# AccessDDMObjClass.ClearFile Method

Clears the specified file.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<DispIdAttribute(5)> _
Public Overridable Sub ClearFile ( _
    <InAttribute> nConnectionId As Short, _
    <InAttribute> FileName As String _
)
```

C#

```
[DispIdAttribute(5)]
public virtual void ClearFile (
    [InAttribute] short nConnectionId,
    [InAttribute] string FileName
)
```

C++

```
[DispIdAttribute(5)]
public:
virtual void ClearFile (
    [InAttribute] short nConnectionId,
    [InAttribute] String^ FileName
)
```

J#

```
/** @attribute DispIdAttribute(5) */
public void ClearFile (
    /** @attribute InAttribute() */ short nConnectionId,
    /** @attribute InAttribute() */ String FileName
)
```

JScript

```
DispIdAttribute(5)
public function ClearFile (
    nConnectionId : short,
    FileName : String
)
```

## Parameters

nConnectionId

The connection id.

FileName

The name of the file to clear.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

public:
virtual void Connect (
    String^ connectionString,
    [InAttribute] [OutAttribute] short% ConnectionId,
    [InAttribute] [OutAttribute] short% CCSId
)
```

J#

```
/** @attribute DispIdAttribute(1) */
public void Connect (
    String connectionString,
    /** @attribute InAttribute() */ /** @attribute OutAttribute() */ /** @ref */ short ConnectionId,
    /** @attribute InAttribute() */ /** @attribute OutAttribute() */ /** @ref */ short CCSId
)
```

JScript

## Parameters

ConnectionString

The connection string.

ConnectionId

The connection identification.

CCSId

The CCS identification.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

    /** @attribute InAttribute() */ /** @attribute OutAttribute() */ /** @ref */ int prgfRecord
    dFlags,
    /** @attribute InAttribute() */ /** @attribute OutAttribute() */ /** @ref */ int plPositio
    n
)
```

## Parameters

IFileId

The file id.

rgfAccessFlags

The access flags.

pbRecord

The pb record.

cbMaxRecord

The maximum record.

pcbRecord

The pcb record.

prgfRecordFlags

The record flags.

plPosition

The specified position.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostCursor Class

Represents the implementation of the IDataCursor interface for host files.

**Namespace:** [Microsoft.HostIntegration.MsHostFileClient](#)

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in Microsoft.HostIntegration.MsHostFileClient.dll)

Inheritance Hierarchy [System.Object](#)

**Microsoft.HostIntegration.MsHostFileClient.HostCursor**

Syntax

C#

```
public class HostCursor : IDataCursor
```

C++

```
public ref class HostCursor : IDataCursor
```

F#

```
type HostCursor =  
    class  
        interface IDataCursor  
    end
```

VB

```
Public Class HostCursor  
    Implements IDataCursor
```

Constructors

	Name	Description
	<a href="#">HostCursor()</a>	Initializes a new instance of the <b>HostCursor</b> class.

Properties

	Name	Description
	<a href="#">AccessMethods</a>	Gets the access methods for the current cursor.
	<a href="#">CursorFlags</a>	Gets the settings for the current cursor flags.
	<a href="#">CursorState</a>	Gets the cursor state.
	<a href="#">FileName</a>	Gets the file name of the file the cursor is currently pointing to.
	<a href="#">MaxRecordLength</a>	Gets the maximum record length of the record the cursor is currently pointing to.
	<a href="#">Position</a>	Gets the current position of the cursor.
	<a href="#">RecordsCount</a>	Gets the records count of the record the cursor is currently pointing to.
	<a href="#">RecordStatusFlags</a>	Gets or sets the record status flag of the record the cursor is currently pointing to.
	<a href="#">RecordType</a>	Gets the record type of the record the cursor is currently pointing to.

Methods

	Name	Description
	<a href="#">Close()</a>	Closes the record that the cursor is currently pointing to.

 <code>Delete()</code>	Deletes the record that the cursor is currently pointing to.
 <code>Equals(Object)</code>	(Inherited from <a href="#">Object</a> .)
 <code>FilterByKey(Object, Boolean, Object, Boolean, Boolean, Int32)</code>	
 <code>FilterByPosition(Int32, Boolean, Int32, Boolean, Boolean)</code>	Filters by position.
 <code>Finalize()</code>	(Inherited from <a href="#">Object</a> .)
 <code>GetHashCode()</code>	(Inherited from <a href="#">Object</a> .)
 <code>GetRecord()</code>	Retrieves the record.
 <code>GetType()</code>	(Inherited from <a href="#">Object</a> .)
 <code>Insert(Object)</code>	Inserts the specified record at the current cursor location.
 <code>LockRecord()</code>	Locks the record located at the current cursor location.
 <code>MemberwiseClone()</code>	(Inherited from <a href="#">Object</a> .)
 <code>MoveBottom()</code>	Moves the cursor to the bottom of the record.
 <code>MoveFirst(DataRecordAccessFlags)</code>	Moves the cursor to the first record using the specified access flags.
 <code>MoveLast(DataRecordAccessFlags)</code>	Moves the cursor to the last record using the specified access flags.
 <code>MoveNext(DataRecordAccessFlags)</code>	Moves the cursor to the next record using the specified access flags.
 <code>MovePrev(DataRecordAccessFlags)</code>	Moves the cursor to the previous record using the specified access flags.
 <code>MoveTo(Int32, DataRecordAccessFlags)</code>	Moves the cursor to a record using the specified position and access flags.
 <code>MoveTop()</code>	Moves the cursor to the top of the record.

 <a href="#">Open(HostDataConnection, String, DataCursorOpenMode, DataCursorShareFlags, IRecordConverter)</a>	Opens the record that the cursor is currently pointing to.
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">UnlockRecord()</a>	Unlocks the record the cursor is currently pointing to.
 <a href="#">Update(Object)</a>	Updates the record the cursor is currently pointing to.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostCursor Members

Represents the implementation of the [IDataCursor](#) interface for host files.

The following tables list the members exposed by the [HostCursor](#) type.

## Public Constructors

Name	Description
<a href="#">HostCursor</a>	Initializes a new instance of the <a href="#">HostCursor</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">AccessMethods</a>	Gets the access methods for the current cursor.
 <a href="#">CursorFlags</a>	Gets the settings for the current cursor flags.
 <a href="#">CursorState</a>	Gets the cursor state.
 <a href="#">FileName</a>	Gets the file name of the file the cursor is currently pointing to.
 <a href="#">MaxRecordLength</a>	Gets the maximum record length of the record the cursor is currently pointing to.
 <a href="#">Position</a>	Gets the current position of the cursor.
 <a href="#">RecordsCount</a>	Gets the records count of the record the cursor is currently pointing to.
 <a href="#">RecordStatusFlags</a>	Gets or sets the record status flag of the record the cursor is currently pointing to.
 <a href="#">RecordType</a>	Gets the record type of the record the cursor is currently pointing to.

## Top

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Close</a>	Closes the record that the cursor is currently pointing to.
 <a href="#">Delete</a>	Deletes the record that the cursor is currently pointing to.
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">FilterByKey</a>	Filters by key.
 <a href="#">FilterByPosition</a>	Filters by position.
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetRecord</a>	Retrieves the record.
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">Insert</a>	Inserts the specified record at the current cursor location.
 <a href="#">LockRecord</a>	Locks the record located at the current cursor location.
 <a href="#">MoveBottom</a>	Moves the cursor to the bottom of the record.
 <a href="#">MoveFirst</a>	Moves the cursor to the first record using the specified access flags.
 <a href="#">MoveLast</a>	Moves the cursor to the last record using the specified access flags.
 <a href="#">MoveNext</a>	Moves the cursor to the next record using the specified access flags.
 <a href="#">MovePrev</a>	Moves the cursor to the previous record using the specified access flags.
 <a href="#">MoveTo</a>	Moves the cursor to a record using the specified position and access flags.
 <a href="#">MoveTop</a>	Moves the cursor to the top of the record.
 <a href="#">Open</a>	Opens the record that the cursor is currently pointing to.
 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ToString</a>	(inherited from <a href="#">Object</a> )
 <a href="#">UnlockRecord</a>	Unlocks the record the cursor is currently pointing to.
 <a href="#">Update</a>	Updates the record the cursor is currently pointing to.

[HostCursor Class](#)

# HostCursor Constructor

Initializes a new instance of the [HostCursor](#) class.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public HostCursor ()
```

C++

```
public:  
HostCursor ()
```

J#

```
public HostCursor ()
```

JScript

```
public function HostCursor ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostCursor.FilterByKey Method

Filters by key.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub FilterByKey ( _
    KeyLow As Object, _
    KeyLowInclusive As Boolean, _
    KeyHigh As Object, _
    KeyHighInclusive As Boolean, _
    ResetTop As Boolean _
)
```

C#

```
public void FilterByKey (
    Object KeyLow,
    bool KeyLowInclusive,
    Object KeyHigh,
    bool KeyHighInclusive,
    bool ResetTop
)
```

C++

```
public:
virtual void FilterByKey (
    Object^ KeyLow,
    bool KeyLowInclusive,
    Object^ KeyHigh,
    bool KeyHighInclusive,
    bool ResetTop
) sealed
```

J#

```
public final void FilterByKey (
    Object KeyLow,
    boolean KeyLowInclusive,
    Object KeyHigh,
    boolean KeyHighInclusive,
    boolean ResetTop
)
```

JScript

```
public final function FilterByKey (
    KeyLow : Object,
    KeyLowInclusive : boolean,
    KeyHigh : Object,
    KeyHighInclusive : boolean,
    ResetTop : boolean
)
```

## Parameters

KeyLow

The low key.

KeyLowInclusive

**true** if the low key is inclusive; otherwise, **false**.

KeyHigh

The high key.

KeyHighInclusive

**true** if the high key is inclusive; otherwise, **false**.

ResetTop

**true** to reset to the top when finished; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

# HostCursor.FilterByPosition Method

Filters by position.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub FilterByPosition ( _
    LowPos As Integer, _
    KeyLowInclusive As Boolean, _
    HighPos As Integer, _
    KeyHighInclusive As Boolean, _
    ResetTop As Boolean _
)
```

C#

```
public void FilterByPosition (
    int LowPos,
    bool KeyLowInclusive,
    int HighPos,
    bool KeyHighInclusive,
    bool ResetTop
)
```

C++

```
public:
virtual void FilterByPosition (
    int LowPos,
    bool KeyLowInclusive,
    int HighPos,
    bool KeyHighInclusive,
    bool ResetTop
) sealed
```

J#

```
public final void FilterByPosition (
    int LowPos,
    boolean KeyLowInclusive,
    int HighPos,
    boolean KeyHighInclusive,
    boolean ResetTop
)
```

JScript

```
public final function FilterByPosition (
    LowPos : int,
    KeyLowInclusive : boolean,
    HighPos : int,
    KeyHighInclusive : boolean,
    ResetTop : boolean
)
```

## Parameters

LowPos

The low position.

KeyLowInclusive

**true** to filter by the low key; otherwise, **false**.

HighPos

The high position.

KeyHighInclusive

**true** to filter by the high key; otherwise, **false**.

ResetTop

**true** to reset to the top when finished; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

    DataRecordAccessFlags AccessFlags
)
```

C++

```
public:
virtual void MoveTo (
    int Position,
    DataRecordAccessFlags AccessFlags
) sealed
```

J#

```
public final void MoveTo (
    int Position,
    DataRecordAccessFlags AccessFlags
)
```

JScript

```
public final function MoveTo (
    Position : int,
    AccessFlags : DataRecordAccessFlags
)
```

## Parameters

Position

The position of the record.

AccessFlags

The access flags necessary to access the record.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostCursor.Open Method

Opens the record that the cursor is currently pointing to.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Open ( _
    Connection As HostDataConnection, _
    FileName As String, _
    Mode As DataCursorOpenMode, _
    Share As DataCursorShareFlags, _
    Converter As IRecordConverter _
)
```

C#

```
public void Open (
    HostDataConnection Connection,
    string FileName,
    DataCursorOpenMode Mode,
    DataCursorShareFlags Share,
    IRecordConverter Converter
)
```

C++

```
public:
void Open (
    HostDataConnection^ Connection,
    String^ FileName,
    DataCursorOpenMode Mode,
    DataCursorShareFlags Share,
    IRecordConverter^ Converter
)
```

J#

```
public void Open (
    HostDataConnection Connection,

    IRecordConverter Converter
)
```

JScript

```
public function Open (
    Connection : HostDataConnection,
    FileName : String,
    Mode : DataCursorOpenMode,
    Share : DataCursorShareFlags,
    Converter : IRecordConverter
)
```

## Parameters

Connection

The connection to the host.

FileName

The name of the file to open.

Mode

The mode to open the record.

Share

The specified share flags.

Converter

The converter of the record.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostDataConnection.CreateConverter Method

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Function CreateConverter ( _
    recordType As Type _
) As IRecordConverter
```

C#

```
public IRecordConverter CreateConverter (
    Type recordType
)
```

C++

```
public:
virtual IRecordConverter^ CreateConverter (
    Type^ recordType
) sealed
```

J#

```
public final IRecordConverter CreateConverter (
    Type recordType
)
```

JScript

```
public final function CreateConverter (
    recordType : Type
) : IRecordConverter
```

## Parameters

recordType

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# HostDataConnection.CreateConverter2 Method

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Function CreateConverter2 ( _
    ccsid As Short, _
    recordType As Type _
) As IRecordConverter
```

C#

```
public IRecordConverter CreateConverter2 (
    short ccsid,
    Type recordType
)
```

C++

```
public:
virtual IRecordConverter^ CreateConverter2 (
    short ccsid,
    Type^ recordType
) sealed
```

J#

```
public final IRecordConverter CreateConverter2 (
    short ccsid,
    Type recordType
)
```

JScript

```
public final function CreateConverter2 (
    ccsid : short,
    recordType : Type
) : IRecordConverter
```

## Parameters

ccsid

recordType

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

    Inherits DbCommand
```

Constructors

	Name	Description
	<a href="#">HostFileCommand()</a>	Initializes a new instance of the <b>HostFileCommand</b> class.
	<a href="#">HostFileCommand(HostFileConnection)</a>	Initializes a new instance of the <b>HostFileCommand</b> class using the specified connection.
	<a href="#">HostFileCommand(String, HostFileConnection)</a>	Initializes a new instance of the <b>HostFileCommand</b> class using the specified command and connection.

Properties

	Name	Description
	<a href="#">CommandText</a>	Gets or sets the text command to run against the data source.(Overrides <a href="#">DbCommand.CommandText</a> .)
	<a href="#">CommandTimeout</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">CommandType</a>	Gets or sets how the CommandText property is interpreted.(Overrides <a href="#">DbCommand.CommandType</a> .)
	<a href="#">Connection</a>	Gets or sets the HostFileConnection used by the current instance.
	<a href="#">Container</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">HostFileClientTracePoint</a>	

 <b>Parameters</b>	Gets the collection of HostFileParameter objects.
 <b>Site</b>	(Inherited from <a href="#">Component</a> .)
 <b>Transaction</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>UpdatedRowSource</b>	(Inherited from <a href="#">DbCommand</a> .)

#### Methods

<b>Name</b>	<b>Description</b>
 <b>Cancel()</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>CreateObjRef(Type)</b>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <b>CreateParameter()</b>	Creates a new instance of a <a href="#">HostFileParameter</a> object.
 <b>Dispose()</b>	(Inherited from <a href="#">Component</a> .)
 <b>Equals(Object)</b>	(Inherited from <a href="#">Object</a> .)
 <b>ExecuteNonQuery()</b>	Executes a SQL statement against a connection object.(Overrides <a href="#">DbCommand.ExecuteNonQuery()</a> .)
 <b>ExecuteNonQueryAsync()</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>ExecuteNonQueryAsync(CancellationTok</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>ExecuteReader()</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>ExecuteReader(CommandBehavior)</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>ExecuteReaderAsync()</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>ExecuteReaderAsync(CancellationTok</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>ExecuteReaderAsync(CommandBehavior)</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>ExecuteReaderAsync(CommandBehavior, CancellationTok</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>ExecuteRecordSet()</b>	Executes a command on a recordset against the connection object.
 <b>ExecuteRecordSet(CommandBehavior, RecordSetType)</b>	Executes a command on a recordset against the connection object.
 <b>ExecuteScalar()</b>	Executes the query and returns the first column of the first row in the result set returned by the query. All other columns and rows are ignored.(Overrides <a href="#">DbCommand.ExecuteScalar()</a> .)
 <b>ExecuteScalarAsync()</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>ExecuteScalarAsync(CancellationTok</b>	(Inherited from <a href="#">DbCommand</a> .)
 <b>GetHashCode()</b>	(Inherited from <a href="#">Object</a> .)
 <b>GetLifetimeService()</b>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <b>GetType()</b>	(Inherited from <a href="#">Object</a> .)
 <b>InitializeLifetimeService()</b>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <b>Prepare()</b>	Creates a prepared (or compiled) version of the command on the data source.(Overrides <a href="#">DbCommand.Prepare()</a> .)
 <b>ToString()</b>	(Inherited from <a href="#">Component</a> .)

## Events

	Name	Description
	<a href="#">Disposed</a>	(Inherited from <a href="#">Component</a> .)

## Explicit Interface Implementations

	Name	Description
	<a href="#">IDbCommand.CreateParameter()</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">IDbCommand.ExecuteReader()</a>	(Inherited from <a href="#">DbCommand</a> .)
	<a href="#">IDbCommand.ExecuteReader(CommandBehavior)</a>	(Inherited from <a href="#">DbCommand</a> .)

## Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileCommand Members

Represents a command to execute against the host file system.

The following tables list the members exposed by the [HostFileCommand](#) type.

## Public Constructors

Name	Description
<a href="#">HostFileCommand</a>	Overloaded. Initializes a new instance of the <a href="#">HostFileCommand</a> class.

## Top

## Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">CommandText</a>	Overridden. Gets or sets the text command to run against the data source.
 <a href="#">CommandTimeout</a>	Overridden. Gets or sets the wait time before terminating the attempt to execute a command and generating an error.
 <a href="#">CommandType</a>	Overridden. Gets or sets how the CommandText property is interpreted.
 <a href="#">Connection</a>	Gets or sets the HostFileConnection used by the current instance.
 <a href="#">Container</a>	(inherited from <a href="#">Component</a> )
 <a href="#">DesignTimeVisible</a>	Overridden. Gets or sets a value that indicates whether the command object should be visible in a customized interface control.
 <a href="#">Parameters</a>	Gets the collection of HostFileParameter objects.
 <a href="#">Site</a>	(inherited from <a href="#">Component</a> )
 <a href="#">Transaction</a>	(inherited from <a href="#">DbCommand</a> )
 <a href="#">UpdatedRowSource</a>	Overridden. Gets or sets how command results are applied to the DataRow when used by the Update method of the adapter.

## Top

## Protected Properties

Name	Description
 <a href="#">CanRaiseEvents</a>	(inherited from <a href="#">Component</a> )
 <a href="#">DbConnection</a>	(inherited from <a href="#">DbCommand</a> )
 <a href="#">DbParameterCollection</a>	(inherited from <a href="#">DbCommand</a> )
 <a href="#">DbTransaction</a>	(inherited from <a href="#">DbCommand</a> )
 <a href="#">DesignMode</a>	(inherited from <a href="#">Component</a> )
 <a href="#">Events</a>	(inherited from <a href="#">Component</a> )

## Top

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Cancel</a>	Overridden. Attempts to cancel the execution of the current instance.
 <a href="#">CreateObjRef</a>	(inherited from <a href="#">MarshalByRefObject</a> )
 <a href="#">CreateParameter</a>	Creates a new instance of a <a href="#">HostFileParameter</a> object.
 <a href="#">Dispose</a>	Overloaded. (inherited from <a href="#">Component</a> )
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">ExecuteNonQuery</a>	Overridden. Executes a SQL statement against a connection object.
 <a href="#">ExecuteReader</a>	Overloaded. (inherited from <a href="#">DbCommand</a> )
 <a href="#">ExecuteRecordSet</a>	Overloaded. Executes a query on a recordset against the connection object.
 <a href="#">ExecuteScalar</a>	Overridden. Executes the query and returns the first column of the first row in the result set returned by the query. All other columns and rows are ignored.
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">InitializeLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
 <a href="#">Prepare</a>	Overridden. Creates a prepared (or compiled) version of the command on the data source.
 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ToString</a>	(inherited from <a href="#">Component</a> )

## HostFileCommand Constructor (HostFileConnection)

Initializes a new instance of the [HostFileCommand](#) class using the specified connection.

Syntax

C#

```
public HostFileCommand(  
    HostFileConnection connection  
)
```

C++

```
public:  
HostFileCommand(  
    HostFileConnection^ connection  
)
```

F#

```
new :  
    connection:HostFileConnection -> HostFileCommand
```

VB

```
Public Sub New (  
    connection As HostFileConnection  
)
```

#### Parameters

*connection*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileConnection](#)

The connection to the host system.

[Return to top](#)

#### HostFileCommand Constructor (String, HostFileConnection)

Initializes a new instance of the [HostFileCommand](#) class using the specified command and connection.

Syntax

C#

```
public HostFileCommand(  
    string commandText,  
    HostFileConnection connection  
)
```

C++

```
public:  
HostFileCommand(  
    String^ commandText,  
    HostFileConnection^ connection  
)
```

F#

```
new :  
    commandText:string *  
    connection:HostFileConnection -> HostFileCommand
```

VB

```
Public Sub New (  
    commandText As String,  
    connection As HostFileConnection  
)
```

#### Parameters

*commandText*

Type: [System.String](#)

The command to pass to the host system.

*connection*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileConnection](#)

The connection used to access the host system.

[Return to top](#)

# HostFileCommand Constructor ()

Initializes a new instance of the [HostFileCommand](#) class.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public HostFileCommand ()
```

C++

```
public:  
HostFileCommand ()
```

J#

```
public HostFileCommand ()
```

JScript

```
public function HostFileCommand ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

[HostFileCommand Class](#)

[HostFileCommand Members](#)

[Microsoft.HostIntegration.MsHostFileClient Namespace](#)

# HostFileCommand Constructor (String, HostFileConnection)

Initializes a new instance of the [HostFileCommand](#) class using the specified command and connection.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    commandText As String, _
    connection As HostFileConnection _
)
```

C#

```
public HostFileCommand (
    string commandText,
    HostFileConnection connection
)
```

C++

```
public:
HostFileCommand (
    String^ commandText,
    HostFileConnection^ connection
)
```

J#

```
public HostFileCommand (
    String commandText,
    HostFileConnection connection
)
```

JScript

```
public function HostFileCommand (
    commandText : String,
    connection : HostFileConnection
)
```

## Parameters

commandText

The command to pass to the host system.

connection

The connection used to access the host system.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileCommand Methods

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Cancel</a>	Overridden. Attempts to cancel the execution of the current instance.
	<a href="#">CreateObjRef</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">CreateParameter</a>	Creates a new instance of a <a href="#">HostFileParameter</a> object.
	<a href="#">Dispose</a>	Overloaded. (inherited from <a href="#">Component</a> )
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">ExecuteNonQuery</a>	Overridden. Executes a SQL statement against a connection object.
	<a href="#">ExecuteReader</a>	Overloaded. (inherited from <a href="#">DbCommand</a> )
	<a href="#">ExecuteRecordSet</a>	Overloaded. Executes a query on a recordset against the connection object.
	<a href="#">ExecuteScalar</a>	Overridden. Executes the query and returns the first column of the first row in the result set returned by the query. All other columns and rows are ignored.
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
	<a href="#">InitializeLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">Prepare</a>	Overridden. Creates a prepared (or compiled) version of the command on the data source.
	 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">ToString</a>	(inherited from <a href="#">Component</a> )

Protected Methods

	Name	Description
	<a href="#">CreateDbParameter</a>	(inherited from <a href="#">DbCommand</a> )
	<a href="#">Dispose</a>	Overloaded. (inherited from <a href="#">Component</a> )
	<a href="#">ExecuteDbDataReader</a>	(inherited from <a href="#">DbCommand</a> )
	<a href="#">Finalize</a>	(inherited from <a href="#">Component</a> )
	<a href="#">GetService</a>	(inherited from <a href="#">Component</a> )
	<a href="#">MemberwiseClone</a>	Overloaded. (inherited from <a href="#">MarshalByRefObject</a> )

Explicit Interface Implementations

Name	Description
<a href="#">System.Data.IDbCommand.CreateParameter</a>	(inherited from <a href="#">DbCommand</a> )
<a href="#">System.Data.IDbCommand.ExecuteReader</a>	Overloaded. (inherited from <a href="#">DbCommand</a> )

## Reference

[HostFileCommand Class](#)

[Microsoft.HostIntegration.MsHostFileClient Namespace](#)

# HostFileCommand.Cancel Method

Attempts to cancel the execution of the current instance.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides Sub Cancel
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override void Cancel ()
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual void Cancel () override
```

J#

```
/** @attribute EditorBrowsableAttribute(EditorBrowsableState.Never) */
public void Cancel ()
```

JScript

```
EditorBrowsableAttribute(EditorBrowsableState.Never)
public override function Cancel ()
```

Remarks

If there is nothing to cancel, nothing happens. However, if there is a command in process, and the attempt to cancel fails, no exception is generated.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## HostFileCommand.ExecuteRecordSet Method ()

Executes a command on a recordset against the connection object.

Syntax

C#

```
public HostFileRecordSet ExecuteRecordSet()
```

C++

```
public:  
HostFileRecordSet^ ExecuteRecordSet()
```

F#

```
member ExecuteRecordSet : unit -> HostFileRecordSet
```

VB

```
Public Function ExecuteRecordSet As HostFileRecordSet
```

## Return Value

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileRecordSet](#)

A HostFileRecordSet containing the results of the command.

[Return to top](#)

## HostFileCommand.ExecuteRecordSet Method (CommandBehavior, RecordSetType)

Executes a command on a recordset against the connection object.

Syntax

C#

```
public HostFileRecordSet ExecuteRecordSet(  
    CommandBehavior behavior,  
    RecordSetType type  
)
```

C++

```
public:  
HostFileRecordSet^ ExecuteRecordSet(  
    CommandBehavior behavior,  
    RecordSetType type  
)
```

F#

```
member ExecuteRecordSet :  
    behavior:CommandBehavior *  
    type:RecordSetType -> HostFileRecordSet
```

VB

```
Public Function ExecuteRecordSet (  
    behavior As CommandBehavior,  
    type As RecordSetType  
) As HostFileRecordSet
```

#### Parameters

*behavior*

Type: [System.Data.CommandBehavior](#)

The behavior of the command.

*type*

Type: [Microsoft.HostIntegration.MsHostFileClient.RecordSetType](#)

The type of recordset on which to execute the command.

#### Return Value

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileRecordSet](#)

A HostFileRecordSet containing the results of the command.

[Return to top](#)

# HostFileCommand.ExecuteRecordSet Method ()

Executes a command on a recordset against the connection object.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration  
Public Function ExecuteRecordSet As HostFileRecordSet
```

C#

```
public HostFileRecordSet ExecuteRecordSet ()
```

C++

```
public:  
HostFileRecordSet^ ExecuteRecordSet ()
```

J#

```
public HostFileRecordSet ExecuteRecordSet ()
```

JScript

```
public function ExecuteRecordSet () : HostFileRecordSet
```

## Return Value

A HostFileRecordSet containing the results of the command.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Executes a command on a recordset against the connection object.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Function ExecuteRecordSet ( _
    behavior As CommandBehavior, _
    type As RecordSetType _
) As HostFileRecordSet
```

C#

```
public HostFileRecordSet ExecuteRecordSet (
    CommandBehavior behavior,
    RecordSetType type
)
```

C++

```
public:
HostFileRecordSet^ ExecuteRecordSet (
    CommandBehavior behavior,
    RecordSetType type
)
```

J#

```
public HostFileRecordSet ExecuteRecordSet (
    CommandBehavior behavior,
    RecordSetType type
)
```

JScript

```
public function ExecuteRecordSet (
    behavior : CommandBehavior,
    type : RecordSetType
) : HostFileRecordSet
```

## Parameters

behavior

The behavior of the command.

type

The type of recordset on which to execute the command.

## Return Value

A HostFileRecordSet containing the results of the command.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileCommand.ExecuteScalar Method

Executes the query and returns the first column of the first row in the result set returned by the query. All other columns and rows are ignored.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function ExecuteScalar As Object
```

C#

```
public override Object ExecuteScalar ()
```

C++

```
public:
virtual Object^ ExecuteScalar () override
```

J#

```
public Object ExecuteScalar ()
```

JScript

```
public override function ExecuteScalar () : Object
```

## Return Value

The first column of the first row in the result set.

Remarks

Use the ExecuteScalar method to retrieve a single value (for example, an aggregate value) from a database.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileCommand.Prepare Method

Creates a prepared (or compiled) version of the command on the data source.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Sub Prepare
```

C#

```
public override void Prepare ()
```

C++

```
public:
virtual void Prepare () override
```

J#

```
public void Prepare ()
```

JScript

```
public override function Prepare ()
```

Remarks

If the CommandType property is set to TableDirect, Prepare does nothing. If CommandType is set to StoredProcedure, the call to Prepare should succeed, although it may result in a no-op.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## Reference

[HostFileCommand Class](#)

[Microsoft.HostIntegration.MsHostFileClient Namespace](#)

# HostFileCommand.CommandText Property

Gets or sets the text command to run against the data source.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property CommandText As String
```

C#

```
public override string CommandText { get; set; }
```

C++

```
public:
virtual property String^ CommandText {
    String^ get () override;
    void set (String^ value) override;
}
```

J#

```
/** @property */
public String get_CommandText ()

/** @property */
public void set_CommandText (String value)
```

JScript

```
public override function get CommandText () : String

public override function set CommandText (value : String)
```

## Property Value

The text command to execute. The default value is an empty string ("").

Remarks

When you set the CommandType to StoredProcedure, you should set the CommandText property to the name of the stored procedure. The command executes this stored procedure when you call one of the Execute methods.

### ◆ Important

The Managed Provider for Host Files does not support any type of transaction. Therefore, you should try to avoid using INSERT, UPDATE, or DELETE commands on mission-critical data.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileCommand.CommandTimeout Property

Gets or sets the wait time before terminating the attempt to execute a command and generating an error.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides Property CommandTimeout As Integer
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override int CommandTimeout { get; set; }
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual property int CommandTimeout {
    int get () override;
    void set (int value) override;
}
```

J#

```
/** @property */
public int get_CommandTimeout ()

/** @property */
public void set_CommandTimeout (int value)
```

JScript

```
public override function get CommandTimeout () : int

public override function set CommandTimeout (value : int)
```

## Property Value

The time in seconds to wait for the command to execute.

Remarks

An `ArgumentException` is generated if the assigned `CommandTimeout` property value is less than 0.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

# HostFileCommand.CommandType Property

Gets or sets how the CommandText property is interpreted.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property CommandType As CommandType
```

C#

```
public override CommandType CommandType { get; set; }
```

C++

```
public:
virtual property CommandType CommandType {
    CommandType get () override;
    void set (CommandType value) override;
}

public CommandType get_CommandType ()

/** @property */
public void set_CommandType (CommandType value)
```

JScript

```
public override function get CommandType () : CommandType

public override function set CommandType (value : CommandType)
```

## Property Value

One of the CommandType values. The default is Text.

Remarks

When you set the CommandType to StoredProcedure, you should set the CommandText property to the name of the stored procedure. The command executes this stored procedure when you call one of the Execute methods.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

```

## Property Value

One of the UpdateRowSource values. The default is Both unless the command is automatically generated. Then the default is None.

Remarks

Throws an ArgumentException if the value entered was not one of the UpdateRowSource values.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Microsoft.HostIntegration.MsHostFileClient.HostFileConnection**

Syntax

C#

```
public class HostFileConnection : DbConnection
```

C++

```
public ref class HostFileConnection : DbConnection
```

F#

```
type HostFileConnection =  
    class  
        inherit DbConnection  
    end
```

VB

```
Public Class HostFileConnection  
    Inherits DbConnection
```

Constructors

Name	Description
 <a href="#">HostFileConnection()</a>	Initializes a new instance of the <b>HostFileConnection</b> class.
 <a href="#">HostFileConnection(String)</a>	Initializes a new instance of the <b>HostFileConnection</b> class using the specified connection string.

Properties

Name	Description
 <a href="#">CanRaiseEvents</a>	(Inherited from <a href="#">Component</a> .)
 <a href="#">ConnectionString</a>	Gets or sets the string used to open the connection.(Overrides <a href="#">DbConnection.ConnectionString</a> .)
 <a href="#">ConnectionTimeout</a>	(Inherited from <a href="#">DbConnection</a> .)
 <a href="#">Container</a>	(Inherited from <a href="#">Component</a> .)
 <a href="#">Database</a>	Gets the name of the current database after a connection is opened, or the database name specified in the connection string before the connection is opened.(Overrides <a href="#">DbConnection.Database</a> .)
 <a href="#">DataSource</a>	Gets the name of the database server to which to connect.(Overrides <a href="#">DbConnection.DataSource</a> .)
 <a href="#">DbProviderFactory</a>	(Inherited from <a href="#">DbConnection</a> .)
 <a href="#">DesignMode</a>	(Inherited from <a href="#">Component</a> .)
 <a href="#">Events</a>	(Inherited from <a href="#">Component</a> .)

 HostFileClientTracePoint	
 LibraryReader	
 Metadata	Gets or sets the metadata on the connection.
 ServerClass	Gets the server class.
 ServerVersion	Gets the server version.(Overrides <a href="#">DbConnection.ServerVersion</a> .)
 Site	(Inherited from <a href="#">Component</a> .)
 State	Gets a string that describes the state of the connection.(Overrides <a href="#">DbConnection.State</a> .)
 TracePoint	

#### Methods

	Name	Description
	<a href="#">BeginDbTransaction(IsolationLevel)</a>	(Inherited from <a href="#">DbConnection</a> .)
	<a href="#">BeginTransaction()</a>	(Inherited from <a href="#">DbConnection</a> .)
	<a href="#">BeginTransaction(IsolationLevel)</a>	(Inherited from <a href="#">DbConnection</a> .)
	<a href="#">ChangeDatabase(String)</a>	(Inherited from <a href="#">DbConnection</a> .)
	<a href="#">Close()</a>	Closes the connection to the database. This is the preferred method of closing any open connection.(Overrides <a href="#">DbConnection.Close()</a> .)
	<a href="#">CreateCommand()</a>	Creates and returns a HostFileCommand object associated with the current connection.
	<a href="#">CreateDbCommand()</a>	(Overrides <a href="#">DbConnection.CreateDbCommand()</a> .)
	<a href="#">CreateObjRef(Type)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
	<a href="#">Dispose()</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">Dispose(Boolean)</a>	(Overrides <a href="#">Component.Dispose(Boolean)</a> .)
	<a href="#">EnlistTransaction(Transaction)</a>	(Inherited from <a href="#">DbConnection</a> .)
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Finalize()</a>	(Overrides <a href="#">Component.Finalize()</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
	<a href="#">GetSchema()</a>	Returns schema information for the data source of this HostFileConnection.(Overrides <a href="#">DbConnection.GetSchema()</a> .)
	<a href="#">GetSchema(String)</a>	Returns schema information for the data source of this DbConnection using the specified string for the schema name.(Overrides <a href="#">DbConnection.GetSchema(String)</a> .)
	<a href="#">GetSchema(String, String[])</a>	Returns schema information for the data source of this HostFileConnection using the specified string for the schema name and the specified string array for the restriction values(Overrides <a href="#">DbConnection.GetSchema(String, String[])</a> .)
	<a href="#">GetService(Type)</a>	(Inherited from <a href="#">Component</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">InitializeLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
	<a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)

 <b>MemberwiseClone(Boolean)</b>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <b>OnStateChange(StateChangeEventArgs)</b>	(Inherited from <a href="#">DbConnection</a> .)
 <b>Open()</b>	Opens a database connection with the settings specified by the HostFileConnection String.(Overrides <a href="#">DbConnection.Open()</a> .)
 <b>OpenAsync()</b>	(Inherited from <a href="#">DbConnection</a> .)
 <b>OpenAsync(CancellationTokens)</b>	(Inherited from <a href="#">DbConnection</a> .)
 <b>ToString()</b>	(Inherited from <a href="#">Component</a> .)

#### Events

<b>Name</b>	<b>Description</b>
 <b>Disposed</b>	(Inherited from <a href="#">Component</a> .)
 <b>StateChange</b>	(Inherited from <a href="#">DbConnection</a> .)

#### Explicit Interface Implementations

<b>Name</b>	<b>Description</b>
 <b>IDbConnection.BeginTransaction()</b>	(Inherited from <a href="#">DbConnection</a> .)
 <b>IDbConnection.BeginTransaction(IsolationLevel)</b>	(Inherited from <a href="#">DbConnection</a> .)
 <b>IDbConnection.CreateCommand()</b>	(Inherited from <a href="#">DbConnection</a> .)

# HostFileConnection Members

Represents a connection to a database.

The following tables list the members exposed by the [HostFileConnection](#) type.

## Public Constructors

Name	Description
<a href="#">HostFileConnection</a>	Overloaded. Initializes a new instance of the <a href="#">HostFileConnection</a> class.

## Top

## Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">ConnectionString</a>	Overridden. Gets or sets the string used to open the connection.
 <a href="#">ConnectionTimeout</a>	Overridden. Gets the time to wait while establishing a connection before terminating the attempt and generating an error.
 <a href="#">Container</a>	(inherited from <a href="#">Component</a> )
 <a href="#">Database</a>	Overridden. Gets the name of the current database after a connection is opened, or the database name specified in the connection string before the connection is opened.
 <a href="#">DataSource</a>	Overridden. Gets the name of the database server to which to connect.
 <a href="#">Metadata</a>	Gets or sets the metadata on the connection.
 <a href="#">ServerClass</a>	Gets the server class.
 <a href="#">ServerVersion</a>	Overridden. Gets the server version.
 <a href="#">Site</a>	(inherited from <a href="#">Component</a> )
 <a href="#">State</a>	Overridden. Gets a string that describes the state of the connection.

## HostFileConnection Constructor ()

Initializes a new instance of the [HostFileConnection](#) class.

Syntax

C#

```
public HostFileConnection()
```

C++

```
public:  
HostFileConnection()
```

F#

```
new : unit -> HostFileConnection
```

VB

```
Public Sub New
```

Examples

## Legacy Code Example

```
try  
{  
    HostFileConnection cn = new HostFileConnection();  
    cn.ConnectionString = cnstring;  
    cn.Open();  
    //do stuff here  
    cn.Close();  
}
```

[Return to top](#)

## HostFileConnection Constructor (String)

Initializes a new instance of the [HostFileConnection](#) class using the specified connection string.

Syntax

C#

```
public HostFileConnection(  
    string connectionString  
)
```

C++

```
public:
HostFileConnection(
    String^ connectionString
)
```

F#

```
new :
    connectionString:string -> HostFileConnection
```

VB

```
Public Sub New (
    connectionString As String
)
```

#### Parameters

*connectionString*

Type: [System.String](#)

The connection string to use.

#### Remarks

The following code sample describes using the HostFileConnection constructor. Note that ETCMLogging and HostFileUtils are developer-created objects that provide logging and utility functionality, respectively.

#### Examples

##### Legacy Code Example

```
public void CNConstructorString(ETCMLogging.Logging logging, string host, string ccid, string cnstring, HostFileUtils.Utils.HostFileType hostfiletype)
{
    HostFileUtils.Oledb oledb = new HostFileUtils.Oledb();
    HostFileUtils.Utils u = new HostFileUtils.Utils();
    logging.LogInfo(host);
    try
    {
        //Create connection
        HostFileConnection cn = new HostFileConnection(cnstring);
        //Open the connection
        logging.LogInfo("Open Connection");
        cn.Open();
        //Close the open connection
        cn.Close();
    }
    catch (Exception e)
    {
        logging.LogInfo(e.Message);
        logging.LogFail(e.StackTrace);
    }
}
```

[Return to top](#)

# HostFileConnection Constructor ()

Initializes a new instance of the [HostFileConnection](#) class.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public HostFileConnection ()
```

C++

```
public:
HostFileConnection ()
```

J#

```
public HostFileConnection ()
```

JScript

```
public function HostFileConnection ()
```

Example

```
try
{
    HostFileConnection cn = new HostFileConnection();
    cn.ConnectionString = cnstring;
    cn.Open();
    //do stuff here
    cn.Close();
}
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileConnection.ChangeDatabase Method

Changes the current database for an open connection.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides Sub ChangeDatabase ( _
    database As String _
)
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override void ChangeDatabase (
    string database
)
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual void ChangeDatabase (
    String^ database
) override
```

J#

```
/** @attribute EditorBrowsableAttribute(EditorBrowsableState.Never) */
public void ChangeDatabase (
    String database
)
```

JScript

```
EditorBrowsableAttribute(EditorBrowsableState.Never)
public override function ChangeDatabase (
    database : String
)
```

## Parameters

database

The name of the database for the connection to use.

Remarks

The value supplied in the database parameter must be a valid database name for the current instance.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

See Also

## Reference

[HostFileConnection Class](#)

[HostFileConnection Members](#)

[Microsoft.HostIntegration.MsHostFileClient Namespace](#)

# HostFileConnection.Close Method

Closes the connection to the database. This is the preferred method of closing any open connection.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Sub Close
```

C#

```
public override void Close ()
```

C++

```
public:
virtual void Close () override
```

J#

```
public void Close ()
```

JScript

```
public override function Close ()
```

Example

```
HostFileConnection conn = null;
try
{
    //perform activities here
}
catch(Exception e)
{
    Log(e);
}
finally
{
    if(conn != null)
    {
        conn.Close();
        conn.Dispose();
    }
}
```

Remarks

The Close method rolls back any pending transactions. It then releases the connection to the connection pool, or closes the connection if connection pooling is disabled.

An application can call Close more than one time. No exception is generated.

If the HostFileConnection goes out of scope, it is not closed. Therefore, you must explicitly close the connection by calling Close or Dispose, which are functionally equivalent. If the connection pooling value Pooling is set to true or yes, this also releases the physical connection.

If you are expecting to throw a great deal of exceptions in your application, consider using the following format in your code to ensure that your connections are closed properly:

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

Creates and returns a HostFileCommand object associated with the current connection.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration  
Public Function CreateCommand As HostFileCommand
```

C#

```
public HostFileCommand CreateCommand ()
```

C++

```
public:  
HostFileCommand^ CreateCommand ()
```

J#

```
public HostFileCommand CreateCommand ()
```

JScript

```
public function CreateCommand () : HostFileCommand
```

## Return Value

A HostFileCommand object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**HostFileConnection.GetSchema Method ()**  
Returns schema information for the data source of this HostFileConnection.

Syntax  
C#

```
public override DataTable GetSchema()
```

C++

```
public:  
virtual DataTable^ GetSchema() override
```

F#

```
override GetSchema : unit -> DataTable
```

VB

```
Public Overrides Function GetSchema As DataTable
```

**Return Value**  
Type: [System.Data.DataTable](#)  
A DataTable that contains schema information.

Remarks  
The following code sample describes how to retrieve schema data from a connection. Note that ETCMLogging and HistFileUtils are developer-specific objects that provide logging and utility functionality, respectively.

Examples  
**Legacy Code Example**

```
public void CNGetSchema(ETCMLogging.Logging logging, string host, string ccscid, string cnst  
ring, HostFileUtils.Utils.HostFileType hostfiletype)  
{  
    HostFileUtils.Oledb oledb = new HostFileUtils.Oledb();  
    HostFileUtils.Utils u = new HostFileUtils.Utils();  
    logging.LogInfo(host);
```

```

try
{
    //Create connection
    HostFileConnection cn = oledb.CreateConnection(logging);

    cn.ConnectionString = cnstring;
    DataTable dt = cn.GetSchema();
    if (dt.HasErrors)
    {
        logging.LogFail("returned datatable has errors");
    }
    //Open the connection
    logging.LogInfo("Open Connection");
    cn.Open();
    DataTable dt2 = cn.GetSchema();
    if (dt2.HasErrors)
    {
        logging.LogFail("returned datatable has errors");
    }
    int rowcnt = dt.Rows.Count;
    for (int i = 0; i < rowcnt; i++)
    {
        int colcnt = dt.Rows[i].ItemArray.Length;
        for (int o = 0; o < colcnt; o++)
        {

    logging.LogFail(e.StackTrace);
}
}

```

[Return to top](#)

#### **HostFileConnection.GetSchema Method (String)**

Returns schema information for the data source of this DbConnection using the specified string for the schema name.

Syntax

C#

```

public override DataTable GetSchema(
    string collectionName
)

```

C++

```

public:
virtual DataTable^ GetSchema(
    String^ collectionName
) override

```

F#

```

override GetSchema :
    collectionName:string -> DataTable

```

VB

```

Public Overrides Function GetSchema (
    collectionName As String

```

```
) As DataTable
```

#### Parameters

*collectionName*

Type: [System.String](#)

The name of the schema to return.

#### Return Value

Type: [System.Data.DataTable](#)

A DataTable that contains schema information.

#### Remarks

When *collectionName* is specified as **null**, the DataTable contains information about all the metadata that is available, and its restrictions.

[Return to top](#)

#### HostFileConnection.GetSchema Method (String, String[])

Returns schema information for the data source of this HostFileConnection using the specified string for the schema name and the specified string array for the restriction values

#### Syntax

C#

```
public override DataTable GetSchema(  
    string collectionName,  
    string[] restrictionValues  
)
```

C++

```
public:  
virtual DataTable^ GetSchema(  
    String^ collectionName,  
    array<String^>^ restrictionValues  
) override
```

F#

```
override GetSchema :  
    collectionName:string *  
    restrictionValues:string[] -> DataTable
```

VB

```
Public Overrides Function GetSchema (  
    collectionName As String,  
    restrictionValues As String()  
) As DataTable
```

#### Parameters

*collectionName*

Type: [System.String](#)

The name of the schema to return.

*restrictionValues*

Type: [System.String](#)

A set of restriction values for the requested schema.

#### Return Value

Type: [System.Data.DataTable](#)

A DataTable that contains schema information.

#### Remarks

When *collectionName* is specified as **null**, the DataTable contains information about all the metadata that is available, and its restrictions.

The `restrictionValues` parameter can supply n depth of values, which are specified by the `restrictions` collection for a specific collection. In order to set values on a given restriction, and not set the values of other restrictions, you need to set the preceding restrictions to null and then put the appropriate value in for the restriction that you would like to specify a value for.

An example of this is the "Tables" collection. If the "Tables" collection has three restrictions (database, owner, and table name) and you want to get back only the tables associated with the owner "Carl", you must pass in the following values at least: **null**, "Carl". If a restriction value is not passed in, the default values are used for that restriction. This is the same mapping as passing in **null**, which is different from passing in an empty string for the parameter value. In that case, the empty string ("") is considered to be the value for the specified parameter.

[Return to top](#)

# HostFileConnection.GetSchema Method ()

Returns schema information for the data source of this HostFileConnection.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetSchema As DataTable
```

C#

```
public override DataTable GetSchema ()
```

C++

```
public:
virtual DataTable^ GetSchema () override
```

J#

```
public DataTable GetSchema ()
```

JScript

```
public override function GetSchema () : DataTable
```

## Return Value

A DataTable that contains schema information.

Example

```
public void CNGetSchema(ETCMLLogging.Logging logging, string host, string ccscid, string cnst
ring, HostFileUtils.Utils.HostFileType hostfiletype)
{
    HostFileUtils.OleDb oledb = new HostFileUtils.OleDb();
    HostFileUtils.Utils u = new HostFileUtils.Utils();
    logging.LogInfo(host);

    try
    {
        //Create connection
        HostFileConnection cn = oledb.CreateConnection(logging);

        cn.ConnectionString = cnstring;
        DataTable dt = cn.GetSchema();
        if (dt.HasErrors)
        {
            logging.LogFail("returned datatable has errors");
        }
        //Open the connection
        logging.LogInfo("Open Connection");
        cn.Open();
        DataTable dt2 = cn.GetSchema();
        if (dt2.HasErrors)
        {
            logging.LogFail("returned datatable has errors");
        }
        int rowcnt = dt.Rows.Count;
        for (int i = 0; i < rowcnt; i++)
        {
            int colcnt = dt.Rows[i].ItemArray.Length;
```

```

        for (int o = 0; o < colcnt; o++)
        {
            u.CompareValues(dt.Rows[i][o].ToString(), dt2.Rows[i][o].ToString())
        }, logging);
    }
    //Close the open connection
    cn.Close();

}
catch (Exception e)
{
    logging.LogInfo(e.Message);
    logging.LogFail(e.StackTrace);
}
}

```

#### Remarks

The following code sample describes how to retrieve schema data from a connection. Note that ETCMLogging and HistFileUtils are developer-specific objects that provide logging and utility functionality, respectively.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileConnection.ConnectionString Property

Gets or sets the string used to open the connection.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property ConnectionString As String
```

C#

```
public override string ConnectionString { get; set; }
```

C++

```
public:
virtual property String^ ConnectionString {
    String^ get () override;
    void set (String^ value) override;
}
```

J#

```
/** @property */
public String get_ConnectionString ()

/** @property */
public void set_ConnectionString (String value)
```

JScript

```
public override function get ConnectionString () : String

public override function set ConnectionString (value : String)
```

## Property Value

The connection string used to establish the initial connection. The default is an empty string.

Example

```
try
{
    HostFileConnection cn = new HostFileConnection();
    cn.ConnectionString = cnstring;
    cn.Open();
    //do stuff here
    cn.Close();
}
```

Remarks

The following code sample show setting the connection string.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileConnection.ConnectionTimeout Property

Gets the time to wait while establishing a connection before terminating the attempt and generating an error.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides ReadOnly Property ConnectionTimeout As Integer
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override int ConnectionTimeout { get; }
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual property int ConnectionTimeout {
    int get () override;
}
```

J#

```
/** @property */
public int get_ConnectionTimeout ()
```

JScript

```
public override function get ConnectionTimeout () : int
```

## Property Value

The time (in seconds) to wait for a connection to open.

Example

```
public void CNConnectionTimeout(ETCMLogging.Logging logging, string host, string ccsid, string cnstring, HostFileUtils.Utils.HostFileType hostfiletype)
{
    HostFileUtils.Oledb oledb = new HostFileUtils.Oledb();
    logging.LogInfo(host);
    try
    {
        //Create connection
        HostFileConnection cn = oledb.CreateConnection(logging);
        cn.ConnectionString = cnstring;
        int i = cn.ConnectionTimeout;
        if (i != 0)
        {
            logging.LogFail("ConnectionTimeout should always be 0 not " + i.ToString());
        }
        //Open the connection
        logging.LogInfo("Open Connection");
        cn.Open();
        i = 999;
        i = cn.ConnectionTimeout;
        if (i != 0)
        {

```

```
        logging.LogFail("ConnectionTimeout should always be 0 not " + i.ToString());
    }
    //Close the open connection
    cn.Close();
}
catch (Exception e)
{
    logging.LogInfo(e.Message);
    logging.LogFail(e.StackTrace);
}
}
```

#### Remarks

In the following code sample, ETCMLogging and HostFileUtils are developer-designed objects used to provide logging and utility code, respectively.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileConnection.State Property

Gets a string that describes the state of the connection.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property State As ConnectionState
```

C#

```
public override ConnectionState State { get; }
```

C++

```
public:
virtual property ConnectionState State {
    ConnectionState get () override;
}
```

J#

```
/** @property */
public ConnectionState get_State ()
```

JScript

```
public override function get State () : ConnectionState
```

## Property Value

The state of the connection.

Example

```
public void CNState(ETCMLLogging.Logging logging, string host, string ccid, string cnstring
, HostFileUtils.Utils.HostFileType hostfiletype)
{
    HostFileUtils.Oledb oledb = new HostFileUtils.Oledb();
    HostFileUtils.Utils u = new HostFileUtils.Utils();

    logging.LogInfo(host);

    try
    {
        //Create connection
        HostFileConnection cn = oledb.CreateConnection(logging);

        cn.ConnectionString = cnstring;
        ConnectionState cs1 = cn.State;
        //Open the connection
        logging.LogInfo("Open Connection");
        cn.Open();
        ConnectionState cs2 = cn.State;
        //Close the open connection
        cn.Close();
        ConnectionState cs3 = cn.State;

        if (!cs1.Equals(ConnectionState.Closed))
        {
```

```

        logging.LogFail("connection should be closed not:"+cs1.ToString());
    }
    if (!cs2.Equals(ConnectionState.Open))
    {
        logging.LogFail("connection should be open not:"+cs2.ToString());
    }
    if (!cs3.Equals(ConnectionState.Closed))
    {
        logging.LogFail("connection should be closed not:"+cs3.ToString());
    }
}
catch (Exception e)
{
    logging.LogInfo(e.Message);
    logging.LogFail(e.StackTrace);
}
}

```

#### Remarks

The following code sample shows using `HostFileConnection.State`. Note that `ETCMLogging` and `HostFileUtils` are developer-created objects that provide logging and utility functionality, respectively. In this sample, a `HostFileUtils` object is used to create an oledb connection that contains preset connection state.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

#### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Syntax

C#

```
public sealed class HostFileConnectionStringBuilder : DbConnectionStringBuilder
```

C++

```
public ref class HostFileConnectionStringBuilder sealed : DbConnectionStringBuilder
```

F#

```
[<Sealed>]
type HostFileConnectionStringBuilder =
    class
        inherit DbConnectionStringBuilder
    end
```

VB

```
Public NotInheritable Class HostFileConnectionStringBuilder
    Inherits DbConnectionStringBuilder
```

Constructors

	Name	Description
	<a href="#">HostFileConnectionStringBuilder()</a>	Initializes a new instance of the <b>HostFileConnectionStringBuilder</b> class.
	<a href="#">HostFileConnectionStringBuilder(String)</a>	Initializes a new instance of the <b>HostFileConnectionStringBuilder</b> class.

Properties

	Name	Description
	<a href="#">AffiliateApplication</a>	Gets or sets the affiliate application associated with the connection string.
	<a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.
	<a href="#">AppcMode</a>	Gets or sets the APPC mode.
	<a href="#">BinAsChar</a>	Gets or sets a value that determines if the connection should treat binary data as character data.
	<a href="#">CertificateCN</a>	
	<a href="#">ConnectionPooling</a>	
	<a href="#">ConnectionString</a>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<a href="#">ConnectionTimeout</a>	
	<a href="#">Count</a>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<a href="#">DataSource</a>	Gets or sets the data source.
	<a href="#">DefaultLibrary</a>	Gets or sets the default library.

 <a href="#">ExtendedProperties</a>	Gets or sets the extended properties of the connection string.
 <a href="#">FileName</a>	Gets or sets the name of the file to access.
 <a href="#">HostCCSID</a>	Gets or sets the host CCSID.
 <a href="#">IntegratedSecurity</a>	Gets or sets the integrated security.
 <a href="#">IsFixedSize</a>	Gets a value that indicates whether the HostFileConnectionStringBuilder has a fixed size.(Overrides <a href="#">DbConnectionStringBuilder.IsFixedSize</a> .)
 <a href="#">IsReadOnly</a>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
 <a href="#">Item(String)</a>	Gets or sets the value associated with the specified key.(Overrides <a href="#">DbConnectionStringBuilder.Item(String)</a> .)
 <a href="#">Keys</a>	Gets an ICollection that contains the keys in the HostFileConnectionStringBuilder.(Overrides <a href="#">DbConnectionStringBuilder.Keys</a> .)
 <a href="#">LocalFolder</a>	
 <a href="#">LocalLU</a>	Gets or sets the local LU.
 <a href="#">Location</a>	Gets or sets the current location.
 <a href="#">MaxPoolSize</a>	
 <a href="#">Metadata</a>	Gets or sets the metadata.
 <a href="#">NetworkAddress</a>	Gets or sets the host network address.
 <a href="#">NetworkPort</a>	Gets or sets the host network port.
 <a href="#">NetworkTransportLibrary</a>	Gets or sets the network transport library.
 <a href="#">OfflineBufferSize</a>	
 <a href="#">Password</a>	Gets or sets the connection string password.
 <a href="#">PCCodePage</a>	Gets or sets the connection string PC code page.
 <a href="#">RemoteLU</a>	Gets or sets the remote LU for the connection string.
 <a href="#">TimeOut</a>	
 <a href="#">UserId</a>	Gets or sets the user ID for the connection string.
 <a href="#">Values</a>	Gets an ICollection that contains the values in the HostFileConnectionStringBuilder.(Overrides <a href="#">DbConnectionStringBuilder.Values</a> .)

#### Methods

Name	Description
 <a href="#">Add(String, Object)</a>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
 <a href="#">Clear()</a>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
 <a href="#">ClearPropertyDescriptors()</a>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
 <a href="#">ContainsKey(String)</a>	Determines whether the HostFileConnectionStringBuilder contains a specific key. (Overrides <a href="#">DbConnectionStringBuilder.ContainsKey(String)</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">EquivalentTo(DbConnectionStringBuilder)</a>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)

 <b>Remove(String)</b>	Removes the entry with the specified key from the HostFileConnectionStringBuilder instance.(Overrides <a href="#">DbConnectionStringBuilder.Remove(String)</a> .)
 <b>ShouldSerialize(String)</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
 <b>ToString()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
 <b>TryGetValue(String, Object)</b>	Retrieves a value corresponding to the supplied key from this DbConnectionStringBuilder.(Overrides <a href="#">DbConnectionStringBuilder.TryGetValue(String, Object)</a> .)

#### Explicit Interface Implementations

	<b>Name</b>	<b>Description</b>
	<b>ICollection.CopyTo(Array, Int32)</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>IDictionary.Add(Object, Object)</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>IDictionary.Contains(Object)</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>IDictionary.GetEnumerator()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>IDictionary.Remove(Object)</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>IEnumerable.GetEnumerator()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetAttributes()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetClassName()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetComponentName()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetConverter()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetDefaultEvent()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetDefaultProperty()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetEditor(Type)</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetEvents()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetEvents(Attribute[])</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetProperties()</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetProperties(Attribute[])</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)
	<b>ITypeDescriptor.GetPropertyOwner(PropertyDescriptor)</b>	(Inherited from <a href="#">DbConnectionStringBuilder</a> .)

# HostFileConnectionStringBuilder Members

Creates a strongly-typed connection strings.

The following tables list the members exposed by the [HostFileConnectionStringBuilder](#) type.

## Public Constructors

Name	Description
<a href="#">HostFileConnectionStringBuilder</a>	Overloaded. Initializes a new instance of the <a href="#">HostFileConnectionStringBuilder</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">AffiliateApplication</a>	Gets or sets the affiliate application associated with the connection string.
 <a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.
 <a href="#">AppcMode</a>	Gets or sets the APPC mode.
 <a href="#">BinAsChar</a>	Gets or sets a value that determines if the connection should treat binary data as character data.
 <a href="#">BrowsableConnectionString</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">CertificateCN</a>	
 <a href="#">ConnectionString</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">Count</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">DataSource</a>	Gets or sets the data source.
 <a href="#">DefaultLibrary</a>	Gets or sets the default library.
 <a href="#">ExtendedProperties</a>	Gets or sets the extended properties of the connection string.
 <a href="#">FileName</a>	Gets or sets the name of the file to access.
 <a href="#">HostCCSID</a>	Gets or sets the host CCSID.
 <a href="#">IntegratedSecurity</a>	Gets or sets the integrated security.
 <a href="#">IsFixedSize</a>	Overridden. Gets a value that indicates whether the HostFileConnectionStringBuilder has a fixed size.
 <a href="#">IsReadOnly</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">Item</a>	Overridden. Gets or sets the value associated with the specified key.
 <a href="#">Keys</a>	Overridden. Gets an ICollection that contains the keys in the HostFileConnectionStringBuilder.
 <a href="#">LocalFolder</a>	
 <a href="#">LocalLU</a>	Gets or sets the local LU.
 <a href="#">Location</a>	Gets or sets the current location.
 <a href="#">Metadata</a>	Gets or sets the metadata.
 <a href="#">NetworkAddress</a>	Gets or sets the host network address.
 <a href="#">NetworkPort</a>	Gets or sets the host network port.
 <a href="#">NetworkTransportLibrary</a>	Gets or sets the network transport library.
 <a href="#">OfflineBufferSize</a>	
 <a href="#">Password</a>	Gets or sets the connection string password.
 <a href="#">PCCodePage</a>	Gets or sets the connection string PC code page.
 <a href="#">RemoteLU</a>	Gets or sets the remote LU for the connection string.
 <a href="#">UserId</a>	Gets or sets the user ID for the connection string.
 <a href="#">Values</a>	Overridden. Gets an ICollection that contains the values in the HostFileConnectionStringBuilder.

# HostFileConnectionStringBuilder.ContainsKey Method

Determines whether the HostFileConnectionStringBuilder contains a specific key.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function ContainsKey ( _
    keyword As String _
) As Boolean
```

C#

```
public override bool ContainsKey (
    string keyword
)
```

C++

```
public:
virtual bool ContainsKey (
    String^ keyword
) override
```

J#

```
public boolean ContainsKey (
    String keyword
)
```

JScript

```
public override function ContainsKey (
    keyword : String
) : boolean
```

## Parameters

keyword

The key to locate in the HostFileConnectionStringBuilder.

## Return Value

**true** if the HostFileConnectionStringBuilder contains an entry with the specified key; otherwise **false**.

Thread Safety Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# HostFileConnectionStringBuilder.Remove Method

Removes the entry with the specified key from the HostFileConnectionStringBuilder instance.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function Remove ( _
    keyword As String _
) As Boolean
```

C#

```
public override bool Remove (
    string keyword
)
```

C++

```
public:
virtual bool Remove (
    String^ keyword
) override
```

J#

```
public boolean Remove (
    String keyword
)
```

JScript

```
public override function Remove (
    keyword : String
) : boolean
```

## Parameters

keyword

The key of the key/value pair to be removed from the connection string in this HostFileConnectionStringBuilder.

## Return Value

**true** if the key existed within the connection string and was removed; **false** if the key did not exist.

Remarks

Because the Remove method returns a value that indicates its success, it is not required to look for the key before trying to remove the key/value pair from the HostFileConnectionStringBuilder instance.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileConnectionStringBuilder.ShouldSerialize Method

Indicates whether the specified key exists in this HostFileConnectionStringBuilder instance.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides Function ShouldSerialize ( _
    keyword As String _
) As Boolean
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override bool ShouldSerialize (
    string keyword
)
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual bool ShouldSerialize (
    String^ keyword
) override
```

J#

```
/** @attribute EditorBrowsableAttribute(EditorBrowsableState.Never) */
public boolean ShouldSerialize (
    String keyword
)
```

JScript

```
EditorBrowsableAttribute(EditorBrowsableState.Never)
public override function ShouldSerialize (
    keyword : String
) : boolean
```

## Parameters

keyword

The key to locate in the DbConnectionStringBuilder.

## Return Value

**true** if the DbConnectionStringBuilder contains an entry with the specified key; otherwise **false**.

Remarks

This method behaves identically to the ContainsKey method.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

) override
```

J#

```
public boolean TryGetValue (
    String keyword,
    /** @attribute OutAttribute() */ /** @ref */ Object value
)
```

JScript

## Parameters

keyword

The key of the item to retrieve.

value

The value corresponding to the key.

## Return Value

**true** if keyword was found within the connection string; otherwise, **false**.

Remarks

The TryGetValue method lets developers safely retrieve a value from a HostFileConnectionStringBuilder without needing to first call the ContainsKey method. Because TryGetValue does not raise an exception when you call it, passing in a nonexistent key, you do not have to look for a key before retrieving its value. Calling TryGetValue with a nonexistent key will place the null value (Nothing in Visual Basic) in the value parameter.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileConnectionStringBuilder Properties

## Public Properties

Name	Description
 <a href="#">AffiliateApplication</a>	Gets or sets the affiliate application associated with the connection string.
 <a href="#">AlternateTPName</a>	Gets or sets the alternate TP name.
 <a href="#">AppcMode</a>	Gets or sets the APPC mode.
 <a href="#">BinAsChar</a>	Gets or sets a value that determines if the connection should treat binary data as character data.
 <a href="#">BrowsableConnectionString</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">CertificateCN</a>	
 <a href="#">ConnectionString</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">Count</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">DataSource</a>	Gets or sets the data source.
 <a href="#">DefaultLibrary</a>	Gets or sets the default library.
 <a href="#">ExtendedProperties</a>	Gets or sets the extended properties of the connection string.
 <a href="#">FileName</a>	Gets or sets the name of the file to access.
 <a href="#">HostCCSID</a>	Gets or sets the host CCSID.
 <a href="#">IntegratedSecurity</a>	Gets or sets the integrated security.
 <a href="#">IsFixedSize</a>	Overridden. Gets a value that indicates whether the HostFileConnectionStringBuilder has a fixed size.
 <a href="#">IsReadOnly</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
 <a href="#">Item</a>	Overridden. Gets or sets the value associated with the specified key.
 <a href="#">Keys</a>	Overridden. Gets an ICollection that contains the keys in the HostFileConnectionStringBuilder.
 <a href="#">LocalFolder</a>	
 <a href="#">LocalLU</a>	Gets or sets the local LU.
 <a href="#">Location</a>	Gets or sets the current location.
 <a href="#">Metadata</a>	Gets or sets the metadata.
 <a href="#">NetworkAddress</a>	Gets or sets the host network address.
 <a href="#">NetworkPort</a>	Gets or sets the host network port.
 <a href="#">NetworkTransportLibrary</a>	Gets or sets the network transport library.
 <a href="#">OfflineBufferSize</a>	
 <a href="#">Password</a>	Gets or sets the connection string password.
 <a href="#">PCCodePage</a>	Gets or sets the connection string PC code page.
 <a href="#">RemoteLU</a>	Gets or sets the remote LU for the connection string.
 <a href="#">UserId</a>	Gets or sets the user ID for the connection string.
 <a href="#">Values</a>	Overridden. Gets an ICollection that contains the values in the HostFileConnectionStringBuilder.

## Explicit Interface Implementations

Name	Description
<a href="#">System.Collections.ICollection.IsSynchronized</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
<a href="#">System.Collections.ICollection.SyncRoot</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )
<a href="#">System.Collections.IDictionary.Item</a>	(inherited from <a href="#">DbConnectionStringBuilder</a> )

[HostFileConnectionStringBuilder Members](#)

[Microsoft.HostIntegration.MsHostFileClient Namespace](#)

# HostFileConnectionStringBuilder.IsFixedSize Property

Gets a value that indicates whether the HostFileConnectionStringBuilder has a fixed size.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property IsFixedSize As Boolean
```

C#

```
public override bool IsFixedSize { get; }
```

C++

```
public:
virtual property bool IsFixedSize {
    bool get () override;
}
```

J#

```
/** @property */
public boolean get_IsFixedSize ()
```

JScript

```
public override function get IsFixedSize () : boolean
```

## Property Value

**true** if the DbConnectionStringBuilder has a fixed size; otherwise **false**.

Remarks

fixed-size collection does not allow adding or removing elements after the collection is created, but it does allow modifying existing elements.

A fixed-size collection is just a collection with a wrapper that prevents adding and removing elements; therefore, if changes are made to the underlying collection, including adding or removing elements, the fixed-size collection reflects those changes

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

[Microsoft.HostIntegration.MsHostFileClient Namespace](#)

# HostFileConnectionStringBuilder.Item Property

Gets or sets the value associated with the specified key.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Default Property Item ( _
    keyword As String _
) As Object
```

C#

```
public override Object this [
    string keyword
] { get; set; }
```

C++

```
public:
virtual property Object^ default [String^] {
    Object^ get (String^ keyword) override;
    void set (String^ keyword, Object^ value) override;
}
```

J#

```
/** @property */
public Object get_Item (String keyword)

/** @property */
public void set_Item (String keyword, Object value)
```

JScript

## Parameters

keyword

The key of the item to get or set.

## Property Value

The value associated with the specified key. If the specified key is not found, trying to get it returns a null reference (Nothing in Visual Basic), and trying to set it creates a new element using the specified key. Passing a null (Nothing in Visual Basic) key throws an `ArgumentNullException`. Assigning a null value removes the key/value pair.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

[Microsoft.HostIntegration.MsHostFileClient Namespace](#)

# HostFileConnectionStringBuilder.Keys Property

Gets an ICollection that contains the keys in the HostFileConnectionStringBuilder.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property Keys As ICollection
```

C#

```
public override ICollection Keys { get; }
```

C++

```
public:
virtual property ICollection^ Keys {
    ICollection^ get () override;
}
```

J#

```
/** @property */
public ICollection get_Keys ()
```

JScript

```
public override function get Keys () : ICollection
```

## Property Value

An ICollection that contains the keys in the HostFileConnectionStringBuilder.

Remarks

The order of the values in the ICollection is unspecified, but it is the same order as the associated values in the ICollection returned by the Values property.

The returned ICollection is not a static copy; instead, the ICollection refers back to the keys in the original HostFileConnectionStringBuilder. Therefore, changes to the HostFileConnectionStringBuilder are reflected in the ICollection.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileConnectionStringBuilder.Values Property

Gets an ICollection that contains the values in the HostFileConnectionStringBuilder.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property Values As ICollection
```

C#

```
public override ICollection Values { get; }
```

C++

```
public:
virtual property ICollection^ Values {
    ICollection^ get () override;
}
```

J#

```
/** @property */
public ICollection get_Values ()
```

JScript

```
public override function get Values () : ICollection
```

## Property Value

An ICollection that contains the values in the HostFileConnectionStringBuilder.

Remarks

The order of the values in the ICollection is unspecified, but it is the same order as the associated keys in the ICollection returned by the Keys method.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

### HostFileDataAdapter Constructor ()

Initializes a new instance of the [HostFileDataAdapter](#) class.

### Syntax

C#

```
public HostFileDataAdapter()
```

C++

```
public:  
HostFileDataAdapter()
```

F#

```
new : unit -> HostFileDataAdapter
```

VB

```
Public Sub New
```

### Remarks

When you create an instance of [HostFileDataAdapter](#), the `SelectCommand` is set to a new [HostFileCommand](#).

[Return to top](#)

### HostFileDataAdapter Constructor (HostFileCommand)

Initializes a new instance of the [HostFileDataAdapter](#) class using the specified select command.

### Syntax

C#

```
public HostFileDataAdapter(  
    HostFileCommand selectCommand  
)
```

C++

```
public:
```

```
HostFileDataAdapter(  
    HostFileCommand^ selectCommand  
)
```

F#

```
new :  
    selectCommand:HostFileCommand -> HostFileDataAdapter
```

VB

```
Public Sub New (  
    selectCommand As HostFileCommand  
)
```

#### Parameters

*selectCommand*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileCommand](#)

The select command to use.

[Return to top](#)

#### HostFileDataAdapter Constructor (String, HostFileConnection)

Initializes a new instance of the [HostFileDataAdapter](#) class using the specified select command text and connection.

Syntax

C#

```
public HostFileDataAdapter(  
    string selectCommandText,  
    HostFileConnection selectConnection  
)
```

C++

```
public:  
HostFileDataAdapter(  
    String^ selectCommandText,  
    HostFileConnection^ selectConnection  
)
```

F#

```
new :  
    selectCommandText:string *  
    selectConnection:HostFileConnection -> HostFileDataAdapter
```

VB

```
Public Sub New (  
    selectCommandText As String,  
    selectConnection As HostFileConnection  
)
```

#### Parameters

*selectCommandText*

Type: [System.String](#)

The select command text to use.

*selectConnection*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileConnection](#)

The host file connection to use.

[Return to top](#)

#### HostFileDataAdapter Constructor (String, String)

Initializes a new instance of the [HostFileDataAdapter](#) class using the specified select command text and connection string.

## Syntax

### C#

```
public HostFileDataAdapter(  
    string selectCommandText,  
    string selectConnectionString  
)
```

### C++

```
public:  
HostFileDataAdapter(  
    String^ selectCommandText,  
    String^ selectConnectionString  
)
```

### F#

```
new :  
    selectCommandText:string *  
    selectConnectionString:string -> HostFileDataAdapter
```

### VB

```
Public Sub New (  
    selectCommandText As String,  
    selectConnectionString As String  
)
```

## Parameters

*selectCommandText*

Type: [System.String](#)

The command text to use.

*selectConnectionString*

Type: [System.String](#)

The connection string to use.

[Return to top](#)

# HostFileDataAdapter Constructor ()

Initializes a new instance of the [HostFileDataAdapter](#) class.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public HostFileDataAdapter ()
```

C++

```
public:  
HostFileDataAdapter ()
```

J#

```
public HostFileDataAdapter ()
```

JScript

```
public function HostFileDataAdapter ()
```

Remarks

When you create an instance of HostFileDataAdapter, the SelectCommand is set to a new HostFileCommand.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**HostFileDataAdapter.FillSchema Method (DataSet, SchemaType)**

Adds a DataTable named "Table" to the specified DataSet and configures the schema to match that in the data source based on the specified SchemaType.

Syntax

```
C#  
  
public override DataTable[] FillSchema(  
    DataSet dataSet,  
    SchemaType schemaType  
)
```

```
C++  
  
public:  
virtual array<DataTable^>^ FillSchema(  
    DataSet^ dataSet,  
    SchemaType schemaType  
) override
```

```
F#  
  
override FillSchema :  
    dataSet:DataSet *  
    schemaType:SchemaType -> DataTable[]
```

```
VB  
  
Public Overrides Function FillSchema (  
    dataSet As DataSet,  
    schemaType As SchemaType  
) As DataTable()
```

**Parameters**

*dataSet*  
Type: [System.Data.DataSet](#)  
A DataSet to insert the schema in.

*schemaType*  
Type: [System.Data.SchemaType](#)  
The SchemaType values that specifies how to insert the schema.

**Return Value**

Type: [System.Data.DataTable](#)

A reference to a collection of DataTable objects that were added to the DataSet.

**Implements**

[IDataAdapter.FillSchema\(DataSet, SchemaType\)](#) [IDataAdapter.FillSchema\(DataSet, SchemaType\)](#)

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function FillSchema ( _
    dataSet As DataSet, _
    schemaType As SchemaType _
) As DataTable()
```

C#

```
public override DataTable[] FillSchema (
    DataSet dataSet,
    SchemaType schemaType
)
```

C++

```
public:
virtual array<DataTable^>^ FillSchema (
    DataSet^ dataSet,
    SchemaType schemaType
) override
```

J#

```
public DataTable[] FillSchema (
    DataSet dataSet,
    SchemaType schemaType
)
```

JScript

```
public override function FillSchema (
    dataSet : DataSet,
    schemaType : SchemaType
) : DataTable[]
```

## Parameters

dataSet

A DataSet to insert the schema in.

schemaType

The SchemaType values that specifies how to insert the schema.

## Return Value

A reference to a collection of DataTable objects that were added to the DataSet.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileDataAdapter.ReturnProviderSpecificTypes Property

Gets or sets a value that indicates whether the host returns provider-specific types.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides Property ReturnProviderSpecificTypes As Boolean
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override bool ReturnProviderSpecificTypes { get; set; }
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual property bool ReturnProviderSpecificTypes {
    bool get () override;
    void set (bool value) override;
}
```

J#

```
/** @property */
public boolean get_ReturnProviderSpecificTypes ()

/** @property */
public void set_ReturnProviderSpecificTypes (boolean value)
```

JScript

```
public override function get ReturnProviderSpecificTypes () : boolean

public override function set ReturnProviderSpecificTypes (value : boolean)
```

## Property Value

**true** if the host returns provider-specific types; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# HostFileDataAdapter.SelectCommand Property

Gets or sets the host file select command.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Property SelectCommand As HostFileCommand
```

C#

```
public HostFileCommand SelectCommand { get; set; }
```

C++

```
public:
property HostFileCommand^ SelectCommand {
    HostFileCommand^ get ();
    void set (HostFileCommand^ value);
}
```

J#

```
/** @property */
public HostFileCommand get_SelectCommand ()

/** @property */
public void set_SelectCommand (HostFileCommand value)
```

JScript

```
public function get SelectCommand () : HostFileCommand

public function set SelectCommand (value : HostFileCommand)
```

## Property Value

The host file select command.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

```

VB

```
Public Class HostFileParameter
    Inherits DbParameter
    Implements IDbDataParameter, IDataParameter
```

Constructors

Name		Description
	<a href="#">HostFileParameter()</a>	Initializes a new instance of the <b>HostFileParameter</b> class.
	<a href="#">HostFileParameter(String, HostFileType)</a>	Initializes a new instance of the <b>HostFileParameter</b> class using the specified name and host file type.

 <a href="#">HostFileParameter(String, HostFileType, Int32, ParameterDirection, String, DataRowVersion, Boolean, Object)</a>	Initializes a new instance of the <b>HostFileParameter</b> class using the specified parameters.
 <a href="#">HostFileParameter(String, HostFileType, Int32, String)</a>	Initializes a new instance of the <b>HostFileParameter</b> class using the specified parameters.
 <a href="#">HostFileParameter(String, HostFileType, Object)</a>	Initializes a new instance of the <b>HostFileParameter</b> class using the specified name, host file type and values.
 <a href="#">HostFileParameter(String, Object)</a>	Initializes a new instance of the <b>HostFileParameter</b> class using the specified name and values.

#### Properties

Name	Description
 <a href="#">DbType</a>	Gets or sets the DbType of the parameter.(Overrides <a href="#">DbParameter.DbType</a> .)
 <a href="#">Direction</a>	(Inherited from <a href="#">DbParameter</a> .)
 <a href="#">HostFileType</a>	Gets or sets the host file type of the parameter.
 <a href="#">ParameterName</a>	Gets or sets the name of the parameter.(Overrides <a href="#">DbParameter.ParameterName</a> .)
 <a href="#">Precision</a>	(Inherited from <a href="#">DbParameter</a> .)
 <a href="#">Scale</a>	(Inherited from <a href="#">DbParameter</a> .)
 <a href="#">Size</a>	(Inherited from <a href="#">DbParameter</a> .)
 <a href="#">SourceColumn</a>	Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the value.(Overrides <a href="#">DbParameter.SourceColumn</a> .)
 <a href="#">SourceColumnNullMapping</a>	(Inherited from <a href="#">DbParameter</a> .)
 <a href="#">SourceVersion</a>	Gets or sets the DataRowVersion to use when loading value.(Overrides <a href="#">DbParameter.SourceVersion</a> .)
 <a href="#">Value</a>	Gets or sets the value of the parameter.(Overrides <a href="#">DbParameter.Value</a> .)

#### Methods

Name	Description
 <a href="#">CreateObjRef(Type)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)

 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">InitializeLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">MemberwiseClone(Boolean)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">ResetDbType()</a>	Resets the DbType property to its original settings.(Overrides <a href="#">DbParameter.ResetDbType()</a> .)
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileParameter Members

Represents a host file parameter.

The following tables list the members exposed by the [HostFileParameter](#) type.

## Public Constructors

Name	Description
<a href="#">HostFileParameter</a>	Overloaded. Initializes a new instance of the <a href="#">HostFileParameter</a> class.

[Top](#)

## Public Properties

Name	Description
 <a href="#">DbType</a>	Overridden. Gets or sets the DbType of the parameter.
 <a href="#">Direction</a>	Overridden. Gets or sets a value that indicates whether the parameter is input-only, output-only, or bidirectional.
 <a href="#">HostFileType</a>	Gets or sets the host file type of the parameter.
 <a href="#">IsNullable</a>	Overridden. Gets or sets a value that indicates whether the parameter accepts <b>null</b> values.
 <a href="#">ParameterName</a>	Overridden. Gets or sets the name of the parameter.
 <a href="#">Precision</a>	Gets or sets the precision of numeric parameters.
 <a href="#">Scale</a>	Get or sets the scale of numeric parameters.
 <a href="#">Size</a>	Overridden. Gets or sets the size of the parameter, in bytes.
 <a href="#">SourceColumn</a>	Overridden. Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the value.
 <a href="#">SourceColumnNullMapping</a>	Overridden. Gets or sets a value that indicates whether the source column is nullable.
 <a href="#">SourceVersion</a>	Overridden. Gets or sets the DataRowVersion to use when loading value.
 <a href="#">Value</a>	Overridden. Gets or sets the value of the parameter.

[Top](#)

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">CreateObjRef</a>	(inherited from <a href="#">MarshalByRefObject</a> )
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">InitializeLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
  <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ResetDbType</a>	Overridden. Resets the DbType property to its original settings.
 <a href="#">ToString</a>	(inherited from <a href="#">Object</a> )

## HostFileParameter Constructor ()

Initializes a new instance of the [HostFileParameter](#) class.

## Syntax

C#

```
public HostFileParameter()
```

C++

```
public:
HostFileParameter()
```

F#

```
new : unit -> HostFileParameter
```

VB

```
Public Sub New
```

[Return to top](#)

#### HostFileParameter Constructor (String, HostFileType)

Initializes a new instance of the [HostFileParameter](#) class using the specified name and host file type.

Syntax

C#

```
public HostFileParameter(
    string name,
    HostFileType hostFileType
)
```

C++

```
public:
HostFileParameter(
    String^ name,
    HostFileType hostFileType
)
```

F#

```
new :
    name:string *
    hostFileType:HostFileType -> HostFileParameter
```

VB

```
Public Sub New (
    name As String,
    hostFileType As HostFileType
)
```

#### Parameters

*name*

Type: [System.String](#)

The name of the parameter.

*hostFileType*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileType](#)

The host file type.

[Return to top](#)

#### HostFileParameter Constructor (String, HostFileType, Int32, ParameterDirection, String, DataRowVersion, Boolean, Object)

Initializes a new instance of the [HostFileParameter](#) class using the specified parameters.

Syntax

C#

```
public HostFileParameter(
    string name,
    HostFileType hostFileType,
    int size,
```

```

ParameterDirection direction,
string sourceColumn,
DataRowVersion sourceVersion,
bool sourceColumnNullMapping,
object value
)

```

C++

```

public:
HostFileParameter(
    String^ name,
    HostFileType hostFileType,
    int size,
    ParameterDirection direction,
    String^ sourceColumn,
    DataRowVersion sourceVersion,
    bool sourceColumnNullMapping,
    Object^ value
)

```

F#

```

new :
    name:string *
    hostFileType:HostFileType *
    size:int *
    direction:ParameterDirection *
    sourceColumn:string *
    sourceVersion:DataRowVersion *
    sourceColumnNullMapping:bool *
    value:Object -> HostFileParameter

```

VB

```

Public Sub New (
    name As String,
    hostFileType As HostFileType,
    size As Integer,
    direction As ParameterDirection,
    sourceColumn As String,
    sourceVersion As DataRowVersion,
    sourceColumnNullMapping As Boolean,
    value As Object
)

```

## Parameters

*name*

Type: [System.String](#)

The name of the parameter.

*hostFileType*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileType](#)

The host file type.

*size*

Type: [System.Int32](#)

The size of the parameter.

*direction*

Type: [System.Data.ParameterDirection](#)

The direction of the parameter.

*sourceColumn*

Type: [System.String](#)

The source column.

*sourceVersion*

Type: [System.Data.DataRowVersion](#)

The source version.

*sourceColumnNullMapping*

Type: [System.Boolean](#)

**true** if the source column is nullable; otherwise, **false**.

*value*

Type: [System.Object](#)

The value of the parameter.

[Return to top](#)

### **HostFileParameter Constructor (String, HostFileType, Int32, String)**

Initializes a new instance of the [HostFileParameter](#) class using the specified parameters.

Syntax

C#

```
public HostFileParameter(  
    string name,  
    HostFileType hostFileType,  
    int size,  
    string srcColumn  
)
```

C++

```
public:  
HostFileParameter(  
    String^ name,  
    HostFileType hostFileType,  
    int size,  
    String^ srcColumn  
)
```

F#

```
new :  
    name:string *  
    hostFileType:HostFileType *  
    size:int *  
    srcColumn:string -> HostFileParameter
```

VB

```
Public Sub New (  
    name As String,  
    hostFileType As HostFileType,  
    size As Integer,  
    srcColumn As String  
)
```

### **Parameters**

*name*

Type: [System.String](#)

The name of the parameter.

*hostFileType*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileType](#)

The host file type.

*size*

Type: [System.Int32](#)

The size, in bytes, of the parameter.

*srcColumn*

Type: [System.String](#)

The source column of the parameter.

[Return to top](#)

### **HostFileParameter Constructor (String, HostFileType, Object)**

Initializes a new instance of the [HostFileParameter](#) class using the specified name, host file type and values.

Syntax

C#

```
public HostFileParameter(  
    string name,  
    HostFileType hostFileType,  
    object value  
)
```

C++

```
public:  
HostFileParameter(  
    String^ name,  
    HostFileType hostFileType,  
    Object^ value  
)
```

F#

```
new :  
    name:string *  
    hostFileType:HostFileType *  
    value:Object -> HostFileParameter
```

VB

```
Public Sub New (  
    name As String,  
    hostFileType As HostFileType,  
    value As Object  
)
```

### **Parameters**

*name*

Type: [System.String](#)

The name of the parameter.

*hostFileType*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileType](#)

The host file type.

*value*

Type: [System.Object](#)

The value of the parameter.

[Return to top](#)

### **HostFileParameter Constructor (String, Object)**

Initializes a new instance of the [HostFileParameter](#) class using the specified name and values.

Syntax

C#

```
public HostFileParameter(  
    string name,  
    object value  
)
```

C++

```
public:
HostFileParameter(
    String^ name,
    Object^ value
)
```

F#

```
new :
    name:string *
    value:Object -> HostFileParameter
```

VB

```
Public Sub New (
    name As String,
    value As Object
)
```

### Parameters

*name*

Type: [System.String](#)

The name of the parameter.

*value*

Type: [System.Object](#)

The value of the parameter.

[Return to top](#)

# HostFileParameter Constructor ()

Initializes a new instance of the [HostFileParameter](#) class.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public HostFileParameter ()
```

C++

```
public:  
HostFileParameter ()
```

J#

```
public HostFileParameter ()
```

JScript

```
public function HostFileParameter ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

)
```

**Parameters**

name

The name of the parameter.

hostFileType

The host file type.

size

The size of the parameter.

direction

The direction of the parameter.

sourceColumn

The source column.

sourceVersion

The source version.

sourceColumnNullMapping

**true** if the source column is nullable; otherwise, **false**.

value

The value of the parameter.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileParameter Properties

Public Properties

	Name	Description
	<a href="#">DbType</a>	Overridden. Gets or sets the DbType of the parameter.
	<a href="#">Direction</a>	Overridden. Gets or sets a value that indicates whether the parameter is input-only, output-only, or bidirectional.
	<a href="#">HostFileType</a>	Gets or sets the host file type of the parameter.
	<a href="#">IsNullable</a>	Overridden. Gets or sets a value that indicates whether the parameter accepts <b>null</b> values.
	<a href="#">ParameterName</a>	Overridden. Gets or sets the name of the parameter.
	<a href="#">Precision</a>	Gets or sets the precision of numeric parameters.
	<a href="#">Scale</a>	Get or sets the scale of numeric parameters.
	<a href="#">Size</a>	Overridden. Gets or sets the size of the parameter, in bytes.
	<a href="#">SourceColumn</a>	Overridden. Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the value.
	<a href="#">SourceColumnNullMapping</a>	Overridden. Gets or sets a value that indicates whether the source column is nullable.
	<a href="#">SourceVersion</a>	Overridden. Gets or sets the DataRowVersion to use when loading value.
	<a href="#">Value</a>	Overridden. Gets or sets the value of the parameter.

Explicit Interface Implementations

# HostFileParameter.DbType Property

Gets or sets the DbType of the parameter.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property DbType As DbType
```

C#

```
public override DbType DbType { get; set; }
```

C++

```
public:
virtual property DbType DbType {
    DbType get () override;
    void set (DbType value) override;
}
```

J#

```
/** @property */
public DbType get_DbType ()

/** @property */
public void set_DbType (DbType value)
```

JScript

```
public override function get DbType () : DbType

public override function set DbType (value : DbType)
```

## Property Value

The DbType of the parameter. The default is string.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileParameter.ParameterName Property

Gets or sets the name of the parameter.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property ParameterName As String
```

C#

```
public override string ParameterName { get; set; }
```

C++

```
public:
virtual property String^ ParameterName {
    String^ get () override;
    void set (String^ value) override;
}
```

J#

```
/** @property */
public String get_ParameterName ()

/** @property */
public void set_ParameterName (String value)
```

JScript

```
public override function get ParameterName () : String

public override function set ParameterName (value : String)
```

## Property Value

The name of the parameter. The default is an empty string.

Remarks

The ParameterName is specified in the form @paramname. You must set ParameterName before executing a command that relies on parameters.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

# HostFileParameter.Precision Property

Gets or sets the precision of numeric parameters.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Property Precision As Byte
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public byte Precision { get; set; }
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual property unsigned char Precision {
    unsigned char get () sealed;
    void set (unsigned char value) sealed;
}
```

J#

```
/** @property */
public final byte get_Precision ()

/** @property */
public final void set_Precision (byte value)
```

JScript

```
public final function get Precision () : byte

public final function set Precision (value : byte)
```

## Property Value

The precision of numeric parameters. The default value is 0, which indicates that a data provider sets the precision for value. Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileParameter.Size Property

Gets or sets the size of the parameter, in bytes.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides Property Size As Integer
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override int Size { get; set; }
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual property int Size {
    int get () override;
    void set (int value) override;
}
```

J#

```
/** @property */
public int get_Size ()

/** @property */
public void set_Size (int value)
```

JScript

```
public override function get Size () : int

public override function set Size (value : int)
```

## Property Value

The size of the parameter. The default value is inferred from the parameter value.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileParameter.SourceColumn Property

Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the value.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property SourceColumn As String
```

C#

```
public override string SourceColumn { get; set; }
```

C++

```
public:
virtual property String^ SourceColumn {
    String^ get () override;
    void set (String^ value) override;
}
```

J#

```
/** @property */
public String get_SourceColumn ()

/** @property */
public void set_SourceColumn (String value)
```

JScript

```
public override function get SourceColumn () : String

public override function set SourceColumn (value : String)
```

## Property Value

The name of the source column that is mapped to the DataSet. The default is an empty string.

Remarks

The link between the value of the IDataParameter and the DataTable may be bidirectional depending on the value of the Direction property

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileParameter.SourceVersion Property

Gets or sets the DataRowVersion to use when loading value.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property SourceVersion As DataRowVersion
```

C#

```
public override DataRowVersion SourceVersion { get; set; }
```

C++

```
public:
virtual property DataRowVersion SourceVersion {
    DataRowVersion get () override;
    void set (DataRowVersion value) override;
}
```

J#

```
/** @property */
public DataRowVersion get_SourceVersion ()

/** @property */
public void set_SourceVersion (DataRowVersion value)
```

JScript

```
public override function get SourceVersion () : DataRowVersion

public override function set SourceVersion (value : DataRowVersion)
```

## Property Value

One of the DataRowVersion values. The default is Current.

Remarks

This property is used by the UpdateCommand during the Update to determine whether the original or current value is used for a parameter value. This allows primary keys to be updated. This property is set to the version of the DataRow used by the Item property, or the GetChildRows method of the DataRow object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

## Reference

[HostFileParameter Class](#)

[HostFileParameter Members](#)

[Microsoft.HostIntegration.MsHostFileClient Namespace](#)

# HostFileParameter.Value Property

Gets or sets the value of the parameter.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Property Value As Object
```

C#

```
public override Object Value { get; set; }
```

C++

```
public:
virtual property Object^ Value {
    Object^ get () override;
    void set (Object^ value) override;
}
```

J#

```
/** @property */
public Object get_Value ()

/** @property */
public void set_Value (Object value)
```

JScript

```
public override function get Value () : Object

public override function set Value (value : Object)
```

## Property Value

The value of the parameter. The default value is **null**.

Remarks

For input parameters, the value is bound to the IDbCommand that is sent to the server. For output and return value parameters, the value is set on completion of the IDbCommand and after the IDataReader is closed.

When sending **null** parameter value to the server, the user must specify DBNull, not **null**. The **null** value in the system is an empty object that has no value. DBNull is used to represent **null** values.

If the application specifies the database type, the bound value is converted to that type when the provider sends the data to the server. The provider attempts to convert any type of value if it supports the IConvertible interface. Conversion errors may result if the specified type is not compatible with the value.

The Value property is overwritten by Update.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Microsoft.HostIntegration.MsHostFileClient.HostFileParameterCollection**

Syntax

C#

```
public class HostFileParameterCollection : DbParameterCollection
```

C++

```
public ref class HostFileParameterCollection : DbParameterCollection
```

F#

```
type HostFileParameterCollection =  
    class  
        inherit DbParameterCollection  
    end
```

VB

```
Public Class HostFileParameterCollection  
    Inherits DbParameterCollection
```

Constructors

Name	Description
 <a href="#">HostFileParameterCollection()</a>	Initializes a new instance of the <b>HostFileParameterCollection</b> class.

Properties

Name	Description
 <a href="#">Count</a>	Gets the number of items in the collection.(Overrides <a href="#">DbParameterCollection.Count</a> .)
 <a href="#">IsFixedSize</a>	Gets a value that indicates whether the collection is a fixed size.(Overrides <a href="#">DbParameterCollection.IsFixedSize</a> .)
 <a href="#">IsReadOnly</a>	Gets a value that indicates whether the collection is read-only.(Overrides <a href="#">DbParameterCollection.IsReadOnly</a> .)
 <a href="#">IsSynchronized</a>	Gets a value that indicates whether the collection is synchronized.(Overrides <a href="#">DbParameterCollection.IsSynchronized</a> .)
 <a href="#">Item(Int32)</a>	Gets or sets the HostFileParameter at the specified index.
 <a href="#">Item(String)</a>	Gets or sets the HostFileParameter with the specified name.

Methods

Name	Description
 <a href="#">Add(HostFileParameter)</a>	Adds a HostFileParameter item with the specified value to the HostFileParameterCollection.
 <a href="#">Add(Object)</a>	(Inherited from <a href="#">DbParameterCollection</a> .)

 <a href="#">AddRange(Array)</a>	(Inherited from <a href="#">DbParameterCollection</a> .)
 <a href="#">AddRange(HostFileParameter[])</a>	Adds an array of items with the specified values to the HostFileParameterCollection.
 <a href="#">Clear()</a>	Removes all HostFileParameter values from the HostFileParameterCollection.(Overrides <a href="#">DbParameterCollection.Clear()</a> .)
 <a href="#">Contains(HostFileParameter)</a>	Indicates whether a HostFileParameter with the specified value exists in the collection.
 <a href="#">Contains(Object)</a>	(Inherited from <a href="#">DbParameterCollection</a> .)
 <a href="#">Contains(String)</a>	Indicates whether a HostFileParameter with the specified name exists in the collection.( Overrides <a href="#">DbParameterCollection.Contains(String)</a> .)
 <a href="#">CopyTo(Array, Int32)</a>	(Inherited from <a href="#">DbParameterCollection</a> .)
 <a href="#">CopyTo(HostFileParameter[], Int32)</a>	Copies an array of HostFileParameter objects starting at the specified index.
 <a href="#">CreateObjRef(Type)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetEnumerator()</a>	Returns an enumerator which supports a simple iteration over the collection.(Overrides <a href="#">DbParameterCollection.GetEnumerator()</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">GetParameter(Int32)</a>	Retrieves the parameter with the specified index.(Overrides <a href="#">DbParameterCollection.GetParameter(Int32)</a> .)

# HostFileParameterCollection Members

Represents a collection of HostFileParameters for a HostFileCommand.

The following tables list the members exposed by the [HostFileParameterCollection](#) type.

## Public Constructors

Name	Description
<a href="#">HostFileParameterCollection</a>	Initializes a new instance of the <a href="#">HostFileParameterCollection</a> class.

[Top](#)

## Public Properties

Name	Description
 <a href="#">Count</a>	Overridden. Gets the number of items in the collection.
 <a href="#">IsFixedSize</a>	Overridden. Gets a value that indicates whether the collection is a fixed size.
 <a href="#">IsReadOnly</a>	Overridden. Gets a value that indicates whether the collection is read-only.
 <a href="#">IsSynchronized</a>	Overridden. Gets a value that indicates whether the collection is synchronized.
 <a href="#">Item</a>	Overloaded. Gets or sets a HostFileParameter in the collection.
 <a href="#">SyncRoot</a>	Overridden. Gets an object to be used to synchronize access to the collection.

[Top](#)

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Add</a>	Overloaded. Adds a HostFileParameter object to the HostFileParameterCollection.
 <a href="#">AddRange</a>	Overloaded. Overridden. Adds a range of items with the specified values to the HostFileParameterCollection.
 <a href="#">Clear</a>	Overridden. Removes all HostFileParameter values from the HostFileParameterCollection.
 <a href="#">Contains</a>	Overloaded. Indicates whether a HostFileParameter with the specified property exists in the collection.
 <a href="#">CopyTo</a>	Overloaded. Overridden. Copies an array of items to the collection starting at the specified index.
 <a href="#">CreateObjRef</a>	(inherited from <a href="#">MarshalByRefObject</a> )
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">GetEnumerator</a>	Overridden. Returns an enumerator which supports a simple iteration over the collection.
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">IndexOf</a>	Overloaded. Determines the index of the specified HostFileParameter object.
 <a href="#">InitializeLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
 <a href="#">Insert</a>	Overloaded. Inserts a parameter object into the HostFileParameter collection.
  <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">Remove</a>	Overloaded. Removes the specified parameter object from the collection.
 <a href="#">RemoveAt</a>	Overloaded. Overridden. Removes a specified parameter object from the collection.
 <a href="#">ToString</a>	(inherited from <a href="#">Object</a> )

[Top](#)

## Protected Methods

Name	Description
 <a href="#">Finalize</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetParameter</a>	Overloaded. Overridden. Retrieves the parameter with the specified property.
 <a href="#">MemberwiseClone</a>	Overloaded. (inherited from <a href="#">MarshalByRefObject</a> )
 <a href="#">SetParameter</a>	Overloaded. Overridden. Sets the specified parameter to the specified value.

[Top](#)

## Explicit Interface Implementations

Name	Description
<a href="#">System.Collections.IList.Item</a>	(inherited from <a href="#">DbParameterCollection</a> )
<a href="#">System.Data.IDataParameterCollection.Item</a>	(inherited from <a href="#">DbParameterCollection</a> )

## HostFileParameterCollection.Add Method (HostFileParameter)

Adds a HostFileParameter item with the specified value to the HostFileParameterCollection.

Syntax

C#

```
public int Add(  
    HostFileParameter value  
)
```

C++

```
public:  
int Add(  
    HostFileParameter^ value  
)
```

F#

```
member Add :  
    value:HostFileParameter -> int
```

VB

```
Public Function Add (  
    value As HostFileParameter  
) As Integer
```

## Parameters

*value*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileParameter](#)

The value of the HostFileParameter to add to the collection.

## Return Value

Type: [System.Int32](#)

The index of the HostFileParameter object in the collection.

[Return to top](#)

# HostFileParameterCollection.Add Method (HostFileParameter)

Adds a HostFileParameter item with the specified value to the HostFileParameterCollection.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Function Add ( _
    value As HostFileParameter _
) As Integer
```

C#

```
public int Add (
    HostFileParameter value
)
```

C++

```
public:
int Add (
    HostFileParameter^ value
)
```

J#

```
public int Add (
    HostFileParameter value
)
```

JScript

```
public function Add (
    value : HostFileParameter
) : int
```

## Parameters

value

The value of the HostFileParameter to add to the collection.

## Return Value

The index of the HostFileParameter object in the collection.

Thread Safety Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

## HostFileParameterCollection.AddRange Method (HostFileParameter[])

Adds an array of items with the specified values to the HostFileParameterCollection.

Syntax

C#

```
public void AddRange(  
    HostFileParameter[] values  
)
```

C++

```
public:  
void AddRange(  
    array<HostFileParameter^>^ values  
)
```

F#

```
member AddRange :  
    values:HostFileParameter[] -> unit
```

VB

```
Public Sub AddRange (  
    values As HostFileParameter()  
)
```

## Parameters

*values*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileParameter](#)

An array of values of type HostFileParameter to add to the collection.

[Return to top](#)

# HostFileParameterCollection.AddRange Method (Array)

Adds an array of items with the specified values to the HostFileParameterCollection.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides Sub AddRange ( _
    values As Array _
)
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override void AddRange (
    Array values
)
```

```
member Contains :  
    value:HostFileParameter -> bool
```

VB

```
Public Function Contains (  
    value As HostFileParameter  
) As Boolean
```

## Parameters

*value*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileParameter](#)

The value of the HostFileParameter to look for in the collection.

## Return Value

Type: [System.Boolean](#)

**true** if the HostFileParameter is in the collection; otherwise, **false**.

[Return to top](#)

## HostFileParameterCollection.Contains Method (String)

Indicates whether a HostFileParameter with the specified name exists in the collection.

Syntax

C#

```
public override bool Contains(  
    string parameterName  
)
```

C++

```
public:  
virtual bool Contains(  
    String^ parameterName  
) override
```

F#

```
override Contains :  
    parameterName:string -> bool
```

VB

```
Public Overrides Function Contains (  
    parameterName As String  
) As Boolean
```

#### Parameters

*parameterName*

Type: [System.String](#)

The name of the HostFileParameter to look for in the collection.

#### Return Value

Type: [System.Boolean](#)

**true** if the HostFileParameter is in the collection; otherwise, **false**.

#### Implements

[IDataParameterCollection.Contains\(String\)](#)

[Return to top](#)

# HostFileParameterCollection.Contains Method (HostFileParameter)

    index:int -> unit
```

VB

```
Public Sub CopyTo (  
    array As HostFileParameter(),  
    index As Integer  
)
```

## Parameters

*array*

Type: [Microsoft.HostIntegration.MsHostFileClient.HostFileParameter](#)

The array of HostFileParameter objects to copy to the collection.

*index*

Type: [System.Int32](#)

The index in the collection to copy the items.

[Return to top](#)

# HostFileParameterCollection.CopyTo Method (Array, Int32)

Copies an array of items to the collection starting at the specified index.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides Sub CopyTo ( _
    array As Array, _
    index As Integer _
)
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override void CopyTo (
    Array array,
    int index
)
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual void CopyTo (
    Array^ array,

public void CopyTo (
    Array array,
    int index
)
```

JScript

```
EditorBrowsableAttribute(EditorBrowsableState.Never)
public override function CopyTo (
    array : Array,
    index : int
)
```

## Parameters

array

The array of items to copy to the collection.

index

The index in the collection to copy the items.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# HostFileParameterCollection.CopyTo Method (HostFileParameter[], Int32)

Copies an array of HostFileParameter objects starting at the specified index.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub CopyTo ( _
    array As HostFileParameter(), _
    index As Integer _
)
```

C#

```
public void CopyTo (
    HostFileParameter[] array,
    int index
)
```

C++

```
public:
void CopyTo (
    array<HostFileParameter^>^ array,
    int index
)
```

J#

```
public void CopyTo (
    HostFileParameter[] array,
    int index
)
```

JScript

```
public function CopyTo (
    array : HostFileParameter[],
    index : int
)
```

## Parameters

array

The array of HostFileParameter objects to copy to the collection.

index

The index in the collection to copy the items.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

```
public void RemoveAt (
    int index
)
```

JScript

```
public override function RemoveAt (
    index : int
)
```

## Parameters

index

The index of the parameter object to remove.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# HostFileParameterCollection.RemoveAt Method (String)

Removes a parameter object from the collection based on the specified name.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Sub RemoveAt ( _
    parameterName As String _
)
```

C#

```
public override void RemoveAt (
    string parameterName
)
```

C++

```
public:
virtual void RemoveAt (
    String^ parameterName
) override
```

J#

```
public void RemoveAt (
    String parameterName
)
```

JScript

```
public override function RemoveAt (
    parameterName : String
)
```

## Parameters

parameterName

The name of the parameter object to remove.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## HostFileParameterCollection.SetParameter Method (Int32, DbParameter)

Sets the parameter object at the specified index to the new value.

Syntax

C#

```
protected override void SetParameter(  
    int index,  
    DbParameter value  
)
```

C++

```
protected:  
virtual void SetParameter(  
    int index,  
    DbParameter^ value  
) override
```

F#

```
override SetParameter :  
    index:int *  
    value:DbParameter -> unit
```

VB

```
Protected Overrides Sub SetParameter (  
    index As Integer,  
    value As DbParameter  
)
```

## Parameters

*index*

Type: [System.Int32](#)

The index where the parameter object is located.

*value*

Type: [System.Data.Common.DbParameter](#)

The new parameter value.

[Return to top](#)

## HostFileParameterCollection.SetParameter Method (String, DbParameter)

Sets the parameter object with the specified name to a new value.

#### Syntax

##### C#

```
protected override void SetParameter(  
    string parameterName,  
    DbParameter value  
)
```

##### C++

```
protected:  
virtual void SetParameter(  
    String^ parameterName,  
    DbParameter^ value  
) override
```

##### F#

```
override SetParameter :  
    parameterName:string *  
    value:DbParameter -> unit
```

##### VB

```
Protected Overrides Sub SetParameter (  
    parameterName As String,  
    value As DbParameter  
)
```

#### Parameters

*parameterName*

Type: [System.String](#)

The name of the parameter object in the collection.

*value*

Type: [System.Data.Common.DbParameter](#)

The new parameter value.

[Return to top](#)

# HostFileParameterCollection.SetParameter Method (Int32, DbParameter)

Sets the parameter object at the specified index to the new value.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Sub SetParameter ( _
    index As Integer, _
    value As DbParameter _
)
```

C#

```
protected override void SetParameter (
    int index,
    DbParameter value
)
```

C++

```
protected:
virtual void SetParameter (
    int index,
    DbParameter^ value
) override
```

J#

```
protected void SetParameter (
    int index,
    DbParameter value
)
```

JScript

```
protected override function SetParameter (
    index : int,
    value : DbParameter
)
```

## Parameters

index

The index where the parameter object is located.

value

The new parameter value.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileParameterCollection.Count Property

Gets the number of items in the collection.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property Count As Integer
```

C#

```
public override int Count { get; }
```

C++

```
public:
virtual property int Count {
    int get () override;
}
```

J#

```
/** @property */
public int get_Count ()
```

JScript

```
public override function get Count () : int
```

## Property Value

The number of items in the collection.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostFileProviderFactory Methods

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">CreateCommand</a>	Overridden. Returns a new instance of the provider's class that implements the DbCommand class.
	<a href="#">CreateCommandBuilder</a>	Overridden. Returns a new instance of the provider's class that implements the DbCommandBuilder class.
	<a href="#">CreateConnection</a>	Overridden. Returns a new instance of the provider's class that implements the DbConnection class.
	<a href="#">CreateConnectionStringBuilder</a>	Overridden. Returns a new instance of the provider's class that implements the DbConnectionStringBuilder class.
	<a href="#">CreateDataAdapter</a>	Overridden. Returns a new instance of the provider's class that implements the DbDataAdapter class.
	<a href="#">CreateDataSourceEnumerator</a>	Overridden. Returns a new instance of the provider's class that implements the DbDataSourceEnumerator class.
	<a href="#">CreateParameter</a>	Overridden. Returns a new instance of the provider's class that implements the DbParameter class.
	<a href="#">CreatePermission</a>	Overridden. Returns a new instance of the provider's class that implements the provider's version of the CodeAccessPermission class.
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )

# HostFileProviderFactory.CreateCommand Method

This method supports the infrastructure and is not intended to be used directly from your code.

Returns a new instance of the provider's class that implements the DbCommand class.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function CreateCommand As DbCommand
```

C#

```
public override DbCommand CreateCommand ()
```

C++

```
public:
virtual DbCommand^ CreateCommand () override
```

J#

```
public DbCommand CreateCommand ()
```

JScript

```
public override function CreateCommand () : DbCommand
```

## Return Value

A new instance of the provider's class.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

```

## Properties

Name	Description
 <a href="#">DeleteCapable</a>	Gets a value that indicates whether the recordset can be deleted.
 <a href="#">Depth</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">FieldCount</a>	Gets the number of columns in the current row.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">HasRows</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">InsertCapable</a>	Gets a value that indicates whether the recordset can have a record inserted into it.
 <a href="#">IsClosed</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">Item(Int32)</a>	Gets the column located at the specified index.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">Item(Int32, DataRecordVersion)</a>	Gets the column with the specified index and version.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">Item(String)</a>	Gets the column with the specified name.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">Item(String, DataRecordVersion)</a>	Gets the column with the specified name and version.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">Position</a>	Gets or sets the position of the recordset.
 <a href="#">RecordsAffected</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">RecordsCount</a>	Gets a value that determines the number of records in the recordset.
 <a href="#">State</a>	Gets the state of the current instance.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">UpdateCapable</a>	Gets a value that indicates whether the recordset can be updated.
 <a href="#">VisibleFieldCount</a>	(Inherited from <a href="#">DbDataReader</a> .)

## Methods

Name	Description
 <a href="#">AddNew()</a>	Adds a new column to the current instance.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">Close()</a>	(Inherited from <a href="#">DbDataReader</a> .)

 <a href="#">CreateObjRef(Type)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">Delete()</a>	Deletes the current instance.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">Dispose()</a>	Releases all resources used by the current instance of the <b>HostFileRecordSet</b> .
 <a href="#">Dispose(Boolean)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">FillRow(DataRow, DataTableMappingCollection, DataColumnMappingCollection, SchemaType, MissingSchemaAction, MissingMappingAction)</a>	Fills the row with the specified objects.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">FillSchema(String, ICollection&lt;DataTable&gt;, DataSet, DataTableMappingCollection, SchemaType, MissingMappingAction, DataColumnMappingCollection)</a>	Fills the schema with the specified objects.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetBoolean(Int32)</a>	Retrieves the value of the specified column as a Boolean.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetByte(Int32)</a>	Retrieves the 8-bit unsigned integer value of the specified column.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetBytes(Int32, Int64, Byte[], Int32, Int32)</a>	Reads a stream of bytes from the specified column offset into the buffer as an array, starting at the given buffer offset.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetChar(Int32)</a>	Retrieves the character value of the specified column.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetChars(Int32, Int64, Char[], Int32, Int32)</a>	Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetData(Int32)</a>	Retrieves the data value of the specified column.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetDataTypeName(Int32)</a>	Retrieves the data type name.(Inherited from <a href="#">UpdateableDataRecord</a> .)

 <a href="#">GetDateTime(Int32)</a>	Retrieves the value of the specified column as a DateTime object.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetDbDataReader(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetDecimal(Int32)</a>	Retrieves the value of the specified column as a Decimal object.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetDouble(Int32)</a>	Retrieves the value of the specified column as a double-precision floating point number.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetFieldType(Int32)</a>	Retrieves the Type that is the data type of the object.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetFieldValue&lt;T&gt;(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFieldValueAsync&lt;T&gt;(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFieldValueAsync&lt;T&gt;(Int32, CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFloat(Int32)</a>	Retrieves the value of the specified column as a single-precision floating point number.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetGuid(Int32)</a>	Retrieves the value of the specified column as a globally unique identifier (GUID).(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetInt16(Int32)</a>	Retrieves the value of the specified column as a 16-bit signed integer.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetInt32(Int32)</a>	Retrieves the value of the specified column as a 32-bit signed integer.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetInt64(Int32)</a>	Retrieves the value of the specified column as a 64-bit signed integer.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)

 <a href="#">GetName(Int32)</a>	Retrieves the name of the specified column.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetOrdinal(String)</a>	Retrieves the ordinal of the specified column.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetProviderType(Int32)</a>	Retrieves the provider of the specified record.
 <a href="#">GetRecordSet(Int32)</a>	Retrieves the recordset of the column.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetSchemaTable()</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetSchemaTable(String)</a>	Returns a DataTable that describes the column metadata of the updateable data record.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetStream(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetString(Int32)</a>	Retrieves the value of the column as a string.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetTextReader(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetValue()</a>	Returns the value of the specified column.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetValue(Int32)</a>	Returns the value of the specified record.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetValue(Int32, DataRecordVersion)</a>	Returns the value of the column with the specified index and version.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">GetValues(Object[])</a>	Returns an array of objects with the column values of the current record.(Inherited from <a href="#">UpdateableDataRecord</a> .)
 <a href="#">InitializeLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">InternalDispose()</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Releases all resources used by the current instance of the <b>HostFileRecordSet</b> .

  <a href="#">IsDBNull(Int32)</a>	Returns a value that indicates whether the column contains non-existent or missing values.(Inherited from <a href="#">UpdateableDataRecord</a> .)
  <a href="#">IsDBNullAsync(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
  <a href="#">IsDBNullAsync(Int32, CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
  <a href="#">LoadRow(DataRow, DataTableMappingCollection, DataColumnMappingCollection, SchemaType, MissingSchemaAction, MissingMappingAction)</a>	Loads the row of the specified record.(Inherited from <a href="#">UpdateableDataRecord</a> .)
  <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
  <a href="#">MemberwiseClone(Boolean)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
  <a href="#">MoveBottom()</a>	Moves the cursor to the bottom of the current recordset.
  <a href="#">MoveNext()</a>	Moves the cursor to the next record in the recordset.
  <a href="#">MovePrevious()</a>	Moves the cursor to the previous record in the recordset.
  <a href="#">MoveTop()</a>	Moves the cursor to the top of the recordset.
  <a href="#">MoveToPosition(Int32)</a>	Moves the cursor to the specified position in the recordset.
  <a href="#">NextResult()</a>	(Inherited from <a href="#">DbDataReader</a> .)
  <a href="#">NextResultAsync()</a>	(Inherited from <a href="#">DbDataReader</a> .)
  <a href="#">NextResultAsync(CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
  <a href="#">Read()</a>	(Inherited from <a href="#">DbDataReader</a> .)
  <a href="#">ReadAsync()</a>	(Inherited from <a href="#">DbDataReader</a> .)
  <a href="#">ReadAsync(CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
  <a href="#">SetValue(Int32, Object)</a>	Specifies the value of the updateable data record using the specified index and value.(Inherited from <a href="#">UpdateableDataRecord</a> .)
  <a href="#">SetValue(Object)</a>	Specifies the value of the updateable data record using the specified value.(Inherited from <a href="#">UpdateableDataRecord</a> .)
  <a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)
  <a href="#">Update()</a>	Updates the specified data record.(Inherited from <a href="#">UpdateableDataRecord</a> .)

#### Explicit Interface Implementations

Name	Description
------	-------------

	<a href="#">DataRecord.GetData(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
---	---	---

Thread Safety

# HostFileRecordSet Members

Represents the host file record set.

The following tables list the members exposed by the [HostFileRecordSet](#) type.

## Public Properties

	Name	Description
	<a href="#">DeleteCapable</a>	Gets a value that indicates whether the recordset can be deleted.
	<a href="#">Depth</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">FieldCount</a>	Gets the number of columns in the current row. (inherited from <a href="#">UpdateableDataRecord</a> )
	<a href="#">HasRows</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">InsertCapable</a>	Gets a value that indicates whether the recordset can have a record inserted into it.
	<a href="#">IsClosed</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">Item</a>	Overloaded. (inherited from <a href="#">UpdateableDataRecord</a> )
	<a href="#">Position</a>	Gets or sets the position of the recordset.
	<a href="#">RecordsAffected</a>	Overridden. Gets a value that determines the number of records affected.
	<a href="#">RecordsCount</a>	Gets a value that determines the number of records in the recordset.
	<a href="#">State</a>	Gets the state of the current instance. (inherited from <a href="#">UpdateableDataRecord</a> )
	<a href="#">UpdateCapable</a>	Gets a value that indicates whether the recordset can be updated.
	<a href="#">VisibleFieldCount</a>	Overridden. Gets a value that determines the number of visible fields in the recordset.

## Top

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">AddNew</a>	Adds a new column to the current instance. (inherited from <a href="#">UpdateableDataRecord</a> )

# HostFileRecordSet.Dispose Method ()

Releases all resources used by the current instance of the [HostFileRecordSet](#).

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Dispose
```

C#

```
public void Dispose ()
```

C++

```
public:
void Dispose ()
```

J#

```
public void Dispose ()
```

JScript

```
public function Dispose ()
```

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

# HostFileRecordSet.GetGuid Method

Retrieves the GUID for the specified record.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<EditorBrowsableAttribute(EditorBrowsableState.Never)> _
Public Overrides Function GetGuid ( _
    i As Integer _
) As Guid
```

C#

```
[EditorBrowsableAttribute(EditorBrowsableState.Never)]
public override Guid GetGuid (
    int i
)
```

C++

```
[EditorBrowsableAttribute(EditorBrowsableState::Never)]
public:
virtual Guid GetGuid (
    int i
) override
```

J#

```
/** @attribute EditorBrowsableAttribute(EditorBrowsableState.Never) */
public Guid GetGuid (
    int i
)
```

JScript

```
EditorBrowsableAttribute(EditorBrowsableState.Never)
public override function GetGuid (
    i : int
) : Guid
```

## Parameters

i

The index of the specified record.

## Return Value

The GUID of the specified record.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

```

C#

```
public abstract bool DeleteCapable { get; }
```

C++

```
public:
virtual property bool DeleteCapable {
    bool get () abstract;
}
```

J#

```
/** @property */
public abstract boolean get_DeleteCapable ()
```

JScript

```
public abstract function get DeleteCapable () : boolean
```

## Property Value

**true** if the recordset can be deleted; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# HostFileRecordSet.InsertCapable Property

Gets a value that indicates whether the recordset can have a record inserted into it.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public MustOverride ReadOnly Property InsertCapable As Boolean
```

C#

```
public abstract bool InsertCapable { get; }
```

C++

```
public:
virtual property bool InsertCapable {
    bool get () abstract;
}
```

J#

```
/** @property */
public abstract boolean get_InsertCapable ()
```

JScript

```
public abstract function get InsertCapable () : boolean
```

## Property Value

**true** if the recordset can have a record inserted into it; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# IAccessDDMObj Members

Represents an interface for communicating with the DDM Server.

The following tables list the members exposed by the [IAccessDDMObj](#) type.

## Public Methods

	Name	Description
	<a href="#">ClearFile</a>	Clears the specified file.
	<a href="#">Close</a>	Closes the file.
	<a href="#">Connect</a>	Connects the specified object to the file.
	<a href="#">Delete</a>	Deletes the current file.
	<a href="#">Disconnect</a>	Stops an object from receiving any command.
	<a href="#">ExecuteCommand</a>	Executes the command.
	<a href="#">Fetch</a>	Retrieves the connection.
	<a href="#">GetServerInfo</a>	Retrieves the server information.
	<a href="#">Insert</a>	Inserts a specified object in the file.
	<a href="#">LockIt</a>	Locks the file.
	<a href="#">MoveBottom</a>	Moves the specified object at the bottom of the file.
	<a href="#">MoveFirst</a>	Moves the specified object in the beginning of the file.
	<a href="#">MoveLast</a>	Moves the specified object to the last item in the file.
	<a href="#">MoveNext</a>	Moves the object to the next item in the file.
	<a href="#">MovePrev</a>	Moves the object to the previous item in the file.
	<a href="#">MoveTo</a>	Moves the object to the specified location.
	<a href="#">MoveTop</a>	Moves the object to the top list of the file.
	<a href="#">Open</a>	Opens the file.
	<a href="#">SetKeyLimits</a>	Sets the limits of the key.
	<a href="#">UnlockIt</a>	Unlocks the specified file.
	<a href="#">Update</a>	Updates the status of the file.

# IAccessDDMObj.ClearFile Method

Clears the specified file.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<DispIdAttribute(5)> _
Sub ClearFile ( _
    <InAttribute> nConnectionId As Short, _
    <InAttribute> FileName As String _
)
```

C#

```
[DispIdAttribute(5)]
void ClearFile (
    [InAttribute] short nConnectionId,
    [InAttribute] string FileName
)
```

C++

```
[DispIdAttribute(5)]
void ClearFile (
    [InAttribute] short nConnectionId,
    [InAttribute] String^ FileName
)
```

J#

```
/** @attribute DispIdAttribute(5) */
void ClearFile (
    /** @attribute InAttribute() */ short nConnectionId,
    /** @attribute InAttribute() */ String FileName
)
```

JScript

```
DispIdAttribute(5)
function ClearFile (
    nConnectionId : short,
    FileName : String
)
```

## Parameters

nConnectionId

The identifier of the connection.

FileName

The name of the file.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

)
```

JScript

## Parameters

lFileId

The identifier of the file.

pbRecord

The record of pb.

cbMaxRecord

The maximum record.

pcbRecord

The record of pcb.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# IAccessDDMObj.GetServerInfo Method

Retrieves the server information.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<DispIdAttribute(3)> _
Sub GetServerInfo ( _
    <InAttribute> nConnectionId As Short, _
    <OutAttribute> ByRef pServerClass As Short, _
    <OutAttribute> ByRef pVersion As Short, _
    <OutAttribute> ByRef pSubVersion As Short, _
    <OutAttribute> ByRef pModification As Short _
)
```

C#

```
[DispIdAttribute(3)]
void GetServerInfo (
    [InAttribute] short nConnectionId,
    out short pServerClass,
    out short pVersion,
    out short pSubVersion,
    out short pModification
)
```

C++

```
[DispIdAttribute(3)]
void GetServerInfo (
    [InAttribute] short nConnectionId,
    [OutAttribute] short% pServerClass,
    [OutAttribute] short% pVersion,
    [OutAttribute] short% pSubVersion,
    [OutAttribute] short% pModification
)
```

J#

```
/** @attribute DispIdAttribute(3) */
void GetServerInfo (
    /** @attribute InAttribute() */ short nConnectionId,
    /** @attribute OutAttribute() */ /** @ref */ short pServerClass,
    /** @attribute OutAttribute() */ /** @ref */ short pVersion,
    /** @attribute OutAttribute() */ /** @ref */ short pSubVersion,
    /** @attribute OutAttribute() */ /** @ref */ short pModification
)
```

JScript

## Parameters

nConnectionId

The identifier of the connection.

pServerClass

The server class.

pVersion

The server version.

pSubVersion

The server subversion.

pModification

The modification.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# IAccessDDMObj.Insert Method

Inserts a specified object in the file.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<DispIdAttribute(18)> _
Sub Insert ( _
    <InAttribute> lFileId As Integer, _
    <InAttribute> <OutAttribute> Record As Byte(), _
    <InAttribute> RecordSize As Integer, _
    <InAttribute> insertType As Short, _
    <InAttribute> recNumber As Integer _
)
```

C#

```
[DispIdAttribute(18)]
void Insert (
    [InAttribute] int lFileId,
    [InAttribute] [OutAttribute] byte[] Record,
    [InAttribute] int RecordSize,
    [InAttribute] short insertType,
    [InAttribute] int recNumber
)
```

C++

```
[DispIdAttribute(18)]
void Insert (
    [InAttribute] int lFileId,
    [InAttribute] [OutAttribute] array<unsigned char>^ Record,
    [InAttribute] int RecordSize,
    [InAttribute] short insertType,
    [InAttribute] int recNumber
)
```

J#

```
/** @attribute DispIdAttribute(18) */
void Insert (
    /** @attribute InAttribute() */ int lFileId,
    /** @attribute InAttribute() */ /** @attribute OutAttribute() */ byte[] Record,
    /** @attribute InAttribute() */ int RecordSize,
    /** @attribute InAttribute() */ short insertType,
    /** @attribute InAttribute() */ int recNumber
)
```

JScript

```
DispIdAttribute(18)
function Insert (
    lFileId : int,
    Record : byte[],
    RecordSize : int,
    insertType : short,
    recNumber : int
)
```

## Parameters

FileId

The identifier of the file.

Record

The record.

RecordSize

The size of the record.

insertType

The type of inserted object.

recNumber

The record number.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

    [InAttribute] String^ FileName,
    [InAttribute] long long ullOptions,
    [OutAttribute] ABBREV_FILATT% FileAttributes,
    [InAttribute] [OutAttribute] array<MYKEYDEFST>^% pKeyDefStructure,
    [InAttribute] [OutAttribute] int% plFileId
)
```

J#

```
/** @attribute DispIdAttribute(6) */
void Open (
    /** @attribute InAttribute() */ short nConnectionId,
    /** @attribute InAttribute() */ String FileName,
    /** @attribute InAttribute() */ long ullOptions,
    /** @attribute OutAttribute() */ /** @ref */ ABBREV_FILATT FileAttributes,
    /** @attribute InAttribute() */ /** @attribute OutAttribute() */ /** @ref */ MYKEYDEFST[]
    pKeyDefStructure,
    /** @attribute InAttribute() */ /** @attribute OutAttribute() */ /** @ref */ int plFileId
)
```

JScript

## Parameters

nConnectionId

The identifier of the connection.

FileName

The name of the file.

ullOptions

The lists of options.

FileAttributes

The attributes of the file.

pKeyDefStructure

The Key Def Structure.

plFileId

The identifier of the file.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# IAccessDDMObj.SetKeyLimits Method

Sets the limits of the key.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
<DispIdAttribute(21)> _
Sub SetKeyLimits ( _
    <InAttribute> lFileId As Integer, _
    <InAttribute> pbKeyLow As Byte(), _
    <InAttribute> cbKeyLow As Integer, _
    <InAttribute> fKeyLowInclusive As Integer, _
    <InAttribute> pbKeyHigh As Byte(), _
    <InAttribute> cbKeyHigh As Integer, _
    <InAttribute> fKeyHighInclusive As Integer _
)
```

C#

```
[DispIdAttribute(21)]
void SetKeyLimits (
    [InAttribute] int lFileId,
    [InAttribute] byte[] pbKeyLow,
    [InAttribute] int cbKeyLow,
    [InAttribute] int fKeyLowInclusive,
    [InAttribute] byte[] pbKeyHigh,
    [InAttribute] int cbKeyHigh,
    [InAttribute] int fKeyHighInclusive
)
```

C++

```
[DispIdAttribute(21)]
void SetKeyLimits (
    [InAttribute] int lFileId,
    [InAttribute] array<unsigned char>^ pbKeyLow,
    [InAttribute] int cbKeyLow,
    [InAttribute] int fKeyLowInclusive,

```

```
lFileId : int,  
pbKeyLow : byte[],  
cbKeyLow : int,  
fKeyLowInclusive : int,  
pbKeyHigh : byte[],  
cbKeyHigh : int,  
fKeyHighInclusive : int  
)
```

## Parameters

lFileId

The identifier of the file.

pbKeyLow

The low pb key.

cbKeyLow

The low cb key.

fKeyLowInclusive

The inclusive low key.

pbKeyHigh

The high pb key.

cbKeyHigh

The high cb key.

fKeyHighInclusive

The inclusive high key.

) : IDataCursor
```

## Parameters

fileName

The name of the file to open the cursor in.

openMode

The mode to open the cursor in.

shareFlags

The share flags to set.

recordType

The record type.

isDefaultType

**true** if it is a default type; otherwise, **false**.

#### Return Value

The opened cursor.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Syntax

C#

```
public interface IDataCursor
```

C++

```
public interface class IDataCursor
```

F#

```
type IDataCursor = interface end
```

VB

```
Public Interface IDataCursor
```

Properties

Name	Description
 <a href="#">AccessMethods</a>	Gets the access methods for the current cursor.
 <a href="#">CursorFlags</a>	Gets the settings for the current cursor flags.
 <a href="#">CursorState</a>	Gets the cursor state.
 <a href="#">FileName</a>	Gets the file name of the file the cursor is currently pointing to.
 <a href="#">MaxRecordLength</a>	Gets the maximum record length of the record the cursor is currently pointing to.
 <a href="#">Position</a>	Gets the current position of the cursor.
 <a href="#">RecordsCount</a>	Gets the records count of the record the cursor is currently pointing to.
 <a href="#">RecordStatusFlags</a>	Gets or sets the record status flag of the record the cursor is currently pointing to.
 <a href="#">RecordType</a>	Gets the record type of the record the cursor is currently pointing to.

Methods

Name	Description
 <a href="#">Close()</a>	Closes the record the cursor is currently pointing to.
 <a href="#">Delete()</a>	Deletes the record the cursor is currently pointing to.
 <a href="#">FilterByKey(Object, Boolean, Object, Boolean, Boolean, Int32)</a>	
 <a href="#">FilterByPosition(Int32, Boolean, Int32, Boolean, Boolean)</a>	Filters by position.
 <a href="#">GetRecord()</a>	Retrieves the record.
 <a href="#">Insert(Object)</a>	Inserts the specified record at the current cursor location.
 <a href="#">LockRecord()</a>	Locks the record located at the current cursor location.
 <a href="#">MoveBottom()</a>	Moves the cursor to the bottom of the recordset.

 <a href="#">MoveFirst(DataRecordAccessFlags)</a>	Moves the cursor to the first record in the recordset, using the specified access flags.
 <a href="#">MoveLast(DataRecordAccessFlags)</a>	Moves the cursor to the last record in the recordset, using the specified access flags.
 <a href="#">MoveNext(DataRecordAccessFlags)</a>	Moves the cursor to the next record in the recordset, using the specified access flags.
 <a href="#">MovePrev(DataRecordAccessFlags)</a>	Moves the cursor to the previous record in the recordset, using the specified access flags
 <a href="#">MoveTo(Int32, DataRecordAccessFlags)</a>	Moves the cursor to a record in the recordset, using the specified position and access flags.
 <a href="#">MoveTop()</a>	Moves the cursor to the top of the recordset.
 <a href="#">UnlockRecord()</a>	Unlocks the record the cursor is currently pointing to.
 <a href="#">Update(Object)</a>	Updates the record the cursor is currently pointing to.

)
```

JScript

```
function FilterByKey (
    loKey : Object,
    loKeyInclusive : boolean,
    hiKey : Object,
    hiKeyInclusive : boolean,
    resetTop : boolean
)
```

## Parameters

loKey

The low key.

loKeyInclusive

**true** if the low key is inclusive; otherwise, **false**.

hiKey

The high key.

hiKeyInclusive

**true** if the high key is inclusive; otherwise, **false**.

resetTop

**true** to reset to the top when finished; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

JScript

```
function FilterByPosition (
    loLimit : int,
    loKeyInclusive : boolean,
    hiLimit : int,
    hiKeyInclusive : boolean,
    resetTop : boolean
)
```

## Parameters

loLimit

The low limit.

loKeyInclusive

**true** to filter by the low key; otherwise, **false**.

hiLimit

The high limit.

hiKeyInclusive

**true** to filter by the high key; otherwise, **false**.

resetTop

**true** to reset to the top after finishing; otherwise, **false**.

Syntax

VB

```
'Declaration  
ReadOnly Property CursorState As DataCursorState
```

C#

```
DataCursorState CursorState { get; }
```

C++

```
property DataCursorState CursorState {  
    DataCursorState get ();  
}
```

J#

```
/** @property */  
DataCursorState get_CursorState ()
```

JScript

```
function get CursorState () : DataCursorState
```

## Property Value

The state of the cursor.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Gets the file name of the file the cursor is currently pointing to.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration  
ReadOnly Property FileName As String
```

C#

```
string FileName { get; }
```

C++

```
property String^ FileName {  
    String^ get ();  
}
```

J#

```
/** @property */  
String get_FileName ()
```

JScript

```
function get FileName () : String
```

## Property Value

The name of the file.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# IDataRecordSet Interface

Represents a data record set.

**Namespace:** [Microsoft.HostIntegration.MsHostFileClient](#)

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in Microsoft.HostIntegration.MsHostFileClient.dll)

Syntax

C#

```
public interface IDataRecordSet : IUpdateableDataRecord, IDataRecord
```

C++

```
public interface class IDataRecordSet : IUpdateableDataRecord,  
    IDataRecord
```

F#

```
type IDataRecordSet =  
    interface  
        interface IUpdateableDataRecord  
        interface IDataRecord  
    end
```

VB

```
Public Interface IDataRecordSet  
    Inherits IUpdateableDataRecord, IDataRecord
```

Properties

	Name	Description
	<a href="#">FieldCount</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">Item(Int32)</a>	Gets or sets the specified column based on the specified index.(Inherited from <a href="#">IUpdateableDataRecord</a> .)
	<a href="#">Item(String)</a>	Gets the column with the specified name.(Inherited from <a href="#">IUpdateableDataRecord</a> .)
	<a href="#">Position</a>	Gets or sets the cursor position in the recordset.
	<a href="#">RecordsCount</a>	Gets the number of records in the recordset.
	<a href="#">State</a>	Gets the state of the current column.(Inherited from <a href="#">IUpdateableDataRecord</a> .)

Methods

	Name	Description
	<a href="#">AddNew()</a>	Adds a new column to the table.(Inherited from <a href="#">IUpdateableDataRecord</a> .)
	<a href="#">Delete()</a>	Deletes the current instance.(Inherited from <a href="#">IUpdateableDataRecord</a> .)
	<a href="#">GetBoolean(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetByte(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetBytes(Int32, Int64, Byte[], Int32, Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetChar(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetChars(Int32, Int64, Char[], Int32, Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetData(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)

 <a href="#">GetDataTypeName(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetDateTime(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Sub PackRecord ( _
    record As Object, _
    buffer As Byte(), _
    ByRef count As Integer _
)
```

C#

```
void PackRecord (
    Object record,
    byte[] buffer,
    ref int count
)
```

C++

```
void PackRecord (
    Object^ record,
    array<unsigned char>^ buffer,
    int% count
)
```

J#

```
void PackRecord (
    Object record,
    byte[] buffer,
    /** @ref */ int count
)
```

JScript

## Parameters

record

buffer

count

The number of records to pack.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

```
Object^ UnpackRecord (
    array<unsigned char>^ buffer,
    int% count
)
```

J#

```
Object UnpackRecord (
    byte[] buffer,
    /** @ref */ int count
)
```

JScript

## Parameters

buffer

The buffer that currently stores the remote record.

count

The number of records to pack.

## Return Value

An object containing the new local record.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

```
Public Interface IUpdateableDataRecord  
    Inherits IDataRecord
```

Properties

	Name	Description
	<a href="#">FieldCount</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">Item(Int32)</a>	Gets or sets the specified column based on the specified index.
	<a href="#">Item(String)</a>	Gets the column with the specified name.
	<a href="#">State</a>	Gets the state of the current column.

Methods

	Name	Description
	<a href="#">AddNew()</a>	Adds a new column to the table.
	<a href="#">Delete()</a>	Deletes the current instance.
	<a href="#">GetBoolean(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetByte(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetBytes(Int32, Int64, Byte[], Int32, Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetChar(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetChars(Int32, Int64, Char[], Int32, Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetData(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetDataTypeName(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetDateTime(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
	<a href="#">GetDecimal(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)

 <a href="#">GetDouble(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetFieldType(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetFloat(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetGuid(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetInt16(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetInt32(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetInt64(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetName(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetOrdinal(String)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetRecordSet(Int32)</a>	Retrieves a recordset based on the specified index.
 <a href="#">GetString(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetValue(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">GetValue(Int32, DataRecordVersion)</a>	Retrieves the value of a field, based on the specified index and data record version.
 <a href="#">GetValues(Object[])</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">IsDBNull(Int32)</a>	(Inherited from <a href="#">IDataRecord</a> .)
 <a href="#">SetValue(Int32, Object)</a>	Sets the value of the field at the specified index.
 <a href="#">Update()</a>	Updates the current instance.

# IUpdateableDataRecord.GetRecordSet Method

Retrieves a recordset based on the specified index.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Function GetRecordSet ( _
    index As Integer _
) As IDataRecordSet
```

C#

```
IDataRecordSet GetRecordSet (
    int index
)
```

C++

```
IDataRecordSet^ GetRecordSet (
    int index
)
```

J#

```
IDataRecordSet GetRecordSet (
    int index
)
```

JScript

```
function GetRecordSet (
    index : int
) : IDataRecordSet
```

## Parameters

index

The index of the recordset to retrieve.

## Return Value

The specified recordset.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# IUpdateableDataRecord.GetValue Method

Retrieves the value of a field, based on the specified index and data record version.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Function GetValue ( _
    index As Integer, _
    version As DataRecordVersion _
) As Object
```

C#

```
Object GetValue (
    int index,
    DataRecordVersion version
)
```

C++

```
Object^ GetValue (
    int index,
    DataRecordVersion version
)
```

J#

```
Object GetValue (
    int index,
    DataRecordVersion version
)
```

JScript

```
function GetValue (
    index : int,
    version : DataRecordVersion
) : Object
```

## Parameters

index

The index of the value to retrieve.

version

The version of the value to retrieve.

## Return Value

An object containing the value of the specified field.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Sets the value of the field at the specified index.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Sub SetValue ( _
    index As Integer, _
    value As Object _
)
```

C#

```
void SetValue (
    int index,
    Object value
)

### IUpdateableDataRecord.Item Property (Int32)

Gets or sets the specified column based on the specified index.

Syntax

C#

```
object this[
    int index
] { get; set; }
```

C++

```
property Object^ default[
    int index
] {
    Object^ get(int index);
    void set(int index, Object^ value);
}
```

F#

```
abstract Item :
    index:int -> Object with get, set
```

VB

```
Property Item (
    index As Integer
) As Object
```

## Parameters

*index*

Type: [System.Int32](#)

The index of the column to get.

## Property Value

Type: [System.Object](#)

The column located at the specified index as an Object.

## Implements

[IDataRecord.Item\(Int32\)](#)

[Return to top](#)

### IUpdateableDataRecord.Item Property (String)

Gets the column with the specified name.

## Syntax

### C#

```
object this[
    string name
] { get; set; }
```

### C++

```
property Object^ default[
    String^ name
] {
    Object^ get(String^ name);
    void set(String^ name, Object^ value);
}
```

### F#

```
abstract Item :
    name:string -> Object with get, set
```

### VB

```
Property Item (
    name As String
) As Object
```

## Parameters

*name*

Type: [System.String](#)

The name of the column to find.

## Property Value

Type: [System.Object](#)

The column with the specified name as an Object.

## Implements

[IDataRecord.Item\(String\)](#)

## Remarks

A case-sensitive lookup is performed first. If it fails, a second case-insensitive search is made.

[Return to top](#)

# IUpdateableDataRecord.Item Property (Int32)

Gets or sets the specified column based on the specified index.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Default Property Item ( _
    index As Integer _
) As Object
```

C#

```
Object this [
    int index
] { get; set; }
```

C++

```
property Object^ default [int] {
    Object^ get (int index);
    void set (int index, Object^ value);
}
```

J#

```
/** @property */
Object get_Item (int index)

/** @property */
void set_Item (int index, Object value)
```

JScript

## Parameters

index

The index of the column to get.

## Property Value

The column located at the specified index as an Object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# RecordSetType Enumeration

Represents the type of recordset on the host file system.

**Namespace:** [Microsoft.HostIntegration.MsHostFileClient](#)

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in Microsoft.HostIntegration.MsHostFileClient.dll)

Syntax

```
C#  
  
public enum RecordSetType
```

```
C++  
  
public enum class RecordSetType
```

```
F#  
  
type RecordSetType
```

```
VB  
  
Public Enumeration RecordSetType
```

Members

Member name	Description
Read	The type is read.
ReadWrite	The type is read/write.
Update	The type is update.

# UpdateableDataRecord Class

Represents an updatable data record.

**Namespace:** [Microsoft.HostIntegration.MsHostFileClient](#)  
**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in Microsoft.HostIntegration.MsHostFileClient.dll)

Inheritance Hierarchy  
[System.Object](#)  
[System.MarshalByRefObject](#)  
[System.Data.Common.DbDataReader](#)  
**Microsoft.HostIntegration.MsHostFileClient.UpdateableDataRecord**  
[Microsoft.HostIntegration.MsHostFileClient.HostFileRecordSet](#)

Syntax  
C#

```
public abstract class UpdateableDataRecord : DbDataReader, IUpdateableDataRecord,
    IDataRecord
```

C++

```
public ref class UpdateableDataRecord abstract : DbDataReader,
    IUpdateableDataRecord, IDataRecord
```

F#

```
[<AbstractClass>]
type UpdateableDataRecord =
    class
        inherit DbDataReader
        interface IUpdateableDataRecord
        interface IDataRecord
    end
```

VB

```
Public MustInherit Class UpdateableDataRecord
    Inherits DbDataReader
    Implements IUpdateableDataRecord, IDataRecord
```

Properties

Name	Description
 Depth	(Inherited from <a href="#">DbDataReader</a> .)
 FieldCount	Gets the number of columns in the current row.(Overrides <a href="#">DbDataReader.FieldCount</a> .)
 HasRows	(Inherited from <a href="#">DbDataReader</a> .)
 IsClosed	(Inherited from <a href="#">DbDataReader</a> .)
 Item(Int32)	Gets the column located at the specified index.(Overrides <a href="#">DbDataReader.Item(Int32)</a> .)
 Item(Int32, DataRecordVersion)	Gets the column with the specified index and version.
 Item(String)	Gets the column with the specified name.(Overrides <a href="#">DbDataReader.Item(String)</a> .)
 Item(String, DataRecordVersion)	Gets the column with the specified name and version.
 RecordsAffected	(Inherited from <a href="#">DbDataReader</a> .)
 State	Gets the state of the current instance.
 VisibleFieldCount	(Inherited from <a href="#">DbDataReader</a> .)

Methods

Name	Description
 AddNew()	Adds a new column to the current instance.
 Close()	(Inherited from <a href="#">DbDataReader</a> .)
 CreateObjRef(Type)	(Inherited from <a href="#">MarshalByRefObject</a> .)
 Delete()	Deletes the current instance.
 Dispose(Boolean)	(Inherited from <a href="#">DbDataReader</a> .)
 Equals(Object)	(Inherited from <a href="#">Object</a> .)
 FillRow(DataRow, DataTableMappingCollection, DataColumnMappingCollection, SchemaType, MissingSchemaAction, MissingMappingAction)	Fills the row with the specified objects.
 FillSchema(String, ICollection<DataTable>, DataSet, DataTableMappingCollection, SchemaType, MissingMappingAction, DataColumnMappingCollection)	Fills the schema with the specified objects.
 Finalize()	(Inherited from <a href="#">Object</a> .)
 GetBoolean(Int32)	Retrieves the value of the specified column as a Boolean.(Overrides <a href="#">DbDataReader.GetBoolean(Int32)</a> .)
 GetByte(Int32)	Retrieves the 8-bit unsigned integer value of the specified column.(Overrides <a href="#">DbDataReader.GetByte(Int32)</a> .)
 GetBytes(Int32, Int64, Byte[], Int32, Int32)	Reads a stream of bytes from the specified column into the buffer as an array, starting at the given buffer offset.(Overrides <a href="#">DbDataReader.GetBytes(Int32, Int64, Byte[], Int32, Int32)</a> .)
 GetChar(Int32)	Retrieves the character value of the specified column.(Overrides <a href="#">DbDataReader.GetChar(Int32)</a> .)

 <a href="#">GetChars(Int32, Int64, Char[], Int32, Int32)</a>	Reads a stream of characters from the specified column offset into the buffer as an array starting at the given offset.(Overrides <a href="#">DbDataReader.GetChars(Int32, Int64, Char[], Int32, Int32)</a> .)
 <a href="#">GetData(Int32)</a>	Retrieves the data value of the specified column.
 <a href="#">GetDataTypeName(Int32)</a>	Retrieves the data type name.(Overrides <a href="#">DbDataReader.GetDataTypeName(Int32)</a> .)
 <a href="#">GetDateTime(Int32)</a>	Retrieves the value of the specified column as a DateTime object.(Overrides <a href="#">DbDataReader.GetDateTime(Int32)</a> .)
 <a href="#">GetDbDataReader(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetDecimal(Int32)</a>	Retrieves the value of the specified column as a Decimal object.(Overrides <a href="#">DbDataReader.GetDecimal(Int32)</a> .)
 <a href="#">GetDouble(Int32)</a>	Retrieves the value of the specified column as a double precision floating point number.(Overrides <a href="#">DbDataReader.GetDouble(Int32)</a> .)
 <a href="#">GetFieldType(Int32)</a>	Retrieves the Type that is the data type of the specified column.(Overrides <a href="#">DbDataReader.GetFieldType(Int32)</a> .)
 <a href="#">GetFieldValue&lt;T&gt;(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFieldValueAsync&lt;T&gt;(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFieldValueAsync&lt;T&gt;(Int32, CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetFloat(Int32)</a>	Retrieves the value of the specified column as a single precision floating point number.(Overrides <a href="#">DbDataReader.GetFloat(Int32)</a> .)
 <a href="#">GetGuid(Int32)</a>	Retrieves the value of the specified column as a GUID unique identifier (GUID).(Overrides <a href="#">DbDataReader.GetGuid(Int32)</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetInt16(Int32)</a>	Retrieves the value of the specified column as a 16-bit signed integer.(Overrides <a href="#">DbDataReader.GetInt16(Int32)</a> .)
 <a href="#">GetInt32(Int32)</a>	Retrieves the value of the specified column as a 32-bit signed integer.(Overrides <a href="#">DbDataReader.GetInt32(Int32)</a> .)
 <a href="#">GetInt64(Int32)</a>	Retrieves the value of the specified column as a 64-bit signed integer.(Overrides <a href="#">DbDataReader.GetInt64(Int32)</a> .)
 <a href="#">GetLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">GetName(Int32)</a>	Retrieves the name of the specified column.(Overrides <a href="#">DbDataReader.GetName(Int32)</a> .)
 <a href="#">GetOrdinal(String)</a>	Retrieves the ordinal of the specified column.(Overrides <a href="#">DbDataReader.GetOrdinal(String)</a> .)
 <a href="#">GetRecordSet(Int32)</a>	Retrieves the recordset of the column.
 <a href="#">GetSchemaTable()</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetSchemaTable(String)</a>	Returns a DataTable that describes the column metadata of the updateable data record.
 <a href="#">GetStream(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetString(Int32)</a>	Retrieves the value of the column as a string.(Overrides <a href="#">DbDataReader.GetString(Int32)</a> .)
 <a href="#">GetTextReader(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetValue()</a>	Returns the value of the specified column.
 <a href="#">GetValue(Int32)</a>	Returns the value of the specified record.(Overrides <a href="#">DbDataReader.GetValue(Int32)</a> .)
 <a href="#">GetValue(Int32, DataRecordVersion)</a>	Returns the value of the column with the specified version.
 <a href="#">GetValues(Object[])</a>	Returns an array of objects with the column values of the current record.(Overrides <a href="#">DbDataReader.GetValues(Object[])</a> .)
 <a href="#">InitializeLifetimeService()</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">IsDBNull(Int32)</a>	Returns a value that indicates whether the column contains non-existent or missing values.(Overrides <a href="#">DbDataReader.IsDBNull(Int32)</a> .)
 <a href="#">IsDBNullAsync(Int32)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">IsDBNullAsync(Int32, CancellationToken)</a>	(Inherited from <a href="#">DbDataReader</a> .)
 <a href="#">LoadRow(DataRow, DataTableMappingCollection, DataColumnMappingCollection, SchemaType, MissingSchemaAction, MissingMappingAction)</a>	Loads the row of the specified record.
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">MemberwiseClone(Boolean)</a>	(Inherited from <a href="#">MarshalByRefObject</a> .)
 <a href="#">NextResult()</a>	(Inherited from <a href="#">DbDataReader</a> .)

 <a href="#">NextResultAsync()</a>	(Inherited from <a href="#">DbDataReader.</a> )
 <a href="#">NextResultAsync(CancellationToken)</a>	(Inherited from <a href="#">DbDataReader.</a> )
 <a href="#">Read()</a>	(Inherited from <a href="#">DbDataReader.</a> )
 <a href="#">ReadAsync()</a>	(Inherited from <a href="#">DbDataReader.</a> )
 <a href="#">ReadAsync(CancellationToken)</a>	(Inherited from <a href="#">DbDataReader.</a> )
 <a href="#">SetValue(Int32, Object)</a>	Specifies the value of the updateable data record u he specified index and value.
 <a href="#">SetValue(Object)</a>	Specifies the value of the updateable data record u he specified value.
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object.</a> )
 <a href="#">Update()</a>	Updates the specified data record.

Explicit Interface Implementations

	Name	Description
	<a href="#">IDataRecord.GetData(Int32)</a>	(Inherited from <a href="#">DbDataReader.</a> )

Thread Safety  
Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# UpdateableDataRecord Members

Represents an updatable data record.

The following tables list the members exposed by the [UpdateableDataRecord](#) type.

## Public Properties

	Name	Description
	<a href="#">Depth</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">FieldCount</a>	Overridden. Gets the number of columns in the current row.
	<a href="#">HasRows</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">IsClosed</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">Item</a>	Overloaded. Overridden. Gets the specified column.
	<a href="#">RecordsAffected</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">State</a>	Gets the state of the current instance.
	<a href="#">VisibleFieldCount</a>	(inherited from <a href="#">DbDataReader</a> )

## Top

## Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">AddNew</a>	Adds a new column to the current instance.
	<a href="#">Close</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">CreateObjRef</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">Delete</a>	Deletes the current instance.
	<a href="#">Dispose</a>	Overloaded. (inherited from <a href="#">DbDataReader</a> )
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">GetBoolean</a>	Overridden. Retrieves the value of the specified column as a Boolean.
	<a href="#">GetByte</a>	Overridden. Retrieves the 8-bit unsigned integer value of the specified column.
	<a href="#">GetBytes</a>	Overridden. Reads a stream of bytes from the specified column offset into the buffer as an array, starting at the given buffer offset.
	<a href="#">GetChar</a>	Overridden. Retrieves the character value of the specified column.
	<a href="#">GetChars</a>	Overridden. Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.
	<a href="#">GetData</a>	Retrieves the data value of the specified column.
	<a href="#">GetDataTypeName</a>	Overridden. Retrieves the data type name.
	<a href="#">GetDateTime</a>	Overridden. Retrieves the value of the specified column as a DateTime object.
	<a href="#">GetDecimal</a>	Overridden. Retrieves the value of the specified column as a Decimal object.
	<a href="#">GetDouble</a>	Overridden. Retrieves the value of the specified column as a double-precision floating point number.
	<a href="#">GetEnumerator</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">GetFieldType</a>	Overridden. Retrieves the Type that is the data type of the object.
	<a href="#">GetFloat</a>	Overridden. Retrieves the value of the specified column as a single-precision floating point number.
	<a href="#">GetGuid</a>	Overridden. Retrieves the value of the specified column as a globally unique identifier (GUID).
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetInt16</a>	Overridden. Retrieves the value of the specified column as a 16-bit signed integer.
	<a href="#">GetInt32</a>	Overridden. Retrieves the value of the specified column as a 32-bit signed integer.
	<a href="#">GetInt64</a>	Overridden. Retrieves the value of the specified column as a 64-bit signed integer.
	<a href="#">GetLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">GetName</a>	Overridden. Retrieves the name of the specified column.
	<a href="#">GetOrdinal</a>	Overridden. Retrieves the ordinal of the specified column.
	<a href="#">GetProviderSpecificFieldType</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">GetProviderSpecificValue</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">GetProviderSpecificValues</a>	(inherited from <a href="#">DbDataReader</a> )

	<a href="#">GetRecordSet</a>	Retrieves the recordset of the column.
	<a href="#">GetSchemaTable</a>	Overloaded.
	<a href="#">GetString</a>	Overridden. Retrieves the value of the column as a string.
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetValue</a>	Overloaded. Retrieves the value of the specified column.
	<a href="#">GetValues</a>	Overridden. Returns an array of objects with the column values of the current record.
	<a href="#">InitializeLifetimeService</a>	(inherited from <a href="#">MarshalByRefObject</a> )
	<a href="#">IsDBNull</a>	Overridden. Returns a value that indicates whether the column contains non-existent or missing values.
	<a href="#">NextResult</a>	(inherited from <a href="#">DbDataReader</a> )
	<a href="#">Read</a>	(inherited from <a href="#">DbDataReader</a> )
	 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">SetValue</a>	Overloaded. Specifies the value of the updateable data record.
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Update</a>	Updates the specified data record.

# UpdateableDataRecord.AddNew Method

Adds a new column to the current instance.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overridable Sub AddNew
```

C#

```
public virtual void AddNew ()
```

C++

```
public:  
virtual void AddNew ()
```

J#

```
public void AddNew ()
```

JScript

```
public function AddNew ()
```

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

# UpdateableDataRecord.Delete Method

Deletes the current instance.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overridable Sub Delete
```

C#

```
public virtual void Delete ()
```

C++

```
public:
virtual void Delete ()
```

J#

```
public void Delete ()
```

JScript

```
public function Delete ()
```

Remarks

Note that you cannot delete or update a FLAT file. This is because the DeleteCapable property is not returned to the provider, but instead goes directly to the host. Therefore, the provider has no way of knowing if delete operations are supported on the targeted files.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

    columnMappings : DataColumnMappingCollection,
    schemaType : SchemaType,
    schemaAction : MissingSchemaAction,
    mappingAction : MissingMappingAction
)
```

## Parameters

row

The row.

tableMappings

The table mappings.

columnMappings

The column mappings.

schemaType

The schema type.

schemaAction

The schema action.

mappingAction

The mapping action.

    DataTableMappingCollection tableMappings,
    SchemaType schemaType,
    MissingMappingAction mappingAction,
    /** @attribute OutAttribute() */ /** @ref */ DataColumnMappingCollection columnMappings
)
```

JScript

## Parameters

tableName

The name of the table.

tables

The tables.

dataSet

The data set.

tableMappings

The table mappings.

schemaType

The type of schema.

mappingAction

The mapping action.

columnMappings

The column mappings.

#### **Return Value**

The schema to fill.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

#### **Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# UpdateableDataRecord.GetBoolean Method

Retrieves the value of the specified column as a Boolean.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetBoolean ( _
    i As Integer _
) As Boolean
```

C#

```
public override bool GetBoolean (
    int i
)
```

C++

```
public:
virtual bool GetBoolean (
    int i
) override
```

J#

```
public boolean GetBoolean (
    int i
)
```

JScript

```
public override function GetBoolean (
    i : int
) : boolean
```

## Parameters

i

The zero-based column ordinal.

## Return Value

The value of the column.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

[UpdateableDataRecord Class](#)

[UpdateableDataRecord Members](#)

[Microsoft.HostIntegration.MsHostFileClient Namespace](#)

# UpdateableDataRecord.GetBytes Method

Reads a stream of bytes from the specified column offset into the buffer as an array, starting at the given buffer offset.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function GetBytes ( _
    i As Integer, _
    fieldOffset As Long, _
    buffer As Byte(), _
    bufferOffset As Integer, _
    length As Integer _
) As Long
```

C#

```
public override long GetBytes (
    int i,
    long fieldOffset,
    byte[] buffer,
    int bufferOffset,
    int length
)
```

C++

```
public:
virtual long long GetBytes (
    int i,
    long long fieldOffset,
    array<unsigned char>^ buffer,
    int bufferOffset,
    int length
) override
```

J#

```
public long GetBytes (
    int i,
    long fieldOffset,
    byte[] buffer,
    int bufferOffset,
    int length
)
```

JScript

```
public override function GetBytes (
    i : int,
    fieldOffset : long,
    buffer : byte[],
    bufferOffset : int,
    length : int
) : long
```

**Parameters**

i

The zero-based column ordinal.

fieldOffset

The index within the field from which to start the read operation.

buffer

The buffer into which to read the stream of bytes.

bufferOffset

The index for buffer to start the read operation.

length

The number of bytes to read.

#### **Return Value**

The actual number of bytes read.

#### **Remarks**

GetBytes returns the number of available bytes in the field. Frequently this is the exact length of the field. However, the number returned may be less than the true length of the field if GetBytes has already been used to obtain bytes from the field.

If you pass a buffer that is **null** reference (Nothing in Visual Basic), GetBytes returns the length of the row in bytes.

No conversions are performed; therefore the data retrieved must already be a byte array.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

#### **Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

) As Integer
```

C#

```
public override int GetOrdinal (
    string name
)
```

C++

```
public:
virtual int GetOrdinal (
    String^ name
) override
```

J#

```
public int GetOrdinal (
    String name
)
```

JScript

```
public override function GetOrdinal (
    name : String
) : int
```

## Parameters

name

The name of the column.

## Return Value

The ordinal of the specified column.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# UpdateableDataRecord.GetRecordSet Method

Retrieves the recordset of the column.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overridable Function GetRecordSet ( _
    index As Integer _
) As IDataRecordSet
```

C#

```
public virtual IDataRecordSet GetRecordSet (
    int index
)
```

C++

```
public:
virtual IDataRecordSet^ GetRecordSet (
    int index
)
```

J#

```
public IDataRecordSet GetRecordSet (
    int index
)
```

JScript

```
public function GetRecordSet (
    index : int
) : IDataRecordSet
```

## Parameters

index

The zero-based column ordinal.

## Return Value

The recordset of the column.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## UpdateableDataRecord.GetSchemaTable Method (String)

Returns a DataTable that describes the column metadata of the updateable data record.

Syntax

C#

```
protected virtual DataTable GetSchemaTable(  
    string tableName  
)
```

C++

```
protected:  
virtual DataTable^ GetSchemaTable(  
    String^ tableName  
)
```

F#

```
abstract GetSchemaTable :  
    tableName:string -> DataTable  
override GetSchemaTable :  
    tableName:string -> DataTable
```

VB

```
Protected Overridable Function GetSchemaTable (  
    tableName As String  
) As DataTable
```

## Parameters

*tableName*

Type: [System.String](#)

The name of the table.

## Return Value

Type: [System.Data.DataTable](#)

A DataTable that describes the column metadata.

[Return to top](#)

# UpdateableDataRecord.GetSchemaTable Method (String)

Returns a DataTable that describes the column metadata of the updateable data record.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overridable Function GetSchemaTable ( _
    tableName As String _
) As DataTable
```

C#

```
protected virtual DataTable GetSchemaTable (
    string tableName
)
```

C++

```
protected:
virtual DataTable^ GetSchemaTable (
    String^ tableName
)
```

J#

```
protected DataTable GetSchemaTable (
    String tableName
)
```

JScript

```
protected function GetSchemaTable (
    tableName : String
) : DataTable
```

## Parameters

tableName

The name of the table.

## Return Value

A DataTable that describes the column metadata.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# UpdateableDataRecord.Update Method

Updates the specified data record.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overridable Function Update As UpdateResult
```

C#

```
public virtual UpdateResult Update ()
```

C++

```
public:
virtual UpdateResult Update ()
```

J#

```
public UpdateResult Update ()
```

JScript

```
public function Update () : UpdateResult
```

## Return Value

The update result.

Remarks

Note that you cannot delete or update a FLAT file. This is because the DeleteCapable property is not returned to the provider, but instead goes directly to the host. Therefore, the provider has no way of knowing if delete operations are supported on the targeted files.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# UpdateableDataRecord.FieldCount Property

Gets the number of columns in the current row.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property FieldCount As Integer
```

C#

```
public override int FieldCount { get; }
```

C++

```
public:
virtual property int FieldCount {
    int get () override;
}
```

J#

```
/** @property */
public int get_FieldCount ()
```

JScript

```
public override function get FieldCount () : int
```

## Property Value

When not positioned in a valid recordset, 0; otherwise the number of columns in the current record. The default is -1.

Remarks

After executing a query that does not return rows (for example, using the ExecuteNonQuery method), FieldCount returns -1.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## UpdateableDataRecord.Item Property (Int32)

Gets the column located at the specified index.

Syntax

C#

```
public override object this[
    int index
] { get; }
```

C++

```
public:
property Object^ default[
    int index
] {
    virtual Object^ get(int index) override;
}
```

F#

```
override Item :
    index:int -> Object with get
```

VB

```
Public Overrides ReadOnly Property Item (
    index As Integer
) As Object
```

## Parameters

*index*

Type: [System.Int32](#)

The index of the column to get.

## Property Value

Type: [System.Object](#)

The column located at the specified index as an Object.

## Implements

[IDataRecord.Item\(Int32\)](#) [IDataRecord.Item\(Int32\)](#)

[Return to top](#)

### UpdateableDataRecord.Item Property (Int32, DataRecordVersion)

Gets the column with the specified index and version.

Syntax

C#

```
public virtual object this[
    int index,
    DataRecordVersion version
] { get; }
```

C++

```
public:
property Object^ default[
    int index,
    DataRecordVersion version
] {
    virtual Object^ get(int index, DataRecordVersion version);
}
```

F#

```
abstract Item :
    index:int *
    version:DataRecordVersion -> Object with get
override Item :
    index:int *
    version:DataRecordVersion -> Object with get
```

VB

```
Public Overridable ReadOnly Property Item (
    index As Integer,
    version As DataRecordVersion
) As Object
```

#### Parameters

*index*

Type: [System.Int32](#)

The index of the column to get.

*version*

Type: [Microsoft.HostIntegration.MsHostFileClient.DataRecordVersion](#)

The version of the column to get.

#### Property Value

Type: [System.Object](#)

The column with the specified index and version.

[Return to top](#)

### UpdateableDataRecord.Item Property (String)

Gets the column with the specified name.

Syntax

C#

```
public override object this[
    string name
] { get; }
```

C++

```
public:
property Object^ default[
```

```
String^ name
] {
    virtual Object^ get(String^ name) override;
}
```

F#

```
override Item :
    name:string -> Object with get
```

VB

```
Public Overrides ReadOnly Property Item (
    name As String
) As Object
```

## Parameters

*name*

Type: [System.String](#)

The name of the column to find.

## Property Value

Type: [System.Object](#)

The column with the specified name as an Object.

## Implements

[IDataRecord.Item\(String\)](#) [IDataRecord.Item\(String\)](#)

Remarks

A case-sensitive lookup is performed first. If it fails, a second case-insensitive search is made.

[Return to top](#)

## UpdateableDataRecord.Item Property (String, DataRecordVersion)

Gets the column with the specified name and version.

Syntax

C#

```
public virtual object this[
    string name,
    DataRecordVersion version
] { get; }
```

C++

```
public:
property Object^ default[
    String^ name,
    DataRecordVersion version
] {
    virtual Object^ get(String^ name, DataRecordVersion version);
}
```

F#

```
abstract Item :
    name:string *
    version:DataRecordVersion -> Object with get
override Item :
    name:string *
    version:DataRecordVersion -> Object with get
```

VB

```
Public Overridable ReadOnly Property Item (
    name As String,
    version As DataRecordVersion
```

) [As Object](#)

#### Parameters

##### *Name*

The name of the column to get.

##### *version*

Type: [Microsoft.HostIntegration.MsHostFileClient.DataRecordVersion](#)

The version of the column to get.

#### Property Value

Type: [System.Object](#)

The column with the specified name and version.

[Return to top](#)

# UpdateableDataRecord.Item Property (Int32)

Gets the column located at the specified index.

**Namespace:** Microsoft.HostIntegration.MsHostFileClient

**Assembly:** Microsoft.HostIntegration.MsHostFileClient (in microsoft.hostintegration.mshostfileclient.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Default Property Item ( _
    index As Integer _
) As Object
```

C#

```
public override Object this [
    int index
] { get; }
```

C++

```
public:
virtual property Object^ default [int] {
    Object^ get (int index) override;
}
```

J#

```
/** @property */
public Object get_Item (int index)
```

JScript

## Parameters

index

The index of the column to get.

## Property Value

The column located at the specified index as an Object.

# Microsoft.HostIntegration.SNA.Session Namespace

Contains the Session Integrator interface, which allows programmatic access to LU0 and LU2 protocols.

## Classes

Class	Description
 <a href="#">EBCDICEncoding</a>	Assists in encoding strings into the EBCDIC format.
 <a href="#">FunctionManagementHeader</a>	Represents a single function management header.
 <a href="#">HostConverter</a>	Provides a wrapper for the string conversion methods in the EBCDICEncoding class.
 <a href="#">ScreenCursor</a>	Provides access to the cursor on the terminal screen.
 <a href="#">ScreenData</a>	Grants access to a specified area of the raw 3270 data representation.
 <a href="#">ScreenField</a>	Grants access to a particular area of the LU2 screen, including the data and attributes.
 <a href="#">ScreenFieldAttributeData</a>	Provides all of the attributes about the ScreenField data.
 <a href="#">ScreenFieldCollection</a>	Contains a collection of ScreenField instances.
 <a href="#">ScreenFieldIndividualAttributeData</a>	Describes the attribute data of a single field.
 <a href="#">ScreenPartialField</a>	Provides access to a part of a screen field.
 <a href="#">ScreenPartialFieldCollection</a>	Contains a collection of ScreenPartialFields instances.
 <a href="#">ScreenPosition</a>	Provides access to a position on the LU2 screen as a 1-based row and column position.
 <a href="#">SessionConnection</a>	SessionConnection is an abstract connection inherited by SessionConnectionLU0 and SessionConnectionDisplay.
 <a href="#">SessionConnectionDisplay</a>	Provides the connection interface for the session display.
 <a href="#">SessionConnectionLU0</a>	Connects to a LU0 session.
 <a href="#">SessionDisplay</a>	Represents a virtual 3270 screen.
 <a href="#">SessionDisplayScript</a>	Programmatically accesses scripts created for the Microsoft Host Integration Server 3270 client.
 <a href="#">SessionDisplayVariableCollection</a>	Provides variables you can use in Session Integrator scripts.
 <a href="#">SessionException</a>	Represents a session exception.
 <a href="#">SessionLU0</a>	Represents a programmable SNA Session to a mainframe.
 <a href="#">SessionLU0Data</a>	Provides access to data being sent and received on an active LU0 session.

## Enumerations

Enumeration	Description
 <a href="#">FunctionManagementHeaderType</a>	Describes the type of function management header (FMH) associated with a given set of data.
 <a href="#">FunctionManagementProfile</a>	Represents the function management profiles supported by Session Integrator.
 <a href="#">ImplementationDetail</a>	Enumerates an implementation details.
 <a href="#">InvalidCharacterAction</a>	Enumerates the action for invalid character.
 <a href="#">ScreenFieldAttribute</a>	Describes the attributes of a field.

 <a href="#">ScreenFieldColor</a>	Contains the possible screen colors returned in the 3270 data stream.
 <a href="#">ScreenFieldHighlighting</a>	Contains the possible screen highlighting values returned in the 3270 data stream.
 <a href="#">SessionDisplayKeys</a>	Describes the session display keys.
 <a href="#">SessionDisplayTransport</a>	Contains the possible transport values for establishing a SessionDisplayConnection.
 <a href="#">SessionDisplayWaitType</a>	Contains the possible wait types that can be used when calling the wait functions.
 <a href="#">SessionLU0InitType</a>	Represents the session initialization type.
 <a href="#">SessionLU0ReceiveIndication</a>	Represents the current state of a session associated with a receive call.
 <a href="#">SessionLU0SendIndication</a>	Contains values used by the Send method of SessionLU0.
 <a href="#">SessionStatus</a>	Displays the status message of a Session Integrator session.
 <a href="#">TNCertificateCheck</a>	Represents the TN Certificate Check.
 <a href="#">TNDeviceType</a>	Describes the TN device types.
 <a href="#">TNSecurity</a>	Represents the TN Security.
 <a href="#">TransmissionServicesProfile</a>	Describes the transmission services profiles supported by Session Integrator.

[Return to top](#)

# EBCDICEncoding Class

Assists in encoding strings into the EBCDIC format.

**Namespace:** [Microsoft.HostIntegration.SNA.Session](#)  
**Assembly:** Microsoft.HostIntegration.SNA.Session (in Microsoft.HostIntegration.SNA.Session.dll)

Inheritance Hierarchy [System.Object](#)  
**Microsoft.HostIntegration.SNA.Session.EBCDICEncoding**

Syntax  
C#

```
[SerializableAttribute]
public class EBCDICEncoding
```

C++

```
[SerializableAttribute]
public ref class EBCDICEncoding
```

F#

```
[<SerializableAttribute>]
type EBCDICEncoding = class end
```

VB

```
<SerializableAttribute>
Public Class EBCDICEncoding
```

Constructors

	Name	Description
	<a href="#">EBCDICEncoding()</a>	Creates a new instance of the <b>EBCDICEncoding</b> class.
	<a href="#">EBCDICEncoding(Int32)</a>	Creates a new instance of the <b>EBCDICEncoding</b> class using the specified codepage.

Methods

	Name	Description
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetBytes(String)</a>	Converts a Unicode string to EBCDIC, returning a byte array.
	<a href="#">GetCodePage()</a>	Returns the code page of the current object.
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetString(Byte[])</a>	Gets the string described in the specified array.
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">SetCodePage(Int32)</a>	Sets the code page of the current object.
	<a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)
	 <a href="#">ValidateCodePage(Int32)</a>	Validates the specified code page.

Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# EBCDICEncoding.GetByteCount Method

Gets the byte count of the specified character string.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
<ObsoleteAttribute("Was needed for Obsolete overload of GetBytes")> _
Public Function GetByteCount ( _
    characters As String _
) As Integer
```

C#

```
[ObsoleteAttribute("Was needed for Obsolete overload of GetBytes")]
public int GetByteCount (
    string characters
)
```

C++

```
[ObsoleteAttribute(L"Was needed for Obsolete overload of GetBytes")]
public:
int GetByteCount (
    String^ characters
)
```

J#

```
/** @attribute ObsoleteAttribute("Was needed for Obsolete overload of GetBytes") */
public int GetByteCount (
    String characters
)
```

JScript

```
ObsoleteAttribute("Was needed for Obsolete overload of GetBytes")
public function GetByteCount (
    characters : String
) : int
```

## Parameters

characters

The string to find the byte count for.

## Return Value

The byte count of the specified character string.

Remarks

This method is obsolete.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

Public Enumeration FunctionManagementHeaderType
```

Members

Member name	Description
<b>FMH0</b>	Function Management Header type 0.
<b>FMH1</b>	Function Management Header type 1. Selects a destination with a logical unit (LU).
<b>FMH2</b>	Function Management Header type 2. Used after an FMH1 to handle data management tasks for the destination.
<b>FMH3</b>	Function Management Header type 3. Handles LU-LU session data management tasks that are common to all destinations.
<b>FMH4</b>	Function Management Header type 4. Carries information about the logical block command contained within a logical message for the Logical Message Service.
<b>FMH61</b>	Function Management Header type 6.1
<b>FMH62</b>	Function Management Header type 6.2.
<b>FMH7</b>	Function Management Header type 7.

Remarks  
61/62/7 are related to APPC, and are not expected to be used in the LU0 programming of SI. The are included for completeness.

	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

Remarks

This class replaces the HostStringConverter class, which has been deprecated. The HostConverter conversion routines are no longer static, which was a problem with HostStringConverter because all threads shared one code page.

Null in output strings are converted to blanks.

Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# HostConverter.ConvertEbcDicToUnicode Method

Converts the specified EBCDIC string to Unicode.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function ConvertEbcDicToUnicode ( _
    ebcDicData As Byte() _
) As String
```

C#

```
public string ConvertEbcDicToUnicode (
    byte[] ebcDicData
)
```

C++

```
public:
String^ ConvertEbcDicToUnicode (
    array<unsigned char>^ ebcDicData
)
```

J#

```
public String ConvertEbcDicToUnicode (
    byte[] ebcDicData
)
```

JScript

```
public function ConvertEbcDicToUnicode (
    ebcDicData : byte[]
) : String
```

## Parameters

ebcDicData

The string to convert.

## Return Value

The converted EBCDIC string

Remarks

Nulls in the output strings are replaced by blanks.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# ScreenCursor Class

Provides access to the cursor on the terminal screen.

**Namespace:** [Microsoft.HostIntegration.SNA.Session](#)  
**Assembly:** Microsoft.HostIntegration.SNA.Session (in Microsoft.HostIntegration.SNA.Session.dll)

Inheritance Hierarchy [System.Object](#)  
**Microsoft.HostIntegration.SNA.Session.ScreenCursor**

Syntax  
C#

```
public class ScreenCursor
```

C++

```
public ref class ScreenCursor
```

F#

```
type ScreenCursor = class end
```

VB

```
Public Class ScreenCursor
```

Properties

	Name	Description
	<a href="#">Column</a>	Gets or sets the cursor column position.
	<a href="#">Row</a>	Gets or sets the cursor row position.

Methods

	Name	Description
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">ToString()</a>	Translates the current instance to a string.(Overrides <a href="#">Object.ToString()</a> .)

Remarks

ScreenCursor is a reference to the actual terminal cursor, and is always associated with the cursor. Changes to the row and column values will show up in ScreenCursor, regardless of which screen the cursor is pointing to.

The only way to retrieve an instance of ScreenCursor is to request an instance from the Screen.

Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# ScreenData.ToString Method

Translates the screen data to a string.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Function ToString As String
```

C#

```
public override string ToString ()
```

C++

```
public:  
virtual String^ ToString () override
```

J#

```
public String ToString ()
```

JScript

```
public override function ToString () : String
```

## Return Value

A string containing the string data.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# ScreenData.Column Property

Gets the column where the data begins.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public ReadOnly Property Column As Short
```

C#

```
public short Column { get; }
```

C++

```
public:  
property short Column {  
    short get ();  
}
```

J#

```
/** @property */  
public short get_Column ()
```

JScript

```
public function get Column () : short
```

## Property Value

The column where the data begins.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenData.Data Property

Gets or sets the raw screen data bytes.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Data As Byte()
```

C#

```
public byte[] Data { get; set; }
```

C++

```
public:
property array<unsigned char>^ Data {
    array<unsigned char>^ get ();
    void set (array<unsigned char>^ value);
}
```

J#

```
/** @property */
public byte[] get_Data ()

/** @property */
public void set_Data (byte[] value)
```

JScript

```
public function get Data () : byte[]

public function set Data (value : byte[])
```

## Property Value

The data retrieved is not translated from the Host Code Page to Unicode.

The screen may change between the times that you get Data and when you set Data. If the screen has changed during this interval, an exception will be thrown when you attempt to set Data.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenData.ExtendedAttributes Property

Gets the 3270 extended attribute information about the screen.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property ExtendedAttributes As Byte()
```

C#

```
public byte[] ExtendedAttributes { get; }
```

C++

```
public:
property array<unsigned char>^ ExtendedAttributes {
    array<unsigned char>^ get ();
}
```

J#

```
/** @property */
public byte[] get_ExtendedAttributes ()
```

JScript

```
public function get ExtendedAttributes () : byte[]
```

## Property Value

The COM3270 extended attribute information about the screen.

Remarks

ExtendedAttributes contains all of the extended attributes for all of the fields and each character position individually corresponding to the bytes in Data.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

```
type ScreenField = class end
```

VB

```
Public Class ScreenField
```

Constructors

Name	Description
 <a href="#">ScreenField(Int16, Int16)</a>	Creates a new instance of the ScreenField class, using the specified row and column position.
 <a href="#">ScreenField(ScreenPosition)</a>	Creates a new instance of the ScreenField class, using the specified field position.
 <a href="#">ScreenField(String, Int16, Int16)</a>	Creates a new instance of the ScreenField class, using the specified data string, row position, and column position.
 <a href="#">ScreenField(String, ScreenPosition)</a>	Creates a new instance of the ScreenField class, using the specified data string and field position.

Properties

Name	Description
 <a href="#">Attributes</a>	Gets the attribute information of the field.
 <a href="#">Column</a>	Gets a 1-based column value that describes the field starts.
 <a href="#">Data</a>	Gets or sets the screen data characters contained in the field.
 <a href="#">IsSnapshot</a>	Gets whether the screen field is a snapshot.
 <a href="#">IsValid</a>	Gets whether the screen field is valid.
 <a href="#">Item(Int16)</a>	Describes an item from a screen field.
 <a href="#">Item(Int16, Int16)</a>	Describes an item from a screen field.
 <a href="#">Length</a>	Gets the length of the field.
 <a href="#">Next</a>	Gets the next field.
 <a href="#">Position</a>	Gets the current screen position.

 Previous	Gets the previous field.
 Row	Gets the row of the current field.
 Screen	Retrieves the screen.
 Snapshot	Retrieves a snapshot of the current screen field.

#### Methods

	Name	Description
	Add(Int32)	Starts the cursor on the specified field and moves forward the specified number of fields.
	Compare(ScreenField, ScreenField)	Compares two specified ScreenField objects and returns an integer that indicates their relationship to one another in the sort order.
	CompareTo(ScreenField)	Compares this instance with a specified ScreenField and returns an integer that indicates whether this instance precedes, follows, or appears in the same position in the sort order as the specified ScreenField.
	Decrement()	Starts the cursor on the specified field and moves back one.
	Equals(Object)	Determines if the current instance is equal to the specified object.(Overrides <a href="#">Object.Equals(Object).</a> )
	Equals(ScreenField)	Determines if the current instance is equal to the specified object.
	Equals(ScreenField, ScreenField)	Determines if the current instance is equal to the specified object with specified sides.
	Finalize()	(Inherited from <a href="#">Object.</a> )
	GetHashCode()	Retrieves the hash code for the current instance.(Overrides <a href="#">Object.GetHashCode().</a> )
	GetType()	(Inherited from <a href="#">Object.</a> )
	Increment()	Starts the cursor on the specified field and moves forward by one.
	MemberwiseClone()	(Inherited from <a href="#">Object.</a> )
	Subtract(Int32)	Starts the cursor on the specified field and moves back the specified number of fields.
	ToString()	Translates the current instance to a string.(Overrides <a href="#">Object.ToString().</a> )

#### Operators

	Name	Description
	Addition(ScreenField, Int32)	Starts the cursor at the specified field and moves forward the specified number.
	Decrement(ScreenField)	Starts the cursor on the specified field and moves back one.
	Equality(ScreenField, ScreenField)	Determines if the specified fields are equal.
	GreaterThan(ScreenField, ScreenField)	Determines if the first specified field is greater than the second specified field.
	GreaterThanOrEqual(ScreenField, ScreenField)	Determines if the first specified field is greater than or equal to the second field.
	Increment(ScreenField)	Starts the cursor on the specified field and moves forward by one.
	Inequality(ScreenField, ScreenField)	Determines if the specified fields are unequal.
	LessThan(ScreenField, ScreenField)	Determines if the first specified field is less than the second field.

	<a href="#">LessThanOrEqual(ScreenField, ScreenField)</a>	Determines if the first specified field is less than or equal to the second field.
	<a href="#">Subtraction(ScreenField, Int32)</a>	Starts the cursor on the specified field and moves back the specified number of fields.

#### Remarks

The constructors create partial fields which are detached from a screen, thus they are never valid. They are used in searching or waiting, as they define the position and content of partial fields that are found on an actual screen.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## Public Properties

Name	Description
 <a href="#">Attributes</a>	Gets the attribute information of the field.
 <a href="#">Column</a>	Gets a 1-based column value that describes the field starts.
 <a href="#">Data</a>	Gets or sets the screen data characters contained in the field.
 <a href="#">IsSnapshot</a>	Gets whether the screen field is a snapshot.
 <a href="#">IsValid</a>	Gets whether the screen field is valid.
 <a href="#">Item</a>	Overloaded. Describes an item from a screen field.
 <a href="#">Length</a>	Gets the length of the field.
 <a href="#">Next</a>	Gets the next field.
 <a href="#">Position</a>	Gets the current screen position.
 <a href="#">Previous</a>	Gets the previous field.
 <a href="#">Row</a>	Gets the row of the current field.
 <a href="#">Screen</a>	Retrieves the screen.
 <a href="#">Snapshot</a>	Retrieves a snapshot of the current screen field.

[Top](#)

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Add</a>	Starts the cursor on the specified field and moves forward the specified number of fields.
 <a href="#">Compare</a>	Compares two specified ScreenField objects and returns an integer that indicates their relationship to one another in the sort order.
 <a href="#">CompareTo</a>	Compares this instance with a specified ScreenField and returns an integer that indicates whether this instance precedes, follows, or appears in the same position in the sort order as the specified ScreenField.
 <a href="#">Decrement</a>	Starts the cursor on the specified field and moves back one.
 <a href="#">Equals</a>	Overloaded. Overridden. Determines if the current instance is equal to the specified object.
 <a href="#">GetHashCode</a>	Overridden. Retrieves the hash code for the current instance.
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">Increment</a>	Starts the cursor on the specified field and moves forward by one.
 <a href="#">op_Addition</a>	Starts the cursor at the specified field and moves forward the specified number.
 <a href="#">op_Decrement</a>	Starts the cursor on the specified field and moves back one.
 <a href="#">op_Equality</a>	Determines if the specified fields are equal.
 <a href="#">op_GreaterThan</a>	Determines if the first specified field is greater than the second specified field.
 <a href="#">op_GreaterThanOrEqual</a>	Determines if the first specified field is greater than or equal to the second field.
 <a href="#">op_Increment</a>	Starts the cursor on the specified field and moves forward by one.
 <a href="#">op_Inequality</a>	Determines if the specified fields are unequal.
 <a href="#">op_LessThan</a>	Determines if the first specified field is less than the second field.
 <a href="#">op_LessThanOrEqual</a>	Determines if the first specified field is less than or equal to the second field.
 <a href="#">op_Subtraction</a>	Starts the cursor on the specified field and moves back the specified number of fields.
 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">Subtract</a>	Starts the cursor on the specified field and moves back the specified number of fields.
 <a href="#">ToString</a>	Overridden. Translates the current instance to a string.

[Return to top](#)  
**ScreenField Constructor (Int16, Int16)**  
Creates a new instance of the ScreenField class, using the specified row and column position.

### Syntax

```
C#  
  
public ScreenField(  
    short row,  
    short column  
)
```

```
C++  
  
public:  
ScreenField(  
    short row,  
    short column  
)
```

```
F#  
  
new :  
    row:int16 *  
    column:int16 -> ScreenField
```

```
VB  
  
Public Sub New (  
    row As Short,  
    column As Short  
)
```

**Parameters**  
*row*  
Type: [System.Int16](#)  
A 1-based value describing where the row starts.  
  
*column*

Type: [System.Int16](#)

A 1-based value describing where the column starts.

[Return to top](#)

#### ScreenField Constructor (ScreenPosition)

Creates a new instance of the ScreenField class, using the specified field position.

Syntax

C#

```
public ScreenField(  
    ScreenPosition position  
)
```

C++

```
public:  
ScreenField(  
    ScreenPosition^ position  
)
```

F#

```
new :  
    position:ScreenPosition -> ScreenField
```

VB

```
Public Sub New (  
    position As ScreenPosition  
)
```

#### Parameters

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position of the start of the field.

[Return to top](#)

#### ScreenField Constructor (String, Int16, Int16)

Creates a new instance of the ScreenField class, using the specified data string, row position, and column position.

Syntax

C#

```
public ScreenField(  
    string data,  
    short row,  
    short column  
)
```

C++

```
public:  
ScreenField(  
    String^ data,  
    short row,  
    short column  
)
```

F#

```
new :  
    data:string *  
    row:int16 *  
    column:int16 -> ScreenField
```

VB

```
Public Sub New (  
    data As String,  
    row As Short,  
    column As Short  
)
```

#### Parameters

*data*

Type: [System.String](#)

A string of text used in the Data portion of the screen field.

*row*

Type: [System.Int16](#)

A 1-based value describing where the row starts.

*column*

Type: [System.Int16](#)

A 1-based value describing where the column starts.

[Return to top](#)

#### ScreenField Constructor (String, ScreenPosition)

Creates a new instance of the ScreenField class, using the specified data string and field position.

Syntax

C#

```
public ScreenField(  
    string data,  
    ScreenPosition position  
)
```

C++

```
public:  
ScreenField(  
    String^ data,  
    ScreenPosition^ position  
)
```

F#

```
new :  
    data:string *  
    position:ScreenPosition -> ScreenField
```

VB

```
Public Sub New (  
    data As String,  
    position As ScreenPosition  
)
```

#### Parameters

*data*

Type: [System.String](#)

A string of text used in the Data portion of the screen field.

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position of the start of the field.

[Return to top](#)

# ScreenField Constructor (ScreenPosition)

Creates a new instance of the ScreenField class, using the specified field position.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    position As ScreenPosition _
)
```

C#

```
public ScreenField (
    ScreenPosition position
)
```

C++

```
public:
    ScreenField (
        ScreenPosition^ position
    )
```

J#

```
public ScreenField (
    ScreenPosition position
)
```

JScript

```
public function ScreenField (
    position : ScreenPosition
)
```

## Parameters

position

The position of the start of the field.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenField Constructor (String, ScreenPosition)

Creates a new instance of the ScreenField class, using the specified data string and field position.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    data As String, _
    position As ScreenPosition _
)
```

C#

```
public ScreenField (
    string data,
    ScreenPosition position
)
```

C++

```
public:
ScreenField (
    String^ data,
    ScreenPosition^ position
)
```

J#

```
public ScreenField (
    String data,
    ScreenPosition position
)
```

JScript

```
public function ScreenField (
    data : String,
    position : ScreenPosition
)
```

## Parameters

data

A string of text used in the Data portion of the screen field.

position

The position of the start of the field.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# ScreenField Constructor (String, Int16, Int16)

Creates a new instance of the ScreenField class, using the specified data string, row position, and column position.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    data As String, _
    row As Short, _
    column As Short _
)
```

C#

```
public ScreenField (
    string data,
    short row,
    short column
)
```

C++

```
public:
ScreenField (
    String^ data,
    short row,
    short column
)
```

J#

```
public ScreenField (
    String data,
    short row,
    short column
)
```

JScript

```
public function ScreenField (
    data : String,
    row : short,
    column : short
)
```

## Parameters

data

A string of text used in the Data portion of the screen field.

row

A 1-based value describing where the row starts.

column

A 1-based value describing where the column starts.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenField Methods

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Add</a>	Starts the cursor on the specified field and moves forward the specified number of fields.
	<a href="#">Compare</a>	Compares two specified ScreenField objects and returns an integer that indicates their relationship to one another in the sort order.
	<a href="#">CompareTo</a>	Compares this instance with a specified ScreenField and returns an integer that indicates whether this instance precedes, follows, or appears in the same position in the sort order as the specified ScreenField.
	<a href="#">Decrement</a>	Starts the cursor on the specified field and moves back one.
	<a href="#">Equals</a>	Overloaded. Overridden. Determines if the current instance is equal to the specified object.
	<a href="#">GetHashCode</a>	Overridden. Retrieves the hash code for the current instance.
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Increment</a>	Starts the cursor on the specified field and moves forward by one.
	<a href="#">op_Addition</a>	Starts the cursor at the specified field and moves forward the specified number.
	<a href="#">op_Decrement</a>	Starts the cursor on the specified field and moves back one.
	<a href="#">op_Equality</a>	Determines if the specified fields are equal.
	<a href="#">op_GreaterThan</a>	Determines if the first specified field is greater than the second specified field.
	<a href="#">op_GreaterThanOrEqual</a>	Determines if the first specified field is greater than or equal to the second field.
	<a href="#">op_Increment</a>	Starts the cursor on the specified field and moves forward by one.
	<a href="#">op_Inequality</a>	Determines if the specified fields are unequal.
	<a href="#">op_LessThan</a>	Determines if the first specified field is less than the second field.
	<a href="#">op_LessThanOrEqual</a>	Determines if the first specified field is less than or equal to the second field.
	<a href="#">op_Subtraction</a>	Starts the cursor on the specified field and moves back the specified number of fields.
	<a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Subtract</a>	Starts the cursor on the specified field and moves back the specified number of fields.
	<a href="#">ToString</a>	Overridden. Translates the current instance to a string.

Protected Methods

	Name	Description
	<a href="#">Finalize</a>	(inherited from <a href="#">Object</a> )

# ScreenField.Add Method

Starts the cursor on the specified field and moves forward the specified number of fields.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function Add ( _
    numberToMove As Integer _
) As ScreenField
```

C#

```
public ScreenField Add (
    int numberToMove
)
```

C++

```
public:
ScreenField^ Add (
    int numberToMove
)
```

J#

```
public ScreenField Add (
    int numberToMove
)
```

JScript

```
public function Add (
    numberToMove : int
) : ScreenField
```

## Parameters

numberToMove

The field to move.

## Return Value

The screen object to be added.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenField.op\_Inequality Method

Determines if the specified fields are unequal.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Operator <> ( _
    leftHandSide As ScreenField, _
    rightHandSide As ScreenField _
) As Boolean
```

C#

```
public static bool operator != (
    ScreenField leftHandSide,
    ScreenField rightHandSide
)
```

C++

```
public:
static bool operator != (
    ScreenField^ leftHandSide,
    ScreenField^ rightHandSide
)
```

J#

JScript

## Parameters

leftHandSide

The first field to compare.

rightHandSide

The second field to compare.

## Return Value

true if the fields are unequal; otherwise, false.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

# ScreenField.Column Property

Gets a 1-based column value that describes the field starts.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property Column As Short
```

C#

```
public short Column { get; }
```

C++

```
public:
property short Column {
    short get ();
}
```

J#

```
/** @property */
public short get_Column ()
```

JScript

```
public function get Column () : short
```

## Property Value

A 1-based column value that describes the field starts.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenField.Data Property

Gets or sets the screen data characters contained in the field.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Data As String
```

C#

```
public string Data { get; set; }
```

C++

```
public:
property String^ Data {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_Data ()

/** @property */
public void set_Data (String value)
```

JScript

```
public function get Data () : String

public function set Data (value : String)
```

## Property Value

The screen data characters contained in the field.

Remarks

The field associated with the current instance may be updated outside of your application. Therefore, you may receive an error if you attempt to overwrite the updated information.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# ScreenField.IsSnapshot Property

Gets whether the screen field is a snapshot.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property IsSnapshot As Boolean
```

C#

```
public bool IsSnapshot { get; }
```

C++

```
public:
property bool IsSnapshot {
    bool get ();
}
```

J#

```
/** @property */
public boolean get_IsSnapshot ()
```

JScript

```
public function get IsSnapshot () : boolean
```

## Property Value

**True** if the screen field is a snapshot; otherwise, **false**.

Remarks

True only if the Snapshot property has been used on another field. If a field is a Snapshot, you cannot change its data.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# ScreenField.IsValid Property

Gets whether the screen field is valid.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property IsValid As Boolean
```

C#

```
public bool IsValid { get; }
```

C++

```
public:
property bool IsValid {
    bool get ();
}
```

J#

```
/** @property */
public boolean get_IsValid ()
```

JScript

```
public function get IsValid () : boolean
```

## Property Value

**True** if the screen field is valid; otherwise, **false**.

Remarks

Whenever the screen updates, which occurs when the host sends data, any field which was extracted from the screen will become invalid. For example:

```
ScreenField f = sessionDisplay.GetField(1,1)
```

```
sessionDisplay.SendKey ("@E")
```

```
sessionDisplay.Wait(...).
```

At this point, f.IsValid is false.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

```
member Item :
    offset:int16 -> ScreenPartialField with get
```

VB

```
Public ReadOnly Property Item (
    offset As Short
) As ScreenPartialField
```

**Parameters**  
*offset*  
Type: [System.Int16](#)  
The offset of the current item.

**Property Value**  
Type: [Microsoft.HostIntegration.SNA.Session.ScreenPartialField](#)  
The item from a screen field.

[Return to top](#)

**ScreenField.Item Property (Int16, Int16)**  
Describes an item from a screen field.

## Syntax

### C#

```
public ScreenPartialField this[
    short offset,
    short length
] { get; }
```

### C++

```
public:
property ScreenPartialField^ default[
    short offset,
    short length
] {
    ScreenPartialField^ get(short offset, short length);
}
```

### F#

```
member Item :
    offset:int16 *
    length:int16 -> ScreenPartialField with get
```

### VB

```
Public ReadOnly Property Item (
    offset As Short,
    length As Short
) As ScreenPartialField
```

## Parameters

### *offset*

Type: [System.Int16](#)

The offset of the item.

### *length*

Type: [System.Int16](#)

The length of the item.

## Property Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPartialField](#)

The item from a screen field.

[Return to top](#)

# ScreenField.Item Property (Int16)

Describes an item from a screen field.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Default Property Item ( _
    offset As Short _
) As ScreenPartialField
```

C#

```
public ScreenPartialField this [
    short offset
] { get; }
```

C++

# ScreenField.Snapshot Property

Retrieves a snapshot of the current screen field.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property Snapshot As ScreenField
```

C#

```
public ScreenField Snapshot { get; }
```

C++

```
public:
property ScreenField^ Snapshot {
    ScreenField^ get ();
}
```

J#

```
/** @property */
public ScreenField get_Snapshot ()
```

JScript

```
public function get Snapshot () : ScreenField
```

## Property Value

A snapshot of the current screen field.

Remarks

It is the NEW field which has the IsSnapshot property set to true.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

See Also

## Reference

[ScreenField Class](#)

[Microsoft.HostIntegration.SNA.Session Namespace](#)

# ScreenFieldAttribute Enumeration

Describes the attributes of a field.

**Namespace:** [Microsoft.HostIntegration.SNA.Session](#)  
**Assembly:** Microsoft.HostIntegration.SNA.Session (in Microsoft.HostIntegration.SNA.Session.dll)

Syntax  
C#

```
[FlagsAttribute]
public enum ScreenFieldAttribute
```

C++

```
[FlagsAttribute]
public enum class ScreenFieldAttribute
```

F#

```
[<FlagsAttribute>]
type ScreenFieldAttribute
```

VB

```
<FlagsAttribute>
Public Enumeration ScreenFieldAttribute
```

## Members

Member name	Description
<b>AutoSkip</b>	The field color is an Autoskip field.
<b>Bright</b>	The Field color is bright and detectable by light pen.
<b>DisplayPen</b>	The Field is a normal display, and detectable by light pen.
<b>Modified</b>	The field has been modified.
<b>NonDisplay</b>	The field is non-display, and not detectable by light pen.
<b>Normal</b>	The field is normal.
<b>Numeric</b>	The field is a numeric input only field.
<b>Protected</b>	The field is protected.

## Remarks

Provides methods to access a collection of short descriptions such as SKIP, DARK or PROT, NUM, BRT that are combined with information about the color and highlighting.

F#

```
type ScreenFieldAttributeData = class end
```

VB

```
Public Class ScreenFieldAttributeData
```

Constructors

Name	Description
 <a href="#">ScreenFieldAttributeData(ScreenFieldAttribute)</a>	Creates a new instance of the <b>ScreenFieldAttributeData</b> class using the specified attributes.
 <a href="#">ScreenFieldAttributeData(ScreenFieldAttribute, ScreenFieldColor, ScreenFieldHighlighting)</a>	Creates a new instance of the <b>ScreenFieldAttributeData</b> class using the specified attributes, color, and highlighting.

Properties

Name	Description
 <a href="#">Alphanumeric</a>	Gets a value that describes if the field is alphanumeric or numeric.
 <a href="#">AutoSkip</a>	Gets a value that determines whether the field is an Autoskip field.
 <a href="#">Bright</a>	Gets a value that determines whether the field is bright or normal.
 <a href="#">Color</a>	Gets the value of the color attribute in the screen field.
 <a href="#">Displayable</a>	Gets a value that determines if the field is displayable or hidden.
 <a href="#">Highlighting</a>	Gets the value of the highlighting attribute in the screen field.
 <a href="#">Modified</a>	Gets a value that determines if the field has been modified by the client application.
 <a href="#">Protected</a>	Gets a value that determines if the field has been protected or non-protected.

Methods

Name	Description
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)

 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">ToString()</a>	Translates the current instance to a string.(Overrides <a href="#">Object.ToString()</a> .)

## ScreenFieldAttributeData Constructor (ScreenFieldAttribute)

Creates a new instance of the [ScreenFieldAttributeData](#) class using the specified attributes.

## Syntax

C#

```
public ScreenFieldAttributeData(  
    ScreenFieldAttribute attribute  
)
```

C++

```
public:  
ScreenFieldAttributeData(  
    ScreenFieldAttribute attribute  
)
```

F#

```
new :  
    attribute:ScreenFieldAttribute -> ScreenFieldAttributeData
```

VB

```
Public Sub New (  
    attribute As ScreenFieldAttribute  
)
```

## Parameters

*attribute*  
Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldAttribute](#)  
A binary list or OR'd attributes.

## Remarks

When using [ScreenDisplay.GetField](#) on an object created with this constructor, only the standard attributes will be available.

[Return to top](#)

## ScreenFieldAttributeData Constructor (ScreenFieldAttribute, ScreenFieldColor, ScreenFieldHighlighting)

Creates a new instance of the [ScreenFieldAttributeData](#) class using the specified attributes, color, and highlighting.

## Syntax

### C#

```
public ScreenFieldAttributeData(  
    ScreenFieldAttribute attribute,  
    ScreenFieldColor color,  
    ScreenFieldHighlighting highlighting  
)
```

### C++

```
public:  
ScreenFieldAttributeData(  
    ScreenFieldAttribute attribute,  
    ScreenFieldColor color,  
    ScreenFieldHighlighting highlighting  
)
```

### F#

```
new :  
    attribute:ScreenFieldAttribute *  
    color:ScreenFieldColor *  
    highlighting:ScreenFieldHighlighting -> ScreenFieldAttributeData
```

### VB

```
Public Sub New (  
    attribute As ScreenFieldAttribute,  
    color As ScreenFieldColor,  
    highlighting As ScreenFieldHighlighting  
)
```

## Parameters

### *attribute*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldAttribute](#)

A binary list or OR'd attributes.

### *color*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldColor](#)

The color of the screen.

### *highlighting*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldHighlighting](#)

The color of the field highlights.

[Return to top](#)

# ScreenFieldAttributeData Constructor (ScreenFieldAttribute)

Creates a new instance of the [ScreenFieldAttributeData](#) class using the specified attributes.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    attribute As ScreenFieldAttribute _
)
```

C#

```
public ScreenFieldAttributeData (
    ScreenFieldAttribute attribute
)
```

C++

```
public:
ScreenFieldAttributeData (
    ScreenFieldAttribute attribute
)
```

J#

```
public ScreenFieldAttributeData (
    ScreenFieldAttribute attribute
)
```

JScript

```
public function ScreenFieldAttributeData (
    attribute : ScreenFieldAttribute
)
```

## Parameters

attribute

A binary list or OR'd attributes.

Remarks

When using `ScreenDisplay.GetField` on an object created with this constructor, only the standard attributes will be available.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenFieldAttributeData.Alphanumeric Property

Gets a value that describes if the field is alphanumeric or numeric.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property Alphanumeric As Boolean
```

C#

```
public bool Alphanumeric { get; }
```

C++

```
public:
property bool Alphanumeric {
    bool get ();
}
```

J#

```
/** @property */
public boolean get_Alphanumeric ()
```

JScript

```
public function get Alphanumeric () : boolean
```

## Property Value

**True** if the field is alphanumeric; otherwise, **false**.

Remarks

Alphanumeric is a this is a 3270 field attribute.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# ScreenFieldAttributeData.AutoSkip Property

Gets a value that determines whether the field is an Autoskip field.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property AutoSkip As Boolean
```

C#

```
public bool AutoSkip { get; }
```

C++

```
public:
property bool AutoSkip {
    bool get ();
}
```

J#

```
/** @property */
public boolean get_AutoSkip ()
```

JScript

```
public function get AutoSkip () : boolean
```

## Property Value

**True** if the field is an Autoskip field; otherwise, **false**.

Remarks

An Autoskip field is equivalent to having both the protected and numeric bits set.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

# ScreenFieldCollection Class

Contains a collection of ScreenField instances.

**Namespace:** [Microsoft.HostIntegration.SNA.Session](#)

**Assembly:** Microsoft.HostIntegration.SNA.Session (in Microsoft.HostIntegration.SNA.Session.dll)

Inheritance Hierarchy [System.Object](#)

**Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection**

Syntax

C#

```
public class ScreenFieldCollection : IEnumerable
```

C++

```
public ref class ScreenFieldCollection : IEnumerable
```

F#

```
type ScreenFieldCollection =  
    class  
        interface IEnumerable  
    end
```

VB

```
Public Class ScreenFieldCollection  
    Implements IEnumerable
```

Constructors

	Name	Description
	<a href="#">ScreenFieldCollection()</a>	Initializes a new instance of the <b>ScreenFieldCollection</b> class using default values.
	<a href="#">ScreenFieldCollection(Int32)</a>	Initializes a new instance of the <b>ScreenFieldCollection</b> class using the specified entries.

Properties

	Name	Description
	<a href="#">Item(Int32)</a>	Retrieves the ScreenField located at the specified index.
	<a href="#">Item(ScreenField)</a>	Gets the ScreenField from the collection that matches the specified ScreenField.
	<a href="#">Item(ScreenPartialField)</a>	Retrieves the ScreenField that contains the specified partial field.
	<a href="#">Item(ScreenPosition)</a>	Retrieves the ScreenField in the collection which is located at the specified position.
	<a href="#">Item(String)</a>	Retrieves the ScreenField in the collection that contains the specified string.
	<a href="#">Length</a>	Gets the number of the Screen Fields in the collection.

Methods

	Name	Description
	<a href="#">Add(ScreenField)</a>	Adds the specified ScreenField to the collection.
	<a href="#">Clear()</a>	Clears the collection.
	<a href="#">Contains(ScreenField)</a>	Returns a value that determines whether the specified screen field is in the collection.
	<a href="#">Contains(ScreenPartialField)</a>	Returns a value that determines whether a screen field containing the specified partial field is in the collection.

 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetEnumerator()</a>	Returns an enumerator for the current instance.
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Remove(ScreenField)</a>	Removes the specified ScreenField from the collection.
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# ScreenFieldCollection Members

Contains a collection of ScreenField instances.

The following tables list the members exposed by the [ScreenFieldCollection](#) type.

## Public Constructors

Name	Description
<a href="#">ScreenFieldCollection</a>	Overloaded. Initializes a new instance of the <a href="#">ScreenFieldCollection</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">Item</a>	Overloaded. Retrieves the specified ScreenField from the collection.
 <a href="#">Length</a>	Gets the number of the Screen Fields in the collection.

## Top

## Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Add</a>	Adds the specified ScreenField to the collection.
	<a href="#">Clear</a>	Clears the collection.
	<a href="#">Contains</a>	Overloaded. Returns a value that determines if the specified screen field is in the collection.
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">GetEnumerator</a>	Returns an enumerator for the current instance.
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 	<a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Remove</a>	Removes the specified ScreenField from the collection.
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )

### ScreenFieldCollection Constructor ()

Initializes a new instance of the [ScreenFieldCollection](#) class using default values.

Syntax

C#

```
public ScreenFieldCollection()
```

C++

```
public:  
ScreenFieldCollection()
```

F#

```
new : unit -> ScreenFieldCollection
```

VB

```
Public Sub New
```

[Return to top](#)

### ScreenFieldCollection Constructor (Int32)

Initializes a new instance of the [ScreenFieldCollection](#) class using the specified entries.

Syntax

C#

```
public ScreenFieldCollection(  
    int entries  
)
```

C++

```
public:  
ScreenFieldCollection(  
    int entries  
)
```

F#

```
new :  
    entries:int -> ScreenFieldCollection
```

VB

```
Public Sub New (  
    entries As Integer  
)
```

#### Parameters

*entries*

Type: [System.Int32](#)

The number of ScreenFields you expect to add to the collection.

[Return to top](#)

# ScreenFieldCollection Constructor ()

Initializes a new instance of the [ScreenFieldCollection](#) class using default values.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public ScreenFieldCollection ()
```

C++

```
public:  
ScreenFieldCollection ()
```

J#

```
public ScreenFieldCollection ()
```

JScript

```
public function ScreenFieldCollection ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenFieldCollection.Add Method

Adds the specified ScreenField to the collection.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Add ( _
    newField As ScreenField _
)
```

C#

```
public void Add (
    ScreenField newField
)
```

C++

```
public:
void Add (
    ScreenField^ newField
)
```

J#

```
public void Add (
    ScreenField newField
)
```

JScript

```
public function Add (
    newField : ScreenField
)
```

## Parameters

newField

The ScreenField to add.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## ScreenFieldCollection.Contains Method (ScreenField)

Returns a value that determines whether the specified screen field is in the collection.

Syntax

C#

```
public bool Contains(  
    ScreenField searchField  
)
```

C++

```
public:  
bool Contains(  
    ScreenField^ searchField  
)
```

F#

```
member Contains :  
    searchField:ScreenField -> bool
```

VB

```
Public Function Contains (  
    searchField As ScreenField  
) As Boolean
```

## Parameters

*searchField*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The ScreenField to search for.

## Return Value

Type: [System.Boolean](#)

**True** if the specified ScreenField is in the collection; otherwise, **false**.

[Return to top](#)

## ScreenFieldCollection.Contains Method (ScreenPartialField)

Returns a value that determines whether a screen field containing the specified partial field is in the collection.

Syntax

C#

```
public bool Contains(  
    ScreenPartialField searchPartialField  
)
```

C++

```
public:  
bool Contains(  
    ScreenPartialField^ searchPartialField  
)
```

F#

```
member Contains :  
    searchPartialField:ScreenPartialField -> bool
```

VB

```
Public Function Contains (  
    searchPartialField As ScreenPartialField  
) As Boolean
```

#### Parameters

*searchPartialField*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPartialField](#)

The partial field to search on.

#### Return Value

Type: [System.Boolean](#)

**True** if a screen in the collection contains the specified partial field; otherwise, **false**.

[Return to top](#)

# ScreenFieldCollection.Contains Method (ScreenField)

Returns a value that determines whether the specified screen field is in the collection.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function Contains ( _
    searchField As ScreenField _
) As Boolean
```

C#

```
public bool Contains (
    ScreenField searchField
)
```

C++

```
public:

### ScreenFieldCollection.Item Property (Int32)

Retrieves the ScreenField located at the specified index.

Syntax

C#

```
public ScreenField this[
    int index
] { get; }
```

C++

```
public:
property ScreenField^ default[
    int index
] {
    ScreenField^ get(int index);
}
```

F#

```
member Item :
    index:int -> ScreenField with get
```

VB

```
Public ReadOnly Property Item (
    index As Integer
) As ScreenField
```

### Parameters

*index*

Type: [System.Int32](#)

The index of the ScreenField to retrieve.

### Property Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The ScreenField at the specified index.

[Return to top](#)

### ScreenFieldCollection.Item Property (ScreenField)

Gets the ScreenField from the collection that matches the specified ScreenField.

Syntax

C#

```
public ScreenField this[
    ScreenField searchField
] { get; }
```

C++

```
public:
property ScreenField^ default[
    ScreenField^ searchField
] {
    ScreenField^ get(ScreenField^ searchField);
}
```

F#

```
member Item :
    searchField:ScreenField -> ScreenField with get
```

VB

```
Public ReadOnly Property Item (
    searchField As ScreenField
) As ScreenField
```

### Parameters

*searchField*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The ScreenField to search for in the collection.

### Property Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The ScreenField that matches the specified ScreenField.

[Return to top](#)

### ScreenFieldCollection.Item Property (ScreenPartialField)

Retrieves the ScreenField that contains the specified partial field.

Syntax

C#

```
public ScreenField this[
    ScreenPartialField searchPartialField
] { get; }
```

C++

```
public:
property ScreenField^ default[
    ScreenPartialField^ searchPartialField
] {
    ScreenField^ get(ScreenPartialField^ searchPartialField);
}
```

F#

```
member Item :
    searchPartialField:ScreenPartialField -> ScreenField with get
```

VB

```
Public ReadOnly Property Item (  
    searchPartialField As ScreenPartialField  
) As ScreenField
```

#### Parameters

*searchPartialField*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPartialField](#)

The partial field to search for in the collection.

#### Property Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The screen field that contains the specified partial field.

[Return to top](#)

#### ScreenFieldCollection.Item Property (ScreenPosition)

Retrieves the ScreenField in the collection which is located at the specified position.

Syntax

C#

```
public ScreenField this[  
    ScreenPosition position  
] { get; }
```

C++

```
public:  
property ScreenField^ default[  
    ScreenPosition^ position  
] {  
    ScreenField^ get(ScreenPosition^ position);  
}
```

F#

```
member Item :  
    position:ScreenPosition -> ScreenField with get
```

VB

```
Public ReadOnly Property Item (  
    position As ScreenPosition  
) As ScreenField
```

#### Parameters

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position to retrieve the ScreenField from.

#### Property Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The ScreenField at the specified position.

[Return to top](#)

#### ScreenFieldCollection.Item Property (String)

Retrieves the ScreenField in the collection that contains the specified string.

Syntax

C#

```
public ScreenField this[  
    string searchText  
] { get; }
```

C++

```
public:
property ScreenField^ default[
    String^ searchText
] {
    ScreenField^ get(String^ searchText);
}
```

F#

```
member Item :
    searchText:string -> ScreenField with get
```

VB

```
Public ReadOnly Property Item (
    searchText As String
) As ScreenField
```

#### Parameters

*searchText*

Type: [System.String](#)

The string to search on.

#### Property Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

the ScreenField in the collection that contains the specified string.

[Return to top](#)

# ScreenFieldCollection.Item Property (Int32)

Retrieves the ScreenField located at the specified index.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Default Property Item ( _
    index As Integer _
) As ScreenField
```

C#

```
public ScreenField this [
    int index
] { get; }
```

C++

```
public:
property ScreenField^ default [int] {
    ScreenField^ get (int index);
}
```

J#

```
/** @property */
public ScreenField get_Item (int index)
```

JScript

## Parameters

index

The index of the ScreenField to retrieve.

## Property Value

The ScreenField at the specified index.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

```
/** @property */
public ScreenField get_Item (ScreenPosition position)
```

JScript

## Parameters

position

The position to retrieve the ScreenField from.

## Property Value

The ScreenField at the specified position.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# ScreenFieldCollection.Item Property (String)

Retrieves the ScreenField in the collection that contains the specified string.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Default Property Item ( _
    searchText As String _
) As ScreenField
```

C#

```
public ScreenField this [
    string searchText
] { get; }
```

C++

```
public:
property ScreenField^ default [String^] {
    ScreenField^ get (String^ searchText);
}
```

J#

```
/** @property */
public ScreenField get_Item (String searchText)
```

JScript

## Parameters

searchText

The string to search on.

## Property Value

the ScreenField in the collection that contains the specified string.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Gets the number of the Screen Fields in the collection.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public ReadOnly Property Length As Integer
```

C#

```
public int Length { get; }
```

C++

```
public:  
property int Length {  
    int get ();  
}
```

J#

```
/** @property */  
public int get_Length ()
```

JScript

```
public function get Length () : int
```

## Property Value

The number of the Screen Fields in the collection.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Inheritance Hierarchy [System.Object](#)

[Microsoft.HostIntegration.SNA.Session.ScreenFieldAttributeData](#)

**Microsoft.HostIntegration.SNA.Session.ScreenFieldIndividualAttributeData**

Syntax

C#

```
public class ScreenFieldIndividualAttributeData : ScreenFieldAttributeData
```

C++

```
public ref class ScreenFieldIndividualAttributeData : ScreenFieldAttributeData
```

F#

```
type ScreenFieldIndividualAttributeData =  
    class  
        inherit ScreenFieldAttributeData  
    end
```

VB

```
Public Class ScreenFieldIndividualAttributeData  
    Inherits ScreenFieldAttributeData
```

Constructors

	Name	Description
	<a href="#">ScreenFieldIndividualAttributeData(ScreenFieldAttribute)</a>	Creates a new instance of the <b>ScreenFieldIndividualAttributeData</b> class using the specified collection of attributes.
	<a href="#">ScreenFieldIndividualAttributeData(ScreenFieldAttribute, ScreenFieldColor, ScreenFieldHighlighting)</a>	Creates a new instance of the <b>ScreenFieldIndividualAttributeData</b> class using the specified collection of attributes.

Properties

	Name	Description
	<a href="#">Alphanumeric</a>	Gets a value that describes if the field is alphanumeric or numeric.(Inherited from <a href="#">ScreenFieldAttributeData</a> .)
	<a href="#">AutoSkip</a>	Gets a value that determines whether the field is an Autoskip field.(Inherited from <a href="#">ScreenFieldAttributeData</a> .)
	<a href="#">Bright</a>	Gets a value that determines whether the field is bright or normal.(Inherited from <a href="#">ScreenFieldAttributeData</a> .)
	<a href="#">Color</a>	Gets the value of the color attribute in the screen field.(Inherited from <a href="#">ScreenFieldAttributeData</a> .)
	<a href="#">Displayable</a>	Gets a value that determines if the field is displayable or hidden.(Inherited from <a href="#">ScreenFieldAttributeData</a> .)

	<b>Highlighting</b>	Gets the value of the highlighting attribute in the screen field.(Inherited from <a href="#">ScreenFieldAttributeData</a> .)
	<b>Modified</b>	Gets a value that determines if the field has been modified by the client application.(Inherited from <a href="#">ScreenFieldAttributeData</a> .)
	<b>Protected</b>	Gets a value that determines if the field has been protected or non-protected.(Inherited from <a href="#">ScreenFieldAttributeData</a> .)

#### Methods

	<b>Name</b>	<b>Description</b>
	<b><a href="#">Equals(Object)</a></b>	(Inherited from <a href="#">Object</a> .)
	<b><a href="#">Finalize()</a></b>	(Inherited from <a href="#">Object</a> .)
	<b><a href="#">GetHashCode()</a></b>	(Inherited from <a href="#">Object</a> .)
	<b><a href="#">GetType()</a></b>	(Inherited from <a href="#">Object</a> .)
	<b><a href="#">MemberwiseClone()</a></b>	(Inherited from <a href="#">Object</a> .)
	<b><a href="#">ToString()</a></b>	Translates the current instance to a string.(Inherited from <a href="#">ScreenFieldAttributeData</a> .)

#### Remarks

The difference between [ScreenFieldIndividualAttributeData](#) and [ScreenFieldAttributeData](#) is that when comparing them (or one of them and a [ScreenFieldAttributeData](#)) the attributes are not compared as a whole, but individually. If you have a field with the attributes Normal and Bright, its attribute will compare equal only to a [ScreenFieldAttributeData](#) which has both Normal and Bright set. [ScreenFieldIndividualAttributeData](#) will compare equal to three different [ScreenFieldIndividualAttributeData](#) values: bright only, normal only, both normal and bright. This can then be used to find all fields on the screen which are Bright using [GetFields\(new ScreenFieldIndividualAttributeData\(ScreenFieldAttribute.Bright\)\)](#), which will find all fields which are bright, regardless of their other attributes.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

new :  
    attribute:ScreenFieldAttribute -> ScreenFieldIndividualAttributeData
```

```
VB  
  
Public Sub New (  
    attribute As ScreenFieldAttribute  
)
```

**Parameters**  
*attribute*  
Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldAttribute](#)  
A collection of OR'd attributes that describe the field.

[Return to top](#)

**ScreenFieldIndividualAttributeData Constructor (ScreenFieldAttribute, ScreenFieldColor, ScreenFieldHighlighting)**

Creates a new instance of the [ScreenFieldIndividualAttributeData](#) class using the specified collection of attributes.

Syntax

```
C#  
  
public ScreenFieldIndividualAttributeData(  
    ScreenFieldAttribute attribute,  
    ScreenFieldColor color,  
    ScreenFieldHighlighting highlighting
```

```
)
```

C++

```
public:
ScreenFieldIndividualAttributeData(
    ScreenFieldAttribute attribute,
    ScreenFieldColor color,
    ScreenFieldHighlighting highlighting
)
```

F#

```
new :
    attribute:ScreenFieldAttribute *
    color:ScreenFieldColor *
    highlighting:ScreenFieldHighlighting -> ScreenFieldIndividualAttributeData
```

VB

```
Public Sub New (
    attribute As ScreenFieldAttribute,
    color As ScreenFieldColor,
    highlighting As ScreenFieldHighlighting
)
```

#### Parameters

*attribute*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldAttribute](#)

A collection of OR'd attributes that describe the field.

*color*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldColor](#)

The color of the field.

*highlighting*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldHighlighting](#)

The highlight of the field.

[Return to top](#)

# ScreenFieldIndividualAttributeData Constructor (ScreenFieldAttribute)

Creates a new instance of the [ScreenFieldIndividualAttributeData](#) class using the specified collection of attributes.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    attribute As ScreenFieldAttribute _
)
```

C#

```
public ScreenFieldIndividualAttributeData (
    ScreenFieldAttribute attribute
)
```

C++

```
public:
ScreenFieldIndividualAttributeData (
    ScreenFieldAttribute attribute
)
```

J#

```
public ScreenFieldIndividualAttributeData (
    ScreenFieldAttribute attribute
)
```

JScript

```
public function ScreenFieldIndividualAttributeData (
    attribute : ScreenFieldAttribute
)
```

## Parameters

attribute

A collection of OR'd attributes that describe the field.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenPartialField Class

Provides access to a part of a screen field.

**Namespace:** [Microsoft.HostIntegration.SNA.Session](#)

**Assembly:** Microsoft.HostIntegration.SNA.Session (in Microsoft.HostIntegration.SNA.Session.dll)

Inheritance Hierarchy [System.Object](#)

**Microsoft.HostIntegration.SNA.Session.ScreenPartialField**

Syntax

C#

```
public class ScreenPartialField
```

C++

```
public ref class ScreenPartialField
```

F#

```
type ScreenPartialField = class end
```

VB

```
Public Class ScreenPartialField
```

Constructors

Name	Description
 <a href="#">ScreenPartialField(Int16, Int16, Int16)</a>	Creates a new instance of the <b>ScreenPartialField</b> class using the specified row, column, and length.
 <a href="#">ScreenPartialField(ScreenPosition, Int16)</a>	Creates a new instance of the <b>ScreenPartialField</b> class using the specified screen position and length.
 <a href="#">ScreenPartialField(String, Int16, Int16)</a>	Creates a new instance of the <b>ScreenPartialField</b> class using the specified screen row, column, and data.
 <a href="#">ScreenPartialField(String, ScreenPosition)</a>	Creates a new instance of the <b>ScreenPartialField</b> class using the specified text string and screen position.

Properties

Name	Description
 <a href="#">Column</a>	Gets the column where the partial field is located.
 <a href="#">Data</a>	Gets or sets the screen data characters contained in the partial field.
 <a href="#">Field</a>	Gets the field that the current instance is associated with.
 <a href="#">IsValid</a>	Returns true if there is a valid Field associated with this partial field; otherwise false.
 <a href="#">Length</a>	Gets the length of the partial field.
 <a href="#">Offset</a>	Gets the offset of a partial field within a field.
 <a href="#">Position</a>	Retrieves the position of the current instance.
 <a href="#">Row</a>	Gets the row where the partial field is located.

Methods

Name	Description
------	-------------

 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">ToString()</a>	Translates the current instance to a string value.(Overrides <a href="#">Object.ToString()</a> .)

#### Remarks

The constructors create partial fields which are detached from a screen, thus they are never valid. They are used in searching or waiting, as they define the position and content of partial fields that are found on an actual screen.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

#### See Also

### ScreenPartialField Constructor (Int16, Int16, Int16)

Creates a new instance of the [ScreenPartialField](#) class using the specified row, column, and length.

Syntax

C#

```
public ScreenPartialField(  
    short row,  
    short column,  
    short length  
)
```

C++

```
public:  
ScreenPartialField(  
    short row,  
    short column,  
    short length  
)
```

F#

```
new :  
    row:int16 *  
    column:int16 *  
    length:int16 -> ScreenPartialField
```

VB

```
Public Sub New (  
    row As Short,  
    column As Short,  
    length As Short  
)
```

Parameters

*row*

Type: [System.Int16](#)

The 1-based row where the partial field starts.

*column*

Type: [System.Int16](#)

The 1-based column where the partial field starts.

*length*

Type: [System.Int16](#)

The maximum length of the partial field.

[Return to top](#)

#### **ScreenPartialField Constructor (ScreenPosition, Int16)**

Creates a new instance of the [ScreenPartialField](#) class using the specified screen position and length.

Syntax

C#

```
public ScreenPartialField(  
    ScreenPosition position,  
    short length  
)
```

C++

```
public:  
ScreenPartialField(  
    ScreenPosition^ position,  
    short length  
)
```

F#

```
new :  
    position:ScreenPosition *  
    length:int16 -> ScreenPartialField
```

VB

```
Public Sub New (  
    position As ScreenPosition,  
    length As Short  
)
```

#### **Parameters**

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position of the start of the partial field.

*length*

Type: [System.Int16](#)

The maximum length of the partial field.

[Return to top](#)

#### **ScreenPartialField Constructor (String, Int16, Int16)**

Creates a new instance of the [ScreenPartialField](#) class using the specified screen row, column, and data.

Syntax

C#

```
public ScreenPartialField(  
    string data,  
    short row,  
    short column  
)
```

C++

```
public:
ScreenPartialField(
    String^ data,
    short row,
    short column
)
```

F#

```
new :
    data:string *
    row:int16 *
    column:int16 -> ScreenPartialField
```

VB

```
Public Sub New (
    data As String,
    row As Short,
    column As Short
)
```

#### Parameters

*data*

Type: [System.String](#)

The string of text to be used in the data portion.

The length is assumed to be the number of characters in this parameter.

*row*

Type: [System.Int16](#)

The 1-based row where the partial field starts.

*column*

Type: [System.Int16](#)

The 1-based column where the partial field starts.

[Return to top](#)

#### ScreenPartialField Constructor (String, ScreenPosition)

Creates a new instance of the [ScreenPartialField](#) class using the specified text string and screen position.

Syntax

C#

```
public ScreenPartialField(
    string data,
    ScreenPosition position
)
```

C++

```
public:
ScreenPartialField(
    String^ data,
    ScreenPosition^ position
)
```

F#

```
new :
    data:string *
    position:ScreenPosition -> ScreenPartialField
```

VB

```
Public Sub New (  
    data As String,  
    position As ScreenPosition  
)
```

#### Parameters

*data*

Type: [System.String](#)

The string of text to be used in the data portion.

The length is assumed to be the number of characters in this parameter.

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position of the start of the partial field.

[Return to top](#)

# ScreenPartialField Constructor (ScreenPosition, Int16)

Creates a new instance of the [ScreenPartialField](#) class using the specified screen position and length.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    position As ScreenPosition, _
    length As Short _
)
```

C#

```
public ScreenPartialField (
    ScreenPosition position,
    short length
)
```

C++

```
public:
ScreenPartialField (
    ScreenPosition^ position,
    short length
)
```

J#

```
public ScreenPartialField (
    ScreenPosition position,
    short length
)
```

JScript

```
public function ScreenPartialField (
    position : ScreenPosition,
    length : short
)
```

## Parameters

position

The position of the start of the partial field.

length

The maximum length of the partial field.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenPartialField.ToString Method

Translates the current instance to a string value.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Function ToString As String
```

C#

```
public override string ToString ()
```

C++

```
public:  
virtual String^ ToString () override
```

J#

```
public String ToString ()
```

JScript

```
public override function ToString () : String
```

## Return Value

The current instance, as a string value.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenPartialField.Column Property

Gets the column where the partial field is located.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public ReadOnly Property Column As Short
```

C#

```
public short Column { get; }
```

C++

```
public:  
property short Column {  
    short get ();  
}
```

J#

```
/** @property */  
public short get_Column ()
```

JScript

```
public function get Column () : short
```

## Property Value

The column where the partial field is located.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenPartialField.Data Property

Gets or sets the screen data characters contained in the partial field.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Data As String
```

C#

```
public string Data { get; set; }
```

C++

```
public:
property String^ Data {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_Data ()

/** @property */
public void set_Data (String value)
```

JScript

```
public function get Data () : String

public function set Data (value : String)
```

## Property Value

The screen data characters contained in the partial field.

Remarks

If the current instance is associated with a field on a screen, and that field has changed, and if you attempt to change the Data for that field, you will receive an error.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenPartialField.Field Property

Gets the field that the current instance is associated with.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public ReadOnly Property Field As ScreenField
```

C#

```
public ScreenField Field { get; }
```

C++

```
public:  
property ScreenField^ Field {  
    ScreenField^ get ();  
}
```

J#

```
/** @property */  
public ScreenField get_Field ()
```

JScript

```
public function get Field () : ScreenField
```

## Property Value

The field that the current instance is associated with. Null if the instance was created by calling the Constructor.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

# ScreenPartialField.IsValid Property

Returns true if there is a valid Field associated with this partial field; otherwise false.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property IsValid As Boolean
```

C#

```
public bool IsValid { get; }
```

C++

```
public:
property bool IsValid {
    bool get ();
}
```

J#

```
/** @property */
public boolean get_IsValid ()
```

JScript

```
public function get IsValid () : boolean
```

## Property Value

**True** if there is a valid Field associated with this partial field; otherwise **false**.

Remarks

IsValid is relevant only if the current instance is associated with a field on a screen.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenPartialField.Length Property

Gets the length of the partial field.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property Length As Short
```

C#

```
public short Length { get; }
```

C++

```
public:
property short Length {
    short get ();
}
```

J#

```
/** @property */
public short get_Length ()
```

JScript

```
public function get Length () : short
```

## Property Value

The length of the partial field. Will return -1 if the partial field was obtained from a field via an indexer and a length was not specified.

Remarks

If the Data property is updated (on a partial field not associated with a field), then Length will change.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

# ScreenPartialField.Offset Property

Gets the offset of a partial field within a field.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property Offset As Short
```

C#

```
public short Offset { get; }
```

C++

```
public:
property short Offset {
    short get ();
}
```

J#

```
/** @property */
public short get_Offset ()
```

JScript

```
public function get Offset () : short
```

## Property Value

The offset of a partial field within a field.

Remarks

Offset is valid only if the current instance was obtained from a field through an Indexer.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

### ScreenPartialFieldCollection Constructor (Int32)

Creates a new instance of the [ScreenPartialFieldCollection](#) class using the specified number of potential entries.

Syntax

C#

```
public ScreenPartialFieldCollection(  
    int entries  
)
```

C++

```
public:  
ScreenPartialFieldCollection(  
    int entries  
)
```

F#

```
new :  
    entries:int -> ScreenPartialFieldCollection
```

VB

```
Public Sub New (  
    entries As Integer  
)
```

#### Parameters

*entries*

Type: [System.Int32](#)

The number of ScreenPartialFields which you expect to add to the collection.

[Return to top](#)

# ScreenPartialFieldCollection Constructor ()

Creates a new instance of the [ScreenPartialFieldCollection](#) class.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public ScreenPartialFieldCollection ()
```

C++

```
public:  
ScreenPartialFieldCollection ()
```

J#

```
public ScreenPartialFieldCollection ()
```

JScript

```
public function ScreenPartialFieldCollection ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

# ScreenPartialFieldCollection.Add Method

Adds a new partial field to the collection.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Add ( _
    newPartialField As ScreenPartialField _
)
```

C#

```
public void Add (
    ScreenPartialField newPartialField
)
```

C++

```
public:
void Add (
    ScreenPartialField^ newPartialField
)
```

J#

```
public void Add (
    ScreenPartialField newPartialField
)
```

JScript

```
public function Add (
    newPartialField : ScreenPartialField
)
```

## Parameters

newPartialField

The new partial field to add.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ScreenPartialFieldCollection.Clear Method

Empties the collection.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub Clear
```

C#

```
public void Clear ()
```

C++

```
public:  
void Clear ()
```

J#

```
public void Clear ()
```

JScript

```
public function Clear ()
```

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# ScreenPartialFieldCollection.Contains Method

Checks to see if the specified PartialField is contained in the collection.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function Contains ( _
    searchPartialField As ScreenPartialField _
) As Boolean
```

C#

```
public bool Contains (
    ScreenPartialField searchPartialField
)
```

C++

```
public:
bool Contains (
    ScreenPartialField^ searchPartialField
)
```

J#

```
public boolean Contains (
    ScreenPartialField searchPartialField
)
```

JScript

```
public function Contains (
    searchPartialField : ScreenPartialField
) : boolean
```

## Parameters

searchPartialField

The field to search on. If the searchPartialField contains no data, only the starting position is used.

## Return Value

**True** if the specified partial field is in the collection; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

```
member Item :
    index:int -> ScreenPartialField with get
```

VB

```
Public ReadOnly Property Item (
    index As Integer
) As ScreenPartialField
```

**Parameters**  
*index*  
Type: [System.Int32](#)  
The index of the item to retrieve.

**Property Value**  
Type: [Microsoft.HostIntegration.SNA.Session.ScreenPartialField](#)  
The partial field to retrieve, or **null** if not found.

[Return to top](#)  
**ScreenPartialFieldCollection.Item Property (ScreenPartialField)**

Retrieves a partial field from the collection using the specified partial field.

Syntax

C#

```
public ScreenPartialField this[
    ScreenPartialField searchPartialField
] { get; }
```

C++

```
public:
property ScreenPartialField^ default[
    ScreenPartialField^ searchPartialField
] {
    ScreenPartialField^ get(ScreenPartialField^ searchPartialField);
}
```

F#

```
member Item :
    searchPartialField:ScreenPartialField -> ScreenPartialField with get
```

VB

```
Public ReadOnly Property Item (
    searchPartialField As ScreenPartialField
) As ScreenPartialField
```

#### Parameters

*searchPartialField*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPartialField](#)

The field to search for in the collection. May be null.

#### Property Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPartialField](#)

If searchPartialField has no Data, a PartialField is returned if it contains the starting position of searchPartialField.

If searchPartialField contains data, then a PartialField is returned if it contains the data of the partial field at the appropriate location.

[Return to top](#)

#### ScreenPartialFieldCollection.Item Property (ScreenPosition)

Retrieves a partial field from the collection using the specified position.

Syntax

C#

```
public ScreenPartialField this[
    ScreenPosition position
] { get; }
```

C++

```
public:
property ScreenPartialField^ default[
    ScreenPosition^ position
] {
    ScreenPartialField^ get(ScreenPosition^ position);
}
```

F#

```
member Item :
    position:ScreenPosition -> ScreenPartialField with get
```

VB

```
Public ReadOnly Property Item (  
    position As ScreenPosition  
) As ScreenPartialField
```

#### Parameters

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position of the field to retrieve.

#### Property Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPartialField](#)

The partial field located at the specified position.

[Return to top](#)

#### ScreenPartialFieldCollection.Item Property (String)

Retrieves a partial field from the collection using the specified search string.

Syntax

C#

```
public ScreenPartialField this[  
    string searchText  
] { get; }
```

C++

```
public:  
property ScreenPartialField^ default[  
    String^ searchText  
] {  
    ScreenPartialField^ get(String^ searchText);  
}
```

F#

```
member Item :  
    searchText:string -> ScreenPartialField with get
```

VB

```
Public ReadOnly Property Item (  
    searchText As String  
) As ScreenPartialField
```

#### Parameters

*searchText*

Type: [System.String](#)

The string to search on.

#### Property Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPartialField](#)

The first partial field in the collection that contains the specified string.

[Return to top](#)

# ScreenPartialFieldCollection.Item Property (Int32)

Retrieves a partial field from the collection using the specified index.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Default Property Item ( _
    index As Integer _
) As ScreenPartialField
```

C#

```
public ScreenPartialField this [
    int index
] { get; }
```

C++

```
public:
property ScreenPartialField^ default [int] {
    ScreenPartialField^ get (int index);
}
```

J#

```
/** @property */
public ScreenPartialField get_Item (int index)
```

JScript

## Parameters

index

The index of the item to retrieve.

## Property Value

The partial field to retrieve, or **null** if not found.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# ScreenPosition Constructor

Creates a new instance of the [ScreenPosition](#) class.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    row As Short, _
    column As Short _
)
```

C#

```
public ScreenPosition (
    short row,
    short column
)
```

C++

```
public:
ScreenPosition (
    short row,
    short column
)
```

J#

```
public ScreenPosition (
    short row,
    short column
)
```

JScript

```
public function ScreenPosition (
    row : short,
    column : short
)
```

## Parameters

row

The row position.

column

The column position.

## Remarks

The constructor assigns a 1-based row and column position. The parameter values are not checked at construction time, except to confirm that the values are inside the boundaries of the 3278/9 terminal.

/** @property */
public short get_Row ()

/** @property */
public void set_Row (short value)
```

JScript

```
public function get Row () : short

public function set Row (value : short)
```

## Property Value

The row of the position.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Syntax

C#

```
public class SessionConnection
```

C++

```
public ref class SessionConnection
```

F#

```
type SessionConnection = class end
```

VB

```
Public Class SessionConnection
```

Properties

	Name	Description
	<a href="#">DestinationLogicalUnitName</a>	Gets or sets the Logical Unit name of the destination.
	<a href="#">HostCodePage</a>	Gets or sets a value indicating the type of host code set identifier (CCSID) for the current instance.
	<a href="#">IsConnected</a>	Gets a value that determines if the session is connected.
	<a href="#">LogicalUnitName</a>	Gets or sets a value that contains the name of the logical unit or pool name for the session.
	<a href="#">ServerName</a>	Gets or sets a value that contains the name of the server.

Methods

	Name	Description
	<a href="#">CreateSessionConnection()</a>	Creates a new session connection
	<a href="#">Dispose()</a>	Releases the resources used by SessionConnection.
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Finalize()</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Finalizes the session connection.(Overrides <a href="#">Object.Finalize()</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">InternalFinish()</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Ends the session connection.
	<a href="#">InternalGetDestinationLogicalUnit()</a>	Gets the destination logical unit.

 <a href="#">InternalGetLUName()</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Gets the logical unit name.
 <a href="#">InternalGetServerName()</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Gets the session connection server name.
 <a href="#">InternalOffline()</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the connection offline.
 <a href="#">InternalOnline()</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the connection online.
 <a href="#">InternalSetCodePage(Int32)</a>	Sets the code page for the session connection display.
 <a href="#">InternalSetDestinationLogicalUnit(String)</a>	Sets the destination logical unit.
 <a href="#">InternalSetLUName(String)</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the logical unit name.
 <a href="#">InternalSetServerName(String)</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the server name for the session connection display.
 <a href="#">Load(FileInfo)</a>	Initializes a connection using the specified file information.
 <a href="#">Load(String)</a>	Initializes a connection string using the specified connection string.
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Offline()</a>	Disconnects the session between the Session Integrator Service and the connected host.
 <a href="#">Online()</a>	Reestablishes a disconnected session.
 <a href="#">ParseConnectionString(String)</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Parses the connection string for the connection
 <a href="#">ReleaseSessionConnection()</a>	Releases the session connection.
 <a href="#">Save(FileInfo)</a>	Saves the session connection.
 <a href="#">SetRequiredTags(Object)</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the required tags for the session connection display.
 <a href="#">ToString()</a>	Returns the current instance as a string.(Overrides <a href="#">Object.ToString()</a> .)
 <a href="#">UseParsedTags()</a>	Uses parsed tags for the session connection display.

#### Fields

	Name	Description
	<a href="#">_traceContainer</a>	
	<a href="#">_tracePoint</a>	

#### Remarks

SessionConnection initializes a connection object by loading the Filename and populating the class. It is used to provide basic functionality such as saving connection strings to disk, and reading them back in.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# SessionConnection Members

SessionConnection is an abstract connection inherited by SessionConnectionLU0 and SessionConnectionDisplay.

The following tables list the members exposed by the [SessionConnection](#) type.

## Public Properties

	Name	Description
	<a href="#">DestinationLogicalUnitName</a>	Gets or sets the Logical Unit name of the destination.
	<a href="#">HostCodePage</a>	Gets or sets a value indicating the type of host code set identifier (CCSID) for the current instance.
	<a href="#">IsConnected</a>	Gets a value that determines if the session is connected.
	<a href="#">LogicalUnitName</a>	Gets or sets a value that contains the name of the logical unit or pool name for the session.
	<a href="#">ServerName</a>	Gets or sets a value that contains the name of the server.

[Top](#)

## Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">Dispose</a>	Releases the resources used by SessionConnection.
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Load</a>	Overloaded. Initializes a connection.
	<a href="#">Offline</a>	Disconnects the session between the Session Integrator Service and the connected host.
	<a href="#">Online</a>	Reestablishes a disconnected session.
	 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Save</a>	Saves the session connection.
	<a href="#">ToString</a>	Overridden. Returns the current instance as a string.

[Top](#)

## Protected Methods

	Name	Description
	<a href="#">CreateSessionConnection</a>	Creates a new session connection
	<a href="#">Finalize</a>	Overridden. Finalizes the session connection.
	<a href="#">InternalFinish</a>	Ends the session connection.
	<a href="#">InternalGetDestinationLogicalUnit</a>	Gets the destination logical unit.
	<a href="#">InternalGetLUName</a>	Gets the logical unit name.
	<a href="#">InternalGetServerName</a>	Gets the session connection server name.
	<a href="#">InternalOffline</a>	Sets the connection offline.
	<a href="#">InternalOnline</a>	Sets the connection online.
	<a href="#">InternalSetCodePage</a>	Sets the code page for the session connection display.
	<a href="#">InternalSetDestinationLogicalUnit</a>	Sets the destination logical unit.
	<a href="#">InternalSetLUName</a>	Sets the logical unit name.
	<a href="#">InternalSetServerName</a>	Sets the server name for the session connection display.
	<a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )
	<a href="#">ParseConnectionString</a>	Parses the connection string for the connection
	<a href="#">ReleaseSessionConnection</a>	Releases the session connection.
	<a href="#">SetRequiredTags</a>	Sets the required tags for the session connection display.
	<a href="#">UseParsedTags</a>	Uses parsed tags for the session connection display.

# SessionConnection.CreateSessionConnection Method

Creates a new session connection

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Protected Overridable Sub CreateSessionConnection
```

C#

```
protected virtual void CreateSessionConnection ()
```

C++

```
protected:  
virtual void CreateSessionConnection ()
```

J#

```
protected void CreateSessionConnection ()
```

JScript

```
protected function CreateSessionConnection ()
```

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

See Also

**Reference**

[SessionConnection Class](#)

# SessionConnection.Dispose Method

Releases the resources used by SessionConnection.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Dispose
```

C#

```
public void Dispose ()
```

C++

```
public:
void Dispose ()
```

J#

```
public void Dispose ()
```

JScript

```
public function Dispose ()
```

Remarks

Call Dispose when you are finished using the SessionConnection. Dispose leaves the SessionConnection in an unusable state. After calling Dispose, you must release all references to the SessionConnection so the garbage collector can reclaim the memory that the SessionConnection was occupying.

## Note

Always call Dispose before you release your last reference to the SessionConnection. Otherwise, the resources it is using will not be freed until the garbage collector calls SessionConnection.Finalize.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[SessionConnection Class](#)

[SessionConnection Members](#)

[Microsoft.HostIntegration.SNA.Session Namespace](#)

# SessionConnection.Finalize Method

This method supports the infrastructure and is not intended to be used directly from your code.

Finalizes the session connection.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Sub Finalize
```

C#

```
~SessionConnection()
```

C++

```
!SessionConnection ()
```

J#

```
protected void finalize ()
```

JScript

```
protected override function Finalize ()
```

Remarks

This method overrides System.Object.Finalize. Application code should not call this method; an object's Finalize method is automatically invoked during garbage collection, unless finalization by the garbage collector has been disabled by a call to the System.GC.SuppressFinalize method.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

### SessionConnection.Load Method (FileInfo)

Initializes a connection using the specified file information.

Syntax

C#

```
public void Load(  
    FileInfo fileInfo  
)
```

C++

```
public:  
void Load(  
    FileInfo^ fileInfo  
)
```

F#

```
member Load :  
    fileInfo:FileInfo -> unit
```

VB

```
Public Sub Load (  
    fileInfo As FileInfo  
)
```

### Parameters

*fileInfo*

Type: [System.IO.FileInfo](#)

The file information to initialize the connection with.

[Return to top](#)

### SessionConnection.Load Method (String)

Initializes a connection string using the specified connection string.

Syntax

C#

```
public void Load(  
    string connectionString  
)
```

C++

```
public:
void Load(
    String^ connectionString
)
```

F#

```
member Load :
    connectionString:string -> unit
```

VB

```
Public Sub Load (
    connectionString As String
)
```

#### Parameters

*connectionString*

Type: [System.String](#)

The connection string to initialize the connection with.

[Return to top](#)

# SessionConnection.Load Method (FileInfo)

Initializes a connection using the specified file information.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Load ( _
    fileInfo As FileInfo _
)
```

C#

```
public void Load (
    FileInfo fileInfo
)
```

C++

```
public:
void Load (
    FileInfo^ fileInfo
)
```

J#

```
public void Load (
    FileInfo fileInfo
)
```

JScript

```
public function Load (
    fileInfo : FileInfo
)
```

## Parameters

fileInfo

The file information to initialize the connection with.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

See Also

## Reference

# SessionConnection.Load Method (String)

Initializes a connection string using the specified connection string.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Load ( _
    connectionString As String _
)
```

C#

```
public void Load (
    string connectionString
)
```

C++

```
public:
void Load (
    String^ connectionString
)
```

J#

```
public void Load (
    String connectionString
)
```

JScript

```
public function Load (
    connectionString : String
)
```

## Parameters

connectionString

The connection string to initialize the connection with.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

[SessionConnection Members](#)

[Microsoft.HostIntegration.SNA.Session Namespace](#)

# SessionConnection.Offline Method

Disconnects the session between the Session Integrator Service and the connected host.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub Offline
```

C#

```
public void Offline ()
```

C++

```
public:  
void Offline ()
```

J#

```
public void Offline ()
```

JScript

```
public function Offline ()
```

Remarks

By calling Offline, any sessions using the connection will no longer be able to exchange data.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

# SessionConnection.Online Method

Reestablishes a disconnected session.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub Online
```

C#

```
public void Online ()
```

C++

```
public:  
void Online ()
```

J#

```
public void Online ()
```

JScript

```
public function Online ()
```

Remarks

Online attempts to reestablish a connection that was disconnected using Offline.

Online attempts to acquire the same connection used prior to calling Offline.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionConnection.ParseConnectionString Method

This method supports the infrastructure and is not intended to be used directly from your code.

Parses the connection string for the connection

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Protected Sub ParseConnectionString ( _
    connectionString As String _
)
```

C#

```
protected void ParseConnectionString (
    string connectionString
)
```

C++

```
protected:
void ParseConnectionString (
    String^ connectionString
)
```

J#

```
protected void ParseConnectionString (
    String connectionString
)
```

JScript

```
protected function ParseConnectionString (
    connectionString : String
)
```

## Parameters

connectionString

The connection string to be parsed.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionConnection.Save Method

Saves the session connection.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Save ( _
    fileInfo As FileInfo _
)
```

C#

```
public void Save (
    FileInfo fileInfo
)
```

C++

```
public:
void Save (
    FileInfo^ fileInfo
)
```

J#

```
public void Save (
    FileInfo fileInfo
)
```

JScript

```
public function Save (
    fileInfo : FileInfo
)
```

## Parameters

fileInfo

Path description of the file to save the session information to.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

This method supports the infrastructure and is not intended to be used directly from your code.

Sets the required tags for the session connection display.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overridable Sub SetRequiredTags ( _
    value As Object _
)
```

C#

```
protected virtual void SetRequiredTags (
    Object value
)
```

C++

```
protected:
virtual void SetRequiredTags (
    Object^ value
)
```

J#

```
protected void SetRequiredTags (
    Object value
)
```

JScript

```

# SessionConnection.ToString Method

Returns the current instance as a string.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Overrides Function ToString As String
```

C#

```
public override string ToString ()
```

C++

```
public:  
virtual String^ ToString () override
```

J#

```
public String ToString ()
```

JScript

```
public override function ToString () : String
```

## Return Value

The current instance as a string.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionConnection.DestinationLogicalUnitName Property

Gets or sets the Logical Unit name of the destination.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property DestinationLogicalUnitName As String
```

C#

```
public string DestinationLogicalUnitName { get; set; }
```

C++

```
public:
property String^ DestinationLogicalUnitName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_DestinationLogicalUnitName ()

/** @property */
public void set_DestinationLogicalUnitName (String value)
```

JScript

```
public function get DestinationLogicalUnitName () : String

public function set DestinationLogicalUnitName (value : String)
```

## Property Value

The destination Logical Unit name.

Remarks

Read only in 3270 and only available after connecting to the host. Settable in LU0.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionConnection.HostCodePage Property

Gets or sets a value indicating the type of host code set identifier (CCSID) for the current instance.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property HostCodePage As Integer
```

C#

```
public int HostCodePage { get; set; }
```

C++

```
public:
property int HostCodePage {
    int get ();
    void set (int value);
}
```

J#

```
/** @property */
public int get_HostCodePage ()

/** @property */
public void set_HostCodePage (int value)
```

JScript

```
public function get HostCodePage () : int

public function set HostCodePage (value : int)
```

## Property Value

The type of host code page.

Remarks

The CCSID must match the data as represented on the remote host computer.

HostCodePage is accessible at any time during a normal connection.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

## Reference

[SessionConnection Class](#)

[SessionConnection Members](#)

[Microsoft.HostIntegration.SNA.Session Namespace](#)

# SessionConnection.IsConnected Property

Gets a value that determines if the session is connected.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property IsConnected As Boolean
```

C#

```
public bool IsConnected { get; }
```

C++

```
public:
property bool IsConnected {
    bool get ();
}
```

J#

```
/** @property */
public boolean get_IsConnected ()
```

JScript

```
public function get IsConnected () : boolean
```

## Property Value

**True** if the session is connected; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

## Reference

[SessionConnection Class](#)

[SessionConnection Members](#)

[Microsoft.HostIntegration.SNA.Session Namespace](#)

# SessionConnection.LogicalUnitName Property

Gets or sets a value that contains the name of the logical unit or pool name for the session.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property LogicalUnitName As String
```

C#

```
public string LogicalUnitName { get; set; }
```

C++

```
public:
property String^ LogicalUnitName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_LogicalUnitName ()

/** @property */
public void set_LogicalUnitName (String value)
```

JScript

```
public function get LogicalUnitName () : String

public function set LogicalUnitName (value : String)
```

## Property Value

The name of the LU. May be **null**.

Remarks

For LU2, LogicalUnitName contains the name of the connected LogicalUnit on the Host and is read only.

If LogicalUnitName is null, the underlying architecture will pick the first available LU and use that in the connection. Once connected, LogicalUnitName contains the name of the LU used to connect.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionConnection.ServerName Property

Gets or sets a value that contains the name of the server.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property ServerName As String
```

C#

```
public string ServerName { get; set; }
```

C++

```
public:
property String^ ServerName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_ServerName ()

/** @property */
public void set_ServerName (String value)
```

JScript

```
public function get ServerName () : String

public function set ServerName (value : String)
```

## Property Value

The name of the server.

Remarks

Only settable in TN 3270, not in LU0 and not in SNA 3270.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[Microsoft.HostIntegration.SNA.Session.SessionConnection](#)

**Microsoft.HostIntegration.SNA.Session.SessionConnectionDisplay**

Syntax

C#

```
public class SessionConnectionDisplay : SessionConnection
```

C++

```
public ref class SessionConnectionDisplay : SessionConnection
```

F#

```
type SessionConnectionDisplay =  
    class  
        inherit SessionConnection  
    end
```

VB

```
Public Class SessionConnectionDisplay  
    Inherits SessionConnection
```

Constructors

Name	Description
 <a href="#">SessionConnectionDisplay()</a>	Creates a new instance of the <b>SessionConnectionDisplay</b> class.
 <a href="#">SessionConnectionDisplay(String)</a>	Creates a new instance of the <b>SessionConnectionDisplay</b> class using the specified connection string.

Properties

Name	Description
 <a href="#">CertificateCheck</a>	Gets or sets the certificate check for the session connection display.
 <a href="#">DestinationLogicalUnitName</a>	Gets or sets the Logical Unit name of the destination.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">DeviceType</a>	Gets or sets the device type.
 <a href="#">HostCodePage</a>	Gets or sets a value indicating the type of host code set identifier (CCSID) for the current instance.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">Implementation</a>	
 <a href="#">InvalidCharacterSupport</a>	
 <a href="#">IsConnected</a>	Gets a value that determines if the session is connected.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">LogicalUnitName</a>	Gets or sets a value that contains the name of the logical unit or pool name for the session.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">Security</a>	Gets or sets the TNsecurity for the session connection display.
 <a href="#">ServerName</a>	Gets or sets a value that contains the name of the server.(Inherited from <a href="#">SessionConnection</a> .)

 <b>TN3270Port</b>	Gets or sets the number of the TN3270 port.
 <b>TN3270Server</b>	Gets or sets a value containing the name of the TN3270 server to service the session.
 <b>Transport</b>	Gets or sets a value that contains the session display transport used to establish the session.

#### Methods

<b>Name</b>	<b>Description</b>
 <b>CreateSessionConnection()</b>	Creates a new session connection.(Overrides <a href="#">SessionConnection.CreateSessionConnection()</a> .)
 <b>Dispose()</b>	Releases the resources used by SessionConnection.(Inherited from <a href="#">SessionConnection</a> .)
 <b>Equals(Object)</b>	(Inherited from <a href="#">Object</a> .)
 <b>Finalize()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Finalizes the session connection.(Inherited from <a href="#">SessionConnection</a> .)
 <b>GetHashCode()</b>	(Inherited from <a href="#">Object</a> .)
 <b>GetType()</b>	(Inherited from <a href="#">Object</a> .)
 <b>InternalFinish()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Ends the session connection.(Overrides <a href="#">SessionConnection.InternalFinish()</a> .)
 <b>InternalGetDestinationLogicalUnit()</b>	Gets the destination logical unit.(Overrides <a href="#">SessionConnection.InternalGetDestinationLogicalUnit()</a> .)
 <b>InternalGetLUName()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Gets the logical unit name.(Overrides <a href="#">SessionConnection.InternalGetLUName()</a> .)
 <b>InternalGetServerName()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Gets the session connection server name.(Overrides <a href="#">SessionConnection.InternalGetServerName()</a> .)
 <b>InternalOffline()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the connection offline.(Overrides <a href="#">SessionConnection.InternalOffline()</a> .)
 <b>InternalOnline()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the connection online.(Overrides <a href="#">SessionConnection.InternalOnline()</a> .)
 <b>InternalSetCodePage(Int32)</b>	Sets the code page for the session connection display.(Overrides <a href="#">SessionConnection.InternalSetCodePage(Int32)</a> .)
 <b>InternalSetDestinationLogicalUnit(String)</b>	Sets the destination logical unit.(Overrides <a href="#">SessionConnection.InternalSetDestinationLogicalUnit(String)</a> .)
 <b>InternalSetLUName(String)</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the logical unit name.(Overrides <a href="#">SessionConnection.InternalSetLUName(String)</a> .)
 <b>InternalSetServerName(String)</b>	Sets the server name for the session connection display.(Overrides <a href="#">SessionConnection.InternalSetServerName(String)</a> .)
 <b>Load(FileInfo)</b>	Initializes a connection using the specified file information.(Inherited from <a href="#">SessionConnection</a> .)

 <a href="#">Load(String)</a>	Initializes a connection string using the specified connection string.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Offline()</a>	Disconnects the session between the Session Integrator Service and the connected host.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">Online()</a>	Reestablishes a disconnected session.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">ParseConnectionString(String)</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Parses the connection string for the connection(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">ReleaseSessionConnection()</a>	Releases the session connection.(Overrides <a href="#">SessionConnection.ReleaseSessionConnection()</a> .)
 <a href="#">Save(FileInfo)</a>	Saves the session connection.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">SetRequiredTags(Object)</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the required tags for the session connection display.(Overrides <a href="#">SessionConnection.SetRequiredTags(Object)</a> .)
 <a href="#">ToString()</a>	Returns the current instance as a string.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">UseParsedTags()</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Uses parsed tags for the session connection display.(Overrides <a href="#">SessionConnection.UseParsedTags()</a> .)

# SessionConnectionDisplay Members

Provides the connection interface for the session display.

The following tables list the members exposed by the [SessionConnectionDisplay](#) type.

## Public Constructors

Name	Description
<a href="#">SessionConnectionDisplay</a>	Overloaded. Creates a new instance of the <a href="#">SessionConnectionDisplay</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">CertificateCheck</a>	Gets or sets the certificate check for the session connection display.
 <a href="#">DestinationLogicalUnitName</a>	Gets or sets the Logical Unit name of the destination. (inherited from <a href="#">SessionConnection</a> )
 <a href="#">DeviceType</a>	Gets or sets the device type.
 <a href="#">HostCodePage</a>	Gets or sets a value indicating the type of host code set identifier (CCSID) for the current instance. (inherited from <a href="#">SessionConnection</a> )
 <a href="#">IsConnected</a>	Gets a value that determines if the session is connected. (inherited from <a href="#">SessionConnection</a> )
 <a href="#">LogicalUnitName</a>	Gets or sets a value that contains the name of the logical unit or pool name for the session. (inherited from <a href="#">SessionConnection</a> )
 <a href="#">Security</a>	Gets or sets the TNsecurity for the session connection display.
 <a href="#">ServerName</a>	Gets or sets a value that contains the name of the server. (inherited from <a href="#">SessionConnection</a> )
 <a href="#">TN3270Port</a>	Gets or sets the number of the TN3270 port.
 <a href="#">TN3270Server</a>	Gets or sets a value containing the name of the TN3270 server to service the session.
 <a href="#">Transport</a>	Gets or sets a value that contains the session display transport used to establish the session.

## Top

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Dispose</a>	Releases the resources used by SessionConnection. (inherited from <a href="#">SessionConnection</a> )
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">Load</a>	Overloaded. (inherited from <a href="#">SessionConnection</a> )
 <a href="#">Offline</a>	Disconnects the session between the Session Integrator Service and the connected host. (inherited from <a href="#">SessionConnection</a> )
 <a href="#">Online</a>	Reestablishes a disconnected session. (inherited from <a href="#">SessionConnection</a> )
 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">Save</a>	(inherited from <a href="#">SessionConnection</a> )
 <a href="#">ToString</a>	Returns the current instance as a string. (inherited from <a href="#">SessionConnection</a> )

## Top

## Protected Methods

Name	Description
 <a href="#">CreateSessionConnection</a>	Overridden. Creates a new session connection
 <a href="#">Finalize</a>	Finalizes the session connection. (inherited from <a href="#">SessionConnection</a> )
 <a href="#">InternalFinish</a>	Overridden. Ends the session connection.
 <a href="#">InternalGetDestinationLogicalUnit</a>	Overridden. Gets the destination logical unit.
 <a href="#">InternalGetLUName</a>	Overridden. Gets the logical unit name.
 <a href="#">InternalGetServerName</a>	Overridden. Gets the session connection server name.
 <a href="#">InternalOffline</a>	Overridden. Sets the connection offline.
 <a href="#">InternalOnline</a>	Overridden. Sets the connection online.
 <a href="#">InternalSetCodePage</a>	Overridden. Sets the code page for the session connection display.
 <a href="#">InternalSetDestinationLogicalUnit</a>	Overridden. Sets the destination logical unit.
 <a href="#">InternalSetLUName</a>	Overridden. Sets the logical unit name.

 <a href="#">InternalSetServerName</a>	Overridden. Sets the server name for the session connection display.
 <a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ParseConnectionString</a>	(inherited from <a href="#">SessionConnection</a> )
 <a href="#">ReleaseSessionConnection</a>	Overridden. Releases the session connection.
 <a href="#">SetRequiredTags</a>	Overridden. Sets the required tags for the session connection display.
 <a href="#">UseParsedTags</a>	Overridden. Uses parsed tags for the session connection display.

## SessionConnectionDisplay Constructor ()

Creates a new instance of the [SessionConnectionDisplay](#) class.

Syntax

C#

```
public SessionConnectionDisplay()
```

C++

```
public:  
SessionConnectionDisplay()
```

F#

```
new : unit -> SessionConnectionDisplay
```

VB

```
Public Sub New
```

[Return to top](#)

## SessionConnectionDisplay Constructor (String)

Creates a new instance of the [SessionConnectionDisplay](#) class using the specified connection string.

Syntax

C#

```
public SessionConnectionDisplay(  
    string connectionString  
)
```

C++

```
public:  
SessionConnectionDisplay(  
    String^ connectionString  
)
```

F#

```
new :  
    connectionString:string -> SessionConnectionDisplay
```

VB

```
Public Sub New (  
    connectionString As String  
)
```

**Parameters**

*connectionString*

Type: [System.String](#)

The connection string that connects to the session.

[Return to top](#)

# SessionConnectionDisplay Constructor ()

Creates a new instance of the [SessionConnectionDisplay](#) class.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public SessionConnectionDisplay ()
```

C++

```
public:  
SessionConnectionDisplay ()
```

J#

```
public SessionConnectionDisplay ()
```

JScript

```
public function SessionConnectionDisplay ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionConnectionDisplay Properties

## Public Properties

	Name	Description
	<a href="#">CertificateCheck</a>	Gets or sets the certificate check for the session connection display.
	<a href="#">DestinationLogicalUnitName</a>	Gets or sets the Logical Unit name of the destination. (inherited from <a href="#">SessionConnection</a> )
	<a href="#">DeviceType</a>	Gets or sets the device type.
	<a href="#">HostCodePage</a>	Gets or sets a value indicating the type of host code set identifier (CCSID) for the current instance. (inherited from <a href="#">SessionConnection</a> )
	<a href="#">IsConnected</a>	Gets a value that determines if the session is connected. (inherited from <a href="#">SessionConnection</a> )
	<a href="#">LogicalUnitName</a>	Gets or sets a value that contains the name of the logical unit or pool name for the session. (inherited from <a href="#">SessionConnection</a> )
	<a href="#">Security</a>	Gets or sets the TNsecurity for the session connection display.
	<a href="#">ServerName</a>	Gets or sets a value that contains the name of the server. (inherited from <a href="#">SessionConnection</a> )
	<a href="#">TN3270Port</a>	Gets or sets the number of the TN3270 port.
	<a href="#">TN3270Server</a>	Gets or sets a value containing the name of the TN3270 server to service the session.
	<a href="#">Transport</a>	Gets or sets a value that contains the session display transport used to establish the session.

Gets or sets the device type.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property DeviceType As TNDeviceType
```

C#

```
public TNDeviceType DeviceType { get; set; }
```

C++

```
public:
property TNDeviceType DeviceType {
    TNDeviceType get ();
    void set (TNDeviceType value);
}
```

J#

```
/** @property */
public TNDeviceType get_DeviceType ()

/** @property */
public void set_DeviceType (TNDeviceType value)
```

JScript

```
public function get DeviceType () : TNDeviceType

public function set DeviceType (value : TNDeviceType)
```

## Property Value

The device type.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# SessionConnectionDisplay.Security Property

Gets or sets the TNSecurity for the session connection display.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Security As TNSecurity
```

C#

```
public TNSecurity Security { get; set; }
```

C++

```
public:
property TNSecurity Security {
    TNSecurity get ();
    void set (TNSecurity value);
}
```

J#

```
/** @property */
public TNSecurity get_Security ()

/** @property */
public void set_Security (TNSecurity value)
```

JScript

```
public function get Security () : TNSecurity

public function set Security (value : TNSecurity)
```

## Property Value

The TNSecurity.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionConnectionDisplay.TN3270Port Property

Gets or sets the number of the TN3270 port.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property TN3270Port As Integer
```

C#

```
public int TN3270Port { get; set; }
```

C++

```
public:
property int TN3270Port {
    int get ();
    void set (int value);
}
```

J#

```
/** @property */
public int get_TN3270Port ()

/** @property */
public void set_TN3270Port (int value)
```

JScript

```
public function get TN3270Port () : int

public function set TN3270Port (value : int)
```

## Property Value

The TN3270 port number.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

## Reference

[SessionConnectionDisplay Class](#)

[SessionConnectionDisplay Members](#)

[Microsoft.HostIntegration.SNA.Session Namespace](#)

# SessionConnectionDisplay.TN3270Server Property

Gets or sets a value containing the name of the TN3270 server to service the session.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property TN3270Server As String
```

C#

```
public string TN3270Server { get; set; }
```

C++

```
public:
property String^ TN3270Server {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_TN3270Server ()

/** @property */
public void set_TN3270Server (String value)
```

JScript

```
public function get TN3270Server () : String

public function set TN3270Server (value : String)
```

## Property Value

Once you establish the session, TN3270Server becomes read-only.

You may enter the server name in the following formats:

1. dotted IP Address:Port Number
2. Hostname : Port Number
3. Hostname with domain suffix : Port Number

For example, if the TN3270 server to connect to is called MYSERVER with an IP Address of 169.172.1.1 listening on port 23 for TN traffic, the following strings should all connect properly:

- MYSERVER
- MYSERVER:23
- 169.172.1.1
- 169.172.1.1:23

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# SessionConnectionDisplay.Transport Property

Gets or sets a value that contains the session display transport used to establish the session.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Transport As SessionDisplayTransport
```

C#

```
public SessionDisplayTransport Transport { get; set; }
```

C++

```
public:
property SessionDisplayTransport Transport {
    SessionDisplayTransport get ();
    void set (SessionDisplayTransport value);
}
```

J#

```
/** @property */
public SessionDisplayTransport get_Transport ()

/** @property */
public void set_Transport (SessionDisplayTransport value)
```

JScript

```
public function get Transport () : SessionDisplayTransport

public function set Transport (value : SessionDisplayTransport)
```

## Property Value

The session display transport used to establish the session.

Remarks

Once you establish the session, Transport becomes read-only.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

```

VB

```
Public Class SessionConnectionLU0  
    Inherits SessionConnection
```

Constructors

	Name	Description
	<a href="#">SessionConnectionLU0()</a>	Creates a new instance of the <b>SessionConnectionLU0</b> class.
	<a href="#">SessionConnectionLU0(String)</a>	Creates a new instance of the <b>SessionConnectionLU0</b> class using the specified connection string.

Properties

	Name	Description
	<a href="#">DestinationLogicalUnitName</a>	Gets or sets the Logical Unit name of the destination.(Inherited from <a href="#">SessionConnection</a> .)
	<a href="#">FMProfile</a>	Gets a value that describes the function management profile received in the BIND.
	<a href="#">HostCodePage</a>	Gets or sets a value indicating the type of host code set identifier (CCSID) for the current instance.(Inherited from <a href="#">SessionConnection</a> .)
	<a href="#">IsConnected</a>	Gets a value that determines if the session is connected.(Inherited from <a href="#">SessionConnection</a> .)
	<a href="#">LogicalUnitName</a>	Gets or sets a value that contains the name of the logical unit or pool name for the session.(Inherited from <a href="#">SessionConnection</a> .)
	<a href="#">LUType</a>	Gets a value that describes the LU type returned in the BIND.
	<a href="#">ModeName</a>	Gets or Sets the mode name sent in an INITSELF request to start a session.
	<a href="#">ReceiveMultipleRUChains</a>	Gets a value that describes how the host manages Request Units (RUs).
	<a href="#">SendMultipleRUChains</a>	Gets a value that describes how the application sends Request Units (RUs).

 <b>ServerName</b>	Gets or sets a value that contains the name of the server.(Inherited from <a href="#">SessionConnection</a> .)
 <b>Timeout</b>	Gets or sets a value that describes how long the connection waits for a BIND and SDT to arrive before returning an error.
 <b>TSProfile</b>	Profile received in the BIND.

#### Methods

<b>Name</b>	<b>Description</b>
 <b>CreateSessionConnection()</b>	(Overrides <a href="#">SessionConnection.CreateSessionConnection()</a> .)
 <b>Dispose()</b>	Releases the resources used by SessionConnection.(Inherited from <a href="#">SessionConnection</a> .)
 <b>Equals(Object)</b>	(Inherited from <a href="#">Object</a> .)
 <b>Finalize()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Finalizes the session connection.(Inherited from <a href="#">SessionConnection</a> .)
 <b>GetHashCode()</b>	(Inherited from <a href="#">Object</a> .)
 <b>GetType()</b>	(Inherited from <a href="#">Object</a> .)
 <b>InternalFinish()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Ends the session connection.(Overrides <a href="#">SessionConnection.InternalFinish()</a> .)
 <b>InternalGetDestinationLogicalUnit()</b>	(Overrides <a href="#">SessionConnection.InternalGetDestinationLogicalUnit()</a> .)
 <b>InternalGetLUName()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Gets the logical unit name.(Overrides <a href="#">SessionConnection.InternalGetLUName()</a> .)
 <b>InternalGetServerName()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Gets the session connection server name.(Overrides <a href="#">SessionConnection.InternalGetServerName()</a> .)
 <b>InternalOffline()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the connection offline.(Overrides <a href="#">SessionConnection.InternalOffline()</a> .)
 <b>InternalOnline()</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the connection online.(Overrides <a href="#">SessionConnection.InternalOnline()</a> .)
 <b>InternalSetCodePage(Int32)</b>	(Overrides <a href="#">SessionConnection.InternalSetCodePage(Int32)</a> .)
 <b>InternalSetDestinationLogicalUnit(String)</b>	(Overrides <a href="#">SessionConnection.InternalSetDestinationLogicalUnit(String)</a> .)
 <b>InternalSetLUName(String)</b>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the logical unit name.(Overrides <a href="#">SessionConnection.InternalSetLUName(String)</a> .)
 <b>InternalSetServerName(String)</b>	(Overrides <a href="#">SessionConnection.InternalSetServerName(String)</a> .)
 <b>Load(FileInfo)</b>	Initializes a connection using the specified file information.(Inherited from <a href="#">SessionConnection</a> .)
 <b>Load(String)</b>	Initializes a connection string using the specified connection string.(Inherited from <a href="#">SessionConnection</a> .)
 <b>MemberwiseClone()</b>	(Inherited from <a href="#">Object</a> .)

 <a href="#">Offline()</a>	Disconnects the session between the Session Integrator Service and the connected host.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">Online()</a>	Reestablishes a disconnected session.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">ParseConnectionString(String)</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Parses the connection string for the connection(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">ReleaseSessionConnection()</a>	(Overrides <a href="#">SessionConnection.ReleaseSessionConnection()</a> .)
 <a href="#">Save(FileInfo)</a>	Saves the session connection.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">SetRequiredTags(Object)</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Sets the required tags for the session connection.(Overrides <a href="#">SessionConnection.SetRequiredTags(Object)</a> .)
 <a href="#">ToString()</a>	Returns the current instance as a string.(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">UseParsedTags()</a>	This API supports the product infrastructure and is not intended to be used directly from your code. Uses parsed tags for the session connection display.(Overrides <a href="#">SessionConnection.UseParsedTags()</a> .)

#### Fields

Name	Description
 <a href="#">_traceContainer</a>	(Inherited from <a href="#">SessionConnection</a> .)
 <a href="#">_tracePoint</a>	(Inherited from <a href="#">SessionConnection</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

This method supports the infrastructure and is not intended to be used directly from your code.

Gets the logical unit name.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Function InternalGetLUName As String
```

C#

```
protected override string InternalGetLUName ()
```

C++

```
protected:
virtual String^ InternalGetLUName () override
```

J#

```
protected String InternalGetLUName ()
```

JScript

```
protected override function InternalGetLUName () : String
```

## Return Value

The logical unit name.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionConnectionLU0 Properties

## Public Properties

	Name	Description
	<a href="#">DestinationLogicalUnitName</a>	Gets or sets the Logical Unit name of the destination. (inherited from <a href="#">SessionConnection</a> )
	<a href="#">FMProfile</a>	Gets a value that describes the function management profile received in the BIND.
	<a href="#">HostCodePage</a>	Gets or sets a value indicating the type of host code set identifier (CCSID) for the current instance. (inherited from <a href="#">SessionConnection</a> )
	<a href="#">IsConnected</a>	Gets a value that determines if the session is connected. (inherited from <a href="#">SessionConnection</a> )
	<a href="#">LogicalUnitName</a>	Gets or sets a value that contains the name of the logical unit or pool name for the session. (inherited from <a href="#">SessionConnection</a> )
	<a href="#">LUType</a>	Gets a value that describes the LU type returned in the BIND.
	<a href="#">ModeName</a>	Gets or Sets the mode name sent in an INITSELF request to start a session.
	<a href="#">ReceiveMultipleRUChains</a>	Gets a value that describes how the host manages Request Units (RUs).
	<a href="#">SendMultipleRUChains</a>	Gets a value that describes how the application sends Request Units (RUs).
	<a href="#">ServerName</a>	Gets or sets a value that contains the name of the server. (inherited from <a href="#">SessionConnection</a> )
	<a href="#">Timeout</a>	Gets or sets a value that describes how long the connection waits for a BIND and SDT to arrive before returning an error.
	<a href="#">TSProfile</a>	Profile received in the BIND.

# SessionConnectionLU0.FMProfile Property

Gets a value that describes the function management profile received in the BIND.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property FMProfile As FunctionManagementProfile
```

C#

```
public FunctionManagementProfile FMProfile { get; }
```

C++

```
public:
property FunctionManagementProfile FMProfile {
    FunctionManagementProfile get ();
}
```

J#

```
/** @property */
public FunctionManagementProfile get_FMProfile ()
```

JScript

```
public function get FMProfile () : FunctionManagementProfile
```

## Property Value

A FunctionManagementProfile containing the function management profile received in the BIND.

Remarks

The function management profile is used in a BIND command.

FMProfile becomes read-only after you establish a connection.

For more information on acceptable values for FMProfile, see the IBM documentation "Client/Server Communication Programming".

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionConnectionLU0.LUType Property

Gets a value that describes the LU type returned in the BIND.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public ReadOnly Property LUType As Short
```

C#

```
public short LUType { get; }
```

C++

```
public:  
property short LUType {  
    short get ();  
}
```

J#

```
/** @property */  
public short get_LUType ()
```

JScript

```
public function get LUType () : short
```

## Property Value

The LU type returned in the BIND.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionConnectionLU0.ModeName Property

Gets or Sets the mode name sent in an INITSELF request to start a session.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Property ModeName As String
```

C#

```
public string ModeName { get; set; }
```

C++

```
public:
property String^ ModeName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_ModeName ()

/** @property */
public void set_ModeName (String value)
```

JScript

```
public function get ModeName () : String

public function set ModeName (value : String)
```

## Property Value

The mode name to send.

Remarks

ModeName is ignored when other session initialization options are chosen.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionDisplay Class

Represents a virtual 3270 screen.

**Namespace:** [Microsoft.HostIntegration.SNA.Session](#)

**Assembly:** Microsoft.HostIntegration.SNA.Session (in Microsoft.HostIntegration.SNA.Session.dll)

Inheritance Hierarchy [System.Object](#)

**Microsoft.HostIntegration.SNA.Session.SessionDisplay**

Syntax

C#

```
public class SessionDisplay
```

C++

```
public ref class SessionDisplay
```

F#

```
type SessionDisplay = class end
```

VB

```
Public Class SessionDisplay
```

Constructors

Name	Description
 <a href="#">SessionDisplay()</a>	Creates a new instance of the <b>SessionDisplay</b> class.
 <a href="#">SessionDisplay(SessionConnectionDisplay)</a>	Creates a new <b>SessionDisplay</b> object using the specified connection

Properties

Name	Description
 <a href="#">Columns</a>	Gets the number of columns on the screen.
 <a href="#">Connection</a>	Gets the underlying SessionConnectionDisplay object associated with the session.
 <a href="#">CurrentField</a>	Gets the current field where the cursor is located.
 <a href="#">Cursor</a>	Gets the cursor.
 <a href="#">IsConnected</a>	Gets a value that determines if there is an underlying Connection object.
 <a href="#">IsScreenClear</a>	Gets a value that determines if the screen is clear.
 <a href="#">OIA</a>	Gets the Operator Information Area (OIA) for the current screen.
 <a href="#">Rows</a>	Gets the number of rows on the current screen.

Methods

Name	Description
 <a href="#">Connect(SessionConnectionDisplay)</a>	Initializes a LU2 session using the specified connection object.
 <a href="#">Connect(String)</a>	Initializes a LU2 session using the specified connection string.
 <a href="#">Disconnect()</a>	Disconnect from a previously-connected session.
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)

 <code>ExecuteScript(SessionDisplayScript)</code>	Walks through the script on the current session.
 <code>Finalize()</code>	Allows SessionDisplay to attempt to free resources and perform other cleanup operations before SessionDisplay is reclaimed by garbage collection.(Overrides <a href="#">Object.Finalize()</a> .)
 <code>GetField(Int16, Int16)</code>	Returns a field from the screen using the specified row and column.
 <code>GetField(Int16, Int16, ScreenFieldAttributeData)</code>	Returns a field from the screen using the specified row, column, and field attribute.
 <code>GetField(ScreenPosition)</code>	Returns a field from the screen using the specified position.
 <code>GetField(ScreenPosition, ScreenFieldAttributeData)</code>	Returns a field from the screen using the specified starting position and field attribute.
 <code>GetField(String)</code>	Returns a field from the screen using the specified search value.
 <code>GetField(String, Int16, Int16)</code>	Returns a field value from the screen using the specified search value, row position, and column position.
 <code>GetField(String, ScreenPosition)</code>	Returns a field from the screen using the specified search value and position.
 <code>GetFields()</code>	Retrieves a collection of all fields on the screen.
 <code>GetFields(ScreenFieldAttributeData)</code>	Retrieves a collection of fields from the screen based on the specified search attribute.
 <code>GetFields(String)</code>	Retrieves a collection of fields from the screen based on the specified data.
 <code>GetFieldsByColumn(Int16)</code>	Retrieves all fields from the specified column.
 <code>GetFieldsByColumn(Int16, Int16)</code>	Retrieves all fields from the specified column, using the specified starting row.
 <code>GetFieldsByColumn(Int16, Int16, Int16)</code>	Retrieves all fields from the specified column, starting at the specified row, and ending at the specified row.
 <code>GetFieldsByColumn(Int16, Int16, Int16, String)</code>	Retrieves all fields from the specified column, starting at the specified row, and ending at either the specified row or when the specified data is found.
 <code>GetFieldsByColumn(Int16, Int16, String)</code>	Retrieves all fields from the specified column, starting at the specified row, and ending when the specified data is found.
 <code>GetFieldsByColumn(Int16, String)</code>	Retrieves all fields from the screen based on the specified column and end data.
 <code>GetFieldsByColumn(String, Int16)</code>	Retrieves all fields from the specified column that contain the specified data.
 <code>GetFieldsByColumn(String, Int16, Int16)</code>	Retrieves all fields from the specified column that contain the specified data, starting at the specified row.
 <code>GetFieldsByColumn(String, Int16, Int16, Int16)</code>	Retrieves all fields from the specified column that contain the specified data, starting at the specified row, and ending at the specified row.
 <code>GetFieldsByRow(Int16)</code>	Retrieves all fields in the specified row.
 <code>GetFieldsByRow(Int16, Int16)</code>	Retrieves all fields in the specified row, starting at the specified column.

 <code>GetFieldsByRow(Int16, Int16, Int16)</code>	Retrieves all fields in the specified row, starting at the specified column, and ending at the specified column.
 <code>GetFieldsByRow(Int16, Int16, Int16, String)</code>	Retrieves all fields in the specified row, starting at the specified column, and ending at either the specified column, or else when the specified data is found.
 <code>GetFieldsByRow(Int16, Int16, String)</code>	Retrieves all fields in the specified row, starting at the specified column, and ending when the specified data is found.
 <code>GetFieldsByRow(Int16, String)</code>	Retrieves all fields in the specified row, ending at the specified data.
 <code>GetFieldsByRow(String, Int16)</code>	Retrieves all fields in the specified row that contain the specified search data.
 <code>GetFieldsByRow(String, Int16, Int16)</code>	Retrieves all fields in the specified row that contain the specified data, starting at the specified column.
 <code>GetFieldsByRow(String, Int16, Int16, Int16)</code>	Retrieves all fields in the specified row that contain the specified data, starting at the specified column, and ending at the specified column.
 <code>GetHashCode()</code>	(Inherited from <a href="#">Object</a> .)
 <code>GetScreenData(Int16, Int16, Int16)</code>	Retrieves 3270 screen data based on the specified row, column, and data length.
 <code>GetScreenData(Int16, Int16, String)</code>	Retrieves 3270 screen data based on the specified screen locations.
 <code>GetType()</code>	(Inherited from <a href="#">Object</a> .)
 <code>MemberwiseClone()</code>	(Inherited from <a href="#">Object</a> .)
 <code>MoveCursor(Int16, Int16)</code>	Moves the cursor to the specified row and column location.
 <code>MoveCursor(ScreenPosition)</code>	Moves the cursor to the specified position.
 <code>MoveNextField()</code>	Moves the cursor forward through the specified fields and returns that field.
 <code>MoveNextField(Int32)</code>	Advances the cursor the number of fields specified and returns that field.
 <code>MoveNextField(ScreenFieldAttributeData)</code>	Advances the cursor to the next field that contains the specified attributes and returns that field.
 <code>MoveNextField(ScreenFieldAttributeData, Int32)</code>	Advances the cursor through the fields that contain the specified attributes, the specified number of times, and returns that field.
 <code>MovePreviousField()</code>	Moves the cursor back to the previous field.
 <code>MovePreviousField(Int32)</code>	Moves the cursor back through the number of specified fields and returns that field.
 <code>MovePreviousField(ScreenFieldAttributeData)</code>	Moves the cursor back to the previous field that has the specified attributes and returns that field.
 <code>MovePreviousField(ScreenFieldAttributeData, Int32)</code>	Moves the cursor back through a number of fields that have the specified attributes and returns that field.
 <code>MoveToField(Int16, Int16)</code>	Moves the cursor to the field at the specified row and column, and returns that field.

 <a href="#">MoveToField(Int16, Int16, ScreenFieldAttributeData)</a>	Moves the cursor to the first field at or after the specified location that contains the specified attributes, and returns that field.
 <a href="#">MoveToField(ScreenPosition)</a>	Moves the cursor to the field at the specified position and returns that field.
 <a href="#">MoveToField(ScreenPosition, ScreenFieldAttributeData)</a>	Moves the cursor to the first field at or after the specified position that contains the specified attributes, and returns that field.
 <a href="#">MoveToField(String)</a>	Moves the cursor to the first field that contains the specified value, and returns that field.
 <a href="#">MoveToField(String, Int16, Int16)</a>	Moves the cursor to the first field at or after the specified location that contains the specified value, and returns that field.
 <a href="#">MoveToField(String, ScreenPosition)</a>	Moves the cursor to the first field at or after the specified position that contains the specified value, and returns that field.
 <a href="#">SendKey(SessionDisplayKeys)</a>	Sends one or more keys to the host session.
 <a href="#">SendKey(String)</a>	Sends one or more keys to the host session.
 <a href="#">ToString()</a>	Translates the current instance into a string.(Overrides <a href="#">Object.ToString()</a> .)
 <a href="#">WaitForContent(ScreenFieldCollection, Int32)</a>	Waits for the information in the specified partial fields to appear on the screen.
 <a href="#">WaitForContent(ScreenPartialFieldCollection, Int32)</a>	Waits for the specified partial fields to appear on the screen.
 <a href="#">WaitForContent(String, Int32)</a>	Waits for the specified string to appear on the screen.
 <a href="#">WaitForContent(String[], Int32)</a>	Waits for the specified strings to appear on the screen.
 <a href="#">WaitForOutboundwork(Int32)</a>	
 <a href="#">WaitForSession(SessionDisplayWaitType, Int32)</a>	Waits for the session to enter the specified state.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# SessionDisplay Members

Represents a virtual 3270 screen.

The following tables list the members exposed by the [SessionDisplay](#) type.

## Public Constructors

Name	Description
<a href="#">SessionDisplay</a>	Overloaded. Initializes a new instance of the <a href="#">SessionDisplay</a> class using default values.

## Top

## Public Properties

Name	Description
 <a href="#">Columns</a>	Gets the number of columns on the screen.
 <a href="#">Connection</a>	Gets the underlying SessionConnectionDisplay object associated with the session.
 <a href="#">CurrentField</a>	Gets the current field where the cursor is located.
 <a href="#">Cursor</a>	Gets the cursor.
 <a href="#">IsConnected</a>	Gets a value that determines if there is an underlying Connection object.
 <a href="#">IsScreenClear</a>	Gets a value that determines if the screen is clear.
 <a href="#">OIA</a>	Gets the Operator Information Area (OIA) for the current screen.
 <a href="#">Rows</a>	Gets the number of rows on the current screen.

## Top

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Connect</a>	Overloaded. Initializes a LU2 session using the specified connection.
 <a href="#">Disconnect</a>	Disconnect from a previously-connected session.
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">ExecuteScript</a>	Walks through the script on the current session.
 <a href="#">GetField</a>	Overloaded. Returns a field from the screen which matches one of the conditions provided by the parameters.
 <a href="#">GetFields</a>	Overloaded. Retrieves a collection of fields from the screen based on the specified parameters.
 <a href="#">GetFieldsByColumn</a>	Overloaded. Retrieves a collection of fields from the screen based on the specified column.
 <a href="#">GetFieldsByRow</a>	Overloaded. Retrieves the fields in the specified row.
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetScreenData</a>	Overloaded. Retrieves 3270 screen data based on the specified screen locations.
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">MoveCursor</a>	Overloaded. Moves the cursor to the specified location.
 <a href="#">MoveNextField</a>	Overloaded. Advances the cursor to another field and returns that field.
 <a href="#">MovePreviousField</a>	Overloaded. Moves the cursor back through the specified fields and returns that field.
 <a href="#">MoveToField</a>	Overloaded. Moves the cursor to a specified field and returns that field.
  <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">SendKey</a>	Overloaded.
 <a href="#">ToString</a>	Overridden. Translates the current instance into a string.
 <a href="#">WaitForContent</a>	Overloaded. Waits for the specified fields, partial fields, or search strings to appear on the screen.
 <a href="#">WaitForSession</a>	Waits for the session to enter the specified state.

## Top

## Protected Methods

Name	Description
 <a href="#">Finalize</a>	Overridden. Allows SessionDisplay to attempt to free resources and perform other cleanup operations before SessionDisplay is reclaimed by garbage collection.
 <a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )

### SessionDisplay Constructor (SessionConnectionDisplay)

Creates a new [SessionDisplay](#) object using the specified connection

Syntax

C#

```
public SessionDisplay(  
    SessionConnectionDisplay connection  
)
```

C++

```
public:  
SessionDisplay(  
    SessionConnectionDisplay^ connection  
)
```

F#

```
new :  
    connection:SessionConnectionDisplay -> SessionDisplay
```

VB

```
Public Sub New (  
    connection As SessionConnectionDisplay  
)
```

#### Parameters

*connection*

Type: [Microsoft.HostIntegration.SNA.Session.SessionConnectionDisplay](#)

The session connection to use.

[Return to top](#)

# SessionDisplay Constructor ()

Creates a new instance of the [SessionDisplay](#) class.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public SessionDisplay ()
```

C++

```
public:  
SessionDisplay ()
```

J#

```
public SessionDisplay ()
```

JScript

```
public function SessionDisplay ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## SessionDisplay.Connect Method (SessionConnectionDisplay)

Initializes a LU2 session using the specified connection object.

Syntax

C#

```
public void Connect(  
    SessionConnectionDisplay connection  
)
```

C++

```
public:  
void Connect(  
    SessionConnectionDisplay^ connection  
)
```

F#

```
member Connect :  
    connection:SessionConnectionDisplay -> unit
```

VB

```
Public Sub Connect (  
    connection As SessionConnectionDisplay  
)
```

## Parameters

*connection*

Type: [Microsoft.HostIntegration.SNA.Session.SessionConnectionDisplay](#)

The connection object containing the connection information.

[Return to top](#)

## SessionDisplay.Connect Method (String)

Initializes a LU2 session using the specified connection string.

Syntax

C#

```
public void Connect(  
    string connectionString  
)
```

C++

```
public:
void Connect(
    String^ connectionString
)
```

F#

```
member Connect :
    connectionString:string -> unit
```

VB

```
Public Sub Connect (
    connectionString As String
)
```

#### Parameters

*connectionString*

Type: [System.String](#)

The connection string containing the connection information.

[Return to top](#)

# SessionDisplay.Connect Method (SessionConnectionDisplay)

Initializes a LU2 session using the specified connection object.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Connect ( _
    connection As SessionConnectionDisplay _
)
```

C#

```
public void Connect (
    SessionConnectionDisplay connection
)
```

C++

```
public:
void Connect (
    SessionConnectionDisplay^ connection
)
```

J#

```
public void Connect (
    SessionConnectionDisplay connection
)
```

JScript

```
public function Connect (
    connection : SessionConnectionDisplay
)
```

## Parameters

connection

The connection object containing the connection information.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# SessionDisplay.Connect Method (String)

Initializes a LU2 session using the specified connection string.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Connect ( _
    connectionString As String _
)
```

C#

```
public void Connect (
    string connectionString
)
```

C++

```
public:
void Connect (
    String^ connectionString
)
```

J#

```
public void Connect (
    String connectionString
)
```

JScript

```
public function Connect (
    connectionString : String
)
```

## Parameters

connectionString

The connection string containing the connection information.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

See Also

## Reference

[SessionDisplay Class](#)

[SessionDisplay Members](#)

[Microsoft.HostIntegration.SNA.Session Namespace](#)

# SessionDisplay.Disconnect Method

Disconnect from a previously-connected session.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub Disconnect
```

C#

```
public void Disconnect ()
```

C++

```
public:  
void Disconnect ()
```

J#

```
public void Disconnect ()
```

JScript

```
public function Disconnect ()
```

Remarks

After this call completes, successfully or otherwise, the application must call the Connect method in order to establish a session.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

# SessionDisplay.ExecuteScript Method

Walks through the script on the current session.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub ExecuteScript ( _
    script As SessionDisplayScript _
)
```

C#

```
public void ExecuteScript (
    SessionDisplayScript script
)
```

C++

```
public:
void ExecuteScript (
    SessionDisplayScript^ script
)
```

J#

```
public void ExecuteScript (
    SessionDisplayScript script
)
```

JScript

```
public function ExecuteScript (
    script : SessionDisplayScript
)
```

## Parameters

script

The script to execute.

Remarks

ExecuteScript uses SessionDisplayScript to walk through the script on the current session.

Any problem in the script throws a ScriptError exception. The InnerException will contain the actual problem with the script.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

### SessionDisplay.GetField Method (Int16, Int16)

Returns a field from the screen using the specified row and column.

## Syntax

C#

```
public ScreenField GetField(  
    short row,  
    short column  
)
```

C++

```
public:  
ScreenField^ GetField(  
    short row,  
    short column  
)
```

F#

```
member GetField :  
    row:int16 *  
    column:int16 -> ScreenField
```

VB

```
Public Function GetField (  
    row As Short,  
    column As Short  
) As ScreenField
```

---

## Parameters

*row*

Type: [System.Int16](#)

The row of the field to return.

*column*

Type: [System.Int16](#)

The column of the field to return.

## Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that starts at the specified row and column.

[Return to top](#)

## SessionDisplay.GetField Method (Int16, Int16, ScreenFieldAttributeData)

Returns a field from the screen using the specified row, column, and field attribute.

Syntax

C#

```
public ScreenField GetField(  
    short row,  
    short column,  
    ScreenFieldAttributeData attributes  
)
```

C++

```
public:  
ScreenField^ GetField(  
    short row,  
    short column,  
    ScreenFieldAttributeData^ attributes  
)
```

F#

```
member GetField :  
    row:int16 *  
    column:int16 *  
    attributes:ScreenFieldAttributeData -> ScreenField
```

VB

```
Public Function GetField (  
    row As Short,  
    column As Short,  
    attributes As ScreenFieldAttributeData  
) As ScreenField
```

## Parameters

*row*

Type: [System.Int16](#)

The row to begin the search on.

*column*

Type: [System.Int16](#)

The column to begin the search on.

*attributes*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldAttributeData](#)

The field attributes to search on.

## Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The first field at or after the starting row and column position that contains the specified field attributes.

[Return to top](#)

#### **SessionDisplay.GetField Method (ScreenPosition)**

Returns a field from the screen using the specified position.

Syntax

C#

```
public ScreenField GetField(  
    ScreenPosition position  
)
```

C++

```
public:  
ScreenField^ GetField(  
    ScreenPosition^ position  
)
```

F#

```
member GetField :  
    position:ScreenPosition -> ScreenField
```

VB

```
Public Function GetField (  
    position As ScreenPosition  
) As ScreenField
```

#### **Parameters**

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The starting position of the field to return.

#### **Return Value**

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that starts at the specified position.

[Return to top](#)

#### **SessionDisplay.GetField Method (ScreenPosition, ScreenFieldAttributeData)**

Returns a field from the screen using the specified starting position and field attribute.

Syntax

C#

```
public ScreenField GetField(  
    ScreenPosition position,  
    ScreenFieldAttributeData attributes  
)
```

C++

```
public:  
ScreenField^ GetField(  
    ScreenPosition^ position,  
    ScreenFieldAttributeData^ attributes  
)
```

F#

```
member GetField :  
    position:ScreenPosition *  
    attributes:ScreenFieldAttributeData -> ScreenField
```

VB

```
Public Function GetField (  
    position As ScreenPosition,  
    attributes As ScreenFieldAttributeData  
) As ScreenField
```

#### Parameters

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position on the screen to begin searching.

*attributes*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldAttributeData](#)

The attributes to search the screen on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The first field at or after the starting position that contains the specified field attributes.

[Return to top](#)

#### SessionDisplay.GetField Method (String)

Returns a field from the screen using the specified search value.

Syntax

C#

```
public ScreenField GetField(  
    string searchText  
)
```

C++

```
public:  
ScreenField^ GetField(  
    String^ searchText  
)
```

F#

```
member GetField :  
    searchText:string -> ScreenField
```

VB

```
Public Function GetField (  
    searchText As String  
) As ScreenField
```

#### Parameters

*searchText*

Type: [System.String](#)

the value to search the screen for.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that contains the specified search value.

[Return to top](#)

#### SessionDisplay.GetField Method (String, Int16, Int16)

Returns a field value from the screen using the specified search value, row position, and column position.

Syntax

C#

```
public ScreenField GetField(  

```

```
string searchText,  
short row,  
short column  
)
```

C++

```
public:  
ScreenField^ GetField(  
String^ searchText,  
short row,  
short column  
)
```

F#

```
member GetField :  
    searchText:string *  
    row:int16 *  
    column:int16 -> ScreenField
```

VB

```
Public Function GetField (  
    searchText As String,  
    row As Short,  
    column As Short  
) As ScreenField
```

#### Parameters

*searchText*

Type: [System.String](#)

The string value to search on.

*row*

Type: [System.Int16](#)

The row to begin the search on.

*column*

Type: [System.Int16](#)

The column to begin the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The first field at or after the specified row and column position that contains the search value.

[Return to top](#)

#### SessionDisplay.GetField Method (String, ScreenPosition)

Returns a field from the screen using the specified search value and position.

Syntax

C#

```
public ScreenField GetField(  
    string searchText,  
    ScreenPosition position  
)
```

C++

```
public:  
ScreenField^ GetField(  
String^ searchText,  
ScreenPosition^ position  
)
```

F#

```
member GetField :  
    searchText:string *  
    position:ScreenPosition -> ScreenField
```

VB

```
Public Function GetField (  
    searchText As String,  
    position As ScreenPosition  
) As ScreenField
```

#### Parameters

*searchText*

Type: [System.String](#)

The string value to search on.

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position on the screen to begin searching.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The first field at or after the starting position that contains the specified search value.

[Return to top](#)

# SessionDisplay.GetField Method (ScreenPosition)

Returns a field from the screen using the specified position.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function GetField ( _
    position As ScreenPosition _
) As ScreenField
```

C#

```
public ScreenField GetField (
    ScreenPosition position
)
```

C++

```
public:
ScreenField^ GetField (
    ScreenPosition^ position
)
```

J#

```
public ScreenField GetField (
    ScreenPosition position
)
```

JScript

```
public function GetField (
    position : ScreenPosition
) : ScreenField
```

## Parameters

position

The starting position of the field to return.

## Return Value

The field that starts at the specified position.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

```

VB

```
Public Function GetFieldsByColumn (  
    column As Short,  
    startingRow As Short  
) As ScreenFieldCollection
```

#### Parameters

*column*

Type: [System.Int16](#)

The position of the column to search on.

*startingRow*

Type: [System.Int16](#)

The row to start the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByColumn Method (Int16, Int16, Int16)

Retrieves all fields from the specified column, starting at the specified row, and ending at the specified row.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByColumn(  

```

```

short column,
short startingRow,
short endingRow
)

```

C++

```

public:
ScreenFieldCollection^ GetFieldsByColumn(
short column,
short startingRow,
short endingRow
)

```

F#

```

member GetFieldsByColumn :
    column:int16 *
    startingRow:int16 *
    endingRow:int16 -> ScreenFieldCollection

```

VB

```

Public Function GetFieldsByColumn (
    column As Short,
    startingRow As Short,
    endingRow As Short
) As ScreenFieldCollection

```

#### Parameters

*column*

Type: [System.Int16](#)

The position of the column to search on.

*startingRow*

Type: [System.Int16](#)

The row to start the search on.

*endingRow*

Type: [System.Int16](#)

The row to end the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByColumn Method (Int16, Int16, Int16, String)

Retrieves all fields from the specified column, starting at the specified row, and ending at either the specified row or when the specified data is found.

Syntax

C#

```

public ScreenFieldCollection GetFieldsByColumn(
short column,
short startingRow,
short endingRow,
string endData
)

```

C++

```

public:
ScreenFieldCollection^ GetFieldsByColumn(
short column,

```

```
short startingRow,  
short endingRow,  
String^ endData  
)
```

F#

```
member GetFieldsByColumn :  
    column:int16 *

    endingRow:int16 *  
    endData:string -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByColumn (  
    column As Short,  
    startingRow As Short,  
    endingRow As Short,  
    endData As String  
) As ScreenFieldCollection
```

#### Parameters

*column*

Type: [System.Int16](#)

The position of the column to search on.

*startingRow*

Type: [System.Int16](#)

The row to start the search on.

*endingRow*

Type: [System.Int16](#)

The row to end the search on.

*endData*

Type: [System.String](#)

The data to end the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### **SessionDisplay.GetFieldsByColumn Method (Int16, Int16, String)**

Retrieves all fields from the specified column, starting at the specified row, and ending when the specified data is found.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByColumn(  
    short column,  
    short startingRow,  
    string endData  
)
```

C++

```
public:  
ScreenFieldCollection^ GetFieldsByColumn(  
    short column,  
    short startingRow,  
    String^ endData  
)
```

F#

```
member GetFieldsByColumn :  
    column:int16 *  
    startingRow:int16 *  
    endData:string -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByColumn (  
    column As Short,  
    startingRow As Short,  
    endData As String  
) As ScreenFieldCollection
```

#### Parameters

*column*

Type: [System.Int16](#)

The position of the column to search on.

*startingRow*

Type: [System.Int16](#)

The row to start the search on.

*endData*

Type: [System.String](#)

The data to end the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByColumn Method (Int16, String)

Retrieves all fields from the screen based on the specified column and end data.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByColumn(  
    short column,  
    string endData  
)
```

C++

```
public:  
ScreenFieldCollection^ GetFieldsByColumn(  
    short column,  
    String^ endData  
)
```

F#

```
member GetFieldsByColumn :  
    column:int16 *  
    endData:string -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByColumn (  
    column As Short,  
    endData As String  
) As ScreenFieldCollection
```

#### Parameters

*column*

Type: [System.Int16](#)

The position of the column to search on.

*endData*

Type: [System.String](#)

The data to end the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByColumn Method (String, Int16)

Retrieves all fields from the specified column that contain the specified data.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByColumn(  
    string searchText,  
    short column  
)
```

C++

```
public:  
ScreenFieldCollection^ GetFieldsByColumn(  
    String^ searchText,  
    short column  
)
```

F#

```
member GetFieldsByColumn :  
    searchText:string *  
    column:int16 -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByColumn (  
    searchText As String,  
    column As Short  
) As ScreenFieldCollection
```

#### Parameters

*searchText*

Type: [System.String](#)

The data to search on.

*column*

Type: [System.Int16](#)

The position of the column to search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByColumn Method (String, Int16, Int16)

Retrieves all fields from the specified column that contain the specified data, starting at the specified row.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByColumn(  

```

```

string searchText,
short column,
short startingRow
)

```

C++

```

public:
ScreenFieldCollection^ GetFieldsByColumn(
String^ searchText,
short column,
short startingRow
)

```

F#

```

member GetFieldsByColumn :
    searchText:string *
    column:int16 *
    startingRow:int16 -> ScreenFieldCollection

```

VB

```

Public Function GetFieldsByColumn (
    searchText As String,
    column As Short,
    startingRow As Short
) As ScreenFieldCollection

```

#### Parameters

*searchText*

Type: [System.String](#)

The data to search on.

*column*

Type: [System.Int16](#)

The position of the column to search on.

*startingRow*

Type: [System.Int16](#)

The row to start the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByColumn Method (String, Int16, Int16, Int16)

Retrieves all fields from the specified column that contain the specified data, starting at the specified row, and ending at the specified row.

Syntax

C#

```

public ScreenFieldCollection GetFieldsByColumn(
    string searchText,
    short column,
    short startingRow,
    short endingRow
)

```

C++

```

public:
ScreenFieldCollection^ GetFieldsByColumn(
String^ searchText,

```

```
short column,  
short startingRow,  
short endingRow  
)
```

F#

```
member GetFieldsByColumn :  
    searchText:string *  
    column:int16 *  
    startingRow:int16 *  
    endingRow:int16 -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByColumn (  
    searchText As String,  
    column As Short,  
    startingRow As Short,  
    endingRow As Short  
) As ScreenFieldCollection
```

#### Parameters

*searchText*

Type: [System.String](#)

The data to search

*column*

Type: [System.Int16](#)

The position of the column to search on.

*startingRow*

Type: [System.Int16](#)

The row to begin the search on.

*endingRow*

Type: [System.Int16](#)

The row to end the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

# SessionDisplay.GetFieldsByColumn Method (Int16)

Retrieves all fields from the specified column.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function GetFieldsByColumn ( _
    column As Short _
) As ScreenFieldCollection
```

C#

```
public ScreenFieldCollection GetFieldsByColumn (
    short column
)
```

C++

```
public:
ScreenFieldCollection^ GetFieldsByColumn (
    short column
)
```

J#

```
public ScreenFieldCollection GetFieldsByColumn (
    short column
)
```

JScript

```
public function GetFieldsByColumn (
    column : short
) : ScreenFieldCollection
```

## Parameters

column

The position of the column to search on.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

### SessionDisplay.GetFieldsByRow Method (Int16)

Retrieves all fields in the specified row.

#### Syntax

```
C#  
  
public ScreenFieldCollection GetFieldsByRow(  
    short row  
)
```

```
C++  
  
public:  
ScreenFieldCollection^ GetFieldsByRow(  
    short row  
)
```

```
F#  
  
member GetFieldsByRow :  
    row:int16 -> ScreenFieldCollection
```

```
VB  
  
Public Function GetFieldsByRow (  
    row As Short
```

```
) As ScreenFieldCollection
```

#### Parameters

*row*

Type: [System.Int16](#)

The position of the row to search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByRow Method (Int16, Int16)

Retrieves all fields in the specified row, starting at the specified column.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByRow(  
    short row,  
    short startingColumn  
)
```

C++

```
public:  
ScreenFieldCollection^ GetFieldsByRow(  
    short row,  
    short startingColumn  
)
```

F#

```
member GetFieldsByRow :  
    row:int16 *  
    startingColumn:int16 -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByRow (  
    row As Short,  
    startingColumn As Short  
) As ScreenFieldCollection
```

#### Parameters

*row*

Type: [System.Int16](#)

The position of the row to search on.

*startingColumn*

Type: [System.Int16](#)

The row to start the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByRow Method (Int16, Int16, Int16)

Retrieves all fields in the specified row, starting at the specified column, and ending at the specified column.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByRow(  
    short row,
```

```
    short startingColumn,  
    short endingColumn  
)
```

C++

```
public:  
ScreenFieldCollection^ GetFieldsByRow(  
    short row,  
    short startingColumn,  
    short endingColumn  
)
```

F#

```
member GetFieldsByRow :  
    row:int16 *  
    startingColumn:int16 *  
    endingColumn:int16 -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByRow (  
    row As Short,  
    startingColumn As Short,  
    endingColumn As Short  
) As ScreenFieldCollection
```

#### Parameters

*row*

Type: [System.Int16](#)

The position of the row to search on.

*startingColumn*

Type: [System.Int16](#)

The column to start the search on.

*endingColumn*

Type: [System.Int16](#)

The column to end the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByRow Method (Int16, Int16, Int16, String)

Retrieves all fields in the specified row, starting at the specified column, and ending at either the specified column, or else when the specified data is found.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByRow(  
    short row,  
    short startingColumn,  
    short endingColumn,  
    string endData  
)
```

C++

```
public:  
ScreenFieldCollection^ GetFieldsByRow(  
    short row,  
    short startingColumn,
```

```
    short endingColumn,  
    String^ endData  
)
```

F#

```
member GetFieldsByRow :  
    row:int16 *  
    startingColumn:int16 *  
    endingColumn:int16 *  
    endData:string -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByRow (  
    row As Short,  
    startingColumn As Short,  
    endingColumn As Short,  
    endData As String  
) As ScreenFieldCollection
```

#### Parameters

*row*

Type: [System.Int16](#)

The position of the row to search on.

*startingColumn*

Type: [System.Int16](#)

The column to start the search on.

*endingColumn*

Type: [System.Int16](#)

The column to end the search on.

*endData*

Type: [System.String](#)

The data to end the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByRow Method (Int16, Int16, String)

Retrieves all fields in the specified row, starting at the specified column, and ending when the specified data is found.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByRow(  
    short row,  
    short startingColumn,  
    string endData  
)
```

C++

```
public:  
ScreenFieldCollection^ GetFieldsByRow(  
    short row,  
    short startingColumn,  
    String^ endData  
)
```

F#

```
member GetFieldsByRow :  
    row:int16 *  
    startingColumn:int16 *  
    endData:string -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByRow (  
    row As Short,  
    startingColumn As Short,  
    endData As String  
) As ScreenFieldCollection
```

#### Parameters

*row*

Type: [System.Int16](#)

The position of the row to search on.

*startingColumn*

Type: [System.Int16](#)

The row to start the search on.

*endData*

Type: [System.String](#)

The data to end the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByRow Method (Int16, String)

Retrieves all fields in the specified row, ending at the specified data.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByRow(  
    short row,  
    string endData  
)
```

C++

```
public:  
ScreenFieldCollection^ GetFieldsByRow(  
    short row,  
    String^ endData  
)
```

F#

```
member GetFieldsByRow :  
    row:int16 *  
    endData:string -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByRow (  
    row As Short,  
    endData As String  
) As ScreenFieldCollection
```

#### Parameters

*row*

Type: [System.Int16](#)

The position of the row to search on.

*endData*

Type: [System.String](#)

The data to end the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByRow Method (String, Int16)

Retrieves all fields in the specified row that contain the specified search data.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByRow(  
    string searchText,  
    short row  
)
```

C++

```
public:  
ScreenFieldCollection^ GetFieldsByRow(  
    String^ searchText,  
    short row  
)
```

F#

```
member GetFieldsByRow :  
    searchText:string *  
    row:int16 -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByRow (  
    searchText As String,  
    row As Short  
) As ScreenFieldCollection
```

#### Parameters

*searchText*

Type: [System.String](#)

The data to search on.

*row*

Type: [System.Int16](#)

The position of the row to search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

#### SessionDisplay.GetFieldsByRow Method (String, Int16, Int16)

Retrieves all fields in the specified row that contain the specified data, starting at the specified column.

Syntax

C#

```
public ScreenFieldCollection GetFieldsByRow(  

```

```

string searchText,
short row,
short startingColumn
)

```

C++

```

public:
ScreenFieldCollection^ GetFieldsByRow(
String^ searchText,
short row,
short startingColumn
)

```

F#

```

member GetFieldsByRow :
    searchText:string *
    row:int16 *
    startingColumn:int16 -> ScreenFieldCollection

```

VB

```

Public Function GetFieldsByRow (
    searchText As String,
    row As Short,
    startingColumn As Short
) As ScreenFieldCollection

```

## Parameters

*searchText*

Type: [System.String](#)

The data to search the fields for.

*row*

Type: [System.Int16](#)

The position of the row to search on.

*startingColumn*

Type: [System.Int16](#)

The column to start the search on.

## Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

## SessionDisplay.GetFieldsByRow Method (String, Int16, Int16, Int16)

Retrieves all fields in the specified row that contain the specified data, starting at the specified column, and ending at the specified column.

Syntax

C#

```

public ScreenFieldCollection GetFieldsByRow(
    string searchText,
    short row,
    short startingColumn,
    short endingColumn
)

```

C++

```

public:
ScreenFieldCollection^ GetFieldsByRow(
String^ searchText,

```

```
short row,  
short startingColumn,  
short endingColumn  
)
```

F#

```
member GetFieldsByRow :  
    searchText:string *  
    row:int16 *  
    startingColumn:int16 *  
    endingColumn:int16 -> ScreenFieldCollection
```

VB

```
Public Function GetFieldsByRow (  
    searchText As String,  
    row As Short,  
    startingColumn As Short,  
    endingColumn As Short  
) As ScreenFieldCollection
```

### Parameters

*searchText*

Type: [System.String](#)

The data to search on.

*row*

Type: [System.Int16](#)

The position of the row to search on.

*startingColumn*

Type: [System.Int16](#)

The column to start the search on.

*endingColumn*

Type: [System.Int16](#)

The column to end the search on.

### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of fields that match the specified criteria.

[Return to top](#)

# SessionDisplay.GetFieldsByRow Method (Int16)

Retrieves all fields in the specified row.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function GetFieldsByRow ( _
    row As Short _
) As ScreenFieldCollection
```

C#

```
public ScreenFieldCollection GetFieldsByRow (
    short row
)
```

C++

```
public:
ScreenFieldCollection^ GetFieldsByRow (
    short row
)
```

J#

```
public ScreenFieldCollection GetFieldsByRow (
    short row
)
```

JScript

```
public function GetFieldsByRow (
    row : short
) : ScreenFieldCollection
```

## Parameters

row

The position of the row to search on.

## Return Value

A collection of fields that match the specified criteria.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

### SessionDisplay.GetScreenData Method (Int16, Int16, Int16)

Retrieves 3270 screen data based on the specified row, column, and data length.

Syntax

C#

```
public ScreenData GetScreenData(  
    short row,  
    short column,  
    short maximumLength  
)
```

C++

```
public:  
ScreenData^ GetScreenData(  
    short row,  
    short column,  
    short maximumLength  
)
```

F#

```
member GetScreenData :  
    row:int16 *  
    column:int16 *  
    maximumLength:int16 -> ScreenData
```

VB

```
Public Function GetScreenData (  
    row As Short,  
    column As Short,  
    maximumLength As Short  
) As ScreenData
```

## Parameters

*row*

Type: [System.Int16](#)

The row that contains the requested information.

*column*

Type: [System.Int16](#)

The column that contains the requested information.

*maxLength*

Type: [System.Int16](#)

Maximum number of screen positions returned. If 0, returns the rest of the screen.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenData](#)

The screen data at the specified location.

[Return to top](#)

#### SessionDisplay.GetScreenData Method (Int16, Int16, String)

Retrieves 3270 screen data based on the specified screen locations.

Syntax

C#

```
public ScreenData GetScreenData(  
    short row,  
    short column,  
    string searchText  
)
```

C++

```
public:  
ScreenData^ GetScreenData(  
    short row,  
    short column,  
    String^ searchText  
)
```

F#

```
member GetScreenData :  
    row:int16 *  
    column:int16 *  
    searchText:string -> ScreenData
```

VB

```
Public Function GetScreenData (  
    row As Short,  
    column As Short,  
    searchText As String  
) As ScreenData
```

#### Parameters

*row*

Type: [System.Int16](#)

The row that contains the requested information.

*column*

Type: [System.Int16](#)

The column that contains the requested information.

*searchText*

Type: [System.String](#)

The string to search for on the screen.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenData](#)

The search value, or null if the value is not found.

Remarks

The search value should not attempt to cross field boundaries on the screen.

[Return to top](#)

# SessionDisplay.GetScreenData Method (Int16, Int16, Int16)

Retrieves 3270 screen data based on the specified row, column, and data length.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function GetScreenData ( _
    row As Short, _
    column As Short, _
    maximumLength As Short _
) As ScreenData
```

C#

```
public ScreenData GetScreenData (
    short row,
    short column,
    short maximumLength
)
```

C++

```
public:
ScreenData^ GetScreenData (
    short row,
    short column,
    short maximumLength
)
```

J#

```
public ScreenData GetScreenData (
    short row,
    short column,
    short maximumLength
)
```

JScript

```
public function GetScreenData (
    row : short,
    column : short,
    maximumLength : short
) : ScreenData
```

## Parameters

row

The row that contains the requested information.

column

The column that contains the requested information.

maximumLength

Maximum number of screen positions returned. If 0, returns the rest of the screen.

## Return Value

The screen data at the specified location.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

[Return to top](#)

## SessionDisplay.MoveNextField Method (Int32)

Advances the cursor the number of fields specified and returns that field.

Syntax

C#

```
public ScreenField MoveNextField(  
    int numberOfFields  
)
```

C++

```
public:
```

```
ScreenField^ MoveNextField(  
    int numberOfFields  
)
```

F#

```
member MoveNextField :  
    numberOfFields:int -> ScreenField
```

VB

```
Public Function MoveNextField (  
    numberOfFields As Integer  
) As ScreenField
```

#### Parameters

*numberOfFields*

Type: [System.Int32](#)

The number of fields to advance the cursor through.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that now has the cursor.

[Return to top](#)

#### SessionDisplay.MoveNextField Method (ScreenFieldAttributeData)

Advances the cursor to the next field that contains the specified attributes and returns that field.

Syntax

C#

```
public ScreenField MoveNextField(  
    ScreenFieldAttributeData attributes  
)
```

C++

```
public:  
ScreenField^ MoveNextField(  
    ScreenFieldAttributeData^ attributes

    ScreenFieldAttributeData attributes,
    int numberOfFields
)
```

JScript

```
public function MovePreviousField (
    attributes : ScreenFieldAttributeData,
    numberOfFields : int
) : ScreenField
```

## Parameters

attributes

The attributes of the fields to move the cursor through.

numberOfFields

The number of fields to move the cursor through.

## Return Value

The field that currently has the cursor.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**SessionDisplay.MoveToField Method (Int16, Int16)**

Moves the cursor to the field at the specified row and column, and returns that field.

## Syntax

```
C#  
  
public ScreenField MoveToField(  
    short row,  
    short column  
)
```

```
C++  
  
public:  
ScreenField^ MoveToField(  
    short row,  
    short column  
)
```

```
F#  
  
member MoveToField :  
    row:int16 *  
    column:int16 -> ScreenField
```

```
VB  
  
Public Function MoveToField (
```

```
row As Short,  
column As Short  
) As ScreenField
```

#### Parameters

*row*

Type: [System.Int16](#)

The row of the field to move the cursor to.

*column*

Type: [System.Int16](#)

The column of the field to move the cursor to.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that currently has the cursor.

[Return to top](#)

#### SessionDisplay.MoveToField Method (Int16, Int16, ScreenFieldAttributeData)

Moves the cursor to the first field at or after the specified location that contains the specified attributes, and returns that field.

Syntax

C#

```
public ScreenField MoveToField(  
    short row,  
    short column,  
    ScreenFieldAttributeData attributes  
)
```

C++

```
public:  
ScreenField^ MoveToField(  
    short row,  
    short column,  
    ScreenFieldAttributeData^ attributes  
)
```

F#

```
member MoveToField :  
    row:int16 *  
    column:int16 *  
    attributes:ScreenFieldAttributeData -> ScreenField
```

VB

```
Public Function MoveToField (  
    row As Short,  
    column As Short,  
    attributes As ScreenFieldAttributeData  
) As ScreenField
```

#### Parameters

*row*

Type: [System.Int16](#)

The row to start the search on.

*column*

Type: [System.Int16](#)

The column to start the search on.

*attributes*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldAttributeData](#)

The field attributes to search on

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that currently has the cursor.

[Return to top](#)

#### SessionDisplay.MoveToField Method (ScreenPosition)

Moves the cursor to a the field at the specified position and returns that field.

Syntax

C#

```
public ScreenField MoveToField(  
    ScreenPosition position  
)
```

C++

```
public:  
ScreenField^ MoveToField(  
    ScreenPosition^ position  
)
```

F#

```
member MoveToField :  
    position:ScreenPosition -> ScreenField
```

VB

```
Public Function MoveToField (  
    position As ScreenPosition  
) As ScreenField
```

#### Parameters

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position of the field.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that currently has the cursor.

[Return to top](#)

#### SessionDisplay.MoveToField Method (ScreenPosition, ScreenFieldAttributeData)

Moves the cursor to the first field at or after the specified position that contains the specified attributes, and returns that field.

Syntax

C#

```
public ScreenField MoveToField(  
    ScreenPosition position,  
    ScreenFieldAttributeData attributes  
)
```

C++

```
public:  
ScreenField^ MoveToField(  
    ScreenPosition^ position,  
    ScreenFieldAttributeData^ attributes  
)
```

F#

```
member MoveToField :  
    position:ScreenPosition *  
    attributes:ScreenFieldAttributeData -> ScreenField
```

VB

```
Public Function MoveToField (  
    position As ScreenPosition,  
    attributes As ScreenFieldAttributeData  
) As ScreenField
```

#### Parameters

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position to start the search on.

*attributes*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldAttributeData](#)

The attributes of the field to search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that currently has the cursor.

[Return to top](#)

#### SessionDisplay.MoveToField Method (String)

Moves the cursor to the first field that contains the specified value, and returns that field.

Syntax

C#

```
public ScreenField MoveToField(  
    string searchText  
)
```

C++

```
public:  
ScreenField^ MoveToField(  
    String^ searchText  
)
```

F#

```
member MoveToField :  
    searchText:string -> ScreenField
```

VB

```
Public Function MoveToField (  
    searchText As String  
) As ScreenField
```

#### Parameters

*searchText*

Type: [System.String](#)

The value to

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that currently has the cursor.

[Return to top](#)

#### SessionDisplay.MoveToField Method (String, Int16, Int16)

Moves the cursor to the first field at or after the specified location that contains the specified value, and returns that field.

Syntax

C#

```
public ScreenField MoveToField(  
    string searchText,  
    short row,  
    short column  
)
```

C++

```
public:  
ScreenField^ MoveToField(  
    String^ searchText,  
    short row,  
    short column  
)
```

F#

```
member MoveToField :  
    searchText:string *  
    row:int16 *  
    column:int16 -> ScreenField
```

VB

```
Public Function MoveToField (  
    searchText As String,  
    row As Short,  
    column As Short  
) As ScreenField
```

#### Parameters

*searchText*

Type: [System.String](#)

The value to search on.

*row*

Type: [System.Int16](#)

The row to start the search on.

*column*

Type: [System.Int16](#)

The column to start the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that currently has the cursor.

[Return to top](#)

#### **SessionDisplay.MoveToField Method (String, ScreenPosition)**

Moves the cursor to the first field at or after the specified position that contains the specified value, and returns that field.

Syntax

C#

```
public ScreenField MoveToField(  
    string searchText,  
    ScreenPosition position  
)
```

C++

```
public:
ScreenField^ MoveToField(
    String^ searchText,
    ScreenPosition^ position
)
```

F#

```
member MoveToField :
    searchText:string *
    position:ScreenPosition -> ScreenField
```

VB

```
Public Function MoveToField (
    searchText As String,
    position As ScreenPosition
) As ScreenField
```

#### Parameters

*searchText*

Type: [System.String](#)

The value to search on.

*position*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPosition](#)

The position to start the search on.

#### Return Value

Type: [Microsoft.HostIntegration.SNA.Session.ScreenField](#)

The field that currently has the cursor.

[Return to top](#)

# SessionDisplay.MoveToField Method (ScreenPosition)

Moves the cursor to a the field at the specified position and returns that field.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function MoveToField ( _
    position As ScreenPosition _
) As ScreenField
```

C#

```
public ScreenField MoveToField (
    ScreenPosition position
)
```

C++

```
public:
ScreenField^ MoveToField (
    ScreenPosition^ position
)
```

J#

```
public ScreenField MoveToField (
    ScreenPosition position
)
```

JScript

```
public function MoveToField (
    position : ScreenPosition
) : ScreenField
```

## Parameters

position

The position of the field.

## Return Value

The field that currently has the cursor.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

```
public int WaitForContent(  
    ScreenFieldCollection fields,  
    int timeout  
)
```

C++

```
public:  
int WaitForContent(  
    ScreenFieldCollection^ fields,  
    int timeout  
)
```

F#

```
member WaitForContent :  
    fields:ScreenFieldCollection *  
    timeout:int -> int
```

VB

```
Public Function WaitForContent (  
    fields As ScreenFieldCollection,  
    timeout As Integer  
) As Integer
```

## Parameters

*fields*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenFieldCollection](#)

A collection of ScreenField objects containing information about the fields to be looked for.

*timeout*

Type: [System.Int32](#)

The amount of time in milliseconds to wait before timing out.

**Return Value**

Type: [System.Int32](#)

The array index of the partial field that satisfied the wait.

[Return to top](#)

**SessionDisplay.WaitForContent Method (ScreenPartialFieldCollection, Int32)**

Waits for the specified partial fields to appear on the screen.

Syntax

C#

```
public int WaitForContent(  
    ScreenPartialFieldCollection partialFields,  
    int timeout  
)
```

C++

```
public:  
int WaitForContent(  
    ScreenPartialFieldCollection^ partialFields,  
    int timeout  
)
```

F#

```
member WaitForContent :  
    partialFields:ScreenPartialFieldCollection *  
    timeout:int -> int
```

VB

```
Public Function WaitForContent (  
    partialFields As ScreenPartialFieldCollection,  
    timeout As Integer  
) As Integer
```

**Parameters**

*partialFields*

Type: [Microsoft.HostIntegration.SNA.Session.ScreenPartialFieldCollection](#)

A collection of ScreenPartialField objects containing information about the partial fields to be looked for.

*timeout*

Type: [System.Int32](#)

The amount of time in milliseconds to wait before timing out.

**Return Value**

Type: [System.Int32](#)

The array index of the partial field that satisfied the wait.

[Return to top](#)

**SessionDisplay.WaitForContent Method (String, Int32)**

Waits for the specified string to appear on the screen.

Syntax

C#

```
public void WaitForContent(  
    string searchText,  
    int timeout  
)
```

C++

```
public:  
void WaitForContent(  

```

```
String^ searchText,  
int timeout  
)
```

F#

```
member WaitForContent :  
    searchText:string *  
    timeout:int -> unit
```

VB

```
Public Sub WaitForContent (  
    searchText As String,  
    timeout As Integer  
)
```

#### Parameters

*searchText*

Type: [System.String](#)

The search string to look for on the display.

*timeout*

Type: [System.Int32](#)

The amount of time in milliseconds to wait before timing out.

[Return to top](#)

#### **SessionDisplay.WaitForContent Method (String[], Int32)**

Waits for the specified strings to appear on the screen.

Syntax

C#

```
public int WaitForContent(  
    string[] searchTexts,  
    int timeout  
)
```

C++

```
public:  
int WaitForContent(  
    array<String^>^ searchTexts,  
    int timeout  
)
```

F#

```
member WaitForContent :  
    searchTexts:string[] *  
    timeout:int -> int
```

VB

```
Public Function WaitForContent (  
    searchTexts As String(),  
    timeout As Integer  
) As Integer
```

#### Parameters

*searchTexts*

Type: [System.String](#)

An array of search string to look for anywhere on the display.

*timeout*

Type: [System.Int32](#)

The amount of time in milliseconds to wait before timing out.

**Return Value**

Type: [System.Int32](#)

The array index of the string that satisfied the wait.

[Return to top](#)

# SessionDisplay.WaitForContent Method (ScreenFieldCollection, Int32)

Waits for the information in the specified partial fields to appear on the screen.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function WaitForContent ( _
    fields As ScreenFieldCollection, _
    timeout As Integer _
) As Integer
```

C#

```
public int WaitForContent (
    ScreenFieldCollection fields,
    int timeout
)
```

C++

```
public:
int WaitForContent (
    ScreenFieldCollection^ fields,
    int timeout
)
```

J#

```
public int WaitForContent (
    ScreenFieldCollection fields,
    int timeout
)
```

JScript

```
public function WaitForContent (
    fields : ScreenFieldCollection,
    timeout : int
) : int
```

## Parameters

fields

A collection of ScreenField objects containing information about the fields to be looked for.

timeout

The amount of time in milliseconds to wait before timing out.

## Return Value

The array index of the partial field that satisfied the wait.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionDisplayScript Class

Programmatically accesses scripts created for the Microsoft Host Integration Server 3270 client.

**Namespace:** [Microsoft.HostIntegration.SNA.Session](#)

**Assembly:** Microsoft.HostIntegration.SNA.Session (in Microsoft.HostIntegration.SNA.Session.dll)

Inheritance Hierarchy [System.Object](#)

**Microsoft.HostIntegration.SNA.Session.SessionDisplayScript**

Syntax

C#

```
public class SessionDisplayScript
```

C++

```
public ref class SessionDisplayScript
```

F#

```
type SessionDisplayScript = class end
```

VB

```
Public Class SessionDisplayScript
```

Constructors

Name	Description
 <a href="#">SessionDisplayScript(FileInfo)</a>	Creates a new instance of the <b>SessionDisplayScript</b> class, using the specified script file.
 <a href="#">SessionDisplayScript(FileInfo, SessionDisplayVariableCollection)</a>	Creates a new instance of the <b>SessionDisplayScript</b> class, using the specified script file and variables.

Properties

Name	Description
 <a href="#">ScriptFile</a>	Gets or sets the underlying script file.
 <a href="#">ScriptVariables</a>	Gets or sets the underlying variable collection used when playing the script.

Methods

Name	Description
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Parse()</a>	Parses and validates the script.
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

Remarks

A Host Integration Server script can implement variables using a double percent sign on each end of the name, such as %%MYVARIABLE%%. These script variables are resolved using SessionDisplayVariableCollection.

SessionDisplayScript can translate environment variables that use standard script notation.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

### SessionDisplayScript Constructor (FileInfo)

Creates a new instance of the [SessionDisplayScript](#) class, using the specified script file.

## Syntax

C#

```
public SessionDisplayScript(
    FileInfo scriptFile
)
```

C++

```
public:
    SessionDisplayScript(
        FileInfo^ scriptFile
    )
```

F#

```
new :
    scriptFile:FileInfo -> SessionDisplayScript
```

VB

```
Public Sub New (
    scriptFile As FileInfo
)
```

## Parameters

*scriptFile*

Type: [System.IO.FileInfo](#)

The script file to access programmatically.

[Return to top](#)

### SessionDisplayScript Constructor (FileInfo, SessionDisplayVariableCollection)

Creates a new instance of the [SessionDisplayScript](#) class, using the specified script file and variables.

## Syntax

C#

```
public SessionDisplayScript(
    FileInfo scriptFile,
    SessionDisplayVariableCollection scriptVariables
)
```

```
)
```

C++

```
public:
SessionDisplayScript(
    FileInfo^ scriptFile,
    SessionDisplayVariableCollection^ scriptVariables
)
```

F#

```
new :
    scriptFile:FileInfo *
    scriptVariables:SessionDisplayVariableCollection -> SessionDisplayScript
```

VB

```
Public Sub New (
    scriptFile As FileInfo,
    scriptVariables As SessionDisplayVariableCollection
)
```

#### Parameters

*scriptFile*

Type: [System.IO.FileInfo](#)

The script file to access programmatically.

*scriptVariables*

Type: [Microsoft.HostIntegration.SNA.Session.SessionDisplayVariableCollection](#)

The collection of variables to use in the script file.

[Return to top](#)

# SessionDisplayScript Constructor (FileInfo)

# SessionDisplayScript.Parse Method

Parses and validates the script.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub Parse
```

C#

```
public void Parse ()
```

C++

```
public:  
void Parse ()
```

J#

```
public void Parse ()
```

JScript

```
public function Parse ()
```

Remarks

You can use Parse to ensure that the script and variables are correct prior to playing the script with the Play method.

A SessionException will be thrown if the script doesn't pass the validation. The InnerException should contain the actual information about the parse problem.

**Microsoft.HostIntegration.SNA.Session.SessionDisplayVariableCollection**

Syntax

C#

```
public class SessionDisplayVariableCollection
```

C++

```
public ref class SessionDisplayVariableCollection
```

F#

```
type SessionDisplayVariableCollection = class end
```

VB

```
Public Class SessionDisplayVariableCollection
```

Constructors

	Name	Description
	<a href="#">SessionDisplayVariableCollection(String)</a>	Creates a new instance of the <b>SessionDisplayVariableCollection</b> using the specified name=value pairs.

Properties

	Name	Description
	<a href="#">Count</a>	Gets the number of key/value pairs in the collection.
	<a href="#">Item(String)</a>	Gets the value associated with the specified name from the current instance.

Methods

	Name	Description
	<a href="#">Add(String, String)</a>	Adds a single-named value to the collection.
	<a href="#">Clear()</a>	Clears the collection.
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Remove(String)</a>	Removes the specified variable from the collection.
	<a href="#">ToString()</a>	Returns the current collection as a string value.(Overrides <a href="#">Object.ToString()</a> .)

Remarks

SessionDisplayVariableCollection is designed to be used with SessionDisplayScript to provide variables that can be replaced in a script.

	<a href="#">SessionException(SessionStatus, Exception)</a>	Creates a new instance of the <b>SessionException</b> class using the specified status and Exception as "InnerException".
	<a href="#">SessionException(String)</a>	Creates a new instance of the <b>SessionException</b> class using the string as the Message property.
	<a href="#">SessionException(String, Exception)</a>	Creates a new instance of the <b>SessionException</b> class using the string as Message and exception as InnerException.

## Properties

	Name	Description
	<a href="#">Data</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">ErrorCode</a>	Retrieves the error code.

	<a href="#">HelpLink</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">HResult</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">InnerException</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">Message</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">Source</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">StackTrace</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">TargetSite</a>	(Inherited from <a href="#">Exception</a> .)

#### Methods

	Name	Description
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">EvaluateHR(Int32)</a>	Evaluates the HR.
	<a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetBaseException()</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetObjectData(SerializationInfo, StreamingContext)</a>	Applies to Serialization only.(Overrides <a href="#">Exception.GetObjectData(SerializationInfo, StreamingContext)</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Exception</a> .)
	<a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">ToString()</a>	(Inherited from <a href="#">Exception</a> .)

#### Events

	Name	Description
	<a href="#">SerializeObjectState</a>	(Inherited from <a href="#">Exception</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## SessionException Constructor ()

Creates a new instance of the [SessionException](#) class.

## Syntax

C#

```
public SessionException()
```

C++

```
public:  
SessionException()
```

F#

```
new : unit -> SessionException
```

VB

```
Public Sub New
```

[Return to top](#)

## SessionException Constructor (SerializationInfo, StreamingContext)

Creates a new instance of the [SessionException](#) class which can be serialized.

## Syntax

C#

```
protected SessionException(  
    SerializationInfo info,  
    StreamingContext context  
)
```

C++

```
protected:
SessionException(
    SerializationInfo^ info,
    StreamingContext context
)
```

F#

```
new :
    info:SerializationInfo *
    context:StreamingContext -> SessionException
```

VB

```
Protected Sub New (
    info As SerializationInfo,
    context As StreamingContext
)
```

#### Parameters

*info*

Type: [System.Runtime.Serialization.SerializationInfo](#)  
The information.

*context*

Type: [System.Runtime.Serialization.StreamingContext](#)  
The context.

[Return to top](#)

#### SessionException Constructor (SessionStatus)

Creates a new instance of the [SessionException](#) class using the specified status.

Syntax

C#

```
public SessionException(
    SessionStatus status
)
```

C++

```
public:
SessionException(
    SessionStatus status
)
```

F#

```
new :
    status:SessionStatus -> SessionException
```

VB

```
Public Sub New (
    status As SessionStatus
)
```

#### Parameters

*status*

Type: [Microsoft.HostIntegration.SNA.Session.SessionStatus](#)  
The session status message.

[Return to top](#)

### SessionException Constructor (SessionStatus, Exception)

Creates a new instance of the [SessionException](#) class using the specified status and Exception as "InnerException".

Syntax

C#

```
public SessionException(  
    SessionStatus status,  
    Exception innerException  
)
```

C++

```
public:  
SessionException(  
    SessionStatus status,  
    Exception^ innerException  
)
```

F#

```
new :  
    status:SessionStatus *  
    innerException:Exception -> SessionException
```

VB

```
Public Sub New (  
    status As SessionStatus,  
    innerException As Exception  
)
```

### Parameters

*status*

Type: [Microsoft.HostIntegration.SNA.Session.SessionStatus](#)

The session status message.

*innerException*

Type: [System.Exception](#)

Additional information regarding the status message.

[Return to top](#)

### SessionException Constructor (String)

Creates a new instance of the [SessionException](#) class using the string as the Message property.

Syntax

C#

```
public SessionException(  
    string message  
)
```

C++

```
public:  
SessionException(  
    String^ message  
)
```

F#

```
new :  
    message:string -> SessionException
```

VB

```
Public Sub New (  
    message As String  
)
```

#### Parameters

*message*

Type: [System.String](#)

The message property.

[Return to top](#)

#### SessionException Constructor (String, Exception)

Creates a new instance of the [SessionException](#) class using the string as Message and exception as InnerException.

Syntax

C#

```
public SessionException(  
    string message,  
    Exception innerException  
)
```

C++

```
public:  
SessionException(  
    String^ message,  
    Exception^ innerException  
)
```

F#

```
new :  
    message:string *  
    innerException:Exception -> SessionException
```

VB

```
Public Sub New (  
    message As String,  
    innerException As Exception  
)
```

#### Parameters

*message*

Type: [System.String](#)

The message.

*innerException*

Type: [System.Exception](#)

The inner exception.

[Return to top](#)

# SessionException Constructor ()

Creates a new instance of the [SessionException](#) class.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public SessionException ()
```

C++

```
public:  
SessionException ()
```

J#

```
public SessionException ()
```

JScript

```
public function SessionException ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# SessionException.EvaluateHR Method

Evaluates the HR.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Sub EvaluateHR ( _
    hr As Integer _
)
```

C#

```
public static void EvaluateHR (
    int hr
)
```

C++

```
public:
static void EvaluateHR (
    int hr
)
```

J#

```
public static void EvaluateHR (
    int hr
)
```

JScript

```
public static function EvaluateHR (
    hr : int
)
```

## Parameters

hr

The HR to evaluate.

## Remarks

Evaluates an HR and throws an exception should it be warranted. The HR is typically a return code from the underlying COM3270 Interface.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Assembly:** Microsoft.HostIntegration.SNA.Session (in Microsoft.HostIntegration.SNA.Session.dll)

Inheritance Hierarchy [System.Object](#)

**Microsoft.HostIntegration.SNA.Session.SessionLU0**

Syntax

C#

```
public class SessionLU0
```

C++

```
public ref class SessionLU0
```

F#

```
type SessionLU0 = class end
```

VB

```
Public Class SessionLU0
```

Constructors

Name	Description
 <a href="#">SessionLU0()</a>	Creates a new instance of the <b>SessionLU0</b> class.
 <a href="#">SessionLU0(SessionConnectionLU0)</a>	Creates a new instance of the <b>SessionLU0</b> class using the specified connection.

Properties

Name	Description
 <a href="#">Connection</a>	Gets a value that describes the underlying LU0 session connection.
 <a href="#">IsConnected</a>	Gets a value that describes whether an underlying session connection exists.
 <a href="#">SenseCode</a>	Gets the value of the last Sense Code returned by the mainframe.

Methods

Name	Description
 <a href="#">Connect(SessionConnectionLU0)</a>	Initializes an LU0 session with a connection that has been connected to previously.
 <a href="#">Connect(SessionConnectionLU0, SessionLU0InitType)</a>	Initializes the LU0 session using the specified connection and initialization information.
 <a href="#">Connect(String, SessionLU0InitType)</a>	Initializes the LU0 session using the specified connection string and initialization information.
 <a href="#">Disconnect()</a>	Disconnects from the LU0 session.
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Finalize()</a>	Finalizes the LU0 session object.(Overrides <a href="#">Object.Finalize()</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)

 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Receive(Int32, Boolean)</a>	Receives information from the session.
 <a href="#">Send(SessionLU0Data)</a>	Sends a complete inbound chain of data on an LU0 session using the specified data.
 <a href="#">Send(SessionLU0SendIndication, SessionLU0Data)</a>	Sends a complete inbound chain of data on an LU0 session.
 <a href="#">SendResponse(Int32)</a>	Sends a response or courtesy acknowledgment to the host using the specified sense code.
 <a href="#">SendResponse(Int32, SessionLU0SendIndication)</a>	Sends a response or courtesy acknowledgement to the Host.
 <a href="#">ToString()</a>	Translates the current instance data to a string.(Overrides <a href="#">Object.ToString()</a> .)

### SessionLU0 Constructor ()

Creates a new instance of the [SessionLU0](#) class.

Syntax

C#

```
public SessionLU0()
```

C++

```
public:  
SessionLU0()
```

F#

```
new : unit -> SessionLU0
```

VB

```
Public Sub New
```

Examples

### Legacy Code Example

```
public partial class Form1 : Form  
{  
    private SessionLU0 _session = null;  
    // as the LU0 managed wrapper does no tracing  
    // we will trace the data contents to the provided text box  
    private TextBox m_TextBox = null;  
    private Font m_FixedFont;  
  
    private void CreateSession_Click(object sender, EventArgs e)  
    {  
        try  
        {  
            LUName.Text = LUName.Text.Trim();  
            if (LUName.Text.Length == 0)  
            {  
                MessageBox.Show("You must fill out the LU or Pool Name");  
                return;  
            }  
            _session = new SessionLU0();  
            _session.Connect("LogicalUnitName=" + LUName.Text, SessionLU0InitType.SSCP);  
  
            // receive the logon screen
```

```

SessionLU0Data receivedData = _session.Receive(20000, true);
// trace out the received data
TraceData(false, receivedData.Data, receivedData.Indication);
// disable every button and text box
DisableEverything();

// Insert User/Password
EnableInsertUserId();
}
catch (Exception ex)
{
    MessageBox.Show(ex.Message);
}
}

```

[Return to top](#)

### SessionLU0 Constructor (SessionConnectionLU0)

Creates a new instance of the [SessionLU0](#) class using the specified connection.

Syntax

C#

```

public SessionLU0(
    SessionConnectionLU0 connection
)

```

C++

```

public:
    SessionLU0(
        SessionConnectionLU0^ connection
    )

```

F#

```

new :
    connection:SessionConnectionLU0 -> SessionLU0

```

VB

```

Public Sub New (
    connection As SessionConnectionLU0
)

```

### Parameters

*connection*

Type: [Microsoft.HostIntegration.SNA.Session.SessionConnectionLU0](#)

Describes the connection to the LU0 session.

[Return to top](#)

# SessionLU0 Constructor ()

Creates a new instance of the [SessionLU0](#) class.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public SessionLU0 ()
```

C++

```
public:
SessionLU0 ()
```

J#

```
public SessionLU0 ()
```

JScript

```
public function SessionLU0 ()
```

Example

```
public partial class Form1 : Form
{
    private SessionLU0 _session = null;
    // as the LU0 managed wrapper does no tracing
    // we will trace the data contents to the provided text box
    private TextBox m_TextBox = null;
    private Font m_FixedFont;

    private void CreateSession_Click(object sender, EventArgs e)
    {
        try
        {
            LUName.Text = LUName.Text.Trim();
            if (LUName.Text.Length == 0)
            {
                MessageBox.Show("You must fill out the LU or Pool Name");
                return;
            }
            _session = new SessionLU0();
            _session.Connect("LogicalUnitName=" + LUName.Text, SessionLU0InitType.SSCP);

            // receive the logon screen
            SessionLU0Data receivedData = _session.Receive(20000, true);
            // trace out the received data
            TraceData(false, receivedData.Data, receivedData.Indication);
            // disable every button and text box
            DisableEverything();

            // Insert User/Password
            EnableInsertUserId();
        }
        catch (Exception ex)
```

```
{  
    MessageBox.Show(ex.Message);  
}  
}
```

RemarksThe default constructor initializes any fields to their default values.

    }
}

```

}

[Return to top](#)

#### **SessionLU0.Connect Method (SessionConnectionLU0, SessionLU0InitType)**

Initializes the LU0 session using the specified connection and initialization information.

Syntax

C#

```

public void Connect(
    SessionConnectionLU0 connection,
    SessionLU0InitType initType
)

```

C++

```

public:
void Connect(
    SessionConnectionLU0^ connection,
    SessionLU0InitType initType
)

```

F#

```

member Connect :
    connection:SessionConnectionLU0 *
    initType:SessionLU0InitType -> unit

```

VB

```

Public Sub Connect (
    connection As SessionConnectionLU0,
    initType As SessionLU0InitType
)

```

## Parameters

*connection*

Type: [Microsoft.HostIntegration.SNA.Session.SessionConnectionLU0](#)

A valid session connection with enough information to make a connection.

*initType*

Type: [Microsoft.HostIntegration.SNA.Session.SessionLU0InitType](#)

The initialization information to use to initialize the session.

[Return to top](#)

## SessionLU0.Connect Method (String, SessionLU0InitType)

Initializes the LU0 session using the specified connection string and initialization information.

Syntax

C#

```
public void Connect(  
    string connectionString,  
    SessionLU0InitType initType  
)
```

C++

```
public:  
void Connect(  
    String^ connectionString,  
    SessionLU0InitType initType  
)
```

F#

```
member Connect :  
    connectionString:string *  
    initType:SessionLU0InitType -> unit
```

VB

```
Public Sub Connect (  
    connectionString As String,  
    initType As SessionLU0InitType  
)
```

## Parameters

*connectionString*

Type: [System.String](#)

A valid connection string.

*initType*

Type: [Microsoft.HostIntegration.SNA.Session.SessionLU0InitType](#)

The initialization information to use to initialize the session.

[Return to top](#)

# SessionLU0.Connect Method (SessionConnectionLU0)

Initializes an LU0 session with a connection that has been connected to previously.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Connect ( _
    connection As SessionConnectionLU0 _
)
```

C#

```
public void Connect (
    SessionConnectionLU0 connection
)
```

C++

    SessionConnectionLU0^ connection
)
```

J#

```
public void Connect (
    SessionConnectionLU0 connection
)
```

JScript

```
public function Connect (
    connection : SessionConnectionLU0
)
```

## Parameters

connection

A valid connection string.

## Example

```
public partial class Form1 : Form
{
    private SessionLU0 _session = null;
    // as the LU0 managed wrapper does no tracing
    // we will trace the data contents to the provided text box
    private TextBox m_TextBox = null;
    private Font m_FixedFont;

    private void CreateSession_Click(object sender, EventArgs e)
    {
        try
        {
            LUName.Text = LUName.Text.Trim();
            if (LUName.Text.Length == 0)
            {
                MessageBox.Show("You must fill out the LU or Pool Name");
                return;
            }
        }
    }
}
```

```

_session = new SessionLU0(); _session.Connect("LogicalUnitName=" + LUName.Text, SessionLU0
InitType.SSCP);

// receive the logon screen
SessionLU0Data receivedData = _session.Receive(20000, true);
// trace out the received data
TraceData(false, receivedData.Data, receivedData.Indication);
// disable every button and text box
DisableEverything();

// Insert User/Password
EnableInsertUserId();
}
catch (Exception ex)
{
    MessageBox.Show(ex.Message);
}

```

}

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# SessionLU0.Disconnect Method

Disconnects from the LU0 session.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Disconnect
```

C#

```
public void Disconnect ()
```

C++

```
public:
void Disconnect ()
```

J#

```
public void Disconnect ()
```

JScript

```
public function Disconnect ()
```

Example

```
private void Disconnect_Click(object sender, EventArgs e)
{
    // disable every button and text box
    DisableEverything();
    _session.Disconnect();
    // go back to the original state of buttons
    SetOpeningState();
}
```

Remarks

After you call `Disconnect`, you must call `Connect` in order to re-establish a connection. This is true even if the call fails to complete successfully.

# SessionLU0.Receive Method

Receives information from the session.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Function Receive ( _
    timeout As Integer, _
    autoAcknowledge As Boolean _
) As SessionLU0Data
```

C#

```
public SessionLU0Data Receive (
    int timeout,
    bool autoAcknowledge
)
```

C++

```
public:
SessionLU0Data^ Receive (
    int timeout,
    bool autoAcknowledge
)
```

J#

```
public SessionLU0Data Receive (
    int timeout,
    boolean autoAcknowledge
)
```

JScript

```
public function Receive (
    timeout : int,
    autoAcknowledge : boolean
) : SessionLU0Data
```

## Parameters

timeout

The length of time in seconds before a timeout occurs.

autoAcknowledge

**True** to send an automatic acknowledgment; otherwise, **false**.

## Return Value

A SessionLU0Data containing the LU0 session data.

Example

```
public partial class Form1 : Form
{
    private SessionLU0 _session = null;
    // as the LU0 managed wrapper does no tracing
    // we will trace the data contents to the provided text box
    private TextBox m_TextBox = null;
    private Font m_FixedFont;
```

```

private void CreateSession_Click(object sender, EventArgs e)
{
    try
    {
        LUName.Text = LUName.Text.Trim();
        if (LUName.Text.Length == 0)
        {
            MessageBox.Show("You must fill out the LU or Pool Name");
            return;
        }
        _session = new SessionLU0(); _session.Connect("LogicalUnitName=" + LUName.Text, SessionLU0
InitType.SSCP);

        // receive the logon screen
        SessionLU0Data receivedData = _session.Receive(20000, true);
        // trace out the received data
        TraceData(false, receivedData.Data, receivedData.Indication);
        // disable every button and text box
        DisableEverything();

        // Insert User/Password
        EnableInsertUserId();
    }
    catch (Exception ex)
    {
        MessageBox.Show(ex.Message);
    }
}

```

}

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

### SessionLU0.Send Method (SessionLU0Data)

Sends a complete inbound chain of data on an LU0 session using the specified data.

Syntax

C#

```
public void Send(  
    SessionLU0Data data  
)
```

C++

```
public:  
void Send(  
    SessionLU0Data^ data  
)
```

F#

```
member Send :  
    data:SessionLU0Data -> unit
```

VB

```
Public Sub Send (  
    data As SessionLU0Data  
)
```

## Parameters

*data*

Type: [Microsoft.HostIntegration.SNA.Session.SessionLU0Data](#)

The data to send.

Examples

### Legacy Code Example

```
private void InsertUserId_Click(object sender, EventArgs e)  
{  
    try  
    {  
        // disable every button and text box  
        DisableEverything();  
        // Enter UserName (SNA200 is what is in the script)  
        // AID = 7D - Enter
```

```

byte AID = 0x7D;
// cursor address
byte ca1 = 0x5B;
byte ca2 = 0x6B;
// SBA
byte SBA = 0x11;
byte fa1 = 0x5B;

}
}

```

[Return to top](#)

#### **SessionLU0.Send Method (SessionLU0SendIndication, SessionLU0Data)**

Sends a complete inbound chain of data on an LU0 session.

Syntax

C#

```

public void Send(
    SessionLU0SendIndication indication,
    SessionLU0Data data
)

```

C++

```

public:
void Send(
    SessionLU0SendIndication indication,
    SessionLU0Data^ data
)

```

F#

```

member Send :
    indication:SessionLU0SendIndication *
    data:SessionLU0Data -> unit

```

VB

```

Public Sub Send (
    indication As SessionLU0SendIndication,
    data As SessionLU0Data

```

)

## Parameters

*indication*

Type: [Microsoft.HostIntegration.SNA.Session.SessionLU0SendIndication](#)

Indicates how the data should be processed. Valid values are contained SessionLU0SendHint.

*data*

Type: [Microsoft.HostIntegration.SNA.Session.SessionLU0Data](#)

The data to send.

[Return to top](#)

# SessionLU0.Send Method (SessionLU0Data)

Sends a complete inbound chain of data on an LU0 session using the specified data.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub Send ( _
    data As SessionLU0Data _
)
```

C#

```
public void Send (
    SessionLU0Data data
)
```

C++

```
public:
void Send (
    SessionLU0Data^ data
)
```

J#

```
public void Send (
    SessionLU0Data data
)
```

JScript

```
public function Send (
    data : SessionLU0Data
)
```

## Parameters

data

The data to send.

## Example

```
private void InsertUserId_Click(object sender, EventArgs e)
{
    try
    {
        // disable every button and text box
        DisableEverything();
        // Enter UserName (SNA200 is what is in the script)
        // AID = 7D - Enter
        byte AID = 0x7D;
        // cursor address
        byte ca1 = 0x5B;
        byte ca2 = 0x6B;
        // SBA
        byte SBA = 0x11;
        byte fa1 = 0x5B;
        byte fa2 = 0xE5;
        byte[] sna200 = HostStringConverter.ConvertUnicodeToEbcDic("SNA200");
        // not sure what, 6D
```

```

byte sixD = 0x6D;
byte [] message = new byte [8 + sna200.Length ];
message[0] = AID;
message[1] = ca1;
message[2] = ca2;
message[3] = SBA;
message[4] = fa1;
message[5] = fa2;
Array.Copy(sna200, 0, message, 6, sna200.Length);
message[6 + sna200.Length] = sixD;
message[7 + sna200.Length] = sixD;
// send the stuff off
SessionLU0Data data = new SessionLU0Data();
data.Data = message;
// trace out the data to send
TraceData(true, message, 0);
_session.Send(data);
// allow entering director
EnableEnterDirector();
}
catch (Exception ex)
{
    MessageBox.Show(ex.Message);
}
}

```

Creates a new instance of the [SessionLU0Data](#) class.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public SessionLU0Data ()
```

C++

```
public:
SessionLU0Data ()
```

J#

```
public SessionLU0Data ()
```

JScript

```
public function SessionLU0Data ()
```

Example

```
private void CreateSession_Click(object sender, EventArgs e)
{
    try
    {
        LUName.Text = LUName.Text.Trim();
        if (LUName.Text.Length == 0)
        {
            MessageBox.Show("You must fill out the LU or Pool Name");
            return;
        }
        _session = new SessionLU0(); _session.Connect("LogicalUnitName=" + LUName.Text, SessionLU0
InitType.SSCP);

        // receive the logon screen
        SessionLU0Data receivedData = _session.Receive(20000, true);
        // trace out the received data
        TraceData(false, receivedData.Data, receivedData.Indication);
        // disable every button and text box
        DisableEverything();

        // Insert User/Password
        EnableInsertUserId();
    }
    catch (Exception ex)
    {
        MessageBox.Show(ex.Message);
    }
}
```

**Remarks**The default constructor initializes any fields to their default values.

[Microsoft.HostIntegration.SNA.Session Namespace](#)

# SessionLU0Data.Indication Property

Gets a value that describes the indication sent by the host as to the state of the session.

**Namespace:** Microsoft.HostIntegration.SNA.Session

**Assembly:** Microsoft.HostIntegration.SNA.Session (in microsoft.hostintegration.sna.session.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property Indication As SessionLU0ReceiveIndication
```

C#

```
public SessionLU0ReceiveIndication Indication { get; }
```

C++

```
public:
property SessionLU0ReceiveIndication Indication {
    SessionLU0ReceiveIndication get ();
}
```

J#

```
/** @property */
public SessionLU0ReceiveIndication get_Indication ()
```

JScript

```
public function get Indication () : SessionLU0ReceiveIndication
```

## Property Value

The indication sent by the host as to the state of the session.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

### Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

### Target Platforms

# SessionLU0InitType Enumeration

Represents the session initialization type.

**Namespace:** [Microsoft.HostIntegration.SNA.Session](#)  
**Assembly:** Microsoft.HostIntegration.SNA.Session (in Microsoft.HostIntegration.SNA.Session.dll)

Syntax  
C#

```
public enum SessionLU0InitType
```

C++

```
public enum class SessionLU0InitType
```

F#

```
type SessionLU0InitType
```

VB

```
Public Enumeration SessionLU0InitType
```

Members

Member name	Description
<b>BIND</b>	Wait for an unsolicited bind and SDT is received from the physical logical unit.
<b>INITSELF</b>	Wait for a BIND and SDT to arrive after sending the INITSELF command specified in the data parameter.
<b>SSCP</b>	Wait for an unsolicited bind and SDT is received from the physical logical unit, but allow the application access to the SSCP session.

Examples

**Legacy Code Example**

```
private void CreateSession_Click(object sender, EventArgs e)
{
    try
    {
        LUName.Text = LUName.Text.Trim();
        if (LUName.Text.Length == 0)
        {
            MessageBox.Show("You must fill out the LU or Pool Name");
            return;
        }
        _session = new SessionLU0(); _session.Connect("LogicalUnitName=" + LUName.Text, SessionLU0InitType.SSCP);

        // receive the logon screen
        SessionLU0Data receivedData = _session.Receive(20000, true);
        // trace out the received data
        TraceData(false, receivedData.Data, receivedData.Indication);
        // disable every button and text box
        DisableEverything();

        // Insert User/Password
        EnableInsertUserId();
    }
    catch (Exception ex)
    {
        MessageBox.Show(ex.Message);
    }
}
```

```
}
```

```
}
```

```
public enum class SessionLU0ReceiveIndication
```

F#

```
type SessionLU0ReceiveIndication
```

VB

```
Public Enumeration SessionLU0ReceiveIndication
```

Members

Member name	Description
<b>ApplicationData</b>	The data is application data.
<b>BeginBracket</b>	The host has started a new bracket.
<b>Cancel</b>	The last chain from the host was cancelled.
<b>Chase</b>	The host requests that all outstanding responses be sent.
<b>Clear</b>	The host has cleared the session.
<b>DataComplete</b>	The data represents a complete data chain.
<b>DataIncomplete</b>	The data represents an incomplete data chain.
<b>DefiniteResponse1</b>	The application must send a response to the data.
<b>DefiniteResponse2</b>	The application must send a response to the data.
<b>EndBracket</b>	The host terminated the current bracket.
<b>ExceptionRequest</b>	The SNA Server converted the response into an exception request.
<b>ExceptionResponse1</b>	The application can send a negative response to reject the data.
<b>ExceptionResponse2</b>	The application can send a negative response to reject the data.
<b>ExpeditedData</b>	Data was received on an expedited data flow.
<b>FunctionManagementData</b>	Data is Function Management Data.
<b>LogicalUnitData</b>	Data was received on a logical unit (LU) session.

<b>NegativeResponse</b>	The host sent a negative response.
<b>NoResponse</b>	The application should not send a response to the data.
<b>NormalData</b>	Data was received on a normal data flow.
<b>PositiveResponse</b>	The host sent a positive response.
<b>Quiesce</b>	The host has quiesced the session.
<b>Release</b>	The host has cancelled either the quiesce or shutdown state.
<b>Send</b>	The host has given permission to send.
<b>SessionStarted</b>	The SSCP initiated session has been activated or a session that was reset by a CLEAR has been restarted by an SDT, or a session that previously received an UNBIND has been reactivated by a BIND and SDT.
<b>Shutdown</b>	The host is shutting down the session.
<b>SSCPData</b>	Data was received on a System Service Control Point (SSCP) session.
<b>Unbind</b>	The host has unbound the session.

Member name	Description
<b>ApplicationData</b>	Indicates that the application does not want a response from the host.
<b>DefiniteResponse1</b>	Indicates that the application wants the host to send a response to the data.
<b>DefiniteResponse2</b>	Indicates that the application wants the host to send a response to the data.
<b>EndBracket</b>	Indicates that the application is requesting that the current bracket be ended.
<b>ExceptionResponse1</b>	Indicates that the application wants the host to send a negative response only.
<b>ExceptionResponse2</b>	Indicates that the application wants the host to send a negative response only.
<b>ExpeditedData</b>	Indicates that the application is sending data on an expedited data flow.
<b>FunctionManagementData</b>	Indicates that the application is sending function management data.
<b>LogicalUnitData</b>	Indicates that the application is sending logical unit data.
<b>NoResponse</b>	Indicates that the application is not sending a response.
<b>NormalData</b>	Indicates that the application is sending data on a normal data flow.
<b>PrepareToReceive</b>	Indicates that the application is prepared to receive data.
<b>SSCPData</b>	Indicates that the application is sending SSCP data.

# SessionStatus Enumeration

Displays the status message of a Session Integrator session.

**Namespace:** [Microsoft.HostIntegration.SNA.Session](#)

**Assembly:** Microsoft.HostIntegration.SNA.Session (in Microsoft.HostIntegration.SNA.Session.dll)

Syntax

C#

```
public enum SessionStatus
```

C++

```
public enum class SessionStatus
```

F#

```
type SessionStatus
```

VB

```
Public Enumeration SessionStatus
```

Members

Member name	Description
<b>AccessDenied</b>	The client's user account does not have permission to use the LU or Pool requested.
<b>AlreadyConnected</b>	The connection is already connected to another session.
<b>AlreadyConnectedCOM3270</b>	The application is already connected to a COM3270 object – never returned to Client.
<b>AlreadyExists</b>	Already exists – never returned to Client.
<b>BadParam</b>	The Connection String parameter contains an invalid property setting.
<b>BracketNotAllowed</b>	The session was between brackets but a new bracket could not be started having received SBI from the host.
<b>CertificateCheck</b>	The certificate check.
<b>CertificateCheckReadOnlyAfterConnect</b>	The certificate check read only after connecting.
<b>ClientFailure</b>	The client previously using this host session terminated without calling Disconnect leaving the server in an invalid state (Unexpectedly returned by COM3270).
<b>ConnectionActive</b>	The connection is active – never returned to Client.
<b>ConnectionInvalid</b>	The Connection String contained an invalid setting.
<b>ConnectionNotConnected</b>	The Connection supplied is not yet in the required Connected state.
<b>ConnectionRefused</b>	The connection refused.
<b>ContainsPartialNoScreen</b>	Searching for partial fields is only allowed on a ScreenFieldCollection obtained from a SessionDisplay.
<b>DataQueued</b>	Data is currently queued – never returned to Client.
<b>DataTruncated</b>	The copy extended past the end of the field. The extra data was ignored.

<b>DataTruncated3270</b>	The 3270 data was truncated – never returned to Client.
<b>DefiniteResponseMode</b>	The data was sent using DEFINITE_RESPONSE mode when EXCEPTION_RESPONSE or NO_RESPONSE was requested.
<b>DeviceTypeReadOnlyAfterConnect</b>	The Device Type Property is read-only after the connection has been established.
<b>DeviceTypeRejected</b>	
<b>DluNotYetAvailable</b>	The Destination Logical Unit is only available after the session is connected to a Primary Logical Unit.
<b>DLUReadOnlyIn3270</b>	Destination Logical Unit is read-only for 3270 connections.
<b>ExceptionResponseMode</b>	The data was sent using EXCEPTION_RESPONSE when DEFINITE_RESPONSE or NO_RESPONSE was requested.
<b>False</b>	Internally used value, never returned to Client.
<b>FieldIteratorInvalid</b>	The ScreenField iterator is invalid outside the boundaries of a ScreenFieldCollection.
<b>FieldNotAssociatedWithScreen</b>	The specified field is not associated with the current screen.
<b>FMHLengthError</b>	The Function Management Header returned from the Host contained an invalid length.
<b>HostNotFound</b>	The remote system specified by the "IP" property could not be located.
<b>ImplementationReadOnlyAfterConnect</b>	
<b>InvalidCharacterReadOnlyAfterConnect</b>	
<b>InvalidData</b>	The data was invalid – never returned to Client.
<b>InvalidDeviceMode</b>	The property requested is not valid for the session "MODE" property setting.
<b>InvalidPosition</b>	The position was invalid – never returned to Client.
<b>LinkInactive</b>	The SNA session was successfully created, but the underlying SNA connection is not yet active.
<b>LogicalUnitInactive</b>	The SNA session was successfully created, but the SNA LU is not yet active.
<b>LogicalUnitInUse</b>	The Logical Unit specified an SNA Server LU and the LU is currently being used by another application.
<b>LogicalUnitNotFound</b>	The LU or Pool name does not exist.
<b>NegativeResponse</b>	The host (or SNA server) sent a negative response to the DEFINITE_RESPONSE.
<b>NoChange</b>	No change has occurred – never returned to Client.
<b>NoFreeLogicalUnit</b>	The Logical Unit specified an SNA Server LU Pool and no LU is free in that pool.
<b>NoResponseMode</b>	The data was sent using NO_RESPONSE mode when DEFINITE_RESPONSE or EXCEPTION_RESPONSE requested.
<b>NoResponseReceived</b>	No Response was received from the host to an RQD request. Call the Receive function to get the indication.
<b>NoServerFound</b>	No SNA Server was found with the LU or Pool of the appropriate type and requested name.
<b>NotALocalSession</b>	The target is not a local session – never returned to Client.
<b>NullObjectComparisons</b>	A null object comparison occurred.

<b>Ok</b>	Ok.
<b>OneField</b>	Screen contains only one field – never returned to Client.
<b>OtherThreadWaiting</b>	Another thread has issued a Receive method call for this session, and this call has not yet returned.
<b>PartialChain</b>	A partial chain was received – never returned to Client.
<b>PartialFieldIteratorInvalid</b>	The ScreenPartialField iterator is invalid (outside the boundaries of a ScreenPartialFieldCollection).
<b>PhysicalUnitInactive</b>	The SNA session was successfully created, but the SNA PU is not yet active.
<b>PropertyCleared</b>	The property was cleared – never returned to Client.
<b>PropertyUpdated</b>	The property has been updated – never returned to Client.
<b>ReceiveInProgress</b>	Another thread has issued a Receive() method call for this session which has not yet returned.
<b>ResourceLocation</b>	The server could not initiate resource location.
<b>ScreenDataNotAssociatedWithScreen</b>	The Screen Data instance is not associated with the current screen.
<b>ScreenSizeChanged</b>	The screen size has changed – never returned to Client.
<b>ScriptError</b>	An error parsing the script.
<b>ScriptExceptionError</b>	An error occurred executing a script statement.
<b>SecurityNegotiation</b>	The security negotiation.
<b>SecurityReadOnlyAfterConnect</b>	The security read only after connecting.
<b>SendInProgress</b>	A send is currently in progress – never returned to Client.
<b>SendMultiChain</b>	The session does not support multi-RU chains but the data was larger than the RU size. The data was sent as a sequence of single RU chains.
<b>ServerFailure</b>	The Session Integrator Server serving the session failed.
<b>ServerReadOnly</b>	The Server Property is read-only for SNA Connections.
<b>ServerReadOnlyAfterConnect</b>	The Server Property is read-only after the connection has been established.
<b>SessionBusy</b>	The 3270 session is busy. The Receive () method should be called to determine when input is allowed and this method can be retried.
<b>SessionFailed</b>	The underlying SNA session failed. The application must release the session.
<b>SessionFailure</b>	The Terminal Session Server session is no longer valid. The application should release the session.
<b>SessionLocked</b>	The 3270 Session is locked by a local lock. Examine the OIA to determine the reason for the error.
<b>SessionNotConnected</b>	The client is not connected to a session object through a call to the connect method.
<b>SessionOffline</b>	The session is connected to an SNA session that is currently offline. The application should call the Online() method to activate the session.
<b>SessionQuiesced</b>	The session is quiesced – never returned to Client.
<b>SessionTimeout</b>	The session timed out waiting for the expected data.
<b>SessionTimeoutLU0</b>	The LU0 session timed out – never returned to Client.
<b>SNACConnectionInfoInconsistent</b>	The connection information for 3270 over SNA is not consistent.

<b>SnapshotReadOnly</b>	The Data of a ScreenField which is a Snapshot cannot be updated.
<b>SSCPActive</b>	SSCP is active – never returned to Client.
<b>SslNeeded</b>	Ssl needed.
<b>SslRejected</b>	The Ssl rejected.
<b>StringNotFound</b>	The specified data string could not be found.
<b>SystemError</b>	Method failed due to an internal error.
<b>TN3270</b>	TN3270 – never returned to Client.
<b>TN3270E</b>	TN3270E – never returned to Client.
<b>TNConnectionInfoInconsistent</b>	The connection information for 3270 over TN is not consistent.
<b>TNPortReadOnlyAfterConnect</b>	The TN3270 Port Property is read-only after the connection has been established.
<b>TNServerReadOnlyAfterConnect</b>	The TN3270 Server Property is read-only after the connection has been established.
<b>TopBitsError</b>	Internally used bit mask.
<b>TransportReadOnlyAfterConnect</b>	The Transport Property is read-only after the connection has been established.
<b>UnformattedScreen</b>	The screen is unformatted; no field exists.
<b>VariableCollectionStringFormat</b>	The variable string must consist of 'Name=Value;' pairs.
<b>WaitTimeout</b>	Timeout waiting for the expected data or session state.
<b>WrongSession</b>	Wrong session– never returned to Client.
<b>ZeroLengthField</b>	The data is a zero-length field.

# Microsoft.HostIntegration.TI Namespace

Can use Host Integration Server 2006 load balancing and hot backup capability by deploying multiple Host Integration Server 2006 End-User Client and Host Integration Server 2006 Server computers in a single subdomain.

## Classes

Class	Description
 <a href="#">ClientContext</a>	Represents the context for SharePoint objects and operations.
 <a href="#">ClientContextWebService</a>	Represents a client context for web service.
 <a href="#">CustomTIAttribute</a>	Represents the custom TI attributes in the <b>Microsoft.HostIntegration.TI</b> class.
 <a href="#">CustomTIException</a>	Represents the custom TI exceptions that occur during runtime.
 <a href="#">WcfClientContext</a>	Represents the WCF context for the operations.

## Structures

Structure	Description
 <a href="#">ContextDescriptor</a>	Represents the message context for a description.
 <a href="#">TracingCategoryOptions.ConversionCategories</a>	Represents a tracing category conversion options.
 <a href="#">TracingCategoryOptions.GeneralCategories</a>	Represents the general categories for the <a href="#">TracingCategoryOptions</a> class.
 <a href="#">TracingCategoryOptions.LibraryReaderCategories</a>	Represents a Library Reader Categories for the <a href="#">TracingCategoryOptions</a> class.
 <a href="#">TracingCategoryOptions.ProxyCategories</a>	Represents a proxy categories for the <a href="#">TracingCategoryOptions</a> class.
 <a href="#">TracingCategoryOptions</a>	Represents the Tracing Category Options.
 <a href="#">TracingCategoryOptions.TransportCategories</a>	Represents a transport categories for the <a href="#">TracingCategoryOptions</a> class.

## Enumerations

Enumeration	Description
 <a href="#">WcfClientContext.ConnectionTypes</a>	Enumerates a connection types for WCF client context.
 <a href="#">SupportedKeys</a>	Displays all the supported keys of the <b>Microsoft.HostIntegration.TI</b> class.

[Return to top](#)

# ClientContext Class

Represents the context for SharePoint objects and operations.

**Namespace:** [Microsoft.HostIntegration.TI](#)  
**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in Microsoft.HostIntegration.TI.ClientContext.dll)

Inheritance Hierarchy [System.Object](#)  
**Microsoft.HostIntegration.TI.ClientContext**

Syntax  
C#

```
[SerializableAttribute]  
[DataContractAttribute]  
public class ClientContext
```

C++

```
[SerializableAttribute]  
[DataContractAttribute]  
public ref class ClientContext
```

F#

```
[<SerializableAttribute>]  
[<DataContractAttribute>]  
type ClientContext = class end
```

VB

```
<SerializableAttribute>  
<DataContractAttribute>  
Public Class ClientContext
```

## Constructors

Name	Description
 <a href="#">ClientContext()</a>	Initializes a new instance of the <b>ClientContext</b> class using default values.
 <a href="#">ClientContext(ClientContextWebService)</a>	
 <a href="#">ClientContext(Object[])</a>	Initializes a new instance of the <b>ClientContext</b> class with specified context array.
 <a href="#">ClientContext(SupportedKeys, SupportedKeys, Boolean, Boolean)</a>	Initializes a new instance of the <b>ClientContext</b> class with the specified supported keys and default values.
 <a href="#">ClientContext(WcfClientContext)</a>	

## Properties

Name	Description
 <a href="#">AliasTransactionId</a>	Gets or sets the alias transaction ID for the <b>ClientContext</b> class.
 <a href="#">ConnectionUsage</a>	Gets or sets the connection usage for the <b>ClientContext</b> class.
 <a href="#">Converter</a>	Gets or sets the converter to use.
 <a href="#">DynamicRE</a>	Gets or sets the specified Dynamic Remote Environment.
 <a href="#">IMSClientId</a>	Gets or sets the information management systems client identifier for the <b>ClientContext</b> class.

	IMSLTerm	Gets or sets the information management systems logical terminal for the <b>ClientContext</b> class.
	IMSModName	Gets or sets the name of the returned MOD Name assigned by the executed IMS transaction.
	IPAddress	Gets or sets the specified value of the Internet Protocol (IP) address.
	IsConnectionViable	Gets or sets whether the connection for the <b>ClientContext</b> class is viable.
	IsConversational	Gets or sets whether <b>ClientContext</b> is conversational.
	IsPersistent	Gets or sets whether <b>ClientContext</b> is persistent.
	LibraryName	Gets or sets the library name for the client context.
	LUName	Gets or sets the LU name in the context.
	MirrorProgramName	Gets or sets the name of the Mirror Program.
	ModeName	Gets or sets the mode name associated with the client context.
	OtmaSystemId	Gets or sets the system id for the OTMA in the client context.
	Password	Gets or sets the client password for the class.
	PasswordSecure	
	PersistentConnectionCorrelator	Gets or sets the persistent connection correlator.
	PersistentConnectionTimeout	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.
	Port	Gets or sets the TCP/IP port number that the Transaction Integrator runtime will use.
	ProgramName	Gets or sets the name of the program associated with the client context.
	ReceiveTimeout	Gets or sets the number of seconds that the Transaction Integrator runtime will wait for a response from the host.
	RemoteEnvironment	Gets or sets the specified value of the remote environment.
	SendTimeout	Gets or sets the number of seconds that the Transaction Integrator runtime will wait for completion of a send operation to the host.
	SourceTransactionId	Gets or sets the value of the Source Transaction Id.
	TransactionId	Gets or sets a string object that represents the transaction ID of the client.
	TransportHeaders	Gets or sets a transport header that is associated with the client context.
	User	Gets or sets the value of the user.
	UserAgent	Gets or sets the value for the user agent header that is sent with each request.
	UserObject	
	UserSecure	
	WcfExclusiveUse	Gets or sets an operation that requires exclusives access to the specified object.

#### Methods

	Name	Description
	CleanseAllButPersistent(Object[])	Closes all but persistent connection by contacting the COM+ or .NET Framework application object without the need for a call to the server object.

	<a href="#">ClearAllContext(Object[])</a>	Clears all the set of arrays in the client context.
	<a href="#">CountContext(Object[], Int32)</a>	Shows the object count in the context.
	<a href="#">DeleteContext(String, Object[])</a>	Deletes a specific context in the client context.
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Get_CONNTYPE_Info(Object[], Boolean, Boolean)</a>	Shows the information of the connection type.
	<a href="#">Get_Conversation_Info(Object[], Boolean, String)</a>	Shows the information about the conversation.
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">ImportArray(Object[])</a>	Populates the specified object with data from an array.
	<a href="#">ImportArray(Object[], Boolean)</a>	
	<a href="#">InternalConstructor()</a>	
	<a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">QueryContextInfo(Object[], Int32, String[], Type[])</a>	Renders the information that the query context provides.
	<a href="#">ReadContext(String, Object, Object[])</a>	Uses the <b>ReadContext</b> method to acquire the value of an entry in a TI Context array.
	<a href="#">Reset(Boolean)</a>	Sets the connection to its initial position in the <b>ClientContext</b> class.
	 <a href="#">StringToContextDescriptorBytes(Object)</a>	Indicates the object to convert from string to context.
	<a href="#">ToArray()</a>	Copies the elements of the <b>ClientContext</b> class to a new array.
	<a href="#">ToArray(Boolean)</a>	
	<a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">TracingOptionsOff(Int64)</a>	Switches off the tracing options.
	<a href="#">TracingOptionsOn(Int64)</a>	Switches on the tracing options.
	<a href="#">UpdateWCFOperationContext(WcfClientContext)</a>	
	<a href="#">ValidateKeyword(String)</a>	Checks the context keyword in the client context.
	<a href="#">WriteContext(String, Object, Object[])</a>	Adds or replaces an entry in a TI Context array.

#### Fields

	Name	Description
	 <a href="#">MAX_CONDESC_LEN</a>	Defines the value of the MAX_CONDESC_LEN.

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## Public Properties

Name	Description
 <a href="#">AliasTransactionId</a>	Gets or sets the alias transaction ID for the <b>ClientContext</b> class.
 <a href="#">ConnectionUsage</a>	Gets or sets the connection usage for the <b>ClientContext</b> class.
 <a href="#">Converter</a>	Gets or sets the converter to use.
 <a href="#">DynamicRE</a>	Gets or sets the specified Dynamic Remote Environment.
 <a href="#">IMSClientId</a>	Gets or sets the information management systems client identifier for the <b>ClientContext</b> class.
 <a href="#">IMSLTerm</a>	Gets or sets the information management systems logical terminal for the <b>ClientContext</b> class.
 <a href="#">IMSModName</a>	Gets or sets the name of the returned MOD Name assigned by the executed IMS transaction.
 <a href="#">IPAddress</a>	Gets or sets the specified value of the Internet Protocol (IP) address.
 <a href="#">IsConnectionViable</a>	Gets or sets whether the connection for the <b>ClientContext</b> class is viable.
 <a href="#">IsConversational</a>	Gets or sets whether <b>ClientContext</b> is conversational.
 <a href="#">IsPersistent</a>	Gets or sets whether <b>ClientContext</b> is persistent.
 <a href="#">LibraryName</a>	Gets or sets the library name for the client context.
 <a href="#">LUName</a>	Gets or sets the LU name in the context.
 <a href="#">MirrorProgramName</a>	Gets or sets the name of the Mirror Program.
 <a href="#">ModeName</a>	Gets or sets the mode name associated with the client context.
 <a href="#">OtmaSystemId</a>	Gets or sets the system id for the OTMA in the client context.
 <a href="#">Password</a>	Gets or sets the client password for the class.
 <a href="#">PersistentConnectionCorrelator</a>	Gets or sets the persistent connection correlator.
 <a href="#">PersistentConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.
 <a href="#">Port</a>	Gets or sets the TCP/IP port number that the Transaction Integrator runtime will use.
 <a href="#">ProgramName</a>	Gets or sets the name of the program associated with the client context.
 <a href="#">ReceiveTimeout</a>	Gets or sets the number of seconds that the Transaction Integrator runtime will wait for a response from the host.
 <a href="#">RemoteEnvironment</a>	Gets or sets the specified value of the remote environment.
 <a href="#">SendTimeout</a>	Gets or sets the number of seconds that the Transaction Integrator runtime will wait for completion of a send operation to the host.
 <a href="#">SourceTransactionId</a>	Gets or sets the value of the Source Transaction Id.
 <a href="#">TransactionId</a>	Gets or sets a string object that represents the transaction ID of the client.
 <a href="#">TransportHeaders</a>	Gets or sets a transport header that is associated with the client context.
 <a href="#">User</a>	Gets or sets the value of the user.
 <a href="#">UserAgent</a>	Gets or sets the value for the user agent header that is sent with each request.
 <a href="#">WcfExclusiveUse</a>	Gets or sets an operation that requires exclusives access to the specified object.

## Top

## Public Methods (see also [Protected Methods](#))

Name	Description
------	-------------

	<a href="#">CleanseAllButPersistent</a>	Closes all but persistent connection by contacting the COM+ or .NET Framework application object without the need for a call to the server object.
	<a href="#">ClearAllContext</a>	Clears all the set of arrays in the client context.
	<a href="#">CountContext</a>	Shows the object count in the context.
	<a href="#">DeleteContext</a>	Deletes a specific context in the client context.
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">Get_CONNTYPE_Info</a>	Shows the information of the connection type.
	<a href="#">Get_Conversation_Info</a>	Shows the information about the conversation.
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
	<a href="#">ImportArray</a>	Overloaded. Populates the specified object with data from an array.
	<a href="#">QueryContextInfo</a>	Displays the information that the query context provides.
	<a href="#">ReadContext</a>	Uses the <b>ReadContext</b> method to acquire the value of an entry in a TI Context array.
	 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">Reset</a>	Sets the connection to its initial position in the <b>ClientContext</b> class.
	 <a href="#">StringToContextDescriptorBytes</a>	Indicates the object to convert from string to context.
	<a href="#">ToArray</a>	Overloaded. Copies the elements of the <b>ClientContext</b> class to a new array.
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )
	<a href="#">TracingOptionsOff</a>	Switches off the tracing options.
	<a href="#">TracingOptionsOn</a>	Switches on the tracing options.
	<a href="#">ValidateKeyword</a>	Checks the context keyword in the client context.
	<a href="#">WriteContext</a>	Adds or replaces an entry in a TI Context array.

```

VB

```
Public Sub New (  
    contextArray As Object()  
)
```

#### Parameters

contextArray

Type: [System.Object](#)

A collection of context objects.

[Return to top](#)

#### ClientContext Constructor (SupportedKeys, SupportedKeys, Boolean, Boolean)

Initializes a new instance of the [ClientContext](#) class with the specified supported keys and default values.

Syntax

C#

```
public ClientContext(  
    SupportedKeys supportedKeysValidate,  
    SupportedKeys supportedKeysWrite,  
    bool allowStringsForInts,  
    bool checkValues  
)
```

C++

```

public:
ClientContext(
    SupportedKeys supportedKeysValidate,
    SupportedKeys supportedKeysWrite,
    bool allowStringsForInts,
    bool checkValues
)

```

F#

```

new :
    supportedKeysValidate:SupportedKeys *
    supportedKeysWrite:SupportedKeys *
    allowStringsForInts:bool *
    checkValues:bool -> ClientContext

```

VB

```

Public Sub New (
    supportedKeysValidate As SupportedKeys,
    supportedKeysWrite As SupportedKeys,
    allowStringsForInts As Boolean,
    checkValues As Boolean
)

```

#### Parameters

*supportedKeysValidate*

Type: [Microsoft.HostIntegration.TI.SupportedKeys](#)

The supported keys to validate.

*supportedKeysWrite*

Type: [Microsoft.HostIntegration.TI.SupportedKeys](#)

The supported keys to write.

*allowStringsForInts*

Type: [System.Boolean](#)

**true** to allow strings for ints; otherwise, **false**.

*checkValues*

Type: [System.Boolean](#)

**true** to check the values; otherwise, **false**.

[Return to top](#)

#### ClientContext Constructor (WcfClientContext)

Syntax

C#

```

public ClientContext(
    WcfClientContext contextWcfClientContext
)

```

C++

```

public:
ClientContext(
    WcfClientContext^ contextWcfClientContext
)

```

F#

```

new :
    contextWcfClientContext:WcfClientContext -> ClientContext

```

VB

```
Public Sub New (  
    contextWcfClientContext As WcfClientContext  
)
```

**Parameters**

*contextWcfClientContext*

Type: [Microsoft.HostIntegration.TI.WcfClientContext](#)

[Return to top](#)

# ClientContext Constructor ()

Initializes a new instance of the [ClientContext](#) class using default values.

**Namespace:** Microsoft.HostIntegration.TI

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in microsoft.hostintegration.ti.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public ClientContext ()
```

C++

```
public:  
ClientContext ()
```

J#

```
public ClientContext ()
```

JScript

```
public function ClientContext ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

#### Parameters

*contextArray*

Type: [System.Object](#)

*allowPersistent*

Type: [System.Boolean](#)

[Return to top](#)

# ClientContext.ImportArray Method (Object[])

Populates the specified object with data from an array.

**Namespace:** Microsoft.HostIntegration.TI

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in microsoft.hostintegration.ti.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub ImportArray ( _
    contextArray As Object() _
)
```

C#

```
public void ImportArray (
    Object[] contextArray
)
```

C++

```
public:
void ImportArray (
    array<Object^>^ contextArray
)
```

J#

```
public void ImportArray (
    Object[] contextArray
)
```

JScript

```
public function ImportArray (
    contextArray : Object[]
)
```

## Parameters

contextArray

The set of context to be cleared.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# ClientContext.ImportArray Method (Object[], Boolean)

**Namespace:** Microsoft.HostIntegration.TI

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in microsoft.hostintegration.ti.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub ImportArray ( _
    contextArray As Object(), _
    allowPersistent As Boolean _
)
```

C#

```
public void ImportArray (
    Object[] contextArray,
    bool allowPersistent
)
```

C++

```
public:
void ImportArray (
    array<Object^>^ contextArray,
    bool allowPersistent
)
```

J#

```
public void ImportArray (
    Object[] contextArray,
    boolean allowPersistent
)
```

JScript

```
public function ImportArray (
    contextArray : Object[],
    allowPersistent : boolean
)
```

## Parameters

contextArray

allowPersistent

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ClientContext.QueryContextInfo Method

Renders the information that the query context provides.

**Namespace:** Microsoft.HostIntegration.TI

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in microsoft.hostintegration.ti.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub QueryContextInfo ( _
    ByRef contextArray As Object(), _
    <OutAttribute> ByRef contextCount As Integer, _
    <OutAttribute> ByRef contextNameArray As String(), _
    <OutAttribute> ByRef contextTypeArray As Type() _
)
```

C#

```
public void QueryContextInfo (
    ref Object[] contextArray,
    out int contextCount,
    out string[] contextNameArray,
    out Type[] contextTypeArray
)
```

C++

```
public:
void QueryContextInfo (
    array<Object^>^% contextArray,
    [OutAttribute] int% contextCount,
    [OutAttribute] array<String^>^% contextNameArray,
    [OutAttribute] array<Type^>^% contextTypeArray
)
```

J#

```
public void QueryContextInfo (
    /** @ref */ Object[] contextArray,
    /** @attribute OutAttribute() */ /** @ref */ int contextCount,
    /** @attribute OutAttribute() */ /** @ref */ String[] contextNameArray,
    /** @attribute OutAttribute() */ /** @ref */ Type[] contextTypeArray
)
```

JScript

## Parameters

contextArray

The set of context to be cleared.

contextCount

The number of objects in the context area.

contextNameArray

The name of the array in the context.

contextTypeArray

The type of the array in the context.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# ClientContext.StringToContextDescriptorBytes Method

Indicates the object to convert from string to context.

**Namespace:** Microsoft.HostIntegration.TI

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in microsoft.hostintegration.ti.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Function StringToContextDescriptorBytes ( _
    firstObject As Object _
) As Object
```

C#

```
public static Object StringToContextDescriptorBytes (
    Object firstObject
)
```

C++

```
public:
static Object^ StringToContextDescriptorBytes (
    Object^ firstObject
)
```

J#

```
public static Object StringToContextDescriptorBytes (
    Object firstObject
)
```

JScript

```
public static function StringToContextDescriptorBytes (
    firstObject : Object
) : Object
```

## Parameters

firstObject

The first object.

## Return Value

The object to convert.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## ClientContext.ToArray Method ()

Copies the elements of the [ClientContext](#) class to a new array.

Syntax

C#

```
public object[] ToArray()
```

C++

```
public:  
array<Object^>^ ToArray()
```

F#

```
member ToArray : unit -> Object[]
```

VB

```
Public Function ToArray As Object()
```

## Return Value

Type: [System.Object](#)

An array containing copies of the element of the specified class.

[Return to top](#)

## ClientContext.ToArray Method (Boolean)

Syntax

C#

```
public object[] ToArray(  
    bool AllowPersistent  
)
```

C++

```
public:  
array<Object^>^ ToArray(  
    bool AllowPersistent  
)

# ClientContext Properties

## Public Properties

	Name	Description
	<a href="#">AliasTransactionId</a>	Gets or sets the alias transaction ID for the <a href="#">ClientContext</a> class.
	<a href="#">ConnectionUsage</a>	Gets or sets the connection usage for the <b>ClientContext</b> class.
	<a href="#">Converter</a>	Gets or sets the converter to use.
	<a href="#">DynamicRE</a>	Gets or sets the specified Dynamic Remote Environment.
	<a href="#">IMSClientId</a>	Gets or sets the information management systems client identifier for the <b>ClientContext</b> class.
	<a href="#">IMSLTerm</a>	Gets or sets the information management systems logical terminal for the <b>ClientContext</b> class.
	<a href="#">IMSModName</a>	Gets or sets the name of the returned MOD Name assigned by the executed IMS transaction.
	<a href="#">IPAddress</a>	Gets or sets the specified value of the Internet Protocol (IP) address.
	<a href="#">IsConnectionViable</a>	Gets or sets whether the connection for the <b>ClientContext</b> class is viable.
	<a href="#">IsConversational</a>	Gets or sets whether <b>ClientContext</b> is conversational.
	<a href="#">IsPersistent</a>	Gets or sets whether <b>ClientContext</b> is persistent.
	<a href="#">LibraryName</a>	Gets or sets the library name for the client context.
	<a href="#">LUName</a>	Gets or sets the LU name in the context.
	<a href="#">MirrorProgramName</a>	Gets or sets the name of the Mirror Program.
	<a href="#">ModeName</a>	Gets or sets the mode name associated with the client context.
	<a href="#">OtmaSystemId</a>	Gets or sets the system id for the OTMA in the client context.
	<a href="#">Password</a>	Gets or sets the client password for the class.
	<a href="#">PersistentConnectionCorrelator</a>	Gets or sets the persistent connection correlator.
	<a href="#">PersistentConnectionTimeout</a>	Gets or sets the time to wait while trying to establish a connection before terminating the attempt and generating an error.
	<a href="#">Port</a>	Gets or sets the TCP/IP port number that the Transaction Integrator runtime will use.
	<a href="#">ProgramName</a>	Gets or sets the name of the program associated with the client context.
	<a href="#">ReceiveTimeout</a>	Gets or sets the number of seconds that the Transaction Integrator runtime will wait for a response from the host.
	<a href="#">RemoteEnvironment</a>	Gets or sets the specified value of the remote environment.
	<a href="#">SendTimeout</a>	Gets or sets the number of seconds that the Transaction Integrator runtime will wait for completion of a send operation to the host.
	<a href="#">SourceTransactionId</a>	Gets or sets the value of the Source Transaction Id.
	<a href="#">TransactionId</a>	Gets or sets a string object that represents the transaction ID of the client.
	<a href="#">TransportHeaders</a>	Gets or sets a transport header that is associated with the client context.
	<a href="#">User</a>	Gets or sets the value of the user.
	<a href="#">UserAgent</a>	Gets or sets the value for the user agent header that is sent with each request.
	<a href="#">WcfExclusiveUse</a>	Gets or sets an operation that requires exclusives access to the specified object.

public String get_IMSClientId ()

/** @property */
public void set_IMSClientId (String value)
```

JScript

```
public function get IMSClientId () : String

public function set IMSClientId (value : String)
```

## Property Value

The information management systems client id for the specified class.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Gets or sets the information management systems logical terminal for the [ClientContext](#) class.

**Namespace:** Microsoft.HostIntegration.TI

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in microsoft.hostintegration.ti.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration
<DataMemberAttribute> _
Public Property IMSLTerm As String
```

C#

```
[DataMemberAttribute]
public string IMSLTerm { get; set; }
```

C++

```
[DataMemberAttribute]
public:
property String^ IMSLTerm {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_IMSLTerm ()

/** @property */
public void set_IMSLTerm (String value)
```

JScript

```
public function get IMSLTerm () : String

public function set IMSLTerm (value : String)
```

## Property Value

The information management systems logical terminal for the specified class.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

# ClientContext.TransactionId Property

Gets or sets a string object that represents the transaction ID of the client.

**Namespace:** Microsoft.HostIntegration.TI

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in microsoft.hostintegration.ti.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration
<DataMemberAttribute> _
Public Property TransactionId As String
```

C#

```
[DataMemberAttribute]
public string TransactionId { get; set; }
```

C++

```
[DataMemberAttribute]
public:
property String^ TransactionId {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_TransactionId ()

/** @property */
public void set_TransactionId (String value)
```

JScript

```
public function get TransactionId () : String

public function set TransactionId (value : String)
```

## Property Value

The transaction ID of the client.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# ClientContext.TransportHeaders Property

Gets or sets a transport header that is associated with the client context.

**Namespace:** Microsoft.HostIntegration.TI

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in microsoft.hostintegration.ti.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration
<DataMemberAttribute> _
Public Property TransportHeaders As CustomTransportHeaders
```

C#

```
[DataMemberAttribute]
public CustomTransportHeaders TransportHeaders { get; set; }
```

C++

```
[DataMemberAttribute]
public:
property CustomTransportHeaders^ TransportHeaders {
    CustomTransportHeaders^ get ();
    void set (CustomTransportHeaders^ value);
}
```

J#

```
/** @property */
public CustomTransportHeaders get_TransportHeaders ()

/** @property */
public void set_TransportHeaders (CustomTransportHeaders value)
```

JScript

```
public function get TransportHeaders () : CustomTransportHeaders

public function set TransportHeaders (value : CustomTransportHeaders)
```

## Property Value

The transport header.

    class
        inherit Attribute
        interface IComparable
    end
```

VB

```
<AttributeUsageAttribute(AttributeTargets.All, AllowMultiple := True)>
Public Class CustomTIAtribute
    Inherits Attribute
    Implements IComparable
```

## Constructors

	Name	Description
	<a href="#">CustomTIAtribute(Guid, Object)</a>	Initializes a new instance of the <b>CustomTIAtribute</b> class with a specified name and object value.
	<a href="#">CustomTIAtribute(String, Int32)</a>	Initializes a new instance of the <b>CustomTIAtribute</b> class with a specified name and value.
	<a href="#">CustomTIAtribute(String, Object)</a>	Initializes a new instance of the <b>CustomTIAtribute</b> class with a specified attribute name and value.
	<a href="#">CustomTIAtribute(String, String)</a>	Initializes a new instance of the <b>CustomTIAtribute</b> class with a specified attribute name and value.

## Properties

	Name	Description
	<a href="#">GuidName</a>	Gets or sets the Guid name in the <b>CustomTIAtribute</b> class.
	<a href="#">IntValue</a>	Gets or sets the number that represents the value of the attribute.
	<a href="#">Name</a>	Gets the name of the attribute.
	<a href="#">ObjectValue</a>	Gets or sets the object representation of the attribute value.

 <a href="#">StringValue</a>	Gets or sets the string representation of the attribute value.
 <a href="#">TypeId</a>	(Inherited from <a href="#">Attribute</a> .)

#### Methods

	Name	Description
	<a href="#">CompareTo(Object)</a>	Compares an <b>CustomTIAtribute</b> object with another <b>CustomTIAtribute</b> object and returns an integer that indicates whether the current object precedes, follows, or occurs in the same position in the sort order as the other object.
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Attribute</a> .)
	<a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Attribute</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">IsDefaultAttribute()</a>	(Inherited from <a href="#">Attribute</a> .)
	<a href="#">Match(Object)</a>	(Inherited from <a href="#">Attribute</a> .)
	<a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Explicit Interface Implementations

	Name	Description
	<a href="#">_Attribute.GetIdsOfNames(Guid, IntPtr, UInt32, UInt32, IntPtr)</a>	(Inherited from <a href="#">Attribute</a> .)
	<a href="#">_Attribute.GetTypeInfo(UInt32, UInt32, IntPtr)</a>	(Inherited from <a href="#">Attribute</a> .)
	<a href="#">_Attribute.GetTypeInfoCount(UInt32)</a>	(Inherited from <a href="#">Attribute</a> .)
	<a href="#">_Attribute.Invoke(UInt32, Guid, UInt32, Int16, IntPtr, IntPtr, IntPtr, IntPtr)</a>	(Inherited from <a href="#">Attribute</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

### CustomTIAtribute Constructor (Guid, Object)

Initializes a new instance of the [CustomTIAtribute](#) class with a specified name and object value.

Syntax

C#

```
public CustomTIAtribute(  
    Guid guidName,  
    object attributeValue  
)
```

C++

```
public:  
CustomTIAtribute(  
    Guid guidName,  
    Object^ attributeValue  
)
```

F#

```
new :  
    guidName:Guid *  
    attributeValue:Object -> CustomTIAtribute
```

VB

```
Public Sub New (  
    guidName As Guid,  
    attributeValue As Object  
)
```

### Parameters

*guidName*

Type: [System.Guid](#)

The name for the globally unique identifier.

*attributeValue*

Type: [System.Object](#)

The value of an object attributes.

[Return to top](#)

### **CustomTIAAttribute Constructor (String, Int32)**

Initializes a new instance of the [CustomTIAAttribute](#) class with a specified name and value.

Syntax

C#

```
public CustomTIAAttribute(  
    string attributeName,  
    int attributeValue  
)
```

C++

```
public:  
CustomTIAAttribute(  
    String^ attributeName,  
    int attributeValue  
)
```

F#

```
new :  
    attributeName:string *  
    attributeValue:int -> CustomTIAAttribute
```

VB

```
Public Sub New (  
    attributeName As String,  
    attributeValue As Integer  
)
```

### **Parameters**

*attributeName*

Type: [System.String](#)

The name for the attribute.

*attributeValue*

Type: [System.Int32](#)

A number representing the attribute value.

[Return to top](#)

### **CustomTIAAttribute Constructor (String, Object)**

Initializes a new instance of the [CustomTIAAttribute](#) class with a specified attribute name and value.

Syntax

C#

```
public CustomTIAAttribute(  
    string attributeName,  
    object attributeValue  
)
```

C++

```
public:  
CustomTIAAttribute(  
    String^ attributeName,  
    Object^ attributeValue  
)
```

F#

```
new :  
    attributeName:string *  
    attributeValue:Object -> CustomTIAAttribute
```

VB

```
Public Sub New (  
    attributeName As String,  
    attributeValue As Object  
)
```

#### Parameters

*attributeName*

Type: [System.String](#)

The name for the attribute.

*attributeValue*

Type: [System.Object](#)

The value of the attribute.

[Return to top](#)

#### CustomTIAAttribute Constructor (String, String)

Initializes a new instance of the [CustomTIAAttribute](#) class with a specified attribute name and value.

Syntax

C#

```
public CustomTIAAttribute(  
    string attributeName,  
    string attributeValue  
)
```

C++

```
public:  
CustomTIAAttribute(  
    String^ attributeName,  
    String^ attributeValue  
)
```

F#

```
new :  
    attributeName:string *  
    attributeValue:string -> CustomTIAAttribute
```

VB

```
Public Sub New (  
    attributeName As String,  
    attributeValue As String  
)
```

#### Parameters

*attributeName*

Type: [System.String](#)

The name for the attribute.

*attributeValue*

Type: [System.String](#)

A specified name for the attribute value.

[Return to top](#)

# CustomTIAAttribute Constructor (Guid, Object)

Initializes a new instance of the [CustomTIAAttribute](#) class with a specified name and object value.

**Namespace:** Microsoft.HostIntegration.TI

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in microsoft.hostintegration.ti.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    guidName As Guid, _
    attributeValue As Object _
)
```

C#

```
public CustomTIAAttribute (
    Guid guidName,
    Object attributeValue
)
```

C++

```
public:
CustomTIAAttribute (
    Guid guidName,
    Object^ attributeValue
)
```

J#

```
public CustomTIAAttribute (
    Guid guidName,
    Object attributeValue
)
```

JScript

```
public function CustomTIAAttribute (
    guidName : Guid,
    attributeValue : Object
)
```

## Parameters

guidName

The name for the globally unique identifier.

attributeValue

The value of an object attributes.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# CustomTIAtribute.CompareTo Method

Compares an [CustomTIAtribute](#) object with another **CustomTIAtribute** object and returns an integer that indicates whether the current object precedes, follows, or occurs in the same position in the sort order as the other object.

**Namespace:** Microsoft.HostIntegration.TI

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in microsoft.hostintegration.ti.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration
Public Function CompareTo ( _
    obj As Object _
) As Integer
```

C#

```
public int CompareTo (
    Object obj
)
```

C++

```
public:
virtual int CompareTo (
    Object^ obj
) sealed
```

J#

```
public final int CompareTo (
    Object obj
)
```

JScript

```
public final function CompareTo (
    obj : Object
) : int
```

## Parameters

obj

The object to be compared.

## Return Value

A value that indicates the relative order of the objects being compared.

**CustomTlException Constructor ()**  
Initializes a new instance of the [CustomTlException](#) class using default values.

Syntax  
C#

```
public CustomTlException()
```

C++

```
public:  
CustomTlException()
```

F#

```
new : unit -> CustomTlException
```

VB

```
Public Sub New
```

[Return to top](#)  
**CustomTlException Constructor (SerializationInfo, StreamingContext)**  
Initializes a new instance of the [CustomTlException](#) class with the specified exception info and context.

Syntax  
C#

```
protected CustomTIEException(  
    SerializationInfo info,  
    StreamingContext context  
)
```

C++

```
protected:  
CustomTIEException(  
    SerializationInfo^ info,  
    StreamingContext context  
)
```

F#

```
new :  
    info:SerializationInfo *  
    context:StreamingContext -> CustomTIEException
```

VB

```
Protected Sub New (  
    info As SerializationInfo,  
    context As StreamingContext  
)
```

#### Parameters

*info*

Type: [System.Runtime.Serialization.SerializationInfo](#)

The details of exception.

*context*

Type: [System.Runtime.Serialization.StreamingContext](#)

The context of exception.

[Return to top](#)

#### CustomTIEException Constructor (String)

Initializes a new instance of the [CustomTIEException](#) class with specified message.

Syntax

C#

```
public CustomTIEException(  
    string message  
)
```

C++

```
public:  
CustomTIEException(  
    String^ message  
)
```

F#

```
new :  
    message:string -> CustomTIEException
```

VB

```
Public Sub New (  
    message As String  
)
```

## Parameters

*message*

Type: [System.String](#)

The message for the exception.

[Return to top](#)

## CustomTException Constructor (String, Exception)

Initializes a new instance of the [CustomTException](#) class with the specified message and inner exception.

Syntax

C#

```
public CustomTException(  
    string message,  
    Exception inner  
)
```

C++

```
public:  
CustomTException(  
    String^ message,  
    Exception^ inner  
)
```

F#

```
new :  
    message:string *  
    inner:Exception -> CustomTException
```

VB

```
Public Sub New (  
    message As String,  
    inner As Exception  
)
```

## Parameters

*message*

Type: [System.String](#)

The exception message shown.

*inner*

Type: [System.Exception](#)

The exception instance that caused the current exception.

[Return to top](#)

## CustomTException Constructor (String, Int32)

Initializes a new instance of the [CustomTException](#) class with the specified message and result.

Syntax

C#

```
public CustomTException(  
    string message,  
    int result  
)
```

C++

```
public:  
CustomTException(  
    String^ message,  
    int result  
)
```

F#

```
new :  
    message:string *  
    result:int -> CustomTException
```

VB

```
Public Sub New (  
    message As String,  
    result As Integer  
)
```

#### Parameters

*message*

Type: [System.String](#)

The exception message shown.

*result*

Type: [System.Int32](#)

A specified number that represents the result.

[Return to top](#)

#### CustomTException Constructor (String, Int32, Boolean)

Initializes a new instance of the [CustomTException](#) class with the specified message and compatibility.

Syntax

C#

```
public CustomTException(  
    string message,  
    int compatibleErrorCode,  
    bool makeCompatible  
)
```

C++

```
public:  
CustomTException(  
    String^ message,  
    int compatibleErrorCode,  
    bool makeCompatible  
)
```

F#

```
new :  
    message:string *  
    compatibleErrorCode:int *  
    makeCompatible:bool -> CustomTException
```

VB

```
Public Sub New (  
    message As String,  
    compatibleErrorCode As Integer,  
    makeCompatible As Boolean  
)
```

#### Parameters

*message*

Type: [System.String](#)

The exception message shown.

*compatibleErrorCode*

Type: [System.Int32](#)

The error code of the last parse error.

*makeCompatible*

Type: [System.Boolean](#)

The exception that is compatible with the object.

[Return to top](#)

### **CustomTIException Constructor (String, Int32, Boolean, Exception)**

Initializes a new instance of the [CustomTIException](#) class with the specified message and compatibility.

Syntax

C#

```
public CustomTIException(  
    string message,  
    int compatibleErrorCode,  
    bool makeCompatible,  
    Exception inner  
)
```

C++

```
public:  
CustomTIException(  
    String^ message,  
    int compatibleErrorCode,  
    bool makeCompatible,  
    Exception^ inner  
)
```

F#

```
new :  
    message:string *  
    compatibleErrorCode:int *  
    makeCompatible:bool *  
    inner:Exception -> CustomTIException
```

VB

```
Public Sub New (  
    message As String,  
    compatibleErrorCode As Integer,  
    makeCompatible As Boolean,  
    inner As Exception  
)
```

### **Parameters**

*message*

Type: [System.String](#)

The exception message shown.

*compatibleErrorCode*

Type: [System.Int32](#)

The error code of the last parse error.

*makeCompatible*

Type: [System.Boolean](#)

The exception that is compatible with the object.

*inner*

Type: [System.Exception](#)

The exception instance that caused the current exception.

# CustomTlException Constructor ()

Initializes a new instance of the [CustomTlException](#) class using default values.

**Namespace:** Microsoft.HostIntegration.Tl

**Assembly:** Microsoft.HostIntegration.Tl.ClientContext (in microsoft.hostintegration.tl.clientcontext.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public CustomTlException ()
```

C++

```
public:  
CustomTlException ()
```

J#

```
public CustomTlException ()
```

JScript

```
public function CustomTlException ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

# SupportedKeys Enumeration

Displays all the supported keys of the [Microsoft.HostIntegration.TI](#) class.

**Namespace:** [Microsoft.HostIntegration.TI](#)

**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in Microsoft.HostIntegration.TI.ClientContext.dll)

Syntax

C#

```
[FlagsAttribute]
public enum SupportedKeys
```

C++

```
[FlagsAttribute]
public enum class SupportedKeys
```

F#

```
[<FlagsAttribute>]
type SupportedKeys
```

VB

```
<FlagsAttribute>
Public Enumeration SupportedKeys
```

Members

Member name	Description
<b>AllDefinedKeys</b>	Defines all the supported keys.
<b>AllDefinedKeysExceptTRMAndELM</b>	Defines all the supported keys except the TRM and ELM keys.
<b>AllowCustomTRMAndELM</b>	Allows a customized TRM and ELM settings.
<b>ConnectionTimeout</b>	The time to wait while trying to establish a connection before terminating the attempt and generating an error.
<b>ConnectionType</b>	The type of connection to be used.
<b>IMSClientId</b>	The information management systems client id.
<b>IMSLTerm</b>	The information management systems logical terminal object.
<b>IMSModName</b>	The name of the returned MOD Name assigned by the executed IMS transaction.
<b>LibraryName</b>	The name of the library that the supported key belongs to.
<b>MsTiAdapterAdvanced</b>	The advanced settings of the Adapter.
<b>MsTiAdapterDefault</b>	The default adapter settings.
<b>MsTiAdapterSecurity</b>	The secured adapter.
<b>OtmaSystemId</b>	The system identification.
<b>Password</b>	The password to be used.
<b>PersistentConnections</b>	A connection state that is persistent.

<b>Port</b>	The TCP/IP port number that the Transaction Integrator runtime will use.
<b>ProgramName</b>	The value of the program name associated with the supported keys.
<b>ReceiveTimeout</b>	The number of seconds that the Transaction Integrator runtime will wait for a response from the host.
<b>RemoteEnvironment</b>	The specified remote environment that lies within the <b>SupportedKeys</b> class.
<b>Security</b>	The security settings for the supported keys.
<b>SendTimeout</b>	The number of seconds that the Transaction Integrator runtime will wait for completion of a send operation to the host.
<b>SourceTransactionProgram</b>	The source where the transaction program is processed.
<b>TransactionProgramName</b>	The name of the transaction program being processed.
<b>UserId</b>	The user identification of the supported keys.

# TracingCategoryOptions.TransportCategories Structure

Represents a transport categories for the [TracingCategoryOptions](#) class.

**Namespace:** [Microsoft.HostIntegration.TI](#)  
**Assembly:** Microsoft.HostIntegration.TI.ClientContext (in Microsoft.HostIntegration.TI.ClientContext.dll)

Syntax  
C#

```
public struct TransportCategories
```

C++

```
public value struct TransportCategories
```

F#

```
[<Sealed>]  
type TransportCategories = struct end
```

VB

```
Public Structure TransportCategories
```

## Methods

	Name	Description
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">ValueType</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">ValueType</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">ToString()</a>	(Inherited from <a href="#">ValueType</a> .)

## Fields

	Name	Description
	<a href="#">AllTransportOptions</a>	An all transport options category.
	<a href="#">Details</a>	The details transport category.
	<a href="#">EntryExit</a>	The entrance and exit transport category.
	<a href="#">States</a>	The states transport category.

## Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# System.ServiceModel.Channels.WebSphereMQ Namespace

A connectivity solution that enables the user to use BizTalk Server in an enterprise with WebSphere MQ as the chosen messaging standard.

## Classes

Class	Description
 <a href="#">MQTrace</a>	Exposes methods that assist in tracing.
 <a href="#">WebSphereMQBinaryBinding</a>	Provides WCF binding used to communicate with Websphere MQ using binary encoder.
 <a href="#">WebSphereMQBinaryBindingElement</a>	Represents the configuration element for the WebsphereMQBinaryBinding.
 <a href="#">WebSphereMQBinding</a>	Provides WCF binding used to communicate with Websphere MQ.
 <a href="#">WebSphereMQBindingElement</a>	Represents the configuration element for the WebsphereMQBinding.
 <a href="#">WebSphereMQChannelConfigurationStrings</a>	Represents the configuration strings used in the server.
 <a href="#">WebSphereMQException</a>	Represents a class that wraps runtime WebsphereMQ binding and transport relation exceptions.
 <a href="#">WebSphereMQHeaderProvider</a>	Implements methods that assist in loading extensible headers from the configuration files. The header description in the configuration file must be in a fully qualified format.
 <a href="#">WebSphereMQRequestReplyBinaryBinding</a>	
 <a href="#">WebSphereMQRequestReplyBinaryBindingElement</a>	
 <a href="#">WebSphereMQRequestReplyBinding</a>	
 <a href="#">WebSphereMQRequestReplyBindingElement</a>	
 <a href="#">WebSphereMQRequestReplyTransportBindingElement</a>	
 <a href="#">WebSphereMQTransportBindingElement</a>	Represents the WebsphereMQ transport layer in the WebsphereMQ binding channel stack.
 <a href="#">WebSphereMQTransportElement</a>	Represents the configuration element for WebsphereMQ transport binding element.
 <a href="#">WebSphereMQUri</a>	Provides an object representation of a uniform resource identifier (URI) and easy access to the parts of the URI.

## Interfaces

Interface	Description
 <a href="#">IMQHeaderBase</a>	Defines the properties that the custom headers will implement.
 <a href="#">IMQNotifier</a>	Defines the methods that are used to notify the transaction result for the base client browse lock case.
 <a href="#">IMQTracing</a>	Exposes methods that assist in tracing.
 <a href="#">IMQTransport</a>	Defines the properties and methods that the custom transports will implement. The default Websphere MQ transport implements this interface.
 <a href="#">IPropertyBag</a>	Defines an object with a property bag in which the object can save its properties persistently.

[Return to top](#)

# IMQHeaderBase Interface

Defines the properties that the custom headers will implement.

**Namespace:** [System.ServiceModel.Channels.WebSphereMQ](#)  
**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in System.ServiceModel.Channels.WebSphereMQ.Channel.dll)

Syntax

```
C#  
  
public interface IMQHeaderBase
```

C++

```
public interface class IMQHeaderBase
```

F#

```
type IMQHeaderBase = interface end
```

VB

```
Public Interface IMQHeaderBase
```

Properties

	Name	Description
	<a href="#">FormatStringForThisHeader</a>	Gets the format string for the current header.
	<a href="#">FormatStringOfNextHeader</a>	Gets the format string of the next header.

Gets the format string for the current header.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration  
ReadOnly Property FormatStringForThisHeader As String
```

C#

```
string FormatStringForThisHeader { get; }
```

C++

```
property String^ FormatStringForThisHeader {  
    String^ get ();  
}
```

J#

```
/** @property */  
String get_FormatStringForThisHeader ()
```

JScript

```
function get FormatStringForThisHeader () : String
```

## Property Value

The format string for the current header.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

C++

```
void TraceEnter (
    String^ value
)
```

J#

```
void TraceEnter (
    String value
)
```

JScript

```
function TraceEnter (
    value : String
)
```

## Parameters

value

The value of the traced object.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# IMQTransport Interface

Defines the properties and methods that the custom transports will implement. The default Websphere MQ transport implements this interface.

**Namespace:** [System.ServiceModel.Channels.WebSphereMQ](#)

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in System.ServiceModel.Channels.WebSphereMQ.Channel.dll)

Syntax

C#

```
public interface IMQTransport
```

C++

```
public interface class IMQTransport
```

F#

```
type IMQTransport = interface end
```

VB

```
Public Interface IMQTransport
```

Properties

Name	Description
 <a href="#">HeaderProvider</a>	Gets or sets the object that provides the header for the <b>IMQTransport</b> object.
 <a href="#">MessageEncoder</a>	Gets or sets the message encoder associated with the channel stack.
 <a href="#">PerformanceCounters</a>	Gets or sets the performance counters that is associated with the <b>IMQTransport</b> object.
 <a href="#">PropertyBag</a>	Gets or sets the property bag that is associated with the <b>IMQTransport</b> .

Methods

Name	Description
 <a href="#">OnClose(TimeSpan)</a>	Closes down the channel stack of the <b>IMQTransport</b> object.
 <a href="#">OnOpen(TimeSpan)</a>	Opens the channel stack of the <b>IMQTransport</b> object.
 <a href="#">Send(Message, TimeSpan, Byte[])</a>	Sends the message to the queue.
 <a href="#">SendToReplyQ(Message, TimeSpan, Byte[], String, String)</a>	Sends the message to reply queue.
 <a href="#">SetBrowseLocked(Boolean)</a>	Sets the browse locked.
 <a href="#">TryReceive(TimeSpan, Message, IMQNotifier, Byte[], String, String)</a>	Tries to receive message from the queue.
 <a href="#">TryReceiveFromReplyQ(TimeSpan, Message, IMQNotifier, Byte[])</a>	Indicates to try receiving the message from the queue with the specified interval of time.
 <a href="#">WaitForMessage(TimeSpan)</a>	Indicates to wait for a message to be in the queue with the specified interval of time.

# IMQTransport.OnClose Method

Closes down the channel stack of the [IMQTransport](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Sub OnClose ( _
    timeout As TimeSpan _
)
```

C#

```
void OnClose (
    TimeSpan timeout
)
```

C++

```
void OnClose (
    TimeSpan timeout
)
```

J#

```
void OnClose (
    TimeSpan timeout
)
```

JScript

```
function OnClose (
    timeout : TimeSpan
)
```

## Parameters

timeout

The time period that specifies how long the close operation has to complete before timing out.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

### Reference

[IMQTransport Interface](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# IMQTransport.HeaderProvider Property

Gets or sets the object that provides the header for the [IMQTransport](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Property HeaderProvider As Object
```

C#

```
Object HeaderProvider { get; set; }
```

C++

```
property Object^ HeaderProvider {
    Object^ get ();
    void set (Object^ value);
}
```

J#

```
/** @property */
Object get_HeaderProvider ()

/** @property */
void set_HeaderProvider (Object value)
```

JScript

```
function get HeaderProvider () : Object

function set HeaderProvider (value : Object)
```

## Property Value

The object that provides the header for the specified object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# IMQTransport.MessageEncoder Property

Gets or sets the message encoder associated with the channel stack.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Property MessageEncoder As MessageEncoder
```

C#

```
MessageEncoder MessageEncoder { get; set; }
```

C++

```
property MessageEncoder^ MessageEncoder {
    MessageEncoder^ get ();
    void set (MessageEncoder^ value);
}
```

J#

```
/** @property */
MessageEncoder get_MessageEncoder ()

/** @property */
void set_MessageEncoder (MessageEncoder value)
```

JScript

```
function get MessageEncoder () : MessageEncoder

function set MessageEncoder (value : MessageEncoder)
```

## Property Value

The message encoder associated with the channel stack.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

# MqcihHeader Members

Implements methods that assist headers from the config files.

The following tables list the members exposed by the [MqcihHeader](#) type.

## Public Constructors

Name	Description
<a href="#">MqcihHeader</a>	Initializes a new instance of the <a href="#">MqcihHeader</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">AbendCode</a>	Gets or sets the code of the termination for the <b>MqcihHeader</b> object.
 <a href="#">ADSDescriptor</a>	Gets or sets the descriptor of the ADS.
 <a href="#">AttentionId</a>	Gets or sets the attention identifier of the <b>MqcihHeader</b> object.
 <a href="#">Authenticator</a>	Sets the password or passticket for the header object.
 <a href="#">CancelCode</a>	Gets or sets the transaction code for the specified header object.
 <a href="#">CodedCharSetId</a>	Gets or sets the character set identifier of data that follows <b>MqcihHeader</b> object.
 <a href="#">CompCode</a>	Gets or sets the MQ completion code.
 <a href="#">ConversationalTask</a>	Gets or sets the conversational task value for the specified header object.
 <a href="#">CursorPosition</a>	Gets or sets the position of the cursor of a <b>MqcihHeader</b> object.
 <a href="#">Encoding</a>	Gets or sets the numeric encoding of data that follows <b>MqcihHeader</b> object.
 <a href="#">ErrorOffset</a>	Gets or sets the error offset value for the specified header object.
 <a href="#">Facility</a>	Gets or sets the BVT token value.
 <a href="#">FacilityKeepTime</a>	Gets or sets the bridge facility release time.
 <a href="#">FacilityLike</a>	Gets or sets the terminal emulated attributes for the specified header object.
 <a href="#">Flags</a>	Gets or sets the flags used for the <b>MqcihHeader</b> object.
 <a href="#">Format</a>	Gets or sets the format name of data that follows the <b>MqcihHeader</b> object.
 <a href="#">FormatStringForThisHeader</a>	Overridden. Gets the string that specifies the display format for the current header.
 <a href="#">FormatStringOfNextHeader</a>	Overridden. Gets or sets the string that specifies the display format of the next header.
 <a href="#">Function</a>	Gets or sets the MQ call name or CICS EIBFN function name.
 <a href="#">GetWaitInterval</a>	Gets or sets the wait interval for MQGET call issued by bridge.
 <a href="#">HeaderNameForThisHeader</a>	Overridden. Gets or sets the name of the header for the current header.
 <a href="#">InputItem</a>	Gets or sets the input item for the specified header object.
 <a href="#">LinkType</a>	Gets or sets the type of link of a <b>MqcihHeader</b> object.
 <a href="#">NextTransactionId</a>	Gets or sets the next identifier of the transaction.
 <a href="#">OutputDataLength</a>	Gets or sets the length of the output data for the <b>MqcihHeader</b> object.
 <a href="#">Reason</a>	Gets or sets the MQ reason or feedback code, or CICS EIBRESP2 for the specified header object.
 <a href="#">RemoteSysId</a>	Gets or sets the CICS system identifier of the CICS bridge header.
 <a href="#">RemoteTransId</a>	Gets or sets the value of the Remote Trans Id.
 <a href="#">ReplyToFormat</a>	Gets or sets the MQ format name of the reply message.
 <a href="#">ReturnCode</a>	Gets or sets the return code for the CICS bridge header.
 <a href="#">StartCode</a>	Gets or sets the transaction start code.
 <a href="#">StrucId</a>	Gets the identifier for the structure of the <b>MqcihHeader</b> object.
 <a href="#">StrucIdForThisHeader</a>	Overridden. Gets the identifier of the structure for the current header.
 <a href="#">StrucLength</a>	Gets or sets the length of the structure for the <b>MqcihHeader</b> object.
 <a href="#">TaskEndStatus</a>	Gets or sets the status at the end of task.
 <a href="#">TransactionId</a>	Gets or sets the identifier for the transaction of the <b>MqcihHeader</b> object.
 <a href="#">UOWControl</a>	Gets or sets the control of the unit of work.
 <a href="#">Version</a>	Gets the version of the <b>MqcihHeader</b> object.
 <a href="#">VersionForThisHeader</a>	Overridden. Gets the version for the current header.

## Top

Public Methods (see also [Protected Methods](#))

Name	Description
------	-------------

	<a href="#">Dispose</a>	Overloaded. Releases the resources used by the <b>MqcihHeader</b> class.

 <a href="#">CancelCode</a>	Gets or sets the transaction code for the specified header object.
 <a href="#">CodedCharSetId</a>	Gets or sets the character set identifier of data that follows <b>MqcihHeader</b> object.
 <a href="#">CompCode</a>	Gets or sets the MQ completion code.
 <a href="#">ConversationalTask</a>	Gets or sets the conversational task value for the specified header object.
 <a href="#">CursorPosition</a>	Gets or sets the position of the cursor of a <b>MqcihHeader</b> object.
 <a href="#">Encoding</a>	Gets or sets the numeric encoding of data that follows <b>MqcihHeader</b> object.
 <a href="#">ErrorOffset</a>	Gets or sets the error offset value for the specified header object.
 <a href="#">Facility</a>	Gets or sets the BVT token value.
 <a href="#">FacilityKeepTime</a>	Gets or sets the bridge facility release time.
 <a href="#">FacilityLike</a>	Gets or sets the terminal emulated attributes for the specified header object.
 <a href="#">Flags</a>	Gets or sets the flags used for the <b>MqcihHeader</b> object.
 <a href="#">Format</a>	Gets or sets the format name of data that follows the <b>MqcihHeader</b> object.
 <a href="#">FormatStringForThisHeader</a>	Overridden. Gets the string that specifies the display format for the current header.
 <a href="#">FormatStringOfNextHeader</a>	Overridden. Gets or sets the string that specifies the display format of the next header.
 <a href="#">Function</a>	Gets or sets the MQ call name or CICS EIBFN function name.
 <a href="#">GetWaitInterval</a>	Gets or sets the wait interval for MQGET call issued by bridge.
 <a href="#">HeaderNameForThisHeader</a>	Overridden. Gets or sets the name of the header for the current header.
 <a href="#">InputItem</a>	Gets or sets the input item for the specified header object.
 <a href="#">LinkType</a>	Gets or sets the type of link of a <b>MqcihHeader</b> object.
 <a href="#">NextTransactionId</a>	Gets or sets the next identifier of the transaction.
 <a href="#">OutputDataLength</a>	Gets or sets the length of the output data for the <b>MqcihHeader</b> object.
 <a href="#">Reason</a>	Gets or sets the MQ reason or feedback code, or CICS EIBRESP2 for the specified header object.
 <a href="#">RemoteSysId</a>	Gets or sets the CICS system identifier of the CICS bridge header.
 <a href="#">RemoteTransId</a>	Gets or sets the value of the Remote Trans Id.
 <a href="#">ReplyToFormat</a>	Gets or sets the MQ format name of the reply message.
 <a href="#">ReturnCode</a>	Gets or sets the return code for the CICS bridge header.
 <a href="#">StartCode</a>	Gets or sets the transaction start code.
 <a href="#">StrucId</a>	Gets the identifier for the structure of the <b>MqcihHeader</b> object.
 <a href="#">StrucIdForThisHeader</a>	Overridden. Gets the identifier of the structure for the current header.
 <a href="#">StrucLength</a>	Gets or sets the length of the structure for the <b>MqcihHeader</b> object.
 <a href="#">TaskEndStatus</a>	Gets or sets the status at the end of task.
 <a href="#">TransactionId</a>	Gets or sets the identifier for the transaction of the <b>MqcihHeader</b> object.
 <a href="#">UOWControl</a>	Gets or sets the control of the unit of work.
 <a href="#">Version</a>	Gets the version of the <b>MqcihHeader</b> object.
 <a href="#">VersionForThisHeader</a>	Overridden. Gets the version for the current header.

[MqcihHeader Class](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# MqcihHeader.AbendCode Property

Gets or sets the code of the termination for the [MqcihHeader](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Property AbendCode As String
```

C#

```
public string AbendCode { get; set; }
```

C++

```
public:
property String^ AbendCode {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_AbendCode ()

/** @property */
public void set_AbendCode (String value)
```

JScript

```
public function get AbendCode () : String

public function set AbendCode (value : String)
```

## Property Value

The code of the termination for the object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MqcihHeader.Function Property

Gets or sets the MQ call name or CICS EIBFN function name.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Function As String
```

C#

```
public string Function { get; set; }
```

C++

```
public:
property String^ Function {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_Function ()

/** @property */
public void set_Function (String value)
```

JScript

```
public function get Function () : String

public function set Function (value : String)
```

## Property Value

The MQ call name values or CICS EIBFN function.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Property GetWaitInterval As UInteger
```

C#

```
public uint GetWaitInterval { get; set; }
```

C++

```
public:
property unsigned int GetWaitInterval {
    unsigned int get ();
    void set (unsigned int value);
}
```

J#

```
/** @property */
public UInt32 get_GetWaitInterval ()

/** @property */
public void set_GetWaitInterval (UInt32 value)
```

JScript

```
public function get GetWaitInterval () : uint

public function set GetWaitInterval (value : uint)
```

## Property Value

The wait interval for MQGET call issued by bridge.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

[MqdlhHeader Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# MqdlhHeader Members

Implements methods that assist headers from the config files.

The following tables list the members exposed by the [MqdlhHeader](#) type.

## Public Constructors

Name	Description
<a href="#">MqdlhHeader</a>	Initializes a new instance of the <a href="#">MqdlhHeader</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">CodedCharSetId</a>	Gets or sets the character set identifier of data that follows <b>MqdlhHeader</b> object.
 <a href="#">DestQMgrName</a>	Gets or sets the name of the original destination queue manager for the <b>MqdlhHeader</b> object.
 <a href="#">DestQName</a>	Gets or sets the name of the original destination queue for the <b>MqdlhHeader</b> object.
 <a href="#">Encoding</a>	Gets or sets the numeric encoding of data that follows <b>MqdlhHeader</b> object.
 <a href="#">Format</a>	Gets or sets the format name of data that follows the <b>MqdlhHeader</b> object.
 <a href="#">FormatStringForThisHeader</a>	Overridden. Gets the string that specifies the display format for the current header.
 <a href="#">FormatStringOfNextHeader</a>	Overridden. Gets or sets the string that specifies the display format of the next header.
 <a href="#">HeaderNameForThisHeader</a>	Overridden. Gets the name of the header for the current header.
 <a href="#">PutApplName</a>	Gets or sets the name of application that put the message on the <b>MqdlhHeader</b> object.
 <a href="#">PutApplType</a>	Gets or sets the type of application that put the message on the <b>MqdlhHeader</b> object.
 <a href="#">PutDate</a>	Gets or sets the date when a message was put on the <b>MqdlhHeader</b> object.
 <a href="#">PutTime</a>	Gets or sets the time when a message was put on the <b>MqdlhHeader</b> object.
 <a href="#">Reason</a>	Gets or sets the MQ reason or feedback code, or CICS EIBRESP2.
 <a href="#">StrucId</a>	Gets the structure identifier of the specified <b>MqdlhHeader</b> object.
 <a href="#">StrucIdForThisHeader</a>	Overridden. Gets the identifier of the structure for the current header.
 <a href="#">Version</a>	Gets the version of the <b>MqdlhHeader</b> object.
 <a href="#">VersionForThisHeader</a>	Overridden. Gets the version for the current header.

## Top

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Dispose</a>	Overloaded. Releases the resources used by the <b>MqdlhHeader</b> class.
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ReadFromStream</a>	Overloaded. Overridden.
 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ToString</a>	(inherited from <a href="#">Object</a> )
 <a href="#">WriteToStream</a>	Overloaded. Overridden.

## Top

## Protected Methods

Name	Description
 <a href="#">Dispose</a>	Overloaded.
 <a href="#">Finalize</a>	(inherited from <a href="#">Object</a> )
 <a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ReadFromStream</a>	Overloaded. (inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">ReadStringFromField</a>	(inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">WriteSecureStringToField</a>	(inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">WriteStringToField</a>	(inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">WriteToStream</a>	Overloaded. (inherited from <a href="#">MQHeaderBase</a> )

[MqdlhHeader Class](#)

[MqdlhHeader Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# MqdlhHeader.PutAppName Property

Gets or sets the name of application that put the message on the [MqdlhHeader](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Property PutAppName As String
```

C#

```
public string PutAppName { get; set; }
```

C++

```
public:
property String^ PutAppName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_PutAppName ()

/** @property */
public void set_PutAppName (String value)
```

JScript

```
public function get PutAppName () : String

public function set PutAppName (value : String)
```

## Property Value

The name of application that put the message on the specified object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MQHeaderBase Members

Defines properties and methods that custom headers must implement.

The following tables list the members exposed by the [MQHeaderBase](#) type.

## Protected Constructors

Name	Description
<a href="#">MQHeaderBase</a>	Initializes a new instance of the <a href="#">MQHeaderBase</a> class.

[Top](#)

## Public Properties

Name	Description
 <a href="#">FormatStringForThisHeader</a>	Gets the format string for the current header.
 <a href="#">FormatStringOfNextHeader</a>	Gets the format string for the next header.
 <a href="#">HeaderNameForThisHeader</a>	Gets the name of the header for the current header.
 <a href="#">StructIdForThisHeader</a>	Gets the identifier of the structure for the current header.
 <a href="#">VersionForThisHeader</a>	Gets the version for the current header.

[Top](#)

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ReadFromStream</a>	Overloaded. Retrieves the header base object from the given stream.
 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ToString</a>	(inherited from <a href="#">Object</a> )
 <a href="#">WriteToStream</a>	Overloaded.

[Top](#)

## Protected Methods

Name	Description
 <a href="#">Finalize</a>	(inherited from <a href="#">Object</a> )
 <a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ReadFromStream</a>	Overloaded.
 <a href="#">ReadStringFromField</a>	Retrieves the string object of the specified header from the specific field.
 <a href="#">WriteSecureStringToField</a>	Writes the secure string object of the specified header to the specific field.
 <a href="#">WriteStringToField</a>	Writes a string object of the specified header to the specific field.
 <a href="#">WriteToStream</a>	Overloaded. Writes the header base object to the given stream.

# MQHeaderBase.WriteToStream Method (Byte\*, Int32, Stream)

Writes the header base object to the given stream.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

'Declaration

C#

```
[SuppressMessageAttribute("Microsoft.Performance", "CA1822:MarkMembersAsStatic")]
protected void WriteToStream (
    byte* header,
    int headerSize,
    Stream stream
)
```

C++

```
[SuppressMessageAttribute(L"Microsoft.Performance", L"CA1822:MarkMembersAsStatic")]
protected:
void WriteToStream (
    unsigned char* header,
    int headerSize,
    Stream^ stream
)
```

J#

JScript

## Parameters

header

The stream to write this memory stream to.

headerSize

The header that contains the stream.

stream

A specified value for the header.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[MqiihHeader Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# MqiihHeader Members

Implements methods that assist headers from the config files.

The following tables list the members exposed by the [MqiihHeader](#) type.

## Public Constructors

Name	Description
<a href="#">MqiihHeader</a>	Initializes a new instance of the <a href="#">MqiihHeader</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">Authenticator</a>	Gets or sets the password or passticket for the specified header object.
 <a href="#">CodedCharSetId</a>	Gets or sets the coded character set identifier of the <b>MqiihHeader</b> object.
 <a href="#">CommitMode</a>	Gets or sets the header object using the specified CommitMode.
 <a href="#">Encoding</a>	Gets or sets the numeric encoding of data that follows the <b>MqiihHeader</b> object.
 <a href="#">Flags</a>	Gets or sets the flags used for the <b>MqiihHeader</b> object.
 <a href="#">Format</a>	Gets or sets the format name of the <b>MqiihHeader</b> object.
 <a href="#">FormatStringForThisHeader</a>	Overridden. Gets the specified value to format for the current header.
 <a href="#">FormatStringOfNextHeader</a>	Overridden. Gets or sets the specified value to format for the next header.
 <a href="#">HeaderNameForThisHeader</a>	Overridden. Gets the name of the current header.
 <a href="#">LTermOverride</a>	Gets or sets the logical terminal override, placed in the IO PCB field.
 <a href="#">MFSMapName</a>	Gets or sets the message format services map name.
 <a href="#">ReplyToFormat</a>	Gets or sets the MQ format name of the reply message.
 <a href="#">SecurityScope</a>	Gets or sets the IMS security processing required.
 <a href="#">StrucId</a>	Gets the identifier for the structure of the <b>MqiihHeader</b> object.
 <a href="#">StrucIdForThisHeader</a>	Overridden. Gets the identifier of the structure for the current header.
 <a href="#">StrucLength</a>	Gets or sets the length of the structure for the <b>MqiihHeader</b> object.
 <a href="#">TranInstancelId</a>	Gets or sets the transaction instance identifier for the specified header object.
 <a href="#">TranState</a>	Gets or sets the IMS conversation state.
 <a href="#">Version</a>	Gets the version of the <b>MqiihHeader</b> object.
 <a href="#">VersionForThisHeader</a>	Overridden. Gets the value of the version for the current header.

## Top

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Dispose</a>	Overloaded. Releases the resources used by the <b>MqiihHeader</b> class.
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ReadFromStream</a>	Overloaded. Overridden.
 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ToString</a>	(inherited from <a href="#">Object</a> )
 <a href="#">WriteToStream</a>	Overloaded. Overridden.

## Top

## Protected Methods

Name	Description
 <a href="#">Dispose</a>	Overloaded.
 <a href="#">Finalize</a>	(inherited from <a href="#">Object</a> )
 <a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ReadFromStream</a>	Overloaded. (inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">ReadStringFromField</a>	(inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">WriteSecureStringToField</a>	(inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">WriteStringToField</a>	(inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">WriteToStream</a>	Overloaded. (inherited from <a href="#">MQHeaderBase</a> )

Gets or sets the header object using the specified CommitMode.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Property CommitMode As SByte
```

C#

```
public sbyte CommitMode { get; set; }
```

C++

```
public:
property signed char CommitMode {
    signed char get ();
    void set (signed char value);
}
```

J#

```
/** @property */
public SByte get_CommitMode ()

/** @property */
public void set_CommitMode (SByte value)
```

JScript

```
public function get CommitMode () : sbyte

public function set CommitMode (value : sbyte)
```

## Property Value

The header object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# MqiihHeader.Encoding Property

Gets or sets the numeric encoding of data that follows the [MqiihHeader](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Encoding As UIntInteger
```

C#

```
public uint Encoding { get; set; }
```

C++

```
public:
property unsigned int Encoding {
    unsigned int get ();
    void set (unsigned int value);
}
```

J#

```
/** @property */
public UInt32 get_Encoding ()

/** @property */
public void set_Encoding (UInt32 value)
```

JScript

```
public function get Encoding () : uint

public function set Encoding (value : uint)
```

## Property Value

The numeric encoding of data that follows the specified object.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

[MqmdHeader Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# MqmdHeader Members

Implements methods that assist headers from the config files.

The following tables list the members exposed by the [MqmdHeader](#) type.

## Public Constructors

Name	Description
<a href="#">MqmdHeader</a>	Initializes a new instance of the <a href="#">MqmdHeader</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">AccountingToken</a>	Gets or sets the value of the accounting token.
 <a href="#">ApplIdentityData</a>	Gets or sets the application data relating to the identity of the <b>MqmdHeader</b> object.
 <a href="#">ApplOriginData</a>	Gets or sets the application data relating to the origin of the <b>MqmdHeader</b> object.
 <a href="#">BackoutCount</a>	Gets or sets the count of the number of times that the message has been previously returned by the MQGET call as part of a unit of work, and subsequently backed out.
 <a href="#">CodedCharSetId</a>	Gets or sets the coded character set identifier of the <b>MqmdHeader</b> object.
 <a href="#">CorrelId</a>	Gets or sets a 20-byte application-defined correlation identifier that identifies the message of the <b>MqmdHeader</b> object.
 <a href="#">Encoding</a>	Gets or sets the numeric encoding of data that follows the <b>MqmdHeader</b> object.
 <a href="#">Expiry</a>	Gets or sets the expiry time of the <b>MqmdHeader</b> object.
 <a href="#">Feedback</a>	Gets or sets the feedback or reason code of the <b>MqmdHeader</b> object.
 <a href="#">Format</a>	Gets or sets the format name of the <b>MqmdHeader</b> object.
 <a href="#">FormatStringForThisHeader</a>	Overridden. Gets the specified value to format for the current header.
 <a href="#">FormatStringOfNextHeader</a>	Overridden. Gets or sets the specified value to format for the next header.
 <a href="#">GroupId</a>	Gets or sets the identifier for the group of the <b>MqmdHeader</b> object.
 <a href="#">HeaderNameForThisHeader</a>	Overridden. Gets the name of the current header.
 <a href="#">MsgFlags</a>	Gets or sets the message flag for the message of the <b>MqmdHeader</b> object.
 <a href="#">MsgId</a>	Gets or sets the message identifier of the <b>MqmdHeader</b> object.
 <a href="#">MsgSeqNumber</a>	Gets or sets the sequence number of logical message for the <b>MqmdHeader</b> object.
 <a href="#">MsgType</a>	Gets the type of the currently indexed message.
 <a href="#">Offset</a>	Gets or sets the offset of data in physical message.
 <a href="#">OriginalLength</a>	Gets or sets the original length of the specified <b>MqmdHeader</b> object.
 <a href="#">Persistence</a>	Gets or sets the message persistence of the <b>MqmdHeader</b> object.
 <a href="#">Priority</a>	Gets or sets the message priority of the <b>MqmdHeader</b> object.
 <a href="#">PutApplName</a>	Gets or sets the name of application that put the message on the <b>MqmdHeader</b> object.
 <a href="#">PutApplType</a>	Gets or sets the type of application that put the message on the <b>MqmdHeader</b> object.
 <a href="#">PutDate</a>	Gets or sets the date when a message was put on the <b>MqmdHeader</b> object.
 <a href="#">PutTime</a>	Gets or sets the time when a message was put on the <b>MqmdHeader</b> object.
 <a href="#">ReplyToQ</a>	Gets or sets the name of reply-to queue of the <b>MqmdHeader</b> object.
 <a href="#">ReplyToQMgr</a>	Gets or sets the name of reply-to queue manager of the <b>MqmdHeader</b> object.
 <a href="#">Report</a>	Gets or sets the report to refer.
 <a href="#">StrucId</a>	Gets the identifier for the structure of the <b>MqmdHeader</b> object.
 <a href="#">StrucIdForThisHeader</a>	Overridden. Gets the value of the structure identifier for the current header.
 <a href="#">UserIdentifier</a>	Gets or sets the user identifier of the <b>MqmdHeader</b> object.
 <a href="#">Version</a>	Gets the version of the <b>MqmdHeader</b> object.
 <a href="#">VersionForThisHeader</a>	Overridden. Gets the value of the version for the current header.

# MqmdHeader Constructor

Initializes a new instance of the [MqmdHeader](#) class.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public MqmdHeader ()
```

C++

```
public:
MqmdHeader ()
```

J#

```
public MqmdHeader ()
```

JScript

```
public function MqmdHeader ()
```

**Remarks**The default constructor initializes any fields to their default values.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MqmdHeader Properties

## Public Properties

	Name	Description
	<a href="#">AccountingToken</a>	Gets or sets the value of the accounting token.
	<a href="#">ApplIdentityData</a>	Gets or sets the application data relating to the identity of the <b>MqmdHeader</b> object.
	<a href="#">ApplOriginData</a>	Gets or sets the application data relating to the origin of the <b>MqmdHeader</b> object.
	<a href="#">BackoutCount</a>	Gets or sets the count of the number of times that the message has been previously returned by the MQGET call as part of a unit of work, and subsequently backed out.
	<a href="#">CodedCharSetId</a>	Gets or sets the coded character set identifier of the <b>MqmdHeader</b> object.
	<a href="#">CorrelId</a>	Gets or sets a 20-byte application-defined correlation identifier that identifies the message of the <b>MqmdHeader</b> object.
	<a href="#">Encoding</a>	Gets or sets the numeric encoding of data that follows the <b>MqmdHeader</b> object.
	<a href="#">Expiry</a>	Gets or sets the expiry time of the <b>MqmdHeader</b> object.
	<a href="#">Feedback</a>	Gets or sets the feedback or reason code of the <b>MqmdHeader</b> object.
	<a href="#">Format</a>	Gets or sets the format name of the <b>MqmdHeader</b> object.
	<a href="#">FormatStringForThisHeader</a>	Overridden. Gets the specified value to format for the current header.
	<a href="#">FormatStringOfNextHeader</a>	Overridden. Gets or sets the specified value to format for the next header.
	<a href="#">GroupId</a>	Gets or sets the identifier for the group of the <b>MqmdHeader</b> object.
	<a href="#">HeaderNameForThisHeader</a>	Overridden. Gets the name of the current header.
	<a href="#">MsgFlags</a>	Gets or sets the message flag for the message of the <b>MqmdHeader</b> object.
	<a href="#">MsgId</a>	Gets or sets the message identifier of the <b>MqmdHeader</b> object.
	<a href="#">MsgSeqNumber</a>	Gets or sets the sequence number of logical message for the <b>MqmdHeader</b> object.
	<a href="#">MsgType</a>	Gets the type of the currently indexed message.
	<a href="#">Offset</a>	Gets or sets the offset of data in physical message.
	<a href="#">OriginalLength</a>	Gets or sets the original length of the specified <b>MqmdHeader</b> object.
	<a href="#">Persistence</a>	Gets or sets the message persistence of the <b>MqmdHeader</b> object.
	<a href="#">Priority</a>	Gets or sets the message priority of the <b>MqmdHeader</b> object.
	<a href="#">PutApplName</a>	Gets or sets the name of application that put the message on the <b>MqmdHeader</b> object.
	<a href="#">PutApplType</a>	Gets or sets the type of application that put the message on the <b>MqmdHeader</b> object.
	<a href="#">PutDate</a>	Gets or sets the date when a message was put on the <b>MqmdHeader</b> object.
	<a href="#">PutTime</a>	Gets or sets the time when a message was put on the <b>MqmdHeader</b> object.
	<a href="#">ReplyToQ</a>	Gets or sets the name of reply-to queue of the <b>MqmdHeader</b> object.
	<a href="#">ReplyToQMgr</a>	Gets or sets the name of reply-to queue manager of the <b>MqmdHeader</b> object.
	<a href="#">Report</a>	Gets or sets the report to refer.
	<a href="#">StrucId</a>	Gets the identifier for the structure of the <b>MqmdHeader</b> object.
	<a href="#">StrucIdForThisHeader</a>	Overridden. Gets the value of the structure identifier for the current header.
	<a href="#">UserIdentifier</a>	Gets or sets the user identifier of the <b>MqmdHeader</b> object.
	<a href="#">Version</a>	Gets the version of the <b>MqmdHeader</b> object.
	<a href="#">VersionForThisHeader</a>	Overridden. Gets the value of the version for the current header.

# MqmdHeader.Feedback Property

Gets or sets the feedback or reason code of the [MqmdHeader](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Feedback As UIntInteger
```

C#

```
public uint Feedback { get; set; }
```

C++

```
public:
property unsigned int Feedback {
    unsigned int get ();
    void set (unsigned int value);
}
```

J#

```
/** @property */
public UInt32 get_Feedback ()

/** @property */
public void set_Feedback (UInt32 value)
```

JScript

```
public function get Feedback () : uint

public function set Feedback (value : uint)
```

## Property Value

The feedback or reason code of the specified object.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# MqmdHeader.Report Property

Gets or sets the report to refer.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Property Report As UInteger
```

C#

```
public uint Report { get; set; }
```

C++

```
public:
property unsigned int Report {
    unsigned int get ();
    void set (unsigned int value);
}
```

J#

```
/** @property */
public UInt32 get_Report ()

/** @property */
public void set_Report (UInt32 value)
```

JScript

```
public function get Report () : uint

public function set Report (value : uint)
```

## Property Value

A number that represents the object to report.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# MqmdHeader.StrucId Property

Gets the identifier for the structure of the [MqmdHeader](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property StrucId As String
```

C#

```
public string StrucId { get; }
```

C++

```
public:
property String^ StrucId {
    String^ get ();
}
```

J#

```
/** @property */
public String get_StrucId ()
```

JScript

```
public function get StrucId () : String
```

## Property Value

The identifier for the structure of the specified object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[Mqrfh2Header Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# Mqrfh2Header Members

Implements methods that assist headers from the config files.

The following tables list the members exposed by the [Mqrfh2Header](#) type.

## Public Constructors

Name	Description
<a href="#">Mqrfh2Header</a>	Initializes a new instance of the <a href="#">Mqrfh2Header</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">CodedCharSetId</a>	Gets or sets the coded character set identifier of the <b>Mqrfh2Header</b> object.
 <a href="#">Encoding</a>	Gets or sets the numeric encoding of data that follows the <b>Mqrfh2Header</b> object.
 <a href="#">Flags</a>	Gets or sets the flags used for the <b>Mqrfh2Header</b> object.
 <a href="#">Format</a>	Gets or sets the format name of the <b>Mqrfh2Header</b> object.
 <a href="#">FormatStringForThisHeader</a>	Overridden. Gets the specified value to format for the current header.
 <a href="#">FormatStringOfNextHeader</a>	Overridden. Gets or sets the specified value to format for the next header.
 <a href="#">HeaderNameForThisHeader</a>	Overridden. Gets the name of the header for the current header.
 <a href="#">NameValueCCSID</a>	Gets or sets the name value of the character code set identifier (CCSID).
 <a href="#">NameValueData</a>	Gets or sets the name value of the specified data.
 <a href="#">StrucId</a>	Gets the structure identifier for the <b>Mqrfh2Header</b> object.
 <a href="#">StrucIdForThisHeader</a>	Overridden. Gets the structure identifier for the current header.
 <a href="#">StrucLength</a>	Gets or sets the length of the structure for the <b>Mqrfh2Header</b> object.
 <a href="#">Version</a>	Gets the version of the <b>Mqrfh2Header</b> object.
 <a href="#">VersionForThisHeader</a>	Overridden. Gets the value of the version for the current header.

## Top

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Dispose</a>	Overloaded. Releases the resources used by the <b>Mqrfh2Header</b> class.
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ReadFromStream</a>	Overloaded. Overridden.
 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ToString</a>	(inherited from <a href="#">Object</a> )
 <a href="#">WriteToStream</a>	Overloaded. Overridden.

## Top

## Protected Methods

Name	Description
 <a href="#">Dispose</a>	Overloaded.
 <a href="#">Finalize</a>	(inherited from <a href="#">Object</a> )
 <a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ReadFromStream</a>	Overloaded. (inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">ReadStringFromField</a>	(inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">WriteSecureStringToField</a>	(inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">WriteStringToField</a>	(inherited from <a href="#">MQHeaderBase</a> )
 <a href="#">WriteToStream</a>	Overloaded. (inherited from <a href="#">MQHeaderBase</a> )

C#

```
public string Format { get; set; }
```

C++

```
public:
property String^ Format {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_Format ()

/** @property */
public void set_Format (String value)
```

JScript

```
public function get Format () : String

public function set Format (value : String)
```

## Property Value

The format name of the specified object.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[Mqrfh2Header Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# MQTrace Class

Exposes methods that assist in tracing.

**Namespace:** [System.ServiceModel.Channels.WebSphereMQ](#)  
**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in System.ServiceModel.Channels.WebSphereMQ.Channel.dll)

Inheritance Hierarchy [System.Object](#)  
**System.ServiceModel.Channels.WebSphereMQ.MQTrace**

Syntax  
C#

```
public static class MQTrace
```

C++

```
public ref class MQTrace abstract sealed
```

F#

```
[<AbstractClass>]  
[<Sealed>]  
type MQTrace = class end
```

VB

```
Public NotInheritable Class MQTrace
```

Methods

	Name	Description
	<a href="#">GetTracingInstance()</a>	Indicates the tracing instance to get.
	<a href="#">TraceEnter(String)</a>	Traces the object entered.
	<a href="#">TraceError(String)</a>	Writes an error message to the trace listeners using the specified message.
	<a href="#">TraceExit(String)</a>	Indicates the value of the object to exit.
	<a href="#">TraceInfo(String)</a>	Indicates the information about the tracing process.
	<a href="#">TraceVerbose(String)</a>	Indicates all the messages.
	<a href="#">TraceWarning(String)</a>	Writes a warning message to the trace listeners in the Listeners collection using the specified message.

Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# MQTrace.GetTracingInstance Method

Indicates the tracing instance to get.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Function GetTracingInstance As IMQTracing
```

C#

```
public static IMQTracing GetTracingInstance ()
```

C++

```
public:
static IMQTracing^ GetTracingInstance ()
```

J#

```
public static IMQTracing GetTracingInstance ()
```

JScript

```
public static function GetTracingInstance () : IMQTracing
```

## Return Value

The tracing instance.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MqxqhHeader Class

Implements methods that assist headers from the config files.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Class MqxqhHeader
    Inherits MQHeaderBase
    Implements IDisposable
```

C#

```
public class MqxqhHeader : MQHeaderBase, IDisposable
```

C++

```
public ref class MqxqhHeader : public MQHeaderBase, IDisposable
```

J#

```
public class MqxqhHeader extends MQHeaderBase implements IDisposable
```

JScript

```
public class MqxqhHeader extends MQHeaderBase implements IDisposable
```

Inheritance Hierarchy [System.Object](#)

[System.ServiceModel.Channels.WebSphereMQ.MQHeaderBase](#)

**System.ServiceModel.Channels.WebSphereMQ.MqxqhHeader**

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[MqxqhHeader Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# MqxqhHeader Members

Implements methods that assist headers from the config files.

The following tables list the members exposed by the [MqxqhHeader](#) type.

## Public Constructors

Name	Description
<a href="#">MqxqhHeader</a>	Initializes a new instance of the <a href="#">MqxqhHeader</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">FormatStringForThisHeader</a>	Overridden. Gets the string that specifies the display format for the current header.
 <a href="#">FormatStringOfNextHeader</a>	Overridden. Gets or sets the string that specifies the display format of the next header.
 <a href="#">HeaderNameForThisHeader</a>	Overridden. Gets the name of the header for the current header.
 <a href="#">MsgDescAccountingToken</a>	Gets or sets the message descriptor accounting token for the transmission queue header.
 <a href="#">MsgDescApplIdentityData</a>	Gets or sets the application data relating to identity of the transmission queue header.
 <a href="#">MsgDescApplOriginData</a>	Gets or sets the application data relating to the origin of the transmission queue header.
 <a href="#">MsgDescBackoutCount</a>	Gets or sets the back out counter of the transmission queue header.
 <a href="#">MsgDescCodedCharSetId</a>	Gets or sets the character set identifier of message data of the transmission queue header.
 <a href="#">MsgDescCorrelId</a>	Gets or sets the correlation identifier of the transmission queue header.
 <a href="#">MsgDescEncoding</a>	Gets or sets the encoding of message data for the transmission queue header.
 <a href="#">MsgDescExpiry</a>	Gets or sets the expiry time of the transmission queue header.
 <a href="#">MsgDescFeedback</a>	Gets or sets the feedback or reason code for the transmission queue header.
 <a href="#">MsgDescFormat</a>	Gets or sets the format name of the message data for the transmission queue header.
 <a href="#">MsgDescMsgId</a>	Gets or sets the message identifier for the transmission queue header.
 <a href="#">MsgDescMsgType</a>	Gets or sets the message type for the transmission queue header.
 <a href="#">MsgDescPersistence</a>	Gets or sets the message persistence for the transmission queue header.
 <a href="#">MsgDescPriority</a>	Gets or sets the message priority for the transmission queue header.
 <a href="#">MsgDescPutApplName</a>	Gets or sets the name of the application that put the message for the transmission queue header.
 <a href="#">MsgDescPutApplType</a>	Gets or sets the type of the application for the transmission queue header.
 <a href="#">MsgDescPutDate</a>	Gets or sets the date when the message was put.
 <a href="#">MsgDescPutTime</a>	Gets or sets the time when message was put.
 <a href="#">MsgDescReplyToQ</a>	Gets or sets the name of reply to queue for the transmission queue header.
 <a href="#">MsgDescReplyToQMgr</a>	Gets or sets the name of reply queue manager.
 <a href="#">MsgDescReport</a>	Gets or sets the report options for the transmission queue header.
 <a href="#">MsgDescStruId</a>	Gets the structure identifier for the transmission queue header.
 <a href="#">MsgDescUserIdentifier</a>	Gets or sets the user identifier for the transmission queue header.
 <a href="#">MsgDescVersion</a>	Gets the structure version number for the transmission queue header.
 <a href="#">RemoteQMgrName</a>	Gets or sets the name of the remote queue manager of the <b>MqxqhHeader</b> object.
 <a href="#">RemoteQName</a>	Gets or sets the name of the remote queue of the <b>MqxqhHeader</b> object.
 <a href="#">StruId</a>	Gets the identifier for the structure of the <b>MqxqhHeader</b> object.
 <a href="#">StruIdForThisHeader</a>	Overridden. Gets the identifier of the structure for the current header.
 <a href="#">Version</a>	Gets the version of the <b>MqxqhHeader</b> object.
 <a href="#">VersionForThisHeader</a>	Overridden. Gets the value of the version for the current header.

## Top

## Public Methods (see also [Protected Methods](#))

Name	Description
 <a href="#">Dispose</a>	Overloaded. Releases the resources used by the <b>MqxqhHeader</b> class.
 <a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
 <a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
 <a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
 <a href="#">ReadFromStream</a>	Overloaded. Overridden.

 	<a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )
	<a href="#">WriteToStream</a>	Overloaded. Overridden.

[Top](#)

#### Protected Methods

	Name	Description
	<a href="#">Dispose</a>	Overloaded.
	<a href="#">Finalize</a>	(inherited from <a href="#">Object</a> )
	<a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )
	<a href="#">ReadFromStream</a>	Overloaded. (inherited from <a href="#">MQHeaderBase</a> )
	<a href="#">ReadStringFromField</a>	(inherited from <a href="#">MQHeaderBase</a> )
	<a href="#">WriteSecureStringToField</a>	(inherited from <a href="#">MQHeaderBase</a> )
	<a href="#">WriteStringToField</a>	(inherited from <a href="#">MQHeaderBase</a> )
	<a href="#">WriteToStream</a>	Overloaded. (inherited from <a href="#">MQHeaderBase</a> )

Gets or sets the back out counter of the transmission queue header.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Property MsgDescBackoutCount As UInteger
```

C#

```
public uint MsgDescBackoutCount { get; set; }
```

C++

```
public:
property unsigned int MsgDescBackoutCount {
    unsigned int get ();
    void set (unsigned int value);
}
```

J#

```
/** @property */
public UInt32 get_MsgDescBackoutCount ()

/** @property */
public void set_MsgDescBackoutCount (UInt32 value)
```

JScript

```
public function get MsgDescBackoutCount () : uint

public function set MsgDescBackoutCount (value : uint)
```

## Property Value

The back out counter.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Reference

[MqxqhHeader Class](#)

[MqxqhHeader Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# MqxqhHeader.MsgDescVersion Property

Gets the structure version number for the transmission queue header.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public ReadOnly Property MsgDescVersion As UInteger
```

C#

```
public uint MsgDescVersion { get; }
```

C++

```
public:
property unsigned int MsgDescVersion {
    unsigned int get ();
}
```

J#

```
/** @property */
public UInt32 get_MsgDescVersion ()
```

JScript

```
public function get MsgDescVersion () : uint
```

## Property Value

The structure version number.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# MqxqhHeader.RemoteQMgrName Property

Gets or sets the name of the remote queue manager of the [MqxqhHeader](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Headers (in system.servicemodel.channels.webspheremq.headers.dll)

Usage

Syntax

VB

```
'Declaration
Public Property RemoteQMgrName As String
```

C#

```
public string RemoteQMgrName { get; set; }
```

C++

```
public:
property String^ RemoteQMgrName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_RemoteQMgrName ()

/** @property */
public void set_RemoteQMgrName (String value)
```

JScript

```
public function get RemoteQMgrName () : String

public function set RemoteQMgrName (value : String)
```

## Property Value

The name of the remote queue manager of the specified object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

    end
```

VB

```
Public Class WebSphereMQBinaryBinding  
    Inherits WebSphereMQBinding
```

Constructors

Name	Description
 <a href="#">WebSphereMQBinaryBinding()</a>	Initializes a new instance of the <b>WebSphereMQBinaryBinding</b> class.
 <a href="#">WebSphereMQBinaryBinding(String)</a>	Initializes a new instance of the <b>WebSphereMQBinaryBinding</b> class with the specified configuration name.

Properties

Name	Description
 <a href="#">BinaryStreamElement</a>	Gets the XML element that needs to wrap the binary data.
 <a href="#">CloseTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <a href="#">WebSphereMQBinding</a> object.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeaders in the Message after receiving the Message(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MessageVersion</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">MoveMessageToBackoutQueue</a>	(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <a href="#">WebSphereMQBinding</a> class.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdPassword</a>	Gets or sets the password for the <a href="#">WebSphereMQBinding</a> class.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification.(Inherited from <a href="#">WebSphereMQBinding</a> .)

	MqcdSslClientAuthentication	Gets or sets whether the Mqcd SSL Client Authentication is enabled.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqcdSslPeerName	Gets or sets the Mqcd SSL Peer Name.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqcdTransportType	Gets or sets the Mqcd Transport Type.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqcdUserIdentifier	Gets or sets the Mqcd User Identifier.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqgmoCompleteMessage	Gets or sets the Mqgmo Complete Message.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqgmoConvert	Gets or sets the Mqgmo Convert.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqgmoLogicalOrder	Gets or sets whether the Mqgmo is in Logical Order.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqgmoSyncPoint	Gets or sets the Mqgmo Sync Point.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqgmoWaitInterval	Gets or sets the Mqgmo Wait Interval.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqmdFormat	Gets or sets the Mqmd Format.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqmdPutApplicationName	Gets or sets the Mqmd Put Application Name.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqmdReplyToQueue	Gets or sets the Mqmd reply to Queue.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqmdReplyToQueueManager	Gets or sets the Mqmd Reply to Queue Manager.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqmdSegmentationAllowed	Gets or sets whether the Mqmd Segmentation is allowed.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqmdUserIdentifier	Gets or sets the Mqmd User Identifier.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqpmoLogicalOrder	Gets or sets whether the Mqpmo Logical Order is used.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqpmoSyncPoint	Gets or sets if the Mqpmo Sync Point is enabled.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	MqscsSslKeyRepository	Gets or sets the Mqscs SSL Key Repository.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	Name	(Inherited from <a href="#">Binding</a> .)
	Namespace	(Inherited from <a href="#">Binding</a> .)
	OpenTimeout	(Inherited from <a href="#">Binding</a> .)
	ReaderQuotas	Gets the XmlDictionaryReaderQuotas that is associated with the <b>WebSphereMQBinaryBinding</b> object.(Overrides <a href="#">WebSphereMQBinding.ReaderQuotas</a> .)
	ReceiveContextEnabled	Gets or sets a value that indicates whether the receive context is enabled.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	ReceiveContextValidityDuration	Gets or sets the validity duration of the receive context.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	ReceiveTimeout	(Inherited from <a href="#">Binding</a> .)
	Scheme	Gets the addressing scheme that is used by the <a href="#">WebSphereMQBinding</a> object.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	SendTimeout	(Inherited from <a href="#">Binding</a> .)
	TlCorrelationID	Gets or sets the Tl correlation identifier.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	Transaction	Gets or sets whether the send or receive needs to be performed in a transaction scope.(Inherited from <a href="#">WebSphereMQBinding</a> .)
	UsePersistentConnectionForSend	Gets or sets a property that indicates whether the transport uses a persistent connection for send.(Inherited from <a href="#">WebSphereMQBinding</a> .)

#### Methods

Name	Description
 <a href="#">ApplyConfiguration(String)</a>	Applies the configuration of the <b>WebSphereMQBinaryBinding</b> object with the specified configuration name.(Overrides <a href="#">WebSphereMQBinding.ApplyConfiguration(String)</a> .)
 <a href="#">BuildChannelFactory&lt;TChannel&gt;(BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelFactory&lt;TChannel&gt;(Object[])</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;TChannel&gt;(BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;TChannel&gt;(Object[])</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;TChannel&gt;(Uri, BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)

 <a href="#">BuildChannelListener&lt;'TChannel&gt;(Uri, Object[])</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;'TChannel&gt;(Uri, String, BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;'TChannel&gt;(Uri, String, ListenUriMode, BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;'TChannel&gt;(Uri, String, ListenUriMode, Object[])</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;'TChannel&gt;(Uri, String, Object[])</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">CanBuildChannelFactory&lt;'TChannel&gt;(BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">CanBuildChannelFactory&lt;'TChannel&gt;(Object[])</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">CanBuildChannelListener&lt;'TChannel&gt;(BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">CanBuildChannelListener&lt;'TChannel&gt;(Object[])</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">CreateBindingElements()</a>	Creates a collection that contains the binding elements that are part of the current binding.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetMessageEncodingBindingElement()</a>	Retrieves the binding element that specifies the message version used to encode messages.(Overrides <a href="#">WebSphereMQBinding.GetMessageEncodingBindingElement()</a> .)
 <a href="#">GetMQTransportBindingElement()</a>	Returns a new instance of the WebSphereMQTransportBindingElement when overridden by derived classes.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">GetProperty&lt;'T&gt;(BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# WebSphereMQBinaryBinding Members

Provides WCF binding used to communicate with Websphere MQ using binary encoder.

The following tables list the members exposed by the [WebSphereMQBinaryBinding](#) type.

## Public Constructors

Name	Description
<a href="#">WebSphereMQBinaryBinding</a>	Overloaded. Initializes a new instance of the <a href="#">WebSphereMQBinaryBinding</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">BinaryStreamElement</a>	Gets the XML element that needs to wrap the binary data.
 <a href="#">CloseTimeout</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <a href="#">WebSphereMQBinding</a> object. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeaders in the Message after receiving the Message (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MessageVersion</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdPassword</a>	Gets or sets the password for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the Mqsco SSL Key Repository. (inherited from <a href="#">WebSphereMQBinding</a> )

	<a href="#">Name</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Namespace</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">OpenTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ReaderQuotas</a>	Overridden. Gets the XmlDictionaryReaderQuotas that is associated with the <b>WebSphereMQBinaryBinding</b> object.
	<a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Scheme</a>	Gets the addressing scheme that is used by the <b>WebSphereMQBinding</b> object. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">SendTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">TlCorrelationID</a>	Gets or sets the Tl correlation identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">Transaction</a>	Gets or sets whether the send or receive needs to be performed in a transaction scope. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">UsePersistentConnectionForSend</a>	Gets or sets a property that indicates whether the transport uses a persistent connection for send. (inherited from <a href="#">WebSphereMQBinding</a> )

# WebSphereMQBinaryBinding Constructor

Initializes a new instance of the [WebSphereMQBinaryBinding](#) class.

**Namespace:** [System.ServiceModel.Channels.WebSphereMQ](#)

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in System.ServiceModel.Channels.WebSphereMQ.Channel.dll)

## Overload List

	Name	Description
	<a href="#">WebSphereMQBinaryBinding()</a>	Initializes a new instance of the <a href="#">WebSphereMQBinaryBinding</a> class.
	<a href="#">WebSphereMQBinaryBinding(String)</a>	Initializes a new instance of the <a href="#">WebSphereMQBinaryBinding</a> class with the specified configuration name.

## WebSphereMQBinaryBinding Constructor ()

Initializes a new instance of the [WebSphereMQBinaryBinding](#) class.

Syntax

C#

```
public WebSphereMQBinaryBinding()
```

C++

```
public:  
WebSphereMQBinaryBinding()
```

F#

```
new : unit -> WebSphereMQBinaryBinding
```

VB

```
Public Sub New
```

[Return to top](#)

## WebSphereMQBinaryBinding Constructor (String)

Initializes a new instance of the [WebSphereMQBinaryBinding](#) class with the specified configuration name.

Syntax

C#

```
public WebSphereMQBinaryBinding(  
    string configurationName  
)
```

C++

```
public:  
WebSphereMQBinaryBinding(  
    String^ configurationName  
)
```

F#

```
new :
```

configurationName:[string](#) -> WebSphereMQBinaryBinding

VB

```
Public Sub New (  
    configurationName As String  
)
```

#### Parameters

*configurationName*

Type: [System.String](#)

The name of the configuration.

[Return to top](#)

# WebSphereMQBinaryBinding Constructor ()

Initializes a new instance of the [WebSphereMQBinaryBinding](#) class.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public WebSphereMQBinaryBinding ()
```

C++

```
public:  
WebSphereMQBinaryBinding ()
```

J#

```
public WebSphereMQBinaryBinding ()
```

JScript

```
public function WebSphereMQBinaryBinding ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# WebSphereMQBinaryBinding Properties

## Public Properties

	Name	Description
	<a href="#">BinaryStreamElement</a>	Gets the XML element that needs to wrap the binary data.
	<a href="#">CloseTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <a href="#">WebSphereMQBinding</a> object. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeaders in the Message after receiving the Message (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MessageVersion</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdPassword</a>	Gets or sets the password for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager. (inherited from <a href="#">WebSphereMQBinding</a> )

	<a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqscoSslKeyRepository</a>	Gets or sets the Mqsco SSL Key Repository. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">Name</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Namespace</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">OpenTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ReaderQuotas</a>	Overridden. Gets the XmlDictionaryReaderQuotas that is associated with the <a href="#">WebSphereMQBinaryBinding</a> object.
	<a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Scheme</a>	Gets the addressing scheme that is used by the <b>WebSphereMQBinding</b> object. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">SendTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">TICorrelationID</a>	Gets or sets the TI correlation identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">Transaction</a>	Gets or sets whether the send or receive needs to be performed in a transaction scope. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">UsePersistentConnectionForSend</a>	Gets or sets a property that indicates whether the transport uses a persistent connection for send. (inherited from <a href="#">WebSphereMQBinding</a> )

# WebSphereMQBinaryBinding.BinaryStreamElement Property

Gets the XML element that needs to wrap the binary data.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared ReadOnly Property BinaryStreamElement As String
```

C#

```
public static string BinaryStreamElement { get; }
```

C++

```
public:
static property String^ BinaryStreamElement {
    String^ get ();
}
```

J#

```
/** @property */
public static String get_BinaryStreamElement ()
```

JScript

```
public static function get BinaryStreamElement () : String
```

## Property Value

The XML element that needs to wrap the binary data.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Public Class WebSphereMQBinaryBindingElement  
    Inherits WebSphereMQBindingElement
```

Constructors

Name	Description
 <a href="#">WebSphereMQBinaryBindingElement()</a>	Initializes a new instance of the <b>WebSphereMQBinaryBindingElement</b> class.
 <a href="#">WebSphereMQBinaryBindingElement(String)</a>	Initializes a new instance of the <b>WebSphereMQBinaryBindingElement</b> class with the specified configuration name.

Properties

Name	Description
 <a href="#">BindingElementType</a>	Gets the type of binding element for the specified <b>WebSphereMQBinaryBindingElement</b> object.(Overrides <a href="#">WebSphereMQBindingElement.BindingElementType</a> .)
 <a href="#">CloseTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ConnectionType</a>	Gets the type of connection for the specified <a href="#">WebSphereMQBindingElement</a> object.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">CurrentConfiguration</a>	(Inherited from <a href="#">ConfigurationElement</a> .)

 <a href="#">DeadLetterQueue</a>	Gets or sets a value that indicates whether the specified setting of the dead-letter queue is applied.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ElementInformation</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">ElementProperty</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">EvaluationContext</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets the extensible message queue headers for the specified object.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">HasContext</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Item(ConfigurationProperty)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Item(String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">LockAllAttributesExcept</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockAllElementsExcept</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockAttributes</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockElements</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockItem</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">MoveMessageToBackoutQueue</a>	(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Channel Name.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdConnectionName</a>	Gets or sets the connection name.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified maximum message length.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the string value of the MqcdSslCipherSpecification in the <a href="#">WebSphereMQChannelConfigurationStrings</a> .class.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <a href="#">WebSphereMQBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type of the <a href="#">WebSphereMQBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the unique identifier for the user.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)

 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order of the <a href="#">WebSphereMQTransportElement</a> class. The default is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets a value of the MqscoSslKeyRepository in the specified <a href="#">WebSphereMQChannelConfigurationStrings</a> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">Name</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">OpenTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">Properties</a>	Returns a typed object requested, if present, from the appropriate layer in the binding stack.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReaderQuotas</a>	Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReceiveTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">SendTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">Transaction</a>	Gets or sets the local transaction used.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)

	<a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
---	--	---

#### Methods

	Name	Description
	<a href="#">ApplyConfiguration(Binding)</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
	<a href="#">DeserializeElement(XmlReader, Boolean)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
	<a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
	<a href="#">GetTransformedAssemblyString(String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
	<a href="#">GetTransformedTypeString(String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">Init()</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
	<a href="#">InitializeDefault()</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
	<a href="#">InitializeFrom(Binding)</a>	Initializes the binding element with the content from the specified binding.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)

# WebSphereMQBinaryBindingElement Members

Represents the configuration element for the WebsphereMQBinaryBinding.

The following tables list the members exposed by the [WebSphereMQBinaryBindingElement](#) type.

## Public Constructors

Name	Description
<a href="#">WebSphereMQBinaryBindingElement</a>	Overloaded. Initializes a new instance of the <a href="#">WebSphereMQBinaryBindingElement</a> class.

## Top

Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">CloseTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ConnectionType</a>	Gets the type of connection for the specified <a href="#">WebSphereMQBindingElement</a> object. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">CurrentConfiguration</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets a value that indicates whether the specified setting of the dead-letter queue is applied. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ElementInformation</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets the extensible message queue headers for the specified object. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">LockAllAttributesExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAllElementsExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAttributes</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockElements</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockItem</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Channel Name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdConnectionName</a>	Gets or sets the connection name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified maximum message length. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the string value of the MqcdSslCipherSpecification in the <a href="#">WebSphereMQChannelConfigurationStrings</a> class. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type of the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the unique identifier for the user. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )

 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order of the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets a value of the MqscoSslKeyRepository in the specified <b>WebSphereMQChannelConfigurationStrings</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">Name</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">OpenTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">ReaderQuotas</a>	Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">SendTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">Transaction</a>	Gets or sets the local transaction used. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection. (inherited from <a href="#">WebSphereMQBindingElement</a> )

[Top](#)

#### Protected Properties

	Name	Description
	<a href="#">BindingElementType</a>	Overridden. Gets the type of binding element for the specified <b>WebSphereMQBinaryBindingElement</b> object.
	<a href="#">ElementProperty</a>	(inherited from <a href="#">ConfigurationElement</a> )
	<a href="#">EvaluationContext</a>	(inherited from <a href="#">ConfigurationElement</a> )
	<a href="#">Item</a>	Overloaded. (inherited from <a href="#">ConfigurationElement</a> )
	<a href="#">Properties</a>	Returns a typed object requested, if present, from the appropriate layer in the binding stack. (inherited from <a href="#">WebSphereMQBindingElement</a> )

[Top](#)

#### Public Methods (see also [Protected Methods](#))

```
Public Sub New
```

[Return to top](#)

**WebSphereMQBinaryBindingElement Constructor (String)**

Initializes a new instance of the [WebSphereMQBinaryBindingElement](#) class with the specified configuration name.

Syntax

C#

```
public WebSphereMQBinaryBindingElement(  
    string configurationName  
)
```

C++

```
public:  
WebSphereMQBinaryBindingElement(  
    String^ configurationName  
)
```

F#

```
new :
```

configurationName:[string](#) -> WebSphereMQBinaryBindingElement

VB

```
Public Sub New (  
    configurationName As String  
)
```

#### Parameters

*configurationName*

Type: [System.String](#)

The name of the configuration.

[Return to top](#)

# WebSphereMQBinaryBindingElement Constructor ()

Initializes a new instance of the [WebSphereMQBinaryBindingElement](#) class.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public WebSphereMQBinaryBindingElement ()
```

C++

```
public:  
WebSphereMQBinaryBindingElement ()
```

J#

```
public WebSphereMQBinaryBindingElement ()
```

JScript

```
public function WebSphereMQBinaryBindingElement ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# WebSphereMQBinaryBindingElement.BindingElementType Property

Gets the type of binding element for the specified [WebSphereMQBinaryBindingElement](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides ReadOnly Property BindingElementType As Type
```

C#

```
protected override Type BindingElementType { get; }
```

C++

```
protected:
virtual property Type^ BindingElementType {
    Type^ get () override;
}
```

J#

```
/** @property */
protected Type get_BindingElementType ()
```

JScript

```
protected override function get BindingElementType () : Type
```

## Property Value

The type of binding element for the specified object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

    Inherits Binding
```

Constructors

Name	Description
 <a href="#">WebSphereMQBinding()</a>	Initializes a new instance of the <b>WebSphereMQBinding</b> class.
 <a href="#">WebSphereMQBinding(String)</a>	Initializes a new instance of the <b>WebSphereMQBinding</b> class with the specified configuration name.

Properties

Name	Description
 <a href="#">CloseTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager.
 <a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <b>WebSphereMQBinding</b> object.
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use.
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime.
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeader s in the Message after receiving the Message
 <a href="#">MessageVersion</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">MoveMessageToBackoutQueue</a>	
 <a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name.

 <a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection.
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval.
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <b>WebSphereMQBinding</b> class.
 <a href="#">MqcdPassword</a>	Gets or sets the password for the <b>WebSphereMQBinding</b> class.
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification.
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled.
 <a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name.
 <a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type.
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier.
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message.
 <a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert.
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order.
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point.
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval.
 <a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format.
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name.
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue.
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager.
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed.
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier.
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used.
 <a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled.
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the Mqsco SSL Key Repository.
 <a href="#">Name</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">Namespace</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">OpenTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">ReaderQuotas</a>	Gets constraints on the complexity of SOAP messages that can be processed by endpoint s configured with the binding.
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.
 <a href="#">ReceiveTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">Scheme</a>	Gets the addressing scheme that is used by the <b>WebSphereMQBinding</b> object.(Override s <a href="#">Binding.Scheme</a> .)

 <b>SendTimeout</b>	(Inherited from <a href="#">Binding</a> .)
 <b>TICorrelationID</b>	Gets or sets the TI correlation identifier.
 <b>Transaction</b>	Gets or sets whether the send or receive needs to be performed in a transaction scope.
 <b>UsePersistentConnectionForSend</b>	Gets or sets a property that indicates whether the transport uses a persistent connection for send.

#### Methods

Name	Description
 <b>ApplyConfiguration(String)</b>	Applies the binding configuration to the <b>WebSphereMQBinding</b> object with the specified configuration name.
 <b>BuildChannelFactory&lt;'TChannel'&gt;(BindingParameterCollection)</b>	(Inherited from <a href="#">Binding</a> .)
 <b>BuildChannelFactory&lt;'TChannel'&gt;(Object[])</b>	(Inherited from <a href="#">Binding</a> .)
 <b>BuildChannelListener&lt;'TChannel'&gt;(BindingParameterCollection)</b>	(Inherited from <a href="#">Binding</a> .)
 <b>BuildChannelListener&lt;'TChannel'&gt;(Object[])</b>	(Inherited from <a href="#">Binding</a> .)
 <b>BuildChannelListener&lt;'TChannel'&gt;(Uri, BindingParameterCollection)</b>	(Inherited from <a href="#">Binding</a> .)
 <b>BuildChannelListener&lt;'TChannel'&gt;(Uri, Object[])</b>	(Inherited from <a href="#">Binding</a> .)
 <b>BuildChannelListener&lt;'TChannel'&gt;(Uri, String, BindingParameterCollection)</b>	(Inherited from <a href="#">Binding</a> .)
 <b>BuildChannelListener&lt;'TChannel'&gt;(Uri, String, ListenUriMode, BindingParameterCollection)</b>	(Inherited from <a href="#">Binding</a> .)
 <b>BuildChannelListener&lt;'TChannel'&gt;(Uri, String, ListenUriMode, Object[])</b>	(Inherited from <a href="#">Binding</a> .)
 <b>BuildChannelListener&lt;'TChannel'&gt;(Uri, String, Object[])</b>	(Inherited from <a href="#">Binding</a> .)
 <b>CanBuildChannelFactory&lt;'TChannel'&gt;(BindingParameterCollection)</b>	(Inherited from <a href="#">Binding</a> .)
 <b>CanBuildChannelFactory&lt;'TChannel'&gt;(Object[])</b>	(Inherited from <a href="#">Binding</a> .)
 <b>CanBuildChannelListener&lt;'TChannel'&gt;(BindingParameterCollection)</b>	(Inherited from <a href="#">Binding</a> .)
 <b>CanBuildChannelListener&lt;'TChannel'&gt;(Object[])</b>	(Inherited from <a href="#">Binding</a> .)
 <b>CreateBindingElements()</b>	Creates a collection that contains the binding elements that are part of the current binding.(Overrides <a href="#">Binding.CreateBindingElements()</a> .)
 <b>Equals(Object)</b>	(Inherited from <a href="#">Object</a> .)
 <b>Finalize()</b>	(Inherited from <a href="#">Object</a> .)
 <b>GetHashCode()</b>	(Inherited from <a href="#">Object</a> .)
 <b>GetMessageEncodingBindingElement()</b>	Returns a new instance of the <b>MessageEncodingBindingElement</b> when overridden by derived classes.

 <a href="#">GetMQTransportBindingElement()</a>	Returns a new instance of the <a href="#">WebSphereMQTransportBindingElement</a> when overridden by derived classes.
 <a href="#">GetProperty&lt;'T&gt;(BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

#### Thread Safety

# WebSphereMQBinding Members

Provides WCF binding used to communicate with Websphere MQ.

The following tables list the members exposed by the [WebSphereMQBinding](#) type.

## Public Constructors

Name	Description
<a href="#">WebSphereMQBinding</a>	Overloaded. Initializes a new instance of the <a href="#">WebSphereMQBinding</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">CloseTimeout</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager.
 <a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <b>WebSphereMQBinding</b> object.
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use.
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime.
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeader s in the Message after receiving the Message
 <a href="#">MessageVersion</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name.
 <a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection.
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval.
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <b>WebSphereMQBinding</b> class.
 <a href="#">MqcdPassword</a>	Gets or sets the password for the <b>WebSphereMQBinding</b> class.
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification.
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled.
 <a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name.
 <a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type.
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier.
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message.
 <a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert.
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order.
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point.
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval.
 <a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format.
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name.
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue.
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager.
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed.
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier.
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used.
 <a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled.
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the Mqsco SSL Key Repository.
 <a href="#">Name</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">Namespace</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">OpenTimeout</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">ReaderQuotas</a>	Gets constraints on the complexity of SOAP messages that can be processed by endpoint s configured with the binding.
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.
 <a href="#">ReceiveTimeout</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">Scheme</a>	Overridden. Gets the addressing scheme that is used by the <b>WebSphereMQBinding</b> obj ect.

 <a href="#">SendTimeout</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">TICorrelationID</a>	Gets or sets the TI correlation identifier.
 <a href="#">Transaction</a>	Gets or sets whether the send or receive needs to be performed in a transaction scope.
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a property that indicates whether the transport uses a persistent connection for send.

### WebSphereMQBinding Constructor (String)

Initializes a new instance of the [WebSphereMQBinding](#) class with the specified configuration name.

Syntax

C#

```
public WebSphereMQBinding(  
    string configurationName  
)
```

C++

```
public:  
WebSphereMQBinding(  
    String^ configurationName  
)
```

F#

```
new :
```

```
configurationName:string -> WebSphereMQBinding
```

VB

```
Public Sub New (  
    configurationName As String  
)
```

#### Parameters

*configurationName*

Type: [System.String](#)

The name of the configuration.

[Return to top](#)

# WebSphereMQBinding Constructor ()

Initializes a new instance of the [WebSphereMQBinding](#) class.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public WebSphereMQBinding ()
```

C++

```
public:
WebSphereMQBinding ()
```

J#

```
public WebSphereMQBinding ()
```

JScript

```
public function WebSphereMQBinding ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# WebSphereMQBinding Properties

## Public Properties

	Name	Description
	<a href="#">CloseTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager.
	<a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <a href="#">WebSphereMQBinding</a> object.
	<a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use.
	<a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime.
	<a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeader s in the Message after receiving the Message
	<a href="#">MessageVersion</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name.
	<a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection.
	<a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval.
	<a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <b>WebSphereMQBinding</b> class.
	<a href="#">MqcdPassword</a>	Gets or sets the password for the <b>WebSphereMQBinding</b> class.
	<a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification.
	<a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled.
	<a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name.
	<a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type.
	<a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier.
	<a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message.
	<a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert.
	<a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order.
	<a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point.
	<a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval.
	<a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format.
	<a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name.
	<a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue.
	<a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager.
	<a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed.
	<a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier.
	<a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used.
	<a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled.
	<a href="#">MqscoSslKeyRepository</a>	Gets or sets the Mqsco SSL Key Repository.
	<a href="#">Name</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Namespace</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">OpenTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ReaderQuotas</a>	Gets constraints on the complexity of SOAP messages that can be processed by endpoint s configured with the binding.
	<a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.
	<a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.
	<a href="#">ReceiveTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Scheme</a>	Overridden. Gets the addressing scheme that is used by the <b>WebSphereMQBinding</b> object.
	<a href="#">SendTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">TICorrelationID</a>	Gets or sets the TI correlation identifier.
	<a href="#">Transaction</a>	Gets or sets whether the send or receive needs to be performed in a transaction scope.
	<a href="#">UsePersistentConnectionForSend</a>	Gets or sets a property that indicates whether the transport uses a persistent connection f or send.

[WebSphereMQBinding Class](#)

# WebSphereMQBinding.ClusterQueueManagerName Property

Gets or sets the name of the cluster queue manager.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Property ClusterQueueManagerName As String
```

C#

```
public string ClusterQueueManagerName { get; set; }
```

C++

```
public:
property String^ ClusterQueueManagerName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_ClusterQueueManagerName ()

/** @property */
public void set_ClusterQueueManagerName (String value)
```

JScript

```
public function get ClusterQueueManagerName () : String

public function set ClusterQueueManagerName (value : String)
```

## Property Value

The name of the cluster queue manager.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# WebSphereMQBinding.MqgmoLogicalOrder Property

Gets or sets whether the Mqgmo is in Logical Order.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Property MqgmoLogicalOrder As Nullable(Of Boolean)
```

C#

```
public Nullable<bool> MqgmoLogicalOrder { get; set; }
```

C++

```
public:
property Nullable<bool> MqgmoLogicalOrder {
    Nullable<bool> get ();
    void set (Nullable<bool> value);
}
```

J#

```
/** @property */
public Nullable<boolean> get_MqgmoLogicalOrder ()

/** @property */
public void set_MqgmoLogicalOrder (Nullable<boolean> value)
```

JScript

```
public function get MqgmoLogicalOrder () : Nullable<boolean>

public function set MqgmoLogicalOrder (value : Nullable<boolean>)
```

## Property Value

**True** if the Mqgmo is in Logical Order; otherwise, **false**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Property MqgmoSyncPoint As Nullable(Of Boolean)
```

C#

```
public Nullable<bool> MqgmoSyncPoint { get; set; }
```

C++

```
public:
property Nullable<bool> MqgmoSyncPoint {
    Nullable<bool> get ();
    void set (Nullable<bool> value);
}
```

J#

```
/** @property */
public Nullable<boolean> get_MqgmoSyncPoint ()

/** @property */
public void set_MqgmoSyncPoint (Nullable<boolean> value)
```

JScript

```
public function get MqgmoSyncPoint () : Nullable<boolean>

public function set MqgmoSyncPoint (value : Nullable<boolean>)
```

## Property Value

The Mqgmo Sync Point.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**System.ServiceModel.Channels.WebSphereMQ.WebSphereMQBindingElement**

[System.ServiceModel.Channels.WebSphereMQ.WebSphereMQBinaryBindingElement](#)

[System.ServiceModel.Channels.WebSphereMQ.WebSphereMQRequestReplyBindingElement](#)

Syntax

C#

```
public class WebSphereMQBindingElement : StandardBindingElement
```

C++

```
public ref class WebSphereMQBindingElement : StandardBindingElement
```

F#

```
type WebSphereMQBindingElement =  
    class  
        inherit StandardBindingElement  
    end
```

VB

```
Public Class WebSphereMQBindingElement  
    Inherits StandardBindingElement
```

Constructors

Name	Description
 <a href="#">WebSphereMQBindingElement()</a>	Initializes a new instance of the <b>WebSphereMQBindingElement</b> class.
 <a href="#">WebSphereMQBindingElement(String)</a>	Initializes a new instance of the <b>WebSphereMQBindingElement</b> class with the specified configuration name.

Properties

Name	Description
 <a href="#">BindingElementType</a>	Gets the type of binding element for the specified <b>WebSphereMQBindingElement</b> object.(Overrides <a href="#">StandardBindingElement.BindingElementType</a> .)
 <a href="#">CloseTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name.
 <a href="#">ConnectionType</a>	Gets the type of connection for the specified <b>WebSphereMQBindingElement</b> object.
 <a href="#">CurrentConfiguration</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">DeadLetterQueue</a>	Gets or sets a value that indicates whether the specified setting of the dead-letter queue is applied.
 <a href="#">ElementInformation</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">ElementProperty</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">EvaluationContext</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets the extensible message queue headers for the specified object.
 <a href="#">HasContext</a>	(Inherited from <a href="#">ConfigurationElement</a> .)

 <a href="#">Item(ConfigurationProperty)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Item(String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message.
 <a href="#">LockAllAttributesExcept</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockAllElementsExcept</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockAttributes</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockElements</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockItem</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">MoveMessageToBackoutQueue</a>	
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Channel Name.
 <a href="#">MqcdConnectionName</a>	Gets or sets the connection name.
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain.
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified maximum message length.
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client.
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the string value of the MqcdSslCipherSpecification in the <a href="#">WebSphereMQChannelConfigurationStrings</a> class.
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication.
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type of the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the unique identifier for the user.
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message.
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert.
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message.
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd.
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue.
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager.
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd.
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order of the <a href="#">WebSphereMQTransportElement</a> class. The default is <b>null</b> .
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets a value of the MqscoSslKeyRepository in the specified <a href="#">WebSphereMQChannelConfigurationStrings</a> .
 <a href="#">Name</a>	(Inherited from <a href="#">StandardBindingElement</a> .)

 <a href="#">OpenTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">Properties</a>	Returns a typed object requested, if present, from the appropriate layer in the binding stack.(Overrides <a href="#">StandardBindingElement.Properties</a> .)
 <a href="#">ReaderQuotas</a>	Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding.
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.
 <a href="#">ReceiveTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">SendTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">Transaction</a>	Gets or sets the local transaction used.
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection.

#### Methods

Name	Description
 <a href="#">ApplyConfiguration(Binding)</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">DeserializeElement(XmlReader, Boolean)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">GetTransformedAssemblyString(String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">GetTransformedTypeString(String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Init()</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">InitializeDefault()</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">InitializeFrom(Binding)</a>	Initializes the binding element with the content from the specified binding.(Overrides <a href="#">StandardBindingElement.InitializeFrom(Binding)</a> .)
 <a href="#">IsModified()</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">IsReadOnly()</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">ListErrors(IList)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">OnApplyConfiguration(Binding)</a>	Applies the settings of the configuration element to the <b>WebSphereMQBindingElement</b> object.(Overrides <a href="#">StandardBindingElement.OnApplyConfiguration(Binding)</a> .)
 <a href="#">OnDeserializeUnrecognizedAttribute(String, String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">OnDeserializeUnrecognizedElement(String, XmlReader)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">OnRequiredPropertyNotFound(String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">PostDeserialize()</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">PreSerialize(XmlWriter)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Reset(ConfigurationElement)</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">ResetModified()</a>	(Inherited from <a href="#">ConfigurationElement</a> .)

 <a href="#">SerializeElement(XmlWriter, Boolean)</a>	(Inherited from <a href="#">ConfigurationElement.</a> )
 <a href="#">SerializeToXmlElement(XmlWriter, String)</a>	(Inherited from <a href="#">ConfigurationElement.</a> )
 <a href="#">SetPropertyValue(ConfigurationProperty, Object, Boolean)</a>	(Inherited from <a href="#">ConfigurationElement.</a> )
 <a href="#">SetPropertyValuelIfNotDefaultValue&lt;'T&gt;(String, 'T)</a>	(Inherited from <a href="#">ServiceModelConfigurationElement.</a> )
 <a href="#">SetReadOnly()</a>	(Inherited from <a href="#">ConfigurationElement.</a> )
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object.</a> )
 <a href="#">Unmerge(ConfigurationElement, ConfigurationElement, ConfigurationSaveMode)</a>	(Inherited from <a href="#">ConfigurationElement.</a> )

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# WebSphereMQBindingElement Members

Represents the configuration element for the WebsphereMQBinding.

The following tables list the members exposed by the [WebSphereMQBindingElement](#) type.

## Public Constructors

Name	Description
<a href="#">WebSphereMQBindingElement</a>	Overloaded. Initializes a new instance of the <a href="#">WebSphereMQBindingElement</a> class.

## Top

Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">CloseTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name.
 <a href="#">ConnectionType</a>	Gets the type of connection for the specified <b>WebSphereMQBindingElement</b> object.
 <a href="#">CurrentConfiguration</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets a value that indicates whether the specified setting of the dead-letter queue is applied.
 <a href="#">ElementInformation</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets the extensible message queue headers for the specified object.
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message.
 <a href="#">LockAllAttributesExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAllElementsExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAttributes</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockElements</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockItem</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Channel Name.
 <a href="#">MqcdConnectionName</a>	Gets or sets the connection name.
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain.
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified maximum message length.
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client.
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the string value of the MqcdSslCipherSpecification in the <a href="#">WebSphereMQChannelConfigurationStrings</a> class.
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication.
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type of the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the unique identifier for the user.
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message.
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert.
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message.
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd.
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue.
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager.
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd.
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order of the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> .

 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets a value of the MqscoSslKeyRepository in the specified <b>WebSphereMQChannelConfigurationStrings</b> .
 <a href="#">Name</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">OpenTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">ReaderQuotas</a>	Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding.
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.
 <a href="#">ReceiveTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">SendTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">Transaction</a>	Gets or sets the local transaction used.
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection.

**WebSphereMQBindingElement Constructor (String)**  
Initializes a new instance of the [WebSphereMQBindingElement](#) class with the specified configuration name.

## Syntax

```
C#  
  
public WebSphereMQBindingElement(  
    string configurationName  
)
```

```
C++  
  
public:  
    WebSphereMQBindingElement(  
        String^ configurationName  
)
```

```
F#  
  
new :
```

```
configurationName:string -> WebSphereMQBindingElement
```

VB

```
Public Sub New (  
    configurationName As String  
)
```

**Parameters**

*configurationName*

Type: [System.String](#)

The configuration name of the specified object.

[Return to top](#)

# WebSphereMQBindingElement Constructor ()

Initializes a new instance of the [WebSphereMQBindingElement](#) class.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public WebSphereMQBindingElement ()
```

C++

```
public:  
WebSphereMQBindingElement ()
```

J#

```
public WebSphereMQBindingElement ()
```

JScript

```
public function WebSphereMQBindingElement ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[WebSphereMQBindingElement Class](#)

[WebSphereMQBindingElement Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# WebSphereMQBindingElement Properties

Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">CloseTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name.
 <a href="#">ConnectionType</a>	Gets the type of connection for the specified <a href="#">WebSphereMQBindingElement</a> object.
 <a href="#">CurrentConfiguration</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets a value that indicates whether the specified setting of the dead-letter queue is applied.
 <a href="#">ElementInformation</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets the extensible message queue headers for the specified object.
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message.
 <a href="#">LockAllAttributesExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAllElementsExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAttributes</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockElements</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockItem</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Channel Name.
 <a href="#">MqcdConnectionName</a>	Gets or sets the connection name.
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain.
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified maximum message length.
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client.
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the string value of the MqcdSslCipherSpecification in the <a href="#">WebSphereMQChannelConfigurationStrings</a> class.
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication.
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type of the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the unique identifier for the user.
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message.
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert.
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message.
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd.
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue.
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager.
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd.
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order of the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> .
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqskoSslKeyRepository</a>	Gets or sets a value of the MqskoSslKeyRepository in the specified <b>WebSphereMQChannelConfigurationStrings</b> .
 <a href="#">Name</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">OpenTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )

 <a href="#">ReaderQuotas</a>	Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding.
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.
 <a href="#">ReceiveTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">SendTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">Transaction</a>	Gets or sets the local transaction used.
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection.

#### Protected Properties

Name	Description
 <a href="#">BindingElementType</a>	Overridden. Gets the type of binding element for the specified <b>WebSphereMQBindingElement</b> object.
 <a href="#">ElementProperty</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">EvaluationContext</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">Item</a>	Overloaded. (inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">Properties</a>	Overridden. Returns a typed object requested, if present, from the appropriate layer in the binding stack.

# WebSphereMQBindingElement.BindingElementType Property

Gets the type of binding element for the specified [WebSphereMQBindingElement](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides ReadOnly Property BindingElementType As Type
```

C#

```
protected override Type BindingElementType { get; }
```

C++

```
protected:
virtual property Type^ BindingElementType {
    Type^ get () override;
}
```

J#

```
/** @property */
protected Type get_BindingElementType ()
```

JScript

```
protected override function get BindingElementType () : Type
```

## Property Value

The type of binding element for the specified object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Gets or sets the peer name for the [WebSphereMQBindingElement](#) class. The default value is **null**.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
<ConfigurationPropertyAttribute("mqcdSslPeerName", DefaultValue:=Nothing)> _
Public Property MqcdSslPeerName As String
```

C#

```
[ConfigurationPropertyAttribute("mqcdSslPeerName", DefaultValue=null)]
public string MqcdSslPeerName { get; set; }
```

C++

```
[ConfigurationPropertyAttribute(L"mqcdSslPeerName", DefaultValue=nullptr)]
public:
property String^ MqcdSslPeerName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_MqcdSslPeerName ()

/** @property */
public void set_MqcdSslPeerName (String value)
```

JScript

```
public function get MqcdSslPeerName () : String

public function set MqcdSslPeerName (value : String)
```

## Property Value

A value for the peer name used in the class.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

```
public function get MqscoSslKeyRepository () : String

public function set MqscoSslKeyRepository (value : String)
```

## Property Value

The string value of the MqscoSslKeyRepository. The default is **null**.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

## Reference

[WebSphereMQBindingElement Class](#)

[WebSphereMQBindingElement Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# WebSphereMQBindingElement.Properties Property

Returns a typed object requested, if present, from the appropriate layer in the binding stack.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides ReadOnly Property Properties As ConfigurationPropertyCollection
```

C#

```
protected override ConfigurationPropertyCollection Properties { get; }
```

C++

```
protected:
virtual property ConfigurationPropertyCollection^ Properties {
    ConfigurationPropertyCollection^ get () override;
}
```

J#

```
/** @property */
protected ConfigurationPropertyCollection get_Properties ()
```

JScript

```
protected override function get Properties () : ConfigurationPropertyCollection
```

## Property Value

The type object requested.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# WebSphereMQBindingElement.ReaderQuotas Property

Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
<ConfigurationPropertyAttribute("readerQuotas", DefaultValue:=Nothing)> _
Public Property ReaderQuotas As XmlDictionaryReaderQuotasElement
```

C#

```
[ConfigurationPropertyAttribute("readerQuotas", DefaultValue=null)]
public XmlDictionaryReaderQuotasElement ReaderQuotas { get; set; }
```

C++

```
[ConfigurationPropertyAttribute(L"readerQuotas", DefaultValue=nullptr)]
public:
property XmlDictionaryReaderQuotasElement^ ReaderQuotas {
    XmlDictionaryReaderQuotasElement^ get ();
    void set (XmlDictionaryReaderQuotasElement^ value);
}
```

J#

```
/** @property */
public XmlDictionaryReaderQuotasElement get_ReaderQuotas ()

/** @property */
public void set_ReaderQuotas (XmlDictionaryReaderQuotasElement value)
```

JScript

```
public function get ReaderQuotas () : XmlDictionaryReaderQuotasElement

public function set ReaderQuotas (value : XmlDictionaryReaderQuotasElement)
```

## Property Value

The constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Methods

	Name	Description
	<a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">GetType()</a>	(Inherited from <a href="#">Object</a> .)
	<a href="#">ToString()</a>	(Inherited from <a href="#">Object</a> .)

Fields

	Name	Description
	<a href="#">ClusterQueueManagerName</a>	The ClusterQueueManagerName configuration as a string.
	<a href="#">ConnectionType</a>	The ConnectionType configuration as a string.
	<a href="#">DeadLetterQueue</a>	The DeadLetterQueue configuration as a string.
	<a href="#">ExtensibleMQHeaders</a>	The ExtensibleMQHeaders configuration as a string.
	<a href="#">LeaveMQHeadersInMessage</a>	The LeaveMQHeadersInMessage configuration as a string.
	<a href="#">ManualAddressing</a>	The ManualAddressing configuration as a string.
	<a href="#">MaxBufferPoolSize</a>	The MaxBufferPoolSize configuration as a string.
	<a href="#">MaxReceivedMessageSize</a>	The MaxReceivedMessageSize configuration as a string.
	<a href="#">MoveMessageToBackoutQueue</a>	
	<a href="#">MqcdChannelName</a>	The MqcdChannelName configuration as a string.
	<a href="#">MqcdConnectionName</a>	The MqcdConnectionName configuration as a string.

  MqcdHeartBeatInterval	The MqcdHeartBeatInterval configuration as a string.
  MqcdMaximumMessageLength	The MqcdMaximumMessageLength configuration as a string.
  MqcdPassword	The MqcdPassword configuration as a string.
  MqcdSslCipherSpecification	The MqcdSslCipherSpecification configuration as a string.
  MqcdSslClientAuthentication	The MqcdSslClientAuthentication configuration as a string.
  MqcdSslPeerName	The MqcdSslPeerName configuration as a string.
  MqcdTransportType	The MqcdTransportType configuration as a string.
  MqcdUserIdentifier	The MqcdUserIdentifier configuration as a string.
  MqgmoCompleteMessage	The MqgmoCompleteMessage configuration as a string.
  MqgmoConvert	The MqgmoConvert configuration as a string.
  MqgmoLogicalOrder	The MqgmoLogicalOrder configuration as a string.
  MqgmoSyncPoint	The MqgmoSyncPoint configuration as a string.
  MqgmoWaitInterval	The MqgmoWaitInterval configuration as a string.
  MqmdFormat	The MqmdFormat configuration as a string.
  MqmdPutApplicationName	The MqmdPutApplicationName configuration as a string.
  MqmdReplyToQueue	The MqmdReplyToQueue configuration as a string.
  MqmdReplyToQueueManager	The MqmdReplyToQueueManager configuration as a string.
  MqmdSegmentationAllowed	The MqmdSegmentationAllowed configuration as a string.
  MqmdUserIdentifier	The MqmdUserIdentifier configuration as a string.
  MqpmoLogicalOrder	The MqpmoLogicalOrder configuration as a string.
  MqpmoSyncPoint	The MqpmoSyncPoint configuration as a string.
  MqscoSslKeyRepository	The MqscoSslKeyRepository configuration as a string.
  ReaderQuotas	The ReaderQuotas configuration as a string.
  ReceiveContextEnabled	The ReceiveContextEnabled configuration as a string.
  ReceiveContextValidityDuration	The ReceiveContextValidityDuration configuration as a string.
  Transaction	The Transaction configuration as a string.
  UsePersistentConnectionForSend	The UsePersistentConnectionForSend configuration as a string.

# WebSphereMQException Class

Represents a class that wraps runtime WebsphereMQ binding and transport relation exceptions.

**Namespace:** [System.ServiceModel.Channels.WebSphereMQ](#)  
**Assembly:** [System.ServiceModel.Channels.WebSphereMQ.Channel](#) (in [System.ServiceModel.Channels.WebSphereMQ.Channel.dll](#))

Inheritance Hierarchy [System.Object](#)  
[System.Exception](#)  
[System.SystemException](#)  
[System.ServiceModel.CommunicationException](#)  
**[System.ServiceModel.Channels.WebSphereMQ.WebSphereMQException](#)**

Syntax  
C#

```
[SerializableAttribute]
public class WebSphereMQException : CommunicationException
```

C++

```
[SerializableAttribute]
public ref class WebSphereMQException : CommunicationException
```

F#

```
[<SerializableAttribute>]
type WebSphereMQException =
    class
        inherit CommunicationException
    end
```

VB

```
<SerializableAttribute>
Public Class WebSphereMQException
    Inherits CommunicationException
```

Constructors

	Name	Description
	<a href="#">WebSphereMQException()</a>	Initializes a new instance of the <b>WebSphereMQException</b> class.
	<a href="#">WebSphereMQException(SerializationInfo, StreamingContext)</a>	Initializes a new instance of the <b>WebSphereMQException</b> class by using serialized data.
	<a href="#">WebSphereMQException(String)</a>	Initializes a new instance of the <b>WebSphereMQException</b> class with the specified message.
	<a href="#">WebSphereMQException(String, Exception)</a>	Initializes a new instance of the <b>WebSphereMQException</b> class that contains a specified error message and a reference to the inner exception that caused this exception.
	<a href="#">WebSphereMQException(String, Exception, Int32, Int32)</a>	Initializes a new instance of the <b>WebSphereMQException</b> class.
	<a href="#">WebSphereMQException(String, Exception, Int64)</a>	Initializes a new instance of the <b>WebSphereMQException</b> class with the specified exception message.

 <a href="#">WebSphereMQException(String, Int32, Int32)</a>	Initializes a new instance of the <b>WebSphereMQException</b> class with the specified exception message.
 <a href="#">WebSphereMQException(String, Int64)</a>	Initializes a new instance of the <b>WebSphereMQException</b> class with the specified exception message.

#### Properties

Name	Description
 <a href="#">CompletionCode</a>	Gets the IBM WebsphereMQ completion code.
 <a href="#">Data</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">HelpLink</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">HResult</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">InnerException</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">Message</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">ReasonCode</a>	Gets the reason for the result in the exception property.
 <a href="#">Source</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">StackTrace</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">TargetSite</a>	(Inherited from <a href="#">Exception</a> .)

#### Methods

Name	Description
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetBaseException()</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">GetObjectData(SerializationInfo, StreamingContext)</a>	Populates a <a href="#">SerializationInfo</a> with the data exception of the target object.(Overrides <a href="#">Exception.GetObjectData(SerializationInfo, StreamingContext)</a> .)
 <a href="#">GetType()</a>	(Inherited from <a href="#">Exception</a> .)
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object</a> .)
 <a href="#">NewMQException(Int32, String, Int32, Int32)</a>	Specifies a creation of a new exception message.
 <a href="#">NewMQException(Int32, String, Int64)</a>	Indicates a creation of a new exception message.
 <a href="#">ToString()</a>	(Inherited from <a href="#">Exception</a> .)

#### Events

Name	Description
 <a href="#">SerializeObjectState</a>	(Inherited from <a href="#">Exception</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

[Return to top](#)  
**WebSphereMQException Constructor ()**  
Initializes a new instance of the [WebSphereMQException](#) class.

Syntax  
C#

```
public WebSphereMQException()
```

C++

```
public:  
WebSphereMQException()
```

F#

```
new : unit -> WebSphereMQException
```

VB

```
Public Sub New
```

[Return to top](#)

### WebSphereMQException Constructor (SerializationInfo, StreamingContext)

Initializes a new instance of the [WebSphereMQException](#) class by using serialized data.

Syntax

C#

```
protected WebSphereMQException(  
    SerializationInfo info,  
    StreamingContext context  
)
```

C++

```
protected:  
WebSphereMQException(  
    SerializationInfo^ info,  
    StreamingContext context  
)
```

F#

```
new :  
    info:SerializationInfo *  
    context:StreamingContext -> WebSphereMQException
```

VB

```
Protected Sub New (  
    info As SerializationInfo,  
    context As StreamingContext  
)
```

### Parameters

*info*

Type: [System.Runtime.Serialization.SerializationInfo](#)

The [SerializationInfo](#) object that holds the serialized object data about the exception that is being thrown.

*context*

Type: [System.Runtime.Serialization.StreamingContext](#)

The [StreamingContext](#) object that contains contextual information about the source or destination.

[Return to top](#)

### WebSphereMQException Constructor (String)

Initializes a new instance of the [WebSphereMQException](#) class with the specified message.

Syntax

C#

```
public WebSphereMQException(  
    string msg  
)
```

C++

```
public:  
WebSphereMQException(  
    String^ msg  
)
```

F#

```
new :  
    msg:string -> WebSphereMQException
```

VB

```
Public Sub New (  
    msg As String  
)
```

#### Parameters

*msg*

Type: [System.String](#)

The message that states the error.

[Return to top](#)

#### WebSphereMQException Constructor (String, Exception)

Initializes a new instance of the [WebSphereMQException](#) class that contains a specified error message and a reference to the inner exception that caused this exception.

Syntax

C#

```
public WebSphereMQException(  
    string msg,  
    Exception inner  
)
```

C++

```
public:  
WebSphereMQException(  
    String^ msg,  
    Exception^ inner  
)
```

F#

```
new :  
    msg:string *  
    inner:Exception -> WebSphereMQException
```

VB

```
Public Sub New (  
    msg As String,  
    inner As Exception  
)
```

#### Parameters

*msg*

Type: [System.String](#)

The error message that states the reason for the exception.

*inner*

Type: [System.Exception](#)

The exception that caused the current exception, or **null** when no inner exception is specified.

[Return to top](#)

#### WebSphereMQException Constructor (String, Exception, Int32, Int32)

Initializes a new instance of the [WebSphereMQException](#) class.

Syntax

C#

```
public WebSphereMQException(  
    string msg,  
    Exception inner,  
    int completionCodeIn,  
    int reasonCodeIn  
)
```

C++

```
public:
WebSphereMQException(
    String^ msg,
    Exception^ inner,
    int completionCodeIn,
    int reasonCodeIn
)
```

F#

```
new :
    msg:string *
    inner:Exception *
    completionCodeIn:int *
    reasonCodeIn:int -> WebSphereMQException
```

VB

```
Public Sub New (
    msg As String,
    inner As Exception,
    completionCodeIn As Integer,
    reasonCodeIn As Integer
)
```

#### Parameters

*msg*

Type: [System.String](#)

The exception message.

*inner*

Type: [System.Exception](#)

The inner exception

*completionCodeIn*

Type: [System.Int32](#)

The IBM WebsphereMQ completion code.

*reasonCodeIn*

Type: [System.Int32](#)

The IBM WebsphereMQ reason code.

[Return to top](#)

#### **WebSphereMQException Constructor (String, Exception, Int64)**

Initializes a new instance of the [WebSphereMQException](#) class with the specified exception message.

Syntax

C#

```
public WebSphereMQException(
    string msg,
    Exception inner,
    long hrIn
)
```

C++

```
public:
WebSphereMQException(
    String^ msg,
    Exception^ inner,
    long long hrIn
)
```

F#

```
new :  
    msg:string *  
    inner:Exception *  
    hrIn:int64 -> WebSphereMQException
```

VB

```
Public Sub New (  
    msg As String,  
    inner As Exception,  
    hrIn As Long  
)
```

#### Parameters

*msg*

Type: [System.String](#)

The exception message.

*inner*

Type: [System.Exception](#)

The inner exception.

*hrIn*

Type: [System.Int64](#)

The hrIn.

[Return to top](#)

#### WebSphereMQException Constructor (String, Int32, Int32)

Initializes a new instance of the [WebSphereMQException](#) class with the specified exception message.

Syntax

C#

```
public WebSphereMQException(  
    string msg,  
    int completionCodeIn,  
    int reasonCodeIn  
)
```

C++

```
public:  
WebSphereMQException(  
    String^ msg,  
    int completionCodeIn,  
    int reasonCodeIn  
)
```

F#

```
new :  
    msg:string *  
    completionCodeIn:int *  
    reasonCodeIn:int -> WebSphereMQException
```

VB

```
Public Sub New (  
    msg As String,  
    completionCodeIn As Integer,  
    reasonCodeIn As Integer  
)
```

## Parameters

*msg*

Type: [System.String](#)

The exception message

*completionCodeIn*

Type: [System.Int32](#)

The IBM WebsphereMQ completion code.

*reasonCodeIn*

Type: [System.Int32](#)

The IBM WebsphereMQ reason code.

[Return to top](#)

## WebSphereMQException Constructor (String, Int64)

Initializes a new instance of the [WebSphereMQException](#) class with the specified exception message.

Syntax

C#

```
public WebSphereMQException(  
    string msg,  
    long hrIn  
)
```

C++

```
public:  
WebSphereMQException(  
    String^ msg,  
    long long hrIn  
)
```

F#

```
new :  
    msg:string *  
    hrIn:int64 -> WebSphereMQException
```

VB

```
Public Sub New (  
    msg As String,  
    hrIn As Long  
)
```

## Parameters

*msg*

Type: [System.String](#)

The exception message.

*hrIn*

Type: [System.Int64](#)

The hrIn.

[Return to top](#)

# WebSphereMQException Constructor ()

Initializes a new instance of the [WebSphereMQException](#) class.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration  
Public Sub New
```

C#

```
public WebSphereMQException ()
```

C++

```
public:  
WebSphereMQException ()
```

J#

```
public WebSphereMQException ()
```

JScript

```
public function WebSphereMQException ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Reference

[WebSphereMQException Class](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# WebSphereMQException.GetObjectData Method

Populates a **SerializationInfo** with the data exception of the target object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
<SecurityPermissionAttribute(SecurityAction.Demand, SerializationFormatter:=True)> _
Public Overrides Sub GetObjectData ( _
    info As SerializationInfo, _
    context As StreamingContext _
)
```

C#

```
[SecurityPermissionAttribute(SecurityAction.Demand, SerializationFormatter=true)]
public override void GetObjectData (
    SerializationInfo info,
    StreamingContext context
)
```

C++

```
[SecurityPermissionAttribute(SecurityAction::Demand, SerializationFormatter=true)]
public:
virtual void GetObjectData (
    SerializationInfo^ info,
    StreamingContext context
) override
```

J#

```
/** @attribute SecurityPermissionAttribute(SecurityAction.Demand, SerializationFormatter=tr
ue) */
public void GetObjectData (
    SerializationInfo info,
    StreamingContext context
)
```

JScript

```
public override function GetObjectData (
    info : SerializationInfo,
    context : StreamingContext
)
```

## Parameters

info

The [SerializationInfo](#) to populate with data.

context

The [StreamingContext](#) object that contains contextual information about the source or destination.

static member NewMQException :  
    messageCode:int *  
    msg:string *  
    completionCodeIn:int *  
    reasonCodeIn:int -> WebSphereMQException
```

VB

```
Public Shared Function NewMQException (  
    messageCode As Integer,  
    msg As String,  
    completionCodeIn As Integer,  
    reasonCodeIn As Integer  
) As WebSphereMQException
```

**Parameters**

*messageCode*

Type: [System.Int32](#)

The message code.

*msg*

Type: [System.String](#)

The exception message.

*completionCodeIn*

Type: [System.Int32](#)

The IBM Websphere MQ Completion Code.

*reasonCodeIn*

Type: [System.Int32](#)

The IBM Websphere MQ Reason Code.

#### Return Value

Type: [System.ServiceModel.Channels.WebSphereMQ.WebSphereMQException](#)

A new exception message.

[Return to top](#)

#### **WebSphereMQException.NewMQException Method (Int32, String, Int64)**

Indicates a creation of a new exception message.

Syntax

C#

```
public static WebSphereMQException NewMQException(  
    int messageCode,  
    string msg,  
    long hrIn  
)
```

C++

```
public:  
static WebSphereMQException^ NewMQException(  
    int messageCode,  
    String^ msg,  
    long long hrIn  
)
```

F#

```
static member NewMQException :  
    messageCode:int *  
    msg:string *  
    hrIn:int64 -> WebSphereMQException
```

VB

```
Public Shared Function NewMQException (  
    messageCode As Integer,  
    msg As String,  
    hrIn As Long  
) As WebSphereMQException
```

#### Parameters

*messageCode*

Type: [System.Int32](#)

The message code.

*msg*

Type: [System.String](#)

The exception message.

*hrIn*

Type: [System.Int64](#)

hrIn.

**Return Value**

Type: [System.ServiceModel.Channels.WebSphereMQ.WebSphereMQException](#)

An instance of the [WebSphereMQException](#).

[Return to top](#)

# WebSphereMQException.NewMQException Method (Int32, String, Int64)

Indicates a creation of a new exception message.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Function NewMQException ( _
    messageCode As Integer, _
    msg As String, _
    hrIn As Long _
) As WebSphereMQException
```

C#

```
public static WebSphereMQException NewMQException (
    int messageCode,
    string msg,
    long hrIn
)
```

C++

```
public:
static WebSphereMQException^ NewMQException (
    int messageCode,
    String^ msg,
    long long hrIn
)
```

J#

```
public static WebSphereMQException NewMQException (
    int messageCode,
    String msg,
    long hrIn
)
```

JScript

```
public static function NewMQException (
    messageCode : int,
    msg : String,
    hrIn : long
) : WebSphereMQException
```

## Parameters

messageCode

The message code.

msg

The exception message.

hrIn

hrIn.

## Return Value

An instance of the [WebSphereMQException](#).

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# WebSphereMQException.NewMQException Method (Int32, String, Int32, Int32)

Specifies a creation of a new exception message.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Shared Function NewMQException ( _
    messageCode As Integer, _
    msg As String, _
    completionCodeIn As Integer, _
    reasonCodeIn As Integer _
) As WebSphereMQException
```

C#

```
public static WebSphereMQException NewMQException (
    int messageCode,
    string msg,
    int completionCodeIn,
    int reasonCodeIn
)
```

C++

```
public:
static WebSphereMQException^ NewMQException (
    int messageCode,
    String^ msg,
    int completionCodeIn,
    int reasonCodeIn
)
```

J#

```
public static WebSphereMQException NewMQException (
    int messageCode,
    String msg,
    int completionCodeIn,
    int reasonCodeIn
)
```

JScript

```
public static function NewMQException (
    messageCode : int,
    msg : String,
    completionCodeIn : int,
    reasonCodeIn : int
) : WebSphereMQException
```

## Parameters

messageCode

The message code.

msg

The exception message.

completionCodeIn

The IBM Websphere MQ Completion Code.

reasonCodeIn

The IBM Websphere MQ Reason Code.

#### **Return Value**

A new exception message.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

#### **Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

    Inherits WebSphereMQBinaryBinding
```

Constructors

Name	Description
<a href="#">WebSphereMQRequestReplyBinaryBinding()</a>	Initializes a new instance of the <b>WebSphereMQRequestReplyBinaryBinding</b> class using default values.
<a href="#">WebSphereMQRequestReplyBinaryBinding(String)</a>	

Properties

Name	Description
 <a href="#">CloseTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <a href="#">WebSphereMQBinding</a> object.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeaders in the Message after receiving the Message(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MessageVersion</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">MoveMessageToBackoutQueue</a>	(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <a href="#">WebSphereMQBinding</a> class.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdPassword</a>	Gets or sets the password for the <a href="#">WebSphereMQBinding</a> class.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled.(Inherited from <a href="#">WebSphereMQBinding</a> .)

 <a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqscsSslKeyRepository</a>	Gets or sets the Mqscs SSL Key Repository.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">Name</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">Namespace</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">OpenTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">ReaderQuotas</a>	Gets the XmlDictionaryReaderQuotas that is associated with the <a href="#">WebSphereMQBinaryBinding</a> object.(Inherited from <a href="#">WebSphereMQBinaryBinding</a> .)
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ReceiveTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">Scheme</a>	Gets the addressing scheme that is used by the <a href="#">WebSphereMQBinding</a> object.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">SendTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">TlCorrelationID</a>	Gets or sets the Tl correlation identifier.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">Transaction</a>	Gets or sets whether the send or receive needs to be performed in a transaction scope.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a property that indicates whether the transport uses a persistent connection for send.(Inherited from <a href="#">WebSphereMQBinding</a> .)

#### Methods

Name	Description
 <a href="#">ApplyConfiguration(String)</a>	Applies a binding configuration element to the current binding element.(Overrides <a href="#">WebSphereMQBinaryBinding.ApplyConfiguration(String)</a> .)
 <a href="#">BuildChannelFactory&lt;'TChannel&gt;(BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelFactory&lt;'TChannel&gt;(Object[])</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;'TChannel&gt;(BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;'TChannel&gt;(Object[])</a>	(Inherited from <a href="#">Binding</a> .)

 BuildChannelListener<'TChannel'>(Uri, BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 BuildChannelListener<'TChannel'>(Uri, Object[])	(Inherited from <a href="#">Binding</a> .)
 BuildChannelListener<'TChannel'>(Uri, String, BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 BuildChannelListener<'TChannel'>(Uri, String, ListenUriMode, BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 BuildChannelListener<'TChannel'>(Uri, String, ListenUriMode, Object[])	(Inherited from <a href="#">Binding</a> .)
 BuildChannelListener<'TChannel'>(Uri, String, Object[])	(Inherited from <a href="#">Binding</a> .)
 CanBuildChannelFactory<'TChannel'>(BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 CanBuildChannelFactory<'TChannel'>(Object[])	(Inherited from <a href="#">Binding</a> .)
 CanBuildChannelListener<'TChannel'>(BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 CanBuildChannelListener<'TChannel'>(Object[])	(Inherited from <a href="#">Binding</a> .)
 CreateBindingElements()	Creates a collection that contains the binding elements that are part of the current binding.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 Equals(Object)	(Inherited from <a href="#">Object</a> .)
 Finalize()	(Inherited from <a href="#">Object</a> .)
 GetHashCode()	(Inherited from <a href="#">Object</a> .)
 GetMessageEncodingBindingElement()	Retrieves the binding element that specifies the message version used to encode messages.(Inherited from <a href="#">WebSphereMQBinaryBinding</a> .)
 GetMQTransportBindingElement()	Returns a new instance of the <b>WebSphereMQRequestReplyBinaryBinding</b> binding element.(Overrides <a href="#">WebSphereMQBinding.GetMQTransportBindingElement()</a> .)
 GetProperty<'T'>(BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 GetType()	(Inherited from <a href="#">Object</a> .)
 MemberwiseClone()	(Inherited from <a href="#">Object</a> .)
 ToString()	(Inherited from <a href="#">Object</a> .)

# WebSphereMQRequestReplyBinaryBinding Members

The following tables list the members exposed by the [WebSphereMQRequestReplyBinaryBinding](#) type.

## Public Constructors

Name	Description
<a href="#">WebSphereMQRequestReplyBinaryBinding</a>	Overloaded. Initializes a new instance of the <a href="#">WebSphereMQRequestReplyBinaryBinding</a> class.

## Top

## Public Properties

Name	Description
 <a href="#">BinaryStreamElement</a>	Gets the XML element that needs to wrap the binary data. (inherited from <a href="#">WebSphereMQBinaryBinding</a> )
 <a href="#">CloseTimeout</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <a href="#">WebSphereMQBinding</a> object. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeaders in the Message after receiving the Message (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MessageVersion</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdPassword</a>	Gets or sets the password for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name. (inherited from <a href="#">WebSphereMQBinding</a> )
<a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue. (inherited from <a href="#">WebSphereMQBinding</a> )
<a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager. (inherited from <a href="#">WebSphereMQBinding</a> )
<a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed. (inherited from <a href="#">WebSphereMQBinding</a> )
<a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
<a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used. (inherited from <a href="#">WebSphereMQBinding</a> )
<a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
<a href="#">MqscoSslKeyRepository</a>	Gets or sets the Mqsco SSL Key Repository. (inherited from <a href="#">WebSphereMQBinding</a> )

	<a href="#">Name</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Namespace</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">OpenTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ReaderQuotas</a>	Gets the XmlDictionaryReaderQuotas that is associated with the <a href="#">WebSphereMQBinaryBinding</a> object. (inherited from <a href="#">WebSphereMQBinaryBinding</a> )
	<a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Scheme</a>	Gets the addressing scheme that is used by the <b>WebSphereMQBinding</b> object. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">SendTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">TlCorrelationID</a>	Gets or sets the Tl correlation identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">Transaction</a>	Gets or sets whether the send or receive needs to be performed in a transaction scope. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">UsePersistentConnectionForSend</a>	Gets or sets a property that indicates whether the transport uses a persistent connection for send. (inherited from <a href="#">WebSphereMQBinding</a> )

[Top](#)

Public Methods (see also [Protected Methods](#))

	<b>Name</b>	<b>Description</b>
	<a href="#">BuildChannelFactory</a>	Overloaded. (inherited from <a href="#">Binding</a> )
	<a href="#">BuildChannelListener</a>	Overloaded. (inherited from <a href="#">Binding</a> )
	<a href="#">CanBuildChannelFactory</a>	Overloaded. (inherited from <a href="#">Binding</a> )
	<a href="#">CanBuildChannelListener</a>	Overloaded. (inherited from <a href="#">Binding</a> )
	<a href="#">CreateBindingElements</a>	Creates a collection that contains the binding elements that are part of the current binding. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">Equals</a>	Overloaded. (inherited from <a href="#">Object</a> )
	<a href="#">GetHashCode</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetProperty</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">GetType</a>	(inherited from <a href="#">Object</a> )
	 <a href="#">ReferenceEquals</a>	(inherited from <a href="#">Object</a> )
	<a href="#">ShouldSerializeName</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ShouldSerializeNamespace</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ToString</a>	(inherited from <a href="#">Object</a> )

[Top](#)

Protected Methods

	<b>Name</b>	<b>Description</b>
	<a href="#">ApplyConfiguration</a>	Overridden. Applies a binding configuration element to the current binding element.
	<a href="#">Finalize</a>	(inherited from <a href="#">Object</a> )
	<a href="#">GetMessageEncodingBindingElement</a>	Retrieves the binding element that specifies the message version used to encode messages. (inherited from <a href="#">WebSphereMQBinaryBinding</a> )
	<a href="#">GetMQTransportBindingElement</a>	Overridden. Returns a new instance of the <b>WebSphereMQRequestReplyBinaryBinding</b> binding element.
	<a href="#">MemberwiseClone</a>	(inherited from <a href="#">Object</a> )

### WebSphereMQRequestReplyBinaryBinding Constructor ()

Initializes a new instance of the [WebSphereMQRequestReplyBinaryBinding](#) class using default values.

Syntax

C#

```
public WebSphereMQRequestReplyBinaryBinding()
```

C++

```
public:  
WebSphereMQRequestReplyBinaryBinding()
```

F#

```
new : unit -> WebSphereMQRequestReplyBinaryBinding
```

VB

```
Public Sub New
```

[Return to top](#)

### WebSphereMQRequestReplyBinaryBinding Constructor (String)

Syntax

C#

```
public WebSphereMQRequestReplyBinaryBinding(  
    string configurationName  
)
```

C++

```
public:  
WebSphereMQRequestReplyBinaryBinding(  
    String^ configurationName  
)
```

F#

```
new :  
    configurationName:string -> WebSphereMQRequestReplyBinaryBinding
```

VB

```
Public Sub New (  
    configurationName As String  
)
```

**Parameters**

*configurationName*

Type: [System.String](#)

[Return to top](#)

# WebSphereMQRequestReplyBinaryBinding Constructor ()

Initializes a new instance of the [WebSphereMQRequestReplyBinaryBinding](#) class using default values.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public WebSphereMQRequestReplyBinaryBinding ()
```

C++

```
public:
WebSphereMQRequestReplyBinaryBinding ()
```

J#

```
public WebSphereMQRequestReplyBinaryBinding ()
```

JScript

```
public function WebSphereMQRequestReplyBinaryBinding ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# WebSphereMQRequestReplyBinaryBinding Properties

## Public Properties

	Name	Description
	<a href="#">BinaryStreamElement</a>	Gets the XML element that needs to wrap the binary data. (inherited from <a href="#">WebSphereMQBinaryBinding</a> )
	<a href="#">CloseTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <a href="#">WebSphereMQBinding</a> object. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeaders in the Message after receiving the Message (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MessageVersion</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdPassword</a>	Gets or sets the password for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue. (inherited from <a href="#">WebSphereMQBinding</a> )

	<a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqscoSslKeyRepository</a>	Gets or sets the Mqsco SSL Key Repository. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">Name</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Namespace</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">OpenTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ReaderQuotas</a>	Gets the XmlDictionaryReaderQuotas that is associated with the <a href="#">WebSphereMQBinaryBinding</a> object. (inherited from <a href="#">WebSphereMQBinaryBinding</a> )
	<a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Scheme</a>	Gets the addressing scheme that is used by the <b>WebSphereMQBinding</b> object. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">SendTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">TICorrelationID</a>	Gets or sets the TI correlation identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">Transaction</a>	Gets or sets whether the send or receive needs to be performed in a transaction scope. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">UsePersistentConnectionForSend</a>	Gets or sets a property that indicates whether the transport uses a persistent connection for send. (inherited from <a href="#">WebSphereMQBinding</a> )

**System.ServiceModel.Channels.WebSphereMQ.WebSphereMQRequestReplyBinaryBindingElement**

Syntax

C#

```
public class WebSphereMQRequestReplyBinaryBindingElement : WebSphereMQBinaryBindingElement
```

C++

```
public ref class WebSphereMQRequestReplyBinaryBindingElement : WebSphereMQBinaryBindingElement
```

F#

```
type WebSphereMQRequestReplyBinaryBindingElement =  
    class  
        inherit WebSphereMQBinaryBindingElement  
    end
```

VB

```
Public Class WebSphereMQRequestReplyBinaryBindingElement  
    Inherits WebSphereMQBinaryBindingElement
```

Constructors

	Name	Description
	<a href="#">WebSphereMQRequestReplyBinaryBindingElement()</a>	Initializes a new instance of the <b>WebSphereMQRequestReplyBinaryBindingElement</b> class with the default property values.
	<a href="#">WebSphereMQRequestReplyBinaryBindingElement(String)</a>	

Properties

	Name	Description
	<a href="#">BindingElementType</a>	Gets the type of the binding element.(Overrides <a href="#">WebSphereMQBinaryBindingElement.BindingElementType</a> .)
	<a href="#">CloseTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
	<a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
	<a href="#">ConnectionType</a>	Gets the type of connection for the specified <a href="#">WebSphereMQBindingElement</a> object.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
	<a href="#">CurrentConfiguration</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
	<a href="#">DeadLetterQueue</a>	Gets or sets a value that indicates whether the specified setting of the dead-letter queue is applied.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)

 <a href="#">ElementInformation</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">ElementProperty</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">EvaluationContext</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets the extensible message queue headers for the specified object.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">HasContext</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Item(ConfigurationProperty)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Item(String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">LockAllAttributesExcept</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockAllElementsExcept</a>	(Inherited from <a href="#">ConfigurationElement</a> .)

 <a href="#">LockItem</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">MoveMessageToBackoutQueue</a>	(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Channel Name.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdConnectionName</a>	Gets or sets the connection name.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified maximum message length.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the string value of the MqcdSslCipherSpecification in the <a href="#">WebSphereMQChannelConfigurationStrings</a> .class.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <a href="#">WebSphereMQBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type of the <a href="#">WebSphereMQBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the unique identifier for the user.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)

 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order of the <a href="#">WebSphereMQTransportElement</a> class. The default is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets a value of the MqscoSslKeyRepository in the specified <a href="#">WebSphereMQChannelConfigurationStrings</a> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">Name</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">OpenTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">Properties</a>	Returns a typed object requested, if present, from the appropriate layer in the binding stack.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReaderQuotas</a>	Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReceiveTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">SendTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">Transaction</a>	Gets or sets the local transaction used.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)

## Methods

Name	Description
 <a href="#">ApplyConfiguration(Binding)</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">DeserializeElement(XmlReader, Boolean)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)

# WebSphereMQRequestReplyBinaryBindingElement Members

The following tables list the members exposed by the [WebSphereMQRequestReplyBinaryBindingElement](#) type.

## Public Constructors

Name	Description
<a href="#">WebSphereMQRequestReplyBinaryBindingElement</a>	Overloaded.

## Top

## Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">CloseTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ConnectionType</a>	Gets the type of connection for the specified <a href="#">WebSphereMQBindingElement</a> object. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">CurrentConfiguration</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets a value that indicates whether the specified setting of the dead-letter queue is applied. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ElementInformation</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets the extensible message queue headers for the specified object. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">LockAllAttributesExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAllElementsExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAttributes</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockElements</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockItem</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Channel Name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdConnectionName</a>	Gets or sets the connection name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified maximum message length. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the string value of the MqcdSslCipherSpecification in the <a href="#">WebSphereMQChannelConfigurationStrings</a> .class. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type of the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the unique identifier for the user. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message. (inherited from <a href="#">WebSphereMQBindingElement</a> )

 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order of the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets a value of the MqscoSslKeyRepository in the specified <b>WebSphereMQChannelConfigurationStrings</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">Name</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">OpenTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">ReaderQuotas</a>	Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">SendTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">Transaction</a>	Gets or sets the local transaction used. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection. (inherited from <a href="#">WebSphereMQBindingElement</a> )

**WebSphereMQRequestReplyBinaryBindingElement Constructor (String)**

Syntax  
C#

```
public WebSphereMQRequestReplyBinaryBindingElement(  
    string configurationName  
)
```

C++

```
public:  
WebSphereMQRequestReplyBinaryBindingElement(  
    String^ configurationName  
)
```

F#

```
new :
```

configurationName:[string](#) -> WebSphereMQRequestReplyBinaryBindingElement

VB

```
Public Sub New (  
    configurationName As String  
)
```

**Parameters**

*configurationName*

Type: [System.String](#)

[Return to top](#)

# WebSphereMQRequestReplyBinaryBindingElement Constructor ()

Initializes a new instance of the [WebSphereMQRequestReplyBinaryBindingElement](#) class with the default property values.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public WebSphereMQRequestReplyBinaryBindingElement ()
```

C++

```
public:
WebSphereMQRequestReplyBinaryBindingElement ()
```

J#

```
public WebSphereMQRequestReplyBinaryBindingElement ()
```

JScript

```
public function WebSphereMQRequestReplyBinaryBindingElement ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

Name	Description
 <a href="#">CloseTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ConnectionType</a>	Gets the type of connection for the specified <a href="#">WebSphereMQBindingElement</a> object. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">CurrentConfiguration</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets a value that indicates whether the specified setting of the dead-letter queue is applied. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ElementInformation</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets the extensible message queue headers for the specified object. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">LockAllAttributesExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAllElementsExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAttributes</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockElements</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockItem</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Channel Name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdConnectionName</a>	Gets or sets the connection name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified maximum message length. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the string value of the MqcdSslCipherSpecification in the <a href="#">WebSphereMQChannelConfigurationStrings</a> class. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type of the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the unique identifier for the user. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )

 <a href="#">MqpmoWaitInterval</a>	Gets or sets the wait interval before getting the message. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order of the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets a value of the MqscoSslKeyRepository in the specified <b>WebSphereMQChannelConfigurationStrings</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">Name</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">OpenTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">ReaderQuotas</a>	Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">SendTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">Transaction</a>	Gets or sets the local transaction used. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection. (inherited from <a href="#">WebSphereMQBindingElement</a> )

#### Protected Properties

Name	Description
 <a href="#">BindingElementType</a>	Overridden. Gets the type of the binding element.
 <a href="#">ElementProperty</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">EvaluationContext</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">Item</a>	Overloaded. (inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">Properties</a>	Returns a typed object requested, if present, from the appropriate layer in the binding stack. (inherited from <a href="#">WebSphereMQBindingElement</a> )

# WebSphereMQRequestReplyBinaryBindingElement.BindingElementType Property

Gets the type of the binding element.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides ReadOnly Property BindingElementType As Type
```

C#

```
protected override Type BindingElementType { get; }
```

C++

```
protected:
virtual property Type^ BindingElementType {
    Type^ get () override;
}
```

J#

```
/** @property */
protected Type get_BindingElementType ()
```

JScript

```
protected override function get BindingElementType () : Type
```

## Property Value

The type of the binding element.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

```

Constructors

Name	Description
 <a href="#">WebSphereMQRequestReplyBinding()</a>	Initializes a new instance of the <b>WebSphereMQRequestReplyBinding</b> class with the default property values.
 <a href="#">WebSphereMQRequestReplyBinding(String)</a>	

Properties

Name	Description
 <a href="#">CloseTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <a href="#">WebSphereMQBinding</a> object.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeaders in the Message after receiving the Message(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MessageVersion</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">MoveMessageToBackoutQueue</a>	(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <a href="#">WebSphereMQBinding</a> class.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdPassword</a>	Gets or sets the password for the <a href="#">WebSphereMQBinding</a> class.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled.(Inherited from <a href="#">WebSphereMQBinding</a> .)

 <a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">MqskoSslKeyRepository</a>	Gets or sets the Mqsko SSL Key Repository.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">Name</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">Namespace</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">OpenTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">ReaderQuotas</a>	Gets constraints on the complexity of SOAP messages that can be processed by endpoints configured with the binding.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">ReceiveTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">Scheme</a>	Gets the addressing scheme that is used by the <a href="#">WebSphereMQBinding</a> object.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">SendTimeout</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">TlCorrelationID</a>	Gets or sets the Tl correlation identifier.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">Transaction</a>	Gets or sets whether the send or receive needs to be performed in a transaction scope.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a property that indicates whether the transport uses a persistent connection for send.(Inherited from <a href="#">WebSphereMQBinding</a> .)

#### Methods

Name	Description
 <a href="#">ApplyConfiguration(String)</a>	Applies the settings from the configuration element that corresponds to the specified name to the current instance of the binding element.(Overrides <a href="#">WebSphereMQBinding.ApplyConfiguration(String)</a> .)
 <a href="#">BuildChannelFactory&lt;'TChannel&gt;(BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelFactory&lt;'TChannel&gt;(Object[])</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;'TChannel&gt;(BindingParameterCollection)</a>	(Inherited from <a href="#">Binding</a> .)
 <a href="#">BuildChannelListener&lt;'TChannel&gt;(Object[])</a>	(Inherited from <a href="#">Binding</a> .)

 BuildChannelListener<'TChannel>(Uri, BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 BuildChannelListener<'TChannel>(Uri, Object[])	(Inherited from <a href="#">Binding</a> .)
 BuildChannelListener<'TChannel>(Uri, String, BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 BuildChannelListener<'TChannel>(Uri, String, ListenUriMode, BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 BuildChannelListener<'TChannel>(Uri, String, ListenUriMode, Object[])	(Inherited from <a href="#">Binding</a> .)
 BuildChannelListener<'TChannel>(Uri, String, Object[])	(Inherited from <a href="#">Binding</a> .)
 CanBuildChannelFactory<'TChannel>(BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 CanBuildChannelFactory<'TChannel>(Object[])	(Inherited from <a href="#">Binding</a> .)
 CanBuildChannelListener<'TChannel>(BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 CanBuildChannelListener<'TChannel>(Object[])	(Inherited from <a href="#">Binding</a> .)
 CreateBindingElements()	Creates a collection that contains the binding elements that are part of the current binding.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 Equals(Object)	(Inherited from <a href="#">Object</a> .)
 Finalize()	(Inherited from <a href="#">Object</a> .)
 GetHashCode()	(Inherited from <a href="#">Object</a> .)
 GetMessageEncodingBindingElement()	Returns a new instance of the MessageEncodingBindingElement when overridden by derived classes.(Inherited from <a href="#">WebSphereMQBinding</a> .)
 GetMQTransportBindingElement()	When overridden in a derived class, returns a new instance of the <a href="#">WebSphereMQTransportBindingElement</a> class.(Overrides <a href="#">WebSphereMQBinding.GetMQTransportBindingElement()</a> .)
 GetProperty<'T>(BindingParameterCollection)	(Inherited from <a href="#">Binding</a> .)
 GetType()	(Inherited from <a href="#">Object</a> .)
 MemberwiseClone()	(Inherited from <a href="#">Object</a> .)
 ToString()	(Inherited from <a href="#">Object</a> .)

#### Thread Safety

The following tables list the members exposed by the [WebSphereMQRequestReplyBinding](#) type.

## Public Constructors

Name	Description
<a href="#">WebSphereMQRequestReplyBinding</a>	Overloaded.

## Top

## Public Properties

Name	Description
 <a href="#">CloseTimeout</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <a href="#">WebSphereMQBinding</a> object. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeader s in the Message after receiving the Message (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MessageVersion</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdPassword</a>	Gets or sets the password for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the Mqsco SSL Key Repository. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">Name</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">Namespace</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">OpenTimeout</a>	(inherited from <a href="#">Binding</a> )

	<a href="#">ReaderQuotas</a>	Gets constraints on the complexity of SOAP messages that can be processed by endpoint s configured with the binding. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ReceiveTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">Scheme</a>	Gets the addressing scheme that is used by the <b>WebSphereMQBinding</b> object. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">SendTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">TICorrelationID</a>	Gets or sets the TI correlation identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">Transaction</a>	Gets or sets whether the send or receive needs to be performed in a transaction scope. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">UsePersistentConnectionForSend</a>	Gets or sets a property that indicates whether the transport uses a persistent connection f or send. (inherited from <a href="#">WebSphereMQBinding</a> )

[Top](#)

Public Methods (see also [Protected Methods](#))

	Name	Description
	<a href="#">BuildChannelFactory</a>	Overloaded. (inherited from <a href="#">Binding</a> )
	<a href="#">BuildChannelListener</a>	Overloaded. (inherited from <a href="#">Binding</a> )
	<a href="#">CanBuildChannelFactory</a>	Overloaded. (inherited from <a href="#">Binding</a> )
	<a href="#">CanBuildChannelListener</a>	Overloaded. (inherited from <a href="#">Binding</a> )
	<a href="#">CreateBindingElements</a>	Creates a collection that contains the binding elements that are part of the current binding. (inherited from <a href="#">WebSphereMQBinding</a> )

### WebSphereMQRequestReplyBinding Constructor (String)

Syntax

C#

```
public WebSphereMQRequestReplyBinding(  
    string configurationName  
)
```

C++

```
public:  
WebSphereMQRequestReplyBinding(  
    String^ configurationName  
)
```

F#

```
new :  
    configurationName:string -> WebSphereMQRequestReplyBinding
```

VB

```
Public Sub New (  
    configurationName As String  
)
```

#### Parameters

*configurationName*

Type: [System.String](#)

[Return to top](#)

# WebSphereMQRequestReplyBinding Constructor ()

Initializes a new instance of the [WebSphereMQRequestReplyBinding](#) class with the default property values.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New
```

C#

```
public WebSphereMQRequestReplyBinding ()
```

C++

```
public:
WebSphereMQRequestReplyBinding ()
```

J#

```
public WebSphereMQRequestReplyBinding ()
```

JScript

```
public function WebSphereMQRequestReplyBinding ()
```

**Remarks**The default constructor initializes any fields to their default values.

**Platforms**

**Development Platforms**

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Target Platforms**

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Sub New ( _
    configurationName As String _
)
```

C#

```
public WebSphereMQRequestReplyBinding (
    string configurationName
)
```

C++

```
public:
WebSphereMQRequestReplyBinding (
    String^ configurationName
)
```

J#

```
public WebSphereMQRequestReplyBinding (
    String configurationName
)
```

JScript

```
public function WebSphereMQRequestReplyBinding (
    configurationName : String
)
```

## Parameters

configurationName

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# WebSphereMQRequestReplyBinding.ApplyConfiguration Method

Applies the settings from the configuration element that corresponds to the specified name to the current instance of the binding element.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Sub ApplyConfiguration ( _
    configurationName As String _
)
```

C#

```
protected override void ApplyConfiguration (
    string configurationName
)
```

C++

```
protected:
virtual void ApplyConfiguration (
    String^ configurationName
) override
```

J#

```
protected void ApplyConfiguration (
    String configurationName
)
```

JScript

```
protected override function ApplyConfiguration (
    configurationName : String
)
```

## Parameters

configurationName

The name of the configuration element to take the settings from.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# WebSphereMQRequestReplyBinding Properties

## Public Properties

	Name	Description
	<a href="#">CloseTimeout</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">ClusterQueueManagerName</a>	Gets or sets the name of the cluster queue manager. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ConnectionType</a>	Gets or sets the type of the connection of a <a href="#">WebSphereMQBinding</a> object. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">ExtensibleMQHeaders</a>	Gets or sets a list of custom headers that will be loaded during runtime. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeader s in the Message after receiving the Message (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MessageVersion</a>	(inherited from <a href="#">Binding</a> )
	<a href="#">MqcdChannelName</a>	Gets or sets the Mqcd Channel Name. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd Connection. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum length of the message for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdPassword</a>	Gets or sets the password for the <b>WebSphereMQBinding</b> class. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Mqcd SSL Cipher Specification. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdSslClientAuthentication</a>	Gets or sets whether the Mqcd SSL Client Authentication is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdSslPeerName</a>	Gets or sets the Mqcd SSL Peer Name. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdTransportType</a>	Gets or sets the Mqcd Transport Type. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqcdUserIdentifier</a>	Gets or sets the Mqcd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoCompleteMessage</a>	Gets or sets the Mqgmo Complete Message. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoConvert</a>	Gets or sets the Mqgmo Convert. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoLogicalOrder</a>	Gets or sets whether the Mqgmo is in Logical Order. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoSyncPoint</a>	Gets or sets the Mqgmo Sync Point. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqgmoWaitInterval</a>	Gets or sets the Mqgmo Wait Interval. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdFormat</a>	Gets or sets the Mqmd Format. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdPutApplicationName</a>	Gets or sets the Mqmd Put Application Name. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdReplyToQueue</a>	Gets or sets the Mqmd reply to Queue. (inherited from <a href="#">WebSphereMQBinding</a> )
	<a href="#">MqmdReplyToQueueManager</a>	Gets or sets the Mqmd Reply to Queue Manager. (inherited from <a href="#">WebSphereMQBinding</a> )

 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets whether the Mqmd Segmentation is allowed. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the Mqmd User Identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets whether the Mqpmo Logical Order is used. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets if the Mqpmo Sync Point is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the Mqsco SSL Key Repository. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">Name</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">Namespace</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">OpenTimeout</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">ReaderQuotas</a>	Gets constraints on the complexity of SOAP messages that can be processed by endpoint s configured with the binding. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">ReceiveTimeout</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">Scheme</a>	Gets the addressing scheme that is used by the <b>WebSphereMQBinding</b> object. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">SendTimeout</a>	(inherited from <a href="#">Binding</a> )
 <a href="#">TICorrelationID</a>	Gets or sets the TI correlation identifier. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">Transaction</a>	Gets or sets whether the send or receive needs to be performed in a transaction scope. (inherited from <a href="#">WebSphereMQBinding</a> )
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a property that indicates whether the transport uses a persistent connection f or send. (inherited from <a href="#">WebSphereMQBinding</a> )

**System.ServiceModel.Channels.WebSphereMQ.WebSphereMQRequestReplyBindingElement**

Syntax

```
public class WebSphereMQRequestReplyBindingElement : WebSphereMQBindingElement
```

C++

```
public ref class WebSphereMQRequestReplyBindingElement : WebSphereMQBindingElement
```

F#

```
type WebSphereMQRequestReplyBindingElement =  
    class  
        inherit WebSphereMQBindingElement  
    end
```

VB

```
Public Class WebSphereMQRequestReplyBindingElement  
    Inherits WebSphereMQBindingElement
```

Constructors

Name	Description
 <a href="#">WebSphereMQRequestReplyBindingElement()</a>	Initializes a new instance of the <b>WebSphereMQRequestReplyBindingElement</b> class with the specified values.
 <a href="#">WebSphereMQRequestReplyBindingElement(String)</a>	

Properties

Name	Description
 <a href="#">BindingElementType</a>	Gets the Type of binding that this configuration element represents.(Overrides <a href="#">WebSphereMQBindingElement.BindingElementType</a> .)
 <a href="#">CloseTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ConnectionType</a>	Gets the type of connection for the specified <a href="#">WebSphereMQBindingElement</a> object.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">CurrentConfiguration</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">DeadLetterQueue</a>	Gets or sets a value that indicates whether the specified setting of the dead-letter queue is applied.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ElementInformation</a>	(Inherited from <a href="#">ConfigurationElement</a> .)

 <a href="#">ElementProperty</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">EvaluationContext</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">ExtensibleMQHeaders</a>	Gets or sets the extensible message queue headers for the specified object.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">HasContext</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Item(ConfigurationProperty)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Item(String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">LockAllAttributesExcept</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockAllElementsExcept</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockAttributes</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockElements</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockItem</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">MoveMessageToBackoutQueue</a>	(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Channel Name.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdConnectionName</a>	Gets or sets the connection name.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified maximum message length.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the string value of the MqcdSslCipherSpecification in the <a href="#">WebSphereMQChannelConfigurationStrings</a> .class.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <a href="#">WebSphereMQBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type of the <a href="#">WebSphereMQBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the unique identifier for the user.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)

 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order of the <a href="#">WebSphereMQTransportElement</a> class. The default is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets a value of the MqscoSslKeyRepository in the specified <a href="#">WebSphereMQChannelConfigurationStrings</a> .(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">Name</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">OpenTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">Properties</a>	Returns a typed object requested, if present, from the appropriate layer in the binding stack.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReaderQuotas</a>	Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">ReceiveTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">SendTimeout</a>	(Inherited from <a href="#">StandardBindingElement</a> .)
 <a href="#">Transaction</a>	Gets or sets the local transaction used.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection.(Inherited from <a href="#">WebSphereMQBindingElement</a> .)

#### Methods

Name	Description
 <a href="#">ApplyConfiguration(Binding)</a>	(Inherited from <a href="#">StandardBindingElement</a> .)

 <code>DeserializeElement(XmlReader, Boolean)</code>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <code>Equals(Object)</code>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <code>Finalize()</code>	(Inherited from <a href="#">Object</a> .)

 <a href="#">LockAllElementsExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAttributes</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockElements</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockItem</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Channel Name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdConnectionName</a>	Gets or sets the connection name. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified maximum message length. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the string value of the MqcdSslCipherSpecification in the <a href="#">WebSphereMQChannelConfigurationStrings</a> class. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type of the <b>WebSphereMQBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the unique identifier for the user. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportElement</a> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )

 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order of the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets a value of the MqscoSslKeyRepository in the specified <b>WebSphereMQChannelConfigurationStrings</b> . (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">Name</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">OpenTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">ReaderQuotas</a>	Gets or sets constraints on the complexity of SOAP messages that can be processed by endpoints configured with this binding. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveContextEnabled</a>	Gets or sets a value that indicates whether the receive context is enabled. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveContextValidityDuration</a>	Gets or sets the validity duration of the receive context. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">ReceiveTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">SendTimeout</a>	(inherited from <a href="#">StandardBindingElement</a> )
 <a href="#">Transaction</a>	Gets or sets the local transaction used. (inherited from <a href="#">WebSphereMQBindingElement</a> )
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection. (inherited from <a href="#">WebSphereMQBindingElement</a> )

# WebSphereMQRequestReplyBindingElement.BindingElementType Property

Gets the Type of binding that this configuration element represents.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides ReadOnly Property BindingElementType As Type
```

C#

```
protected override Type BindingElementType { get; }
```

C++

```
protected:
virtual property Type^ BindingElementType {
    Type^ get () override;
}
```

J#

```
/** @property */
protected Type get_BindingElementType ()
```

JScript

```
protected override function get BindingElementType () : Type
```

## Property Value

The binding type.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

```

Constructors

Name	Description
 <a href="#">WebSphereMQRequestReplyTransportBindingElement()</a>	Initializes a new instance of the <b>WebSphereMQRequestReplyTransportBindingElement</b> class.
 <a href="#">WebSphereMQRequestReplyTransportBindingElement(WebSphereMQRequestReplyTransportBindingElement)</a>	Initializes a new instance of the <b>WebSphereMQRequestReplyTransportBindingElement</b> class from the other <b>WebSphereMQRequestReplyTransportBindingElement</b> .

Properties

Name	Description
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">ConnectionType</a>	Gets the type of connection for the <a href="#">WebSphereMQTransportBindingElement</a> object.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">DeadLetterQueue</a>	Gets or sets the property of dead-letter queue to use.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeaders in the message after receiving the message.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">ManualAddressing</a>	(Inherited from <a href="#">TransportBindingElement</a> .)
 <a href="#">MaxBufferPoolSize</a>	(Inherited from <a href="#">TransportBindingElement</a> .)
 <a href="#">MaxReceivedMessageSize</a>	(Inherited from <a href="#">TransportBindingElement</a> .)
 <a href="#">MoveMessageToBackoutQueue</a>	(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Mqcd Channel Name.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd connection name.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval for the specified <a href="#">WebSphereMQTransportBindingElement</a> object.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified Mqcd maximum message length.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)

 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the cipher specification of the specified binding element.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets a value that indicates whether the specified MqcdSsl client authentication is enabled.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <a href="#">WebSphereMQTransportBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type for the <a href="#">WebSphereMQTransportBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the user identifier for the <a href="#">WebSphereMQTransportBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets a value that indicates whether the MQSeries assembled the segmented messages.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqgmoConvert</a>	Gets or sets the MQGMO CONVERT option when performing the MQGET.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order of the <a href="#">WebSphereMQTransportBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <a href="#">WebSphereMQTransportBindingElement</a> class. The default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval in retrieving messages from MQSeries Queue.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application Name to be used.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses to the queue.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets a value that indicates an object that interprets the ReplyToQueue as a Messaging Queuing format name.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the class.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order for the <a href="#">WebSphereMQTransportBindingElement</a> class the default value is <b>null</b> .(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqpmoSyncPoint</a>	Gets or sets a value that indicates whether the Mqpmo Sync Point is enabled.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the secured key repository value as a part of the Message Queuing System Overview (MQSO).(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">Scheme</a>	Gets the URI scheme for the transport.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">TICorrelationID</a>	Gets or sets the value of the TI Correlation ID used in this class.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">TransactedReceiveEnabled</a>	Gets a value that indicates whether the transaction is enabled for a receive operation.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">Transaction</a>	Gets or sets the local transaction used.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a value that indicates whether the connection is persistent.(Inherited from <a href="#">WebSphereMQTransportBindingElement</a> .)

#### Methods

Name	Description
 <a href="#">BuildChannelFactory&lt;'TChannel'&gt;(BindingContext)</a>	Initializes a channel factory for producing channels of a specified type from the binding context.(Overrides <a href="#">WebSphereMQTransportBindingElement.BuildChannelFactory&lt;'TChannel'&gt;(BindingContext)</a> .)

 <a href="#">BuildChannelListener&lt;'TChannel&gt;(BindingContext)</a>	Initializes a channel listener to accept channels of a specified type from the binding context.(Overrides <a href="#">WebSphereMQTransportBindingElement.BuildChannelListener&lt;'TChannel&gt;(BindingContext).</a> )
 <a href="#">CanBuildChannelFactory&lt;'TChannel&gt;(BindingContext)</a>	Returns a value that indicates whether the binding element can build a channel factory for a specific type of channel.(Overrides <a href="#">WebSphereMQTransportBindingElement.CanBuildChannelFactory&lt;'TChannel&gt;(BindingContext).</a> )
 <a href="#">CanBuildChannelListener&lt;'TChannel&gt;(BindingContext)</a>	Returns a value that indicates whether the binding element can build a listener for a specific type of channel.(Overrides <a href="#">WebSphereMQTransportBindingElement.CanBuildChannelListener&lt;'TChannel&gt;(BindingContext).</a> )
 <a href="#">Clone()</a>	Clones the binding element.(Overrides <a href="#">WebSphereMQTransportBindingElement.Clone().</a> )
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">Object.</a> )
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object.</a> )
 <a href="#">GetHashCode()</a>	(Inherited from <a href="#">Object.</a> )
 <a href="#">GetProperty&lt;'T&gt;(BindingContext)</a>	Returns the type of object T requested if it is present or <b>null</b> if it is not present.(Inherited from <a href="#">WebSphereMQTransportBindingElement.</a> )
 <a href="#">GetType()</a>	(Inherited from <a href="#">Object.</a> )
 <a href="#">MemberwiseClone()</a>	(Inherited from <a href="#">Object.</a> )
 <a href="#">ToString()</a>	(Inherited from <a href="#">Object.</a> )

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

## Members

The following tables list the members exposed by the [WebSphereMQRequestReplyTransportBindingElement](#) type.

Public Constructors (see also [Protected Constructors](#))

Name	Description
<a href="#">WebSphereMQRequestReplyTransportBindingElement</a>	Overloaded.

[Top](#)

Protected Constructors

Name	Description
<a href="#">WebSphereMQRequestReplyTransportBindingElement</a>	Overloaded.

[Top](#)

Public Properties

Name	Description
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">ConnectionType</a>	Gets the type of connection for the <a href="#">WebSphereMQTransportBindingElement</a> object. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets the property of dead-letter queue to use. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeader s in the message after receiving the message. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">ManualAddressing</a>	(inherited from <a href="#">TransportBindingElement</a> )
 <a href="#">MaxBufferPoolSize</a>	(inherited from <a href="#">TransportBindingElement</a> )
 <a href="#">MaxReceivedMessageSize</a>	(inherited from <a href="#">TransportBindingElement</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets a value for the Mqcd Channel Name. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd connection name. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval for the specified <b>WebSphereMQTransportBindingElement</b> object. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified Mqcd maximum message length. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the cipher specification of the specified binding element. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets a value that indicates whether the specified MqcdSsl client authentication is enabled. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the user identifier for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets a value that indicates whether the MQSeries assembled the segmented messages. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqgmoConvert</a>	Gets or sets the MQGMO CONVERT option when performing the MQGET. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order of the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )

 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval in retrieving messages from MQSeries Queue. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application Name to be used. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses to the queue. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets a value that indicates an object that interprets the ReplyToQueue as a Message Queuing format name. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the class. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportBindingElement</b> class the default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets a value that indicates whether the Mqpmo Sync Point is enabled. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the secured key repository value as a part of the Message Queuing System Overview (MQSO). (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">Scheme</a>	Gets the URI scheme for the transport. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">TICorrelationID</a>	Gets or sets the value of the TI Correlation ID used in this class. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">TransactedReceiveEnabled</a>	Gets a value that indicates whether the transaction is enabled for a receive operation. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">Transaction</a>	Gets or sets the local transaction used. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a value that indicates whether the connection is persistent. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# WebSphereMQRequestReplyTransportBindingElement.BuildChannelFactory Generic Method

Initializes a channel factory for producing channels of a specified type from the binding context.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Overridable Function BuildChannelFactory(Of TChannel) ( _
    context As BindingContext _
) As IChannelFactory(Of TChannel)
```

C#

```
public virtual IChannelFactory<TChannel> BuildChannelFactory<TChannel> (
    BindingContext context
)
```

C++

```
public:
generic<typename TChannel>
virtual IChannelFactory<TChannel>^ BuildChannelFactory (
    BindingContext^ context
)
```

J#

JScript

## Generic Parameters

TChannel

The type of channel the factory builds.

## Parameters

context

The specified context that provides context for the binding element.

## Return Value

A channel factory for producing channels of a specified type from the binding context.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# WebSphereMQRequestReplyTransportBindingElement.BuildChannelListener Generic Method

Initializes a channel listener to accept channels of a specified type from the binding context.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Overridable Function BuildChannelListener(Of TChannel As IChannel) ( _
    context As BindingContext _
) As IChannelListener(Of TChannel)
```

C#

```
public virtual IChannelListener<TChannel> BuildChannelListener<TChannel> (
    BindingContext context
) where TChannel : IChannel
```

C++

```
public:
generic<typename TChannel> where TChannel : IChannel
virtual IChannelListener<TChannel>^ BuildChannelListener (
    BindingContext^ context
)
```

J#

JScript

## Generic Parameters

TChannel

The type of channel the listener is built to accept.

## Parameters

context

The specified context that provides context for the binding element.

## Return Value

The [IChannelListener](#) of type IChannel initialized from the context.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# WebSphereMQRequestReplyTransportBindingElement.CanBuildChannelFactory Generic Method

Returns a value that indicates whether the binding element can build a channel factory for a specific type of channel.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.websphermq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Function CanBuildChannelFactory(Of TChannel) ( _
    context As BindingContext _
) As Boolean
```

C#

```
public override bool CanBuildChannelFactory<TChannel> (
    BindingContext context
)
```

C++

```
public:
    generic<typename TChannel>
    virtual bool CanBuildChannelFactory (
        BindingContext^ context
    ) override
```

J#

JScript

## GenericParameters

TChannel

The type of channel the channel factory produces.

## Parameters

context

The [BindingContext](#) that provides context for the binding element.

## Return Value

**True** if the `IChannelFactory<TChannel>` of type `TChannel` can be built by the binding element; otherwise, **false**.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

	<a href="#">ManualAddressing</a>	(inherited from <a href="#">TransportBindingElement</a> )
	<a href="#">MaxBufferPoolSize</a>	(inherited from <a href="#">TransportBindingElement</a> )
	<a href="#">MaxReceivedMessageSize</a>	(inherited from <a href="#">TransportBindingElement</a> )
	<a href="#">MqcdChannelName</a>	Gets or sets a value for the Mqcd Channel Name. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd connection name. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval for the specified <b>WebSphereMQTransportBindingElement</b> object. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified Mqcd maximum message length. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqcdSslCipherSpecification</a>	Gets or sets the cipher specification of the specified binding element. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqcdSslClientAuthentication</a>	Gets or sets a value that indicates whether the specified MqcdSsl client authentication is enabled. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqcdTransportType</a>	Gets or sets the transport type for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqcdUserIdentifier</a>	Gets or sets the user identifier for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqgmoCompleteMessage</a>	Gets or sets a value that indicates whether the MQSeries assembled the segmented messages. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqgmoConvert</a>	Gets or sets the MQGMO CONVERT option when performing the MQGET. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order of the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
	<a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval in retrieving messages from MQSeries Queue. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )

 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application Name to be used. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses to the queue. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets a value that indicates an object that interprets the ReplyToQueue as a Messaging Queuing format name. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the class. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportBindingElement</b> class the default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets a value that indicates whether the Mqpmo Sync Point is enabled. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the secured key repository value as a part of the Message Queuing System Overview (MQSO). (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">Scheme</a>	Gets the URI scheme for the transport. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">TICorrelationID</a>	Gets or sets the value of the TI Correlation ID used in this class. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">TransactedReceiveEnabled</a>	Gets a value that indicates whether the transaction is enabled for a receive operation. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">Transaction</a>	Gets or sets the local transaction used. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a value that indicates whether the connection is persistent. (inherited from <a href="#">WebSphereMQTransportBindingElement</a> )

# WebSphereMQRequestReplyTransportElement Members

The following tables list the members exposed by the [WebSphereMQRequestReplyTransportElement](#) type.

## Public Constructors

Name	Description
<a href="#">WebSphereMQRequestReplyTransportElement</a>	Initializes a new instance of the <a href="#">WebSphereMQRequestReplyTransportElement</a> class.

## Top

## Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">BindingElementType</a>	Overridden. Gets the type of the binding element used.
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the specified name for the Cluster Queue Manager. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">ConfigurationElementName</a>	(inherited from <a href="#">ServiceModelExtensionElement</a> )
 <a href="#">ConnectionType</a>	Gets the type of connection for the <a href="#">WebSphereMQTransportElement</a> object. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">CurrentConfiguration</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">ElementInformation</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">LockAllAttributesExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAllElementsExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAttributes</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockElements</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockItem</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">ManualAddressing</a>	Gets or sets a value that indicates whether manual addressing of the message is required. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MaxBufferPoolSize</a>	Gets or sets the maximum size of any buffer pools used by the <b>WebSphereMQTransportElement</b> object. The default is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MaxReceivedMessageSize</a>	Gets or sets the maximum allowable message size that can be received. The default is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets the name of the channel. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdConnectionName</a>	Gets or sets the specified name of the Connection. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum message length for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdPassword</a>	Gets or sets the Mqcd password for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Ssl Cipher specification required. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the user identifier for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert. (inherited from <a href="#">WebSphereMQTransportElement</a> )

 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the key repository in the class. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">Transaction</a>	Gets or sets the local transaction used. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection. (inherited from <a href="#">WebSphereMQTransportElement</a> )

## Reference

[WebSphereMQRequestReplyTransportElement Class](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# WebSphereMQRequestReplyTransportElement.CreateBindingElement Method

Creates a new binding element for the transport element.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides Function CreateBindingElement As BindingElement
```

C#

```
protected override BindingElement CreateBindingElement ()
```

C++

```
protected:
virtual BindingElement^ CreateBindingElement () override
```

J#

```
protected BindingElement CreateBindingElement ()
```

JScript

```
protected override function CreateBindingElement () : BindingElement
```

## Return Value

A new binding element.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

 <a href="#">LockElements</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockItem</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">ManualAddressing</a>	Gets or sets a value that indicates whether manual addressing of the message is required. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MaxBufferPoolSize</a>	Gets or sets the maximum size of any buffer pools used by the <b>WebSphereMQTransportElement</b> object. The default is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MaxReceivedMessageSize</a>	Gets or sets the maximum allowable message size that can be received. The default is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdChannelName</a>	Gets or sets the name of the channel. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdConnectionName</a>	Gets or sets the specified name of the Connection. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum message length for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdPassword</a>	Gets or sets the Mqcd password for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Ssl Cipher specification required. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )

 <a href="#">MqcdUserIdentifier</a>	Gets or sets the user identifier for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> . (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the key repository in the class. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">Transaction</a>	Gets or sets the local transaction used. (inherited from <a href="#">WebSphereMQTransportElement</a> )
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection. (inherited from <a href="#">WebSphereMQTransportElement</a> )

#### Protected Properties

Name	Description

# WebSphereMQRequestReplyTransportElement.BindingElementType Property

Gets the type of the binding element used.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property BindingElementType As Type
```

C#

```
public override Type BindingElementType { get; }
```

C++

```
public:
virtual property Type^ BindingElementType {
    Type^ get () override;
}
```

J#

```
/** @property */
public Type get_BindingElementType ()
```

JScript

```
public override function get BindingElementType () : Type
```

## Property Value

The type of the binding element.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

type WebSphereMQTransportBindingElement =
    class
        inherit TransportBindingElement
        interface ITransactedBindingElement
    end
```

VB

```
Public Class WebSphereMQTransportBindingElement
    Inherits TransportBindingElement
    Implements ITransactedBindingElement
```

Constructors

	Name	Description
	<a href="#">WebSphereMQTransportBindingElement()</a>	Initializes a new instance of the <b>WebSphereMQTransportBindingElement</b> class.
	<a href="#">WebSphereMQTransportBindingElement(WebSphereMQTransportBindingElement)</a>	Initializes a new instance of the <b>WebSphereMQTransportBindingElement</b> class using other objects.

Properties

	Name	Description
	<a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name.
	<a href="#">ConnectionType</a>	Gets the type of connection for the <b>WebSphereMQTransportBindingElement</b> object.
	<a href="#">DeadLetterQueue</a>	Gets or sets the property of dead-letter queue to use.
	<a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeaders in the message after receiving the message.
	<a href="#">ManualAddressing</a>	(Inherited from <a href="#">TransportBindingElement</a> .)
	<a href="#">MaxBufferPoolSize</a>	(Inherited from <a href="#">TransportBindingElement</a> .)

 MaxReceivedMessageSize	(Inherited from <a href="#">TransportBindingElement</a> .)
 MoveMessageToBackoutQueue	
 MqcdChannelName	Gets or sets a value for the Mqcd Channel Name.
 MqcdConnectionName	Gets or sets the Mqcd connection name.
 MqcdHeartBeatInterval	Gets or sets the Mqcd HeartBeat Interval for the specified <b>WebSphereMQTransportBindingElement</b> object.
 MqcdMaximumMessageLength	Gets or sets the specified Mqcd maximum message length.
 MqcdPassword	Gets or sets the password to use when authenticating the client.
 MqcdSslCipherSpecification	Gets or sets the cipher specification of the specified binding element.
 MqcdSslClientAuthentication	Gets or sets a value that indicates whether the specified MqcdSsl client authentication is enabled.
 MqcdSslPeerName	Gets or sets the peer name for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> .
 MqcdTransportType	Gets or sets the transport type for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> .
 MqcdUserIdentifier	Gets or sets the user identifier for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> .
 MqgmoCompleteMessage	Gets or sets a value that indicates whether the MQSeries assembled the segmented messages.
 MqgmoConvert	Gets or sets the MQGMO CONVERT option when performing the MQGET.
 MqgmoLogicalOrder	Gets or sets the logical order of the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> .
 MqgmoSyncPoint	Gets or sets the synchronization point of the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> .
 MqgmoWaitInterval	Gets or sets the wait interval in retrieving messages from MQSeries Queue.
 MqmdFormat	Gets or sets the specified format of the objects used in the class.
 MqmdPutApplicationName	Gets or sets the Application Name to be used.
 MqmdReplyToQueue	Gets or sets the responses to the queue.
 MqmdReplyToQueueManager	Gets or sets a value that indicates an object that interprets the ReplyToQueue as a Messaging Queuing format name.
 MqmdSegmentationAllowed	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.
 MqmdUserIdentifier	Gets or sets the universal identifier found in the class.
 MqpmoLogicalOrder	Gets or sets the logical order for the <b>WebSphereMQTransportBindingElement</b> class the default value is <b>null</b> .
 MqpmoSyncPoint	Gets or sets a value that indicates whether the Mqpmo Sync Point is enabled.
 MqscoSslKeyRepository	Gets or sets the secured key repository value as a part of the Message Queuing System Overview (MQSO).
 Scheme	Gets the URI scheme for the transport.(Overrides <a href="#">TransportBindingElement.Scheme</a> .)

 <b>TICorrelationID</b>	Gets or sets the value of the TI Correlation ID used in this class.
 <b>TransactedReceiveEnabled</b>	Gets a value that indicates whether the transaction is enabled for a receive operation.
 <b>Transaction</b>	Gets or sets the local transaction used.
 <b>UsePersistentConnectionForSend</b>	Gets or sets a value that indicates whether the connection is persistent.

#### Methods

<b>Name</b>	<b>Description</b>
 <b>BuildChannelFactory</b> <'TChannel>(BindingContext)	Builds a channel stack consisting of a WebsphereMQ Transport used to send messages.(Overrides <a href="#">BindingElement.BuildChannelFactory</a> <'TChannel>(BindingContext).)
 <b>BuildChannelListener</b> <'TChannel>(BindingContext)	Builds a channel listener stack that consists of IBM WebsphereMQ transport used to receive messages.(Overrides <a href="#">BindingElement.BuildChannelListener</a> <'TChannel>(BindingContext).)
 <b>CanBuildChannelFactory</b> <'TChannel>(BindingContext)	Returns a value that indicates whether the binding element can build a channel factory for a specific type of channel.(Overrides <a href="#">BindingElement.CanBuildChannelFactory</a> <'TChannel>(BindingContext).)
 <b>CanBuildChannelListener</b> <'TChannel>(BindingContext)	Returns a value that indicates whether the binding element can build a listener for a specific type of channel.(Overrides <a href="#">BindingElement.CanBuildChannelListener</a> <'TChannel>(BindingContext).)
 <b>Clone()</b>	Gets a copy of the specified <b>WebSphereMQTransportBindingElement</b> object.(Overrides <a href="#">BindingElement.Clone()</a> .)
 <b>Equals</b> (Object)	(Inherited from <a href="#">Object</a> .)
 <b>Finalize()</b>	(Inherited from <a href="#">Object</a> .)
 <b>GetHashCode()</b>	(Inherited from <a href="#">Object</a> .)
 <b>GetProperty</b> <'T>(BindingContext)	Returns the type of object T requested if it is present or <b>null</b> if it is not present.(Overrides <a href="#">TransportBindingElement.GetProperty</a> <'T>(BindingContext).)
 <b>GetType()</b>	(Inherited from <a href="#">Object</a> .)
 <b>MemberwiseClone()</b>	(Inherited from <a href="#">Object</a> .)
 <b>ToString()</b>	(Inherited from <a href="#">Object</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

virtual IChannelFactory<TChannel>^ BuildChannelFactory (
    BindingContext^ context
)
```

J#

JScript

## GenericParameters

TChannel

The type of channel that factory builds.

## Parameters

context

Provides the context for the binding element.

## Return Value

A channel factory for producing channels of a specified type from the binding element.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# WebSphereMQTransportBindingElement.GetProperty Generic Method

Returns the type of object T requested if it is present or **null** if it is not present.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Overridable Function GetProperty(Of T) ( _
    context As BindingContext _
) As T
```

C#

```
public virtual T GetProperty<T> (
    BindingContext context
)
```

C++

```
public:
generic<typename T>
virtual T GetProperty (
    BindingContext^ context
)
```

J#

JScript

## Generic Parameters

T

The typed object for which the method is querying.

## Parameters

context

The context for the binding element.

## Return Value

The typed of object T requested if it is present or **null** if it is not present.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

# WebSphereMQTransportBindingElement Properties

## Public Properties

	Name	Description
	<a href="#">ClusterQueueManagerName</a>	Gets or sets the Cluster Queue Manager name.
	<a href="#">ConnectionType</a>	Gets the type of connection for the <a href="#">WebSphereMQTransportBindingElement</a> object.
	<a href="#">DeadLetterQueue</a>	Gets or sets the property of dead-letter queue to use.
	<a href="#">LeaveMQHeadersInMessage</a>	Gets or sets a property that indicates whether the transport needs to leave the MQHeader s in the message after receiving the message.
	<a href="#">ManualAddressing</a>	(inherited from <a href="#">TransportBindingElement</a> )
	<a href="#">MaxBufferPoolSize</a>	(inherited from <a href="#">TransportBindingElement</a> )
	<a href="#">MaxReceivedMessageSize</a>	(inherited from <a href="#">TransportBindingElement</a> )
	<a href="#">MqcdChannelName</a>	Gets or sets a value for the Mqcd Channel Name.
	<a href="#">MqcdConnectionName</a>	Gets or sets the Mqcd connection name.
	<a href="#">MqcdHeartBeatInterval</a>	Gets or sets the Mqcd HeartBeat Interval for the specified <b>WebSphereMQTransportBindingElement</b> object.
	<a href="#">MqcdMaximumMessageLength</a>	Gets or sets the specified Mqcd maximum message length.
	<a href="#">MqcdPassword</a>	Gets or sets the password to use when authenticating the client.
	<a href="#">MqcdSslCipherSpecification</a>	Gets or sets the cipher specification of the specified binding element.
	<a href="#">MqcdSslClientAuthentication</a>	Gets or sets a value that indicates whether the specified MqcdSsl client authentication is enabled.
	<a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> .
	<a href="#">MqcdTransportType</a>	Gets or sets the transport type for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> .
	<a href="#">MqcdUserIdentifier</a>	Gets or sets the user identifier for the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> .
	<a href="#">MqgmoCompleteMessage</a>	Gets or sets a value that indicates whether the MQSeries assembled the segmented messages.
	<a href="#">MqgmoConvert</a>	Gets or sets the MQGMO CONVERT option when performing the MQGET.
	<a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order of the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> .
	<a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportBindingElement</b> class. The default value is <b>null</b> .
	<a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval in retrieving messages from MQSeries Queue.
	<a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.
	<a href="#">MqmdPutApplicationName</a>	Gets or sets the Application Name to be used.
	<a href="#">MqmdReplyToQueue</a>	Gets or sets the responses to the queue.
	<a href="#">MqmdReplyToQueueManager</a>	Gets or sets a value that indicates an object that interprets the ReplyToQueue as a Message Queuing format name.
	<a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.
	<a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the class.
	<a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportBindingElement</b> class the default value is <b>null</b> .
	<a href="#">MqpmoSyncPoint</a>	Gets or sets a value that indicates whether the Mqpmo Sync Point is enabled.
	<a href="#">MqscoSslKeyRepository</a>	Gets or sets the secured key repository value as a part of the Message Queuing System Overview (MQSO).
	<a href="#">Scheme</a>	Overridden. Gets the URI scheme for the transport.
	<a href="#">TICorrelationID</a>	Gets or sets the value of the TI Correlation ID used in this class.
	<a href="#">TransactedReceiveEnabled</a>	Gets a value that indicates whether the transaction is enabled for a receive operation.
	<a href="#">Transaction</a>	Gets or sets the local transaction used.
	<a href="#">UsePersistentConnectionForSend</a>	Gets or sets a value that indicates whether the connection is persistent.

# WebSphereMQTransportBindingElement.ClusterQueueManagerName Property

Gets or sets the Cluster Queue Manager name.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Property ClusterQueueManagerName As String
```

C#

```
public string ClusterQueueManagerName { get; set; }
```

C++

```
public:
property String^ ClusterQueueManagerName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_ClusterQueueManagerName ()

/** @property */
public void set_ClusterQueueManagerName (String value)
```

JScript

```
public function get ClusterQueueManagerName () : String

public function set ClusterQueueManagerName (value : String)
```

## Property Value

A value of the Cluster Queue Manager name.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

[System.ServiceModel.Configuration.ServiceModelExtensionElement](#)  
[System.ServiceModel.Configuration.BindingElementExtensionElement](#)  
**System.ServiceModel.Channels.WebSphereMQ.WebSphereMQTransportElement**

Syntax  
C#

```
public class WebSphereMQTransportElement : BindingElementExtensionElement
```

C++

```
public ref class WebSphereMQTransportElement : BindingElementExtensionElement
```

F#

```
type WebSphereMQTransportElement =  
    class  
        inherit BindingElementExtensionElement  
    end
```

VB

```
Public Class WebSphereMQTransportElement  
    Inherits BindingElementExtensionElement
```

Constructors

Name	Description
 <a href="#">WebSphereMQTransportElement()</a>	Initializes a new instance of the <b>WebSphereMQTransportElement</b> class.

Properties

Name	Description
 <a href="#">BindingElementType</a>	Gets the type of binding element for the specified <b>WebSphereMQTransportElement</b> object.(Overrides <a href="#">BindingElementExtensionElement.BindingElementType</a> .)
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the specified name for the Cluster Queue Manager.
 <a href="#">ConfigurationElementName</a>	(Inherited from <a href="#">ServiceModelExtensionElement</a> .)
 <a href="#">ConnectionType</a>	Gets the type of connection for the <b>WebSphereMQTransportElement</b> object. The default value is <b>null</b> .
 <a href="#">CurrentConfiguration</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use. The default value is <b>null</b> .
 <a href="#">ElementInformation</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">ElementProperty</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">EvaluationContext</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">HasContext</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Item(ConfigurationProperty)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Item(String)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message.
 <a href="#">LockAllAttributesExcept</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockAllElementsExcept</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockAttributes</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockElements</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">LockItem</a>	(Inherited from <a href="#">ConfigurationElement</a> .)

 <a href="#">ManualAddressing</a>	Gets or sets a value that indicates whether manual addressing of the message is required.
 <a href="#">MaxBufferPoolSize</a>	Gets or sets the maximum size of any buffer pools used by the <b>WebSphereMQTransportElement</b> object. The default is <b>null</b> .
 <a href="#">MaxReceivedMessageSize</a>	Gets or sets the maximum allowable message size that can be received. The default is <b>null</b> .
 <a href="#">MoveMessageToBackoutQueue</a>	
 <a href="#">MqcdChannelName</a>	Gets or sets the name of the channel.
 <a href="#">MqcdConnectionName</a>	Gets or sets the specified name of the Connection.
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain.
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum message length for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdPassword</a>	Gets or sets the Mqcd password for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Ssl Cipher specification required.
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication.
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the user identifier for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message.
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert.
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message.
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.
 <a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd.
 <a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue.
 <a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager.
 <a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.
 <a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd.
 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> .
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the key repository in the class.
 <a href="#">Properties</a>	Gets the properties of the specified collection of objects.(Overrides <a href="#">ConfigurationElement.Properties</a> .)
 <a href="#">Transaction</a>	Gets or sets the local transaction used.
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection.

#### Methods

Name	Description
 <a href="#">ApplyConfiguration(BindingElement)</a>	Applies a configuration element from the specified binding element.(Overrides <a href="#">BindingElementExtensionElement.ApplyConfiguration(BindingElement)</a> .)
 <a href="#">CopyFrom(ServiceModelExtensionElement)</a>	Duplicates a specified property from the specified object.(Overrides <a href="#">ServiceModelExtensionElement.CopyFrom(ServiceModelExtensionElement)</a> .)
 <a href="#">CreateBindingElement()</a>	Creates a custom binding element object.(Overrides <a href="#">BindingElementExtensionElement.CreateBindingElement()</a> .)
 <a href="#">DeserializeElement(XmlReader, Boolean)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Equals(Object)</a>	(Inherited from <a href="#">ConfigurationElement</a> .)
 <a href="#">Finalize()</a>	(Inherited from <a href="#">Object</a> .)

 GetHashCode()	(Inherited from <a href="#">ConfigurationElement</a> .)
 GetTransformedAssemblyString(String)	(Inherited from <a href="#">ConfigurationElement</a> .)
 GetTransformedTypeString(String)	(Inherited from <a href="#">ConfigurationElement</a> .)
 GetType()	(Inherited from <a href="#">Object</a> .)
 Init()	(Inherited from <a href="#">ConfigurationElement</a> .)
 InitializeDefault()	(Inherited from <a href="#">ConfigurationElement</a> .)
 InitializeFrom(BindingElement)	Initializes a binding configuration with the content of the specified binding element.(Overrides <a href="#">BindingElementExtensionElement.InitializeFrom(BindingElement)</a> .)
 IsModified()	(Inherited from <a href="#">ServiceModelExtensionElement</a> .)
 IsReadOnly()	(Inherited from <a href="#">ConfigurationElement</a> .)
 ListErrors(IList)	(Inherited from <a href="#">ConfigurationElement</a> .)
 MemberwiseClone()	(Inherited from <a href="#">Object</a> .)
 OnDeserializeUnrecognizedAttribute(String, String)	(Inherited from <a href="#">ConfigurationElement</a> .)
 OnDeserializeUnrecognizedElement(String, XmlReader)	(Inherited from <a href="#">ConfigurationElement</a> .)
 OnRequiredPropertyNotFound(String)	(Inherited from <a href="#">ConfigurationElement</a> .)
 PostDeserialize()	(Inherited from <a href="#">ConfigurationElement</a> .)
 PreSerialize(XmlWriter)	(Inherited from <a href="#">ConfigurationElement</a> .)
 Reset(ConfigurationElement)	(Inherited from <a href="#">ServiceModelExtensionElement</a> .)
 ResetModified()	(Inherited from <a href="#">ConfigurationElement</a> .)
 SerializeElement(XmlWriter, Boolean)	(Inherited from <a href="#">ServiceModelExtensionElement</a> .)
 SerializeToXmlElement(XmlWriter, String)	(Inherited from <a href="#">ConfigurationElement</a> .)
 SetPropertyValues(ConfigurationProperty, Object, Boolean)	(Inherited from <a href="#">ConfigurationElement</a> .)
 SetPropertyValuesIfNotDefaultValues<T>(String, 'T)	(Inherited from <a href="#">ServiceModelConfigurationElement</a> .)
 SetReadOnly()	(Inherited from <a href="#">ConfigurationElement</a> .)
 ToString()	(Inherited from <a href="#">Object</a> .)
 Unmerge(ConfigurationElement, ConfigurationElement, ConfigurationSaveMode)	(Inherited from <a href="#">ConfigurationElement</a> .)

#### Thread Safety

Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

# WebSphereMQTransportElement Members

Represents the configuration element for WebsphereMQ transport binding element.

The following tables list the members exposed by the [WebSphereMQTransportElement](#) type.

## Public Constructors

Name	Description
<a href="#">WebSphereMQTransportElement</a>	Initializes a new instance of the <a href="#">WebSphereMQTransportElement</a> class.

## Top

Public Properties (see also [Protected Properties](#))

Name	Description
 <a href="#">BindingElementType</a>	Overridden. Gets the type of binding element for the specified <b>WebSphereMQTransportElement</b> object.
 <a href="#">ClusterQueueManagerName</a>	Gets or sets the specified name for the Cluster Queue Manager.
 <a href="#">ConfigurationElementName</a>	(inherited from <a href="#">ServiceModelExtensionElement</a> )
 <a href="#">ConnectionType</a>	Gets the type of connection for the <b>WebSphereMQTransportElement</b> object. The default value is <b>null</b> .
 <a href="#">CurrentConfiguration</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">DeadLetterQueue</a>	Gets or sets an enumeration value that indicates the type of dead-letter queue to use. The default value is <b>null</b> .
 <a href="#">ElementInformation</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LeaveMQHeadersInMessage</a>	Gets or sets the header message.
 <a href="#">LockAllAttributesExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAllElementsExcept</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockAttributes</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockElements</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">LockItem</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">ManualAddressing</a>	Gets or sets a value that indicates whether manual addressing of the message is required.
 <a href="#">MaxBufferPoolSize</a>	Gets or sets the maximum size of any buffer pools used by the <b>WebSphereMQTransportElement</b> object. The default is <b>null</b> .
 <a href="#">MaxReceivedMessageSize</a>	Gets or sets the maximum allowable message size that can be received. The default is <b>null</b> .
 <a href="#">MqcdChannelName</a>	Gets or sets the name of the channel.
 <a href="#">MqcdConnectionName</a>	Gets or sets the specified name of the Connection.
 <a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain.
 <a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum message length for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdPassword</a>	Gets or sets the Mqcd password for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Ssl Cipher specification required.
 <a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication.
 <a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdTransportType</a>	Gets or sets the transport type for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqcdUserIdentifier</a>	Gets or sets the user identifier for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message.
 <a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert.
 <a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message.
 <a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.

	<a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd.
	<a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue.
	<a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager.
	<a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.
	<a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd.
	<a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> .
	<a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
	<a href="#">MqscoSslKeyRepository</a>	Gets or sets the key repository in the class.
	<a href="#">Transaction</a>	Gets or sets the local transaction used.
	<a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection.

# WebSphereMQTransportElement.ApplyConfiguration Method

Applies a configuration element from the specified binding element.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Sub ApplyConfiguration ( _
    bindingElement As BindingElement _
)
```

C#

```
public override void ApplyConfiguration (
    BindingElement bindingElement
)
```

C++

```
public:
virtual void ApplyConfiguration (
    BindingElement^ bindingElement
) override
```

J#

```
public void ApplyConfiguration (
    BindingElement bindingElement
)
```

JScript

```
public override function ApplyConfiguration (
    bindingElement : BindingElement
)
```

## Parameters

bindingElement

The specified binding element.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

## Target Platforms

# WebSphereMQTransportElement.CopyFrom Method

Duplicates a specified property from the specified object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides Sub CopyFrom ( _
    from As ServiceModelExtensionElement _
)
```

C#

```
public override void CopyFrom (
    ServiceModelExtensionElement from
)
```

C++

```
public:
virtual void CopyFrom (
    ServiceModelExtensionElement^ from
) override
```

J#

```
public void CopyFrom (
    ServiceModelExtensionElement from
)
```

JScript

```
public override function CopyFrom (
    from : ServiceModelExtensionElement
)
```

## Parameters

from

The specified object that contains the properties to duplicate.

**Thread Safety** Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Platforms**

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

	<a href="#">LockItem</a>	(inherited from <a href="#">ConfigurationElement</a> )
	<a href="#">ManualAddressing</a>	Gets or sets a value that indicates whether manual addressing of the message is required.
	<a href="#">MaxBufferPoolSize</a>	Gets or sets the maximum size of any buffer pools used by the <b>WebSphereMQTransportElement</b> object. The default is <b>null</b> .
	<a href="#">MaxReceivedMessageSize</a>	Gets or sets the maximum allowable message size that can be received. The default is <b>null</b> .
	<a href="#">MqcdChannelName</a>	Gets or sets the name of the channel.
	<a href="#">MqcdConnectionName</a>	Gets or sets the specified name of the Connection.
	<a href="#">MqcdHeartBeatInterval</a>	Gets or sets the interval used by the application domain.
	<a href="#">MqcdMaximumMessageLength</a>	Gets or sets the maximum message length for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
	<a href="#">MqcdPassword</a>	Gets or sets the Mqcd password for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
	<a href="#">MqcdSslCipherSpecification</a>	Gets or sets the Ssl Cipher specification required.
	<a href="#">MqcdSslClientAuthentication</a>	Gets or sets the required client authentication.
	<a href="#">MqcdSslPeerName</a>	Gets or sets the peer name for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
	<a href="#">MqcdTransportType</a>	Gets or sets the transport type for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
	<a href="#">MqcdUserIdentifier</a>	Gets or sets the user identifier for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
	<a href="#">MqgmoCompleteMessage</a>	Gets or sets the complete message.
	<a href="#">MqgmoConvert</a>	Gets or sets the specified object to convert.
	<a href="#">MqgmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
	<a href="#">MqgmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
	<a href="#">MqgmoWaitInterval</a>	Gets or sets the wait interval before getting the message.
	<a href="#">MqmdFormat</a>	Gets or sets the specified format of the objects used in the class.
	<a href="#">MqmdPutApplicationName</a>	Gets or sets the Application name to put in the Mqmd.
	<a href="#">MqmdReplyToQueue</a>	Gets or sets the responses that will be delivered to the queue.
	<a href="#">MqmdReplyToQueueManager</a>	Gets or sets the responses that will be delivered to the queue manager.
	<a href="#">MqmdSegmentationAllowed</a>	Gets or sets a value that indicates whether to use MQSeries Queue Manager Segmentation if an individual message exceeds the MQSeries queue maximum message length.
	<a href="#">MqmdUserIdentifier</a>	Gets or sets the universal identifier found in the Mqmd.

 <a href="#">MqpmoLogicalOrder</a>	Gets or sets the logical order for the <b>WebSphereMQTransportElement</b> class. The default is <b>null</b> .
 <a href="#">MqpmoSyncPoint</a>	Gets or sets the synchronization point of the <b>WebSphereMQTransportElement</b> class. The default value is <b>null</b> .
 <a href="#">MqscoSslKeyRepository</a>	Gets or sets the key repository in the class.
 <a href="#">Transaction</a>	Gets or sets the local transaction used.
 <a href="#">UsePersistentConnectionForSend</a>	Gets or sets a queue to send using the persistent connection.

#### Protected Properties

Name	Description
 <a href="#">ElementProperty</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">EvaluationContext</a>	(inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">Item</a>	Overloaded. (inherited from <a href="#">ConfigurationElement</a> )
 <a href="#">Properties</a>	Overridden. Gets the properties of the specified collection of objects.

[WebSphereMQTransportElement Class](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# WebSphereMQTransportElement.BindingElementType Property

Gets the type of binding element for the specified [WebSphereMQTransportElement](#) object.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Public Overrides ReadOnly Property BindingElementType As Type
```

C#

```
public override Type BindingElementType { get; }
```

C++

```
public:
virtual property Type^ BindingElementType {
    Type^ get () override;
}
```

J#

```
/** @property */
public Type get_BindingElementType ()
```

JScript

```
public override function get BindingElementType () : Type
```

## Property Value

The type of binding element for the specified object.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
<ConfigurationPropertyAttribute("clusterQueueManagerName", DefaultValue:=Nothing)> _
Public Property ClusterQueueManagerName As String
```

C#

```
[ConfigurationPropertyAttribute("clusterQueueManagerName", DefaultValue=null)]
public string ClusterQueueManagerName { get; set; }
```

C++

```
[ConfigurationPropertyAttribute(L"clusterQueueManagerName", DefaultValue=nullptr)]
public:
property String^ ClusterQueueManagerName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_ClusterQueueManagerName ()

/** @property */
public void set_ClusterQueueManagerName (String value)
```

JScript

```
public function get ClusterQueueManagerName () : String

public function set ClusterQueueManagerName (value : String)
```

## Property Value

The name of the Cluster Queue Manager.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
<ConfigurationPropertyAttribute("mqcdSslPeerName", DefaultValue:=Nothing)> _
Public Property MqcdSslPeerName As String
```

C#

```
[ConfigurationPropertyAttribute("mqcdSslPeerName", DefaultValue=null)]
public string MqcdSslPeerName { get; set; }
```

C++

```
[ConfigurationPropertyAttribute(L"mqcdSslPeerName", DefaultValue=nullptr)]
public:
property String^ MqcdSslPeerName {
    String^ get ();
    void set (String^ value);
}
```

J#

```
/** @property */
public String get_MqcdSslPeerName ()

/** @property */
public void set_MqcdSslPeerName (String value)
```

JScript

```
public function get MqcdSslPeerName () : String

public function set MqcdSslPeerName (value : String)
```

## Property Value

A value for the peer name used in the class.

**Thread Safety**Any public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Reference

[WebSphereMQTransportElement Class](#)

[WebSphereMQTransportElement Members](#)

[System.ServiceModel.Channels.WebSphereMQ Namespace](#)

# WebSphereMQTransportElement.Properties Property

Gets the properties of the specified collection of objects.

**Namespace:** System.ServiceModel.Channels.WebSphereMQ

**Assembly:** System.ServiceModel.Channels.WebSphereMQ.Channel (in system.servicemodel.channels.webspheremq.channel.dll)

Usage

Syntax

VB

```
'Declaration
Protected Overrides ReadOnly Property Properties As ConfigurationPropertyCollection
```

C#

```
protected override ConfigurationPropertyCollection Properties { get; }
```

C++

```
protected:
virtual property ConfigurationPropertyCollection^ Properties {
    ConfigurationPropertyCollection^ get () override;
}
```

J#

```
/** @property */
protected ConfigurationPropertyCollection get_Properties ()
```

JScript

```
protected override function get Properties () : ConfigurationPropertyCollection
```

## Property Value

A PropertyCollection object that contains the properties that are set on this entry.

Thread SafetyAny public static (**Shared** in Visual Basic) members of this type are thread safe. Any instance members are not guaranteed to be thread safe.

Platforms

## Development Platforms

Windows Server 2003 R2 SP2, Windows Vista SP2, Windows 7, Windows Server 2008 SP2 and Windows Server 2008 R2
