyExpression](#)

The retrieval of the key value from the underlying reference value.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbRefKeyExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbRelationshipNavigationExpression)

When overridden in a derived class, implements the visitor pattern for DbRelationshipNavigationExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbRelationshipNavigationExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbRelationshipNavigationExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbRelationshipNavigationExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbRelationshipNavigationExpression  
) As ISqlFragment
```

#### Parameters

e

Type: [System.Data.Common.CommandTrees.DbRelationshipNavigationExpression](#)

The navigation of a relationship.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbRelationshipNavigationExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbScanExpression)

When overridden in a derived class, implements the visitor pattern for DbScanExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbScanExpression e  
)
```

C++

```
public:
virtual ISqlFragment^ Visit(
    DbScanExpression^ e
) override
```

F#

```
override Visit :
    e:DbScanExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (
    e As DbScanExpression
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbScanExpression](#)

A scan over an entity set or relationship set, as indicated by the target property.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbScanExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbSkipExpression)

When overridden in a derived class, implements the visitor pattern for DbSkipExpression.

Syntax

C#

```
public override ISqlFragment Visit(
    DbSkipExpression e
)
```

C++

```
public:
virtual ISqlFragment^ Visit(
    DbSkipExpression^ e
) override
```

F#

```
override Visit :
    e:DbSkipExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (
    e As DbSkipExpression
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbSkipExpression](#)

A specified number of elements in the input set.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbSkipExpression.

[Return to top](#)

### **SqlGenerator.Visit Method (DbSortExpression)**

When overridden in a derived class, implements the visitor pattern for DbSortExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbSortExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbSortExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbSortExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbSortExpression  
) As ISqlFragment
```

### **Parameters**

*e*

Type: [System.Data.Common.CommandTrees.DbSortExpression](#)

A sort operation applied to the elements of the specified input set based on the given sort keys.

### **Return Value**

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbSortExpression.

[Return to top](#)

### **SqlGenerator.Visit Method (DbTreatExpression)**

When overridden in a derived class, implements the visitor pattern for DbTreatExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbTreatExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbTreatExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbTreatExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbTreatExpression
```

```
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbTreatExpression](#)

A type conversion operation applied to a polymorphic argument.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbTreatExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbUnionAllExpression)

When overridden in a derived class, implements the visitor pattern for DbUnionAllExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbUnionAllExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbUnionAllExpression^ e  
) override
```

F#

```
override Visit :  
    e:DbUnionAllExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbUnionAllExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbUnionAllExpression](#)

The set union operation between the left and right operands.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbUnionAllExpression.

[Return to top](#)

#### SqlGenerator.Visit Method (DbVariableReferenceExpression)

When overridden in a derived class, implements the visitor pattern for DbVariableReferenceExpression.

Syntax

C#

```
public override ISqlFragment Visit(  
    DbVariableReferenceExpression e  
)
```

C++

```
public:  
virtual ISqlFragment^ Visit(  
    DbVariableReferenceExpression^ e
```

```
) override
```

F#

```
override Visit :  
    e:DbVariableReferenceExpression -> ISqlFragment
```

VB

```
Public Overrides Function Visit (  
    e As DbVariableReferenceExpression  
) As ISqlFragment
```

#### Parameters

*e*

Type: [System.Data.Common.CommandTrees.DbVariableReferenceExpression](#)

A reference to a variable that is currently in scope.

#### Return Value

Type: [Microsoft.HostIntegration.MsDb2EntityClient.ISqlFragment](#)

The visitor pattern for DbVariableReferenceExpression.

[Return to top](#)

# SqlGenerator.Visit Method (DbAndExpression)

When overridden in a derived class, implements the visitor pattern for DbAndExpression.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function Visit ( _
    e As DbAndExpression _
) As ISqlFragment
```

C#

```
public override ISqlFragment Visit (
    DbAndExpression e
)
```

C++

```
public:
virtual ISqlFragment^ Visit (
    DbAndExpression^ e
) override
```

J#

```
public ISqlFragment Visit (
    DbAndExpression e
)
```

JScript

```
public override function Visit (
    e : DbAndExpression
) : ISqlFragment
```

## Parameters

e

An expression that has a binary operator.

## Return Value

The visitor pattern for DbAndExpression.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

When overridden in a derived class, implements the visitor pattern for DbApplyExpression.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function Visit ( _
    e As DbApplyExpression _
) As ISqlFragment
```

C#

```
public override ISqlFragment Visit (
    DbApplyExpression e
)
```

C++

```
public:
virtual ISqlFragment^ Visit (
    DbApplyExpression^ e
) override
```

J#

```
public ISqlFragment Visit (
    DbApplyExpression e
)
```

JScript

```
public override function Visit (
    e : DbApplyExpression
) : ISqlFragment
```

## Parameters

e

The expression that is visited.

## Return Value

The visitor pattern for DbApplyExpression.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

) : ISqlFragment
```

## Parameters

e

A null determination applied to a single argument.

## Return Value

The visitor pattern for DbIsNullExpression.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

When overridden in a derived class, implements the visitor pattern for DbIsOfExpression.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function Visit ( _
    e As DbIsOfExpression _
) As ISqlFragment
```

C#

```
public override ISqlFragment Visit (
    DbIsOfExpression e
)
```

C++

```
public:
virtual ISqlFragment^ Visit (
    DbIsOfExpression^ e
) override
```

J#

```
public ISqlFragment Visit (
    DbIsOfExpression e
)
```

JScript

```
public override function Visit (
    e : DbIsOfExpression
) : ISqlFragment
```

## Parameters

e

The type comparison of a single argument against the specified type.

## Return Value

The visitor pattern for DbIsOfExpression.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SqlGenerator.Visit Method (DbTreatExpression)

When overridden in a derived class, implements the visitor pattern for DbTreatExpression.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function Visit ( _
    e As DbTreatExpression _
) As ISqlFragment
```

C#

```
public override ISqlFragment Visit (
    DbTreatExpression e
)
```

C++

```
public:
virtual ISqlFragment^ Visit (
    DbTreatExpression^ e
) override
```

J#

```
public ISqlFragment Visit (
    DbTreatExpression e
)
```

JScript

```
public override function Visit (
    e : DbTreatExpression
) : ISqlFragment
```

## Parameters

e

A type conversion operation applied to a polymorphic argument.

## Return Value

The visitor pattern for DbTreatExpression.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# SqlGenerator.Visit Method (DbUnionAllExpression)

When overridden in a derived class, implements the visitor pattern for DbUnionAllExpression.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function Visit ( _
    e As DbUnionAllExpression _
) As ISqlFragment
```

C#

```
public override ISqlFragment Visit (
    DbUnionAllExpression e
)
```

C++

```
public:
virtual ISqlFragment^ Visit (
    DbUnionAllExpression^ e
) override
```

J#

```
public ISqlFragment Visit (
    DbUnionAllExpression e
)
```

JScript

```
public override function Visit (
    e : DbUnionAllExpression
) : ISqlFragment
```

## Parameters

e

The set union operation between the left and right operands.

## Return Value

The visitor pattern for DbUnionAllExpression.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

When overridden in a derived class, implements the visitor pattern for DbVariableReferenceExpression.

**Namespace:** Microsoft.HostIntegration.MsDb2EntityClient

**Assembly:** Microsoft.HostIntegration.MsDb2EntityClient (in microsoft.hostintegration.msdb2entityclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function Visit ( _
    e As DbVariableReferenceExpression _
) As ISqlFragment
```

C#

```
public override ISqlFragment Visit (
    DbVariableReferenceExpression e
)
```

C++

```
public:

# Microsoft.HostIntegration.MsHostFileClient Namespace

The **Microsoft.HostIntegration.MsHostFileClient** namespace provides access to the Managed Provider for Host Files.

## Classes

Class	Description
 <a href="#">AccessDDMObjClass</a>	Represents the access DDM object class.
 <a href="#">COMMINFO</a>	Specifies the command info.
 <a href="#">DDMGlobals</a>	Specifies the DDM globals.
 <a href="#">DDMTransport</a>	Represents the client to communicate to the DDM server.
 <a href="#">FILATT</a>	Displays the FILATT.
 <a href="#">HostCursor</a>	Represents the implementation of the IDataCursor interface for host files.
 <a href="#">HostDataConnection</a>	Represents a physical connection to the host file system.
 <a href="#">HostFileCommand</a>	Represents a command to execute against the host file system.
 <a href="#">HostFileConnection</a>	Represents a connection to a database.
 <a href="#">HostFileConnectionStringBuilder</a>	Creates a strongly-typed connection strings.
 <a href="#">HostFileDataAdapter</a>	Represents a set of data commands and a host connection that are used to fill the DataSet and update host files.
 <a href="#">HostFileParameter</a>	Represents a host file parameter.
 <a href="#">HostFileParameterCollection</a>	Represents a collection of HostFileParameters for a HostFileCommand.
 <a href="#">HostFileProviderFactory</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Represents a set of methods for creating instances of the <b>Microsoft.HostIntegration.MsHostFileClient</b> provider's implementation of the data source classes.
 <a href="#">HostFileRecordSet</a>	Represents the host file record set.
 <a href="#">RMTFILEINFO</a>	Displays the remote file information.
 <a href="#">UpdateableDataRecord</a>	Represents an updatable data record.

## Structures

Structure	Description
 <a href="#">DDMTransport.DSSWithMessage.&lt;message&gt;e_FixedBuffer1</a>	Represents the DSS message of the fixed buffer1.
 <a href="#">CHECKOUT</a>	Specifies the checkout method.
 <a href="#">COLATT</a>	Displays the COLATT.
 <a href="#">DATE_ST</a>	Defines the date setting format.
 <a href="#">DDMTransport.DSS</a>	Displays the decentralized software services.
 <a href="#">DDMTransport.DSSWithMessage</a>	Enumerates a DDS with message for the client.
 <a href="#">DDMTransport.GDS</a>	Enumerates the general data stream of the client.
 <a href="#">KEYDEFST</a>	Displays the key def structure.
 <a href="#">KEYLIMIT</a>	Specifies the key limit.

 <a href="#">ODD_RECORDINFO</a>	Displays the odd _ record information.
 <a href="#">SQLDARDSTR</a>	Displays the SQLDARDSTR.
 <a href="#">USERATT</a>	Enumerates the user ATT of the client.

#### Interfaces

Interface	Description
 <a href="#">DDMInterface</a>	Represents the interface of the DDM server.
 <a href="#">IDataConnection</a>	Represents the data connection to the host server.
 <a href="#">IDataCursor</a>	Defines properties and methods for the data cursor.
 <a href="#">IDataRecordSet</a>	Represents a data record set.
 <a href="#">IDDMTransport</a>	Represents the IDDM transport connection.
 <a href="#">IRecordConverter</a>	Converts a data record between a remote system format and a local system format.
 <a href="#">IRecordConverterFactory</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Represents a factory interface for creating instances of the <a href="#">IRecordConverter</a> class.
 <a href="#">IUpdateableDataRecord</a>	Provides access to the column values within each row.

#### Enumerations

Enumeration	Description
 <a href="#">AccessIntentionOptions</a>	Specifies the access intention options.
 <a href="#">ByteStreamOptions</a>	Enumerates a byte stream options.
 <a href="#">CodePoints</a>	Specifies the code points associated in the host.
 <a href="#">ConnectionStates</a>	Specifies the states of connection.
 <a href="#">CursorMovementOptions</a>	Specifies the cursor movement options.
 <a href="#">CursorStateKeyLimits</a>	Specifies the cursor state key limit.
 <a href="#">DataCursorAccessMethods</a>	Represents the data cursor access methods.
 <a href="#">DataCursorFlags</a>	Represents the data cursor flags.
 <a href="#">DataCursorOpenMode</a>	Represents the data cursor open modes.
 <a href="#">DataCursorShareFlags</a>	Displays the share flags.
 <a href="#">DataCursorState</a>	Displays the data cursor state.
 <a href="#">DataRecordAccessFlags</a>	Specifies the data record access flags.
 <a href="#">DataRecordState</a>	Specifies the data record state.
 <a href="#">DataRecordStatusFlags</a>	Specifies the data record status flags.
 <a href="#">DataRecordVersion</a>	Specifies the data record version.
 <a href="#">DataStreamTypes</a>	Specifies the types of data stream.
 <a href="#">DDMAccessMethods</a>	Specifies the DDM access methods.
 <a href="#">DDMDataFormats</a>	Specifies the DDM data formats.
 <a href="#">DDMFileOptions</a>	Specifies the Discovery Data Manager (DDM) file options.

 <a href="#">DDMTransportTypes</a>	Specifies the DDM transport types.
 <a href="#">DisconnectTypes</a>	Specifies the types of disconnection.
 <a href="#">EncodeDataTypes</a>	Specifies the data types to encode.
 <a href="#">FileAccessHistories</a>	Enumerates a file access histories.
 <a href="#">FileClasses</a>	Specifies the file classes.
 <a href="#">FileSharingOptions</a>	Specifies the options in file sharing.
 <a href="#">HostFileType</a>	Specifies the host file types.
 <a href="#">HostServerClass</a>	Specifies the type of the host system.
 <a href="#">InsertRecordOptions</a>	Specifies the options to insert record.
 <a href="#">KeyClass</a>	Specifies the key class associated with the host.
 <a href="#">KeyLimitOptions</a>	Specifies the key limit options.
 <a href="#">KeyOrdering</a>	Specifies the key ordering.
 <a href="#">KeyValueSearchOptions</a>	Specifies the key value search options.
 <a href="#">MWRReturnCodes</a>	Specifies the memory window return codes.
 <a href="#">RecordLengthClasses</a>	Specifies the recorded length of classes.
 <a href="#">RecordSetType</a>	Represents the type of recordset on the host file system.
 <a href="#">SQLDataTypes</a>	Enumerates a SQL data types.
 <a href="#">UpdateResult</a>	Specifies the result of an attempted update.
 <a href="#">WhatRcvdValues</a>	Specifies the values received.

# ABBREV\_FILATT Structure

Displays the ABBREV\_FILATT.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration  
Public Structure ABBREV_FILATT
```

C#

```
public struct ABBREV_FILATT
```

C++

```
public value class ABBREV_FILATT
```

J#

```
public final class ABBREV_FILATT extends ValueType
```

JScript

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ABBREV\_FILATT Members

Displays the ABBREV\_FILATT.

The following tables list the members exposed by the [ABBREV\\_FILATT](#) type.

Public Fields

	Name	Description
	<a href="#">accmthls</a>	The accmthls.
	<a href="#">delcp</a>	The delcp.
	<a href="#">duplicatekey</a>	The duplicatekey.
	<a href="#">inserttcp</a>	The inserttcp.
	<a href="#">modifycp</a>	The modifycp.
	<a href="#">name</a>	The name.
	<a href="#">numkeyfields</a>	The numkeyfields.
