Matrix.CreateShadow Method (Vector3, Plane)

Creates a [Matrix](#) that flattens geometry into a specified [Plane](#) as if casting a shadow from a specified light source.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Matrix CreateShadow (
    Vector3 lightDirection,
    Plane plane
)
```

Parameters

lightDirection

A [Vector3](#) specifying the direction from which the light that will cast the shadow is coming.

plane

The [Plane](#) onto which the new matrix should flatten geometry so as to cast a shadow.

Return Value

A new [Matrix](#) that can be used to flatten geometry onto the specified plane from the specified direction.

Matrix.CreateShadow Method (Vector3, Plane, Matrix)

Fills in a [Matrix](#) to flatten geometry into a specified [Plane](#) as if casting a shadow from a specified light source.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void CreateShadow (  
    ref Vector3 lightDirection,  
    ref Plane plane,  
    out Matrix result  
)
```

Parameters

lightDirection

A [Vector3](#) specifying the direction from which the light that will cast the shadow is coming.

plane

The [Plane](#) onto which the new matrix should flatten geometry so as to cast a shadow.

result

[[OutAttribute](#)] A [Matrix](#) that can be used to flatten geometry onto the specified plane from the specified direction.

Matrix.CreateWorld Method (Vector3, Vector3, Vector3)

Creates a world matrix with the specified parameters.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Matrix CreateWorld (  
    Vector3 position,  
    Vector3 forward,  
    Vector3 up  
)
```

Parameters

position

Position of the object. This value is used in translation operations.

forward

Forward direction of the object.

up

Upward direction of the object; usually [0, 1, 0].

Return Value

The created world matrix.

Remarks

This matrix includes rotation and translation, but not scaling.

Matrix.Decompose Method

Extracts the scalar, translation, and rotation components from a 3D scale/rotate/translate (SRT) [Matrix](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Decompose (  
    out Vector3 scale,  
    out Quaternion rotation,  
    out Vector3 translation  
)
```

Parameters

scale

[[OutAttribute](#)] The scalar component of the transform matrix, expressed as a [Vector3](#).

rotation

[[OutAttribute](#)] The rotation component of the transform matrix, expressed as a [Quaternion](#).

translation

[[OutAttribute](#)] The translation component of the transform matrix, expressed as a [Vector3](#).

Return Value

true if the [Matrix](#) can be decomposed; **false** otherwise.

Example The following example illustrates how to recombine the matrix from the extracted components.

```
Matrix m = Matrix.CreateScale(scale) *  
            Matrix.CreateFromQuaternion(rotation) *  
            Matrix.CreateTranslation(translation);
```

Matrix.op_Multiply Method (Matrix, Single)

Multiplies a matrix by a scalar value.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Matrix op_Multiply (  
    Matrix matrix,  
    float scaleFactor  
)
```

Parameters

matrix

Source matrix.

scaleFactor

Scalar value.

Return Value

Result of the multiplication.

Matrix.op_Multiply Method (Single, Matrix)

Multiplies a matrix by a scalar value.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Matrix op_Multiply (  
    float scaleFactor,  
    Matrix matrix  
)
```

Parameters

scaleFactor

Scalar value.

matrix

Source matrix.

Return Value

Result of the multiplication.

Matrix.op_Subtraction Method

Subtracts matrices.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Matrix op_Subtraction (  
    Matrix matrix1,  
    Matrix matrix2  
)
```

Parameters

matrix1

Source matrix.

matrix2

Source matrix.

Return Value

Result of the subtraction.

Matrix.op_UnaryNegation Method

Negates individual elements of a matrix.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Matrix op_UnaryNegation (  
    Matrix matrix1  
)
```

Parameters

matrix1

Source matrix.

Return Value

Negated matrix.

[Microsoft.Xna.Framework Namespace](#)

Matrix.Backward Property

Gets and sets the backward vector of the [Matrix](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 Backward { get; set; }
```

Property Value

The backward vector of the [Matrix](#).

The default value is composed of the current values for the matrix elements in the third row: [M31](#), [M32](#), and [M33](#).

Matrix.Forward Property

Gets and sets the forward vector of the [Matrix](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 Forward { get; set; }
```

Property Value

The forward vector of the [Matrix](#).

See Also

Reference

[Matrix Structure](#)

[Matrix Members](#)

[Microsoft.Xna.Framework Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Matrix.Identity Property

Returns an instance of the identity matrix.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Matrix Identity { get; }
```

Property Value

The identity matrix.

Remarks

Except for the main diagonal, whose elements are all ones, the identity matrix is a square matrix composed of zeros. Unlike all other matrix multiplications, the multiplication between an identity matrix and another matrix is commutative.

This is useful for initializing a matrix to a known value before you perform additional operations, such as a transformation.

Note

Multiplying a matrix with its inverse results in an identity matrix.

Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework.Game (in microsoft.xna.framework.game.dll)

Syntax

C#

```
public NoSuitableGraphicsDeviceException (  
    string message,  
    Exception inner  
)
```

Parameters

message

A message that describes the error.

inner

The exception that is the cause of the current exception. If the *inner* parameter is not a null reference, the current exception is raised in a catch block that handles the inner exception.

Plane Structure

Defines a plane.

Namespace: Microsoft.Xna.Framework

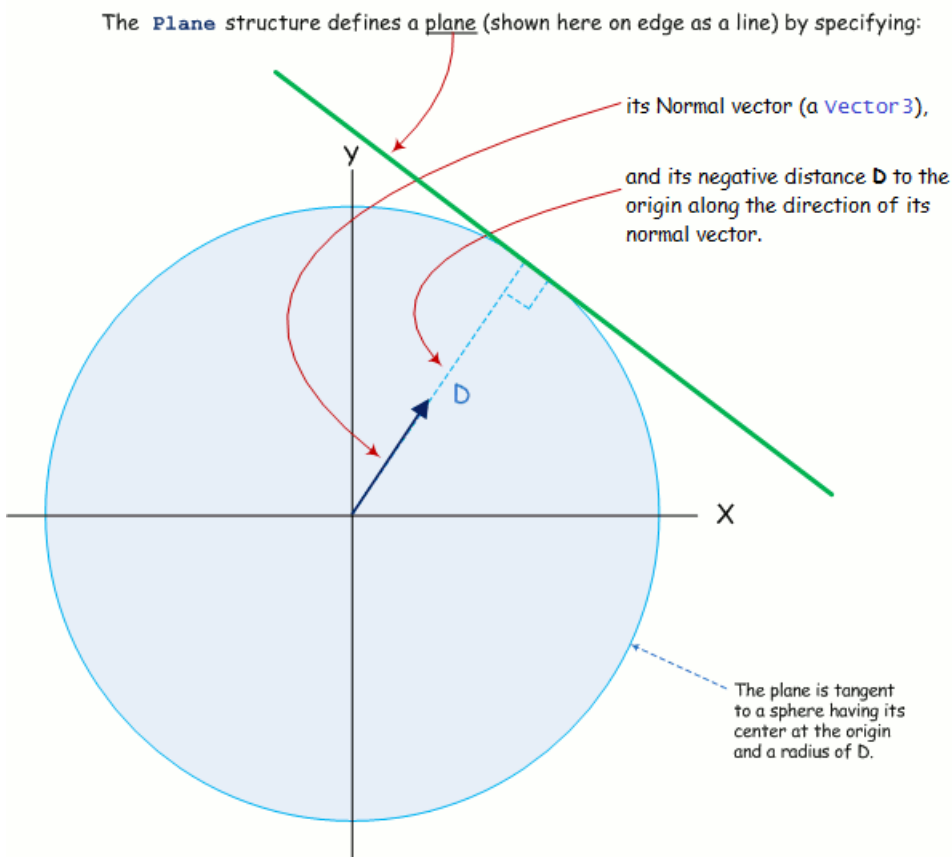

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

```
C#
[TypeConverterAttribute("typeof(Microsoft.Xna.Framework.Design.PlaneConverter)")]
[SerializableAttribute]
public struct Plane : IEquatable<Plane>
```

Remarks

The [Plane](#) structure represents a plane using a 3D vector normal and a distance value (stored as a negative value), as the following figure shows.

Plane Members

The following tables list the members exposed by the Plane type.

Public Constructors

	Name	Description
	Plane	Overloaded. Creates an instance of Plane .

Public Fields

	Name	Description
	D	The distance of the Plane along its normal from the origin.
	Normal	The normal vector of the Plane .

Public Methods

	Name	Description
	Dot	Overloaded. Calculates the dot product of a specified Vector4 and this Plane .
	DotCoordinate	Overloaded. Returns the dot product of a specified Vector3 and the Normal vector of this Plane plus the D constant value of the Plane .
	DotNormal	Overloaded. Returns the dot product of a specified Vector3 and the Normal vector of this Plane .
	Equals	Overloaded. Determines whether two instances of Plane are equal.
	GetHashCode	Gets the hash code for this object.
	GetType	(Inherited from Object .)
	Intersects	Overloaded. Checks whether a Plane intersects a bounding volume.
	Normalize	Overloaded. Changes the coefficients of the Normal vector of a Plane to make it of unit length.
	op_Equality	Determines whether two instances of Plane are equal.
	op_Inequality	Determines whether two instances of Plane are not equal.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a String that represents the current Plane .
	Transform	Overloaded. Transforms a normalized Plane by a Matrix or Quaternion .

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Plane (  
    float a,  
    float b,  
    float c,  
    float d  
)
```

Parameters

a

X component of the normal defining the [Plane](#).

b

Y component of the normal defining the [Plane](#).

c

Z component of the normal defining the [Plane](#).

d

Distance of the [Plane](#) along its normal from the origin.

Plane.DotNormal Method (Vector3)

Returns the dot product of a specified [Vector3](#) and the [Normal](#) vector of this [Plane](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float DotNormal (  
    Vector3 value  
)
```

Parameters

value

The [Vector3](#) to multiply by.

Return Value

The resulting dot product.

Plane.Equals Method (Object)

Determines whether the specified [Object](#) is equal to the [Plane](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [Object](#) to compare with the current [Plane](#).

Return Value

true if the specified [Object](#) is equal to the current [Plane](#); **false** otherwise.

Checks whether the current [Plane](#) intersects a specified [BoundingFrustum](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public PlaneIntersectionType Intersects (  
    BoundingFrustum frustum  
)
```

Parameters

frustum

The [BoundingFrustum](#) to check for intersection with.

Return Value

An enumeration indicating the relationship between the [Plane](#) and the [BoundingFrustum](#).

Exceptions

Exception type	Condition
ArgumentNullException	<i>frustum</i> is null .

Plane.op_Equality Method

Determines whether two instances of [Plane](#) are equal.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Plane lhs,  
    Plane rhs  
)
```

Parameters

lhs

The object to the left of the equality operator.

rhs

The object to the right of the equality operator.

Return Value

true if *left* is equal to *right*; **false** otherwise.

Plane.Transform Method (Plane, Matrix)

Transforms a normalized [Plane](#) by a [Matrix](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Plane Transform (  
    Plane plane,  
    Matrix matrix  
)
```

Parameters

plane

The normalized [Plane](#) to transform. This `Plane` must already be normalized, so that its [Normal](#) vector is of unit length, before this method is called.

matrix

The transform [Matrix](#) to apply to the [Plane](#).

Return Value

A new [Plane](#) that results from applying the transform.

PowerStatus Members

The following tables list the members exposed by the PowerStatus type.

Public Properties

	Name	Description
	BatteryChargeStatus	Gets the BatteryChargeStatus associated with the system.
	BatteryFullLifetime	Gets the full charge lifetime of the primary battery power source.
	BatteryLifePercent	Gets the approximate percentage of full battery time remaining.
	BatteryLifeRemaining	Gets the approximate battery life remaining.
	PowerLineStatus	Gets the PowerLineStatus associated with the system.

Public Methods

	Name	Description
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Public Events

	Name	Description
	PowerStateChanged	Raised when the power state changes.

PowerStatus.BatteryChargeStatus Property

Gets the [BatteryChargeStatus](#) associated with the system.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static BatteryChargeStatus BatteryChargeStatus { get; }
```

Property Value

The [BatteryChargeStatus](#) associated with the system.

[Microsoft.Xna.Framework Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

PowerStatus.BatteryFullLifetime Property

Gets the full charge lifetime of the primary battery power source.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Nullable<TimeSpan> BatteryFullLifetime { get; }
```

Property Value

The full charge lifetime of the primary battery power source.

Remarks Returns the reported number of seconds of battery life available when the battery is fully charged. Returns -1 if the battery life is unknown.

PowerStatus.BatteryLifePercent Property

Gets the approximate percentage of full battery time remaining.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Nullable<float> BatteryLifePercent { get; }
```

Property Value

Approximate percentage of full battery time remaining.

Remarks Returns the approximate percentage, from 0 to 100, of full battery time remaining. Returns 255 if the percentage is unknown.

Quaternion Structure

Defines a four-dimensional vector (x,y,z,w), which is used to efficiently rotate an object about the (x, y, z) vector by the angle theta, where $w = \cos(\text{theta}/2)$.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[TypeConverterAttribute("typeof(Microsoft.Xna.Framework.Design.QuaternionConverter)")]
[SerializableAttribute]
public struct Quaternion : IEquatable<Quaternion>
```

Remarks Quaternions represent a rotation. Typically, they are used for smooth interpolation between two angles, and for avoiding the gimbal lock problem that can occur with euler angles.

Quaternion Members

The following tables list the members exposed by the Quaternion type.

Public Constructors

	Name	Description
	Quaternion	Overloaded. Initializes a new instance of Quaternion .

Public Fields

	Name	Description
	W	Specifies the rotation component of the quaternion.
	X	Specifies the x-value of the vector component of the quaternion.
	Y	Specifies the y-value of the vector component of the quaternion.
	Z	Specifies the z-value of the vector component of the quaternion.

Public Properties

	Name	Description
	Identity	Returns a Quaternion representing no rotation.

Public Methods

	Name	Description
	Add	Overloaded. Adds two Quaternions .
	Concatenate	Overloaded. Concatenates two Quaternions ; the result represents the first rotation followed by the second rotation.
	Conjugate	Overloaded. Calculates the conjugate of a Quaternion .
	CreateFromAxisAngle	Overloaded. Creates a Quaternion from a vector and an angle to rotate about the vector.
	CreateFromRotationMatrix	Overloaded. Creates a Quaternion from a rotation Matrix .
	CreateFromYawPitchRoll	Overloaded. Creates a new Quaternion from specified yaw, pitch, and roll angles.
	Divide	Overloaded. Divides a Quaternion by another Quaternion .
	Dot	Overloaded. Calculates the dot product of two Quaternions .
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Get the hash code of this object.
	GetType	(Inherited from Object .)
	Inverse	Overloaded. Returns the inverse of a Quaternion .
	Length	Calculates the length of a Quaternion .
	LengthSquared	Calculates the length squared of a Quaternion .
	Lerp	Overloaded. Linearly interpolates between two quaternions.
	Multiply	Overloaded. Multiplies a quaternion by a scalar or another quaternion.
	Negate	Overloaded. Flips the sign of each component of the quaternion.
	Normalize	Overloaded. Divides each component of a quaternion by the length of the quaternion.
	op_Addition	Adds two Quaternions .
	op_Division	Divides a Quaternion by another Quaternion .
	op_Equality	Compares two Quaternions for equality.
	op_Inequality	Compare two Quaternions for inequality.
	op_Multiply	Overloaded. Multiplies a quaternion by a scalar or another quaternion.

 op_Subtraction	Subtracts a quaternion from another quaternion.
 op_UnaryNegation	Flips the sign of each component of the quaternion.
 ReferenceEquals	(Inherited from Object .)
 Slerp	Overloaded. Interpolates between two quaternions, using spherical linear interpolation.
 Subtract	Overloaded. Subtracts a quaternion from another quaternion.
 ToString	Retireves a string representation of the current object.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Quaternion CreateFromYawPitchRoll (  
    float yaw,  
    float pitch,  
    float roll  
)
```

Parameters

yaw

The yaw angle, in radians, around the y-axis.

pitch

The pitch angle, in radians, around the x-axis.

roll

The roll angle, in radians, around the z-axis.

Return Value

A new [Quaternion](#) expressing the specified yaw, pitch, and roll angles.

Quaternion.CreateFromYawPitchRoll Method (Single, Single, Single, Quaternion)

Creates a new [Quaternion](#) from specified yaw, pitch, and roll angles.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void CreateFromYawPitchRoll (  
    float yaw,  
    float pitch,  
    float roll,  
    out Quaternion result  
)
```

Parameters

yaw

The yaw angle, in radians, around the y-axis.

pitch

The pitch angle, in radians, around the x-axis.

roll

The roll angle, in radians, around the z-axis.

result

[[OutAttribute](#)] An existing [Quaternion](#) filled in to express the specified yaw, pitch, and roll angles.

Ray Members

The following tables list the members exposed by the Ray type.

Public Constructors

	Name	Description
	Ray	Creates a new instance of Ray .

Public Fields

	Name	Description
	Direction	Unit vector specifying the direction the Ray is pointing.
	Position	Specifies the starting point of the Ray .

Public Methods

	Name	Description
	Equals	Overloaded. Determines whether two instances of Ray are equal.
	GetHashCode	Gets the hash code for this instance.
	GetType	(Inherited from Object .)
	Intersects	Overloaded. Checks whether the Ray intersects a specified plane or bounding volume.
	Op_Equality	Determines whether two instances of Ray are equal.
	Op_Inequality	Determines whether two instances of Ray are not equal.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a String that represents the current Ray .

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Determines whether two instances of [Ray](#) are equal.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [Object](#) to compare with the current [Ray](#).

Return Value

true if the specified [Object](#) is equal to the current [Ray](#); **false** otherwise.

Ray.Intersects Method (BoundingBox)

Checks whether the [Ray](#) intersects a specified [BoundingBox](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Nullable<float> Intersects (  
    BoundingBox box  
)
```

Parameters

box

The [BoundingBox](#) to check for intersection with the [Ray](#).

Return Value

Distance at which the ray intersects the [BoundingBox](#) or **null** if there is no intersection.

Ray.Intersects Method (BoundingBox, Nullable<Single>)

Checks whether the current [Ray](#) intersects a [BoundingBox](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Intersects (  
    ref BoundingBox box,  
    out Nullable<float> result  
)
```

Parameters

box

The [BoundingBox](#) to check for intersection with.

result

[[OutAttribute](#)] Distance at which the ray intersects the [BoundingBox](#) or **null** if there is no intersection.

See Also

Ray.Intersects Method (BoundingFrustum)

Checks whether the [Ray](#) intersects a specified [BoundingFrustum](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Nullable<float> Intersects (  
    BoundingFrustum frustum  
)
```

Parameters

frustum

The [BoundingFrustum](#) to check for intersection with the [Ray](#).

Return Value

Distance at which the ray intersects the [BoundingFrustum](#) or **null** if there is no intersection.

Exceptions

Exception type	Condition
ArgumentNullException	<i>frustum</i> is null .

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Nullable<float> Intersects (  
    Plane plane  
)
```

Parameters

plane

The [Plane](#) with which to calculate this [Ray](#)'s intersection.

Return Value

The distance at which this [Ray](#) intersects the specified [Plane](#), or **null** if there is no intersection.

Ray.op_Equality Method

Determines whether two instances of [Ray](#) are equal.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Ray a,  
    Ray b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if *left* is equal to *right*; **false** otherwise.

Ray.op_Inequality Method

Determines whether two instances of [Ray](#) are not equal.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    Ray a,  
    Ray b  
)
```

Parameters

a

The object to the left of the inequality operator.

b

The object to the right of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

Rectangle Members

The following tables list the members exposed by the Rectangle type.

Public Constructors

	Name	Description
	Rectangle	Initializes a new instance of Rectangle .

Public Fields

	Name	Description
	Height	Specifies the height of the rectangle.
	Width	Specifies the width of the rectangle.
	X	Specifies the x-coordinate of the rectangle.
	Y	Specifies the y-coordinate of the rectangle.

Public Properties

	Name	Description
	Bottom	Returns the y-coordinate of the bottom of the rectangle.
	Center	Gets the Point that specifies the center of the rectangle.
	Empty	Returns a Rectangle with all of its values set to zero.
	IsEmpty	Gets a value that indicates whether the Rectangle is empty.
	Left	Returns the x-coordinate of the left side of the rectangle.
	Location	Gets or sets the upper-left value of the Rectangle .
	Right	Returns the x-coordinate of the right side of the rectangle.
	Top	Returns the y-coordinate of the top of the rectangle.

Public Methods

	Name	Description
	Contains	Overloaded. Determines whether this Rectangle contains a specified point or Rectangle .
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code for this object.
	GetType	(Inherited from Object .)
	Inflate	Pushes the edges of the Rectangle out by the horizontal and vertical values specified.
	Intersect	Overloaded. Creates a Rectangle defining the area where one rectangle overlaps another rectangle.
	Intersects	Overloaded. Determines whether a specified Rectangle intersects with this Rectangle .
	Offset	Overloaded. Changes the position of the Rectangle .
	Op_Equality	Compares two rectangles for equality.
	Op_Inequality	Compares two rectangles for inequality.
	ReferenceEquals	(Inherited from Object .)
	ToString	Retrieves a string representation of the current object.
	Union	Overloaded. Creates a new Rectangle that exactly contains two other rectangles.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Initializes a new instance of [Rectangle](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Rectangle (  
    int x,  
    int y,  
    int width,  
    int height  
)
```

Parameters

x

The x-coordinate of the rectangle.

y

The y-coordinate of the rectangle.

width

Width of the rectangle.

height

Height of the rectangle.

Rectangle.Contains Method (Int32, Int32)

Determines whether this [Rectangle](#) contains a specified point represented by its x- and y-coordinates.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Contains (  
    int x,  
    int y  
)
```

Parameters

x

The x-coordinate of the specified point.

y

The y-coordinate of the specified point.

Return Value

true if the specified point is contained within this [Rectangle](#); **false** otherwise.

Rectangle.Contains Method (Point)

Determines whether this [Rectangle](#) contains a specified [Point](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Contains (  
    Point value  
)
```

Parameters

value

The [Point](#) to evaluate.

Return Value

true if the specified [Point](#) is contained within this [Rectangle](#); **false** otherwise.

Rectangle.Contains Method (Rectangle, Boolean)

Determines whether this [Rectangle](#) entirely contains a specified [Rectangle](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Contains (  
    ref Rectangle value,  
    out bool result  
)
```

Parameters

value

The [Rectangle](#) to evaluate.

result

[[OutAttribute](#)] On exit, is **true** if this [Rectangle](#) entirely contains the specified [Rectangle](#), or **false** if not.

[Microsoft.Xna.Framework Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Rectangle.Inflate Method

Pushes the edges of the [Rectangle](#) out by the horizontal and vertical values specified.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Inflate (  
    int horizontalAmount,  
    int verticalAmount  
)
```

Parameters

horizontalAmount

Value to push the sides out by.

verticalAmount

Value to push the top and bottom out by.

Remarks

Each corner of the [Rectangle](#) is pushed away from the center of the rectangle by the specified amounts. This results in the width and height of the [Rectangle](#) increasing by twice the values provided.

Syntax

C#

```
public static Rectangle Intersect (  
    Rectangle value1,  
    Rectangle value2  
)
```

Parameters

value1

The first [Rectangle](#) to compare.

value2

The second [Rectangle](#) to compare.

Return Value

The area where the two parameters overlap.

Remarks

If the two rectangles do not overlap, the resulting [Rectangle](#) will be empty.

Rectangle.Intersect Method (Rectangle, Rectangle, Rectangle)

Creates a [Rectangle](#) defining the area where one rectangle overlaps with another rectangle.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Intersect (  
    ref Rectangle value1,  
    ref Rectangle value2,  
    out Rectangle result  
)
```

Parameters

value1

The first [Rectangle](#) to compare.

value2

The second [Rectangle](#) to compare.

result

[[OutAttribute](#)] The area where the two first parameters overlap.

Remarks

If the two rectangles do not overlap, the resulting [Rectangle](#) will be empty.

Rectangle.Intersects Method (Rectangle)

Determines whether a specified [Rectangle](#) intersects with this [Rectangle](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Intersects (  
    Rectangle value  
)
```

Parameters

value

The [Rectangle](#) to evaluate.

Return Value

true if the specified [Rectangle](#) intersects with this one; **false** otherwise.

Rectangle.op_Equality Method

Compares two rectangles for equality.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Rectangle a,  
    Rectangle b  
)
```

Parameters

a
Source rectangle.

b
Source rectangle.

Return Value

true if the rectangles are equal; **false** otherwise.

Rectangle.op_Inequality Method

Compares two rectangles for inequality.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    Rectangle a,  
    Rectangle b  
)
```

Parameters

a

Source rectangle.

b

Source rectangle.

Return Value

true if the rectangles are not equal; **false** otherwise.

Rectangle Properties

Public Properties

	Name	Description
	Bottom	Returns the y-coordinate of the bottom of the rectangle.
	Center	Gets the Point that specifies the center of the rectangle.
 S	Empty	Returns a Rectangle with all of its values set to zero.
	IsEmpty	Gets a value that indicates whether the Rectangle is empty.
	Left	Returns the x-coordinate of the left side of the rectangle.
	Location	Gets or sets the upper-left value of the Rectangle .
	Right	Returns the x-coordinate of the right side of the rectangle.
	Top	Returns the y-coordinate of the top of the rectangle.

Rectangle.IsEmpty Property

Gets a value that indicates whether the [Rectangle](#) is empty.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsEmpty { get; }
```

Property Value

true if the rectangle is empty, otherwise **false**.

Remarks

An empty rectangle has all its values set to 0.

Vector2 Members

The following tables list the members exposed by the Vector2 type.

Public Constructors

	Name	Description
	Vector2	Overloaded. Initializes a new instance of Vector2 .

Public Fields

	Name	Description
	X	Gets or sets the x-component of the vector.
	Y	Gets or sets the y-component of the vector.

Public Properties

	Name	Description
	One	Returns a Vector2 with both of its components set to one.
	UnitX	Returns the unit vector for the x-axis.
	UnitY	Returns the unit vector for the y-axis.
	Zero	Returns a Vector2 with all of its components set to zero.

Public Methods

	Name	Description
	Add	Overloaded. Adds two vectors.
	Barycentric	Overloaded. Returns a Vector2 containing the 2D Cartesian coordinates of a point specified in 2D barycentric (areal) coordinates.
	CatmullRom	Overloaded. Performs a Catmull-Rom interpolation using the specified positions.
	Clamp	Overloaded. Restricts a value to be within a specified range.
	Distance	Overloaded. Calculates the distance between two vectors.
	DistanceSquared	Overloaded. Calculates the distance between two vectors squared.
	Divide	Overloaded. Divides a vector by a scalar or another vector.
	Dot	Overloaded. Calculates the dot product of two vectors. If the two vectors are unit vectors, the dot product returns a floating point value between -1 and 1 that can be used to determine some properties of the angle between two vectors. For example, it can show whether the vectors are orthogonal, parallel, or have an acute or obtuse angle between them.
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code of the vector object.
	GetType	(Inherited from Object .)
	Hermite	Overloaded. Performs a Hermite spline interpolation.
	Length	Calculates the length of the vector.
	LengthSquared	Calculates the length of the vector squared.
	Lerp	Overloaded. Performs a linear interpolation between two vectors.

 Max	Overloaded. Returns a vector that contains the highest value from each matching pair of components.
 Min	Overloaded. Returns a vector that contains the lowest value from each matching pair of components.
 Multiply	Overloaded. Multiplies a vector by a scalar or another vector.
 Negate	Overloaded. Returns a vector pointing in the opposite direction.
 Normalize	Overloaded. Creates a unit vector from the specified vector. The result is a vector one unit in length pointing in the same direction as the original vector.
 op_Addition	Adds two vectors.
 op_Division	Overloaded. Divide a vector by a scalar or another vector.
 op_Equality	Tests vectors for equality.
 op_Inequality	Tests vectors for inequality.
 op_Multiply	Overloaded. Multiplies a vector by a scalar or another vector.
 op_Subtraction	Subtracts a vector from a vector.
 op_UnaryNegation	Returns a vector pointing in the opposite direction.
 ReferenceEquals	(Inherited from Object .)
 Reflect	Overloaded. Determines the reflect vector of the given vector and normal.
 SmoothStep	Overloaded. Interpolates between two values using a cubic equation.
 Subtract	Overloaded. Subtracts a vector from a vector.
 ToString	Retrieves a string representation of the current object.
 Transform	Overloaded. Transforms one or more Vector2s by a Matrix or Quaternion .
 TransformNormal	Overloaded. Transforms a vector normal or array of vector normals by a matrix.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Vector2.Barycentric Method (Vector2, Vector2, Vector2, Single, Single)

Returns a [Vector2](#) containing the 2D Cartesian coordinates of a point specified in barycentric (areal) coordinates relative to a 2D triangle.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector2 Barycentric (
    Vector2 value1,
    Vector2 value2,
    Vector2 value3,
    float amount1,
    float amount2
)
```

Parameters

value1

A [Vector2](#) containing the 2D Cartesian coordinates of vertex 1 of the triangle.

value2

A [Vector2](#) containing the 2D Cartesian coordinates of vertex 2 of the triangle.

value3

A [Vector2](#) containing the 2D Cartesian coordinates of vertex 3 of the triangle.

amount1

Barycentric coordinate **b2**, which expresses the weighting factor toward vertex 2 (specified in *value2*).

amount2

Barycentric coordinate **b3**, which expresses the weighting factor toward vertex 3 (specified in *value3*).

Return Value

A new [Vector2](#) containing the 2D Cartesian coordinates of the specified point.

Remarks

About Barycentric Coordinates

Given a triangle with vertices **V1**, **V2**, and **V3**, any point **P** on the plane of that triangle can be specified by three weighting factors **b1**, **b2**, and **b3**, each of which indicates how much relative influence the corresponding triangle vertex contributes to the location of the point, as specified in the following formulas.

$$P_x = (b_1 * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x});$$

$$P_y = (b_1 * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y});$$

Such triple weighting factors **b1**, **b2**, and **b3** are called *barycentric coordinates*.

Barycentric coordinates express relative weights, meaning that **(k * b1)**, **(k * b2)**, and **(k * b3)** are also coordinates of the same point as **b1**, **b2**, and **b3** for any positive value of **k**.

If a set of barycentric coordinates is normalized so that **b1 + b2 + b3 = 1**, the resulting coordinates are unique for the point in question, and are known as *areal* coordinates. When normalized in this way, only two coordinates are needed, say **b2** and **b3**, since **b1** equals **(1 - b2 - b3)**.

What Vector2 Barycentric Does

The **Vector2 Barycentric** method takes three vectors specifying the Cartesian coordinates of the triangle vertices, **V1**, **V2**, and **V3**, and two areal coordinates **b2** and **b3** of some point **P** (**b2** is the *amount1* argument, and **b3** is the *amount2* argument). The **b2** coordinate relates to vertex **V2**, and the **b3** coordinate relates to **V3**.

Barycentric then calculates the Cartesian coordinate of **P** as follows:

$$P_x = ((1 - b_2 - b_3) * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}) ;$$

$$P_y = ((1 - b_2 - b_3) * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}) ;$$

Thus, to calculate the 2D Cartesian coordinates of **P**, you would pass the coordinates of the triangle vertices to **Barycentric** together with the appropriate normalized barycentric coordinates of **P**.

The following relationships may be useful.

- If (*amount1* <= 0) and (*amount2* >= 0) and ($1 - \text{amount1} - \text{amount2} >= 0$), then the point is inside the triangle defined by *value1*, *value2*, and *value3*.
- If (*amount1* == 0) and (*amount2* >= 0) and ($1 - \text{amount1} - \text{amount2} >= 0$), then the point is on the line defined by *value1* and *value3*.
- If (*amount1* >= 0) and (*amount2* == 0) and ($1 - \text{amount1} - \text{amount2} >= 0$), then the point is on the line defined by *value1* and *value2*.
- If (*amount1* >= 0) and (*amount2* >= 0) and ($1 - \text{amount1} - \text{amount2} == 0$), then the point is on the line defined by *value2* and *value3*.

Barycentric coordinates are a form of general coordinates. In this context, using barycentric coordinates represents a change in coordinate systems. What holds true for Cartesian coordinates holds true for barycentric coordinates.

Vector2.Barycentric Method (Vector2, Vector2, Vector2, Single, Single, Vector2)

Returns a [Vector2](#) containing the 2D Cartesian coordinates of a point specified in barycentric (areal) coordinates relative to a 2D triangle.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Barycentric (
    ref Vector2 value1,
    ref Vector2 value2,
    ref Vector2 value3,
    float amount1,
    float amount2,
    out Vector2 result
)
```

Parameters

value1

A [Vector2](#) containing the 2D Cartesian coordinates of vertex 1 of the triangle.

value2

A [Vector2](#) containing the 2D Cartesian coordinates of vertex 2 of the triangle.

value3

A [Vector2](#) containing the 2D Cartesian coordinates of vertex 3 of the triangle.

amount1

Barycentric coordinate **b2**, which expresses the weighting factor toward vertex 2 (specified in *value2*).

amount2

Barycentric coordinate **b3**, which expresses the weighting factor toward vertex 3 (specified in *value3*).

result

[[OutAttribute](#)] The 2D Cartesian coordinates of the specified point are placed in this [Vector2](#) on exit.

Remarks

About Barycentric Coordinates

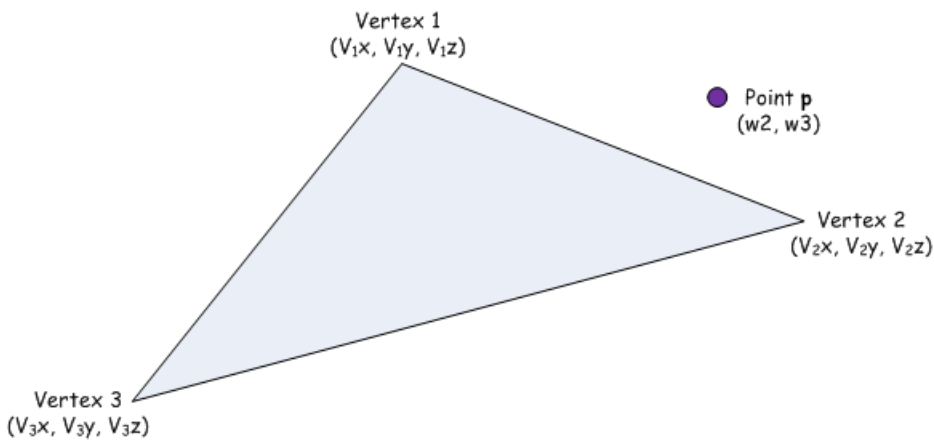

Given a triangle with vertices **V1**, **V2**, and **V3**, any point **P** on the plane of that triangle can be specified by three weighting factors **b1**, **b2**, and **b3**, each of which indicates how much relative influence the corresponding triangle vertex contributes to the location of the point, as specified in the following formulas.

$$\begin{aligned} P_x &= (b_1 * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}); \\ P_y &= (b_1 * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}); \end{aligned}$$

Such triple weighting factors **b1**, **b2**, and **b3** are called *barycentric coordinates*.

Barycentric coordinates express relative weights, meaning that **(k * b1)**, **(k * b2)**, and **(k * b3)** are also coordinates of the same point as **b1**, **b2**, and **b3** for any positive value of **k**.

If a set of barycentric coordinates is normalized so that **b1 + b2 + b3 = 1**, the resulting coordinates are unique for the point in question, and are known as *areal* coordinates. When normalized in this way, only two coordinates are needed, say **b2** and **b3**, since **b1** equals **(1 - b2 - b3)**.

What Vector2 Barycentric Does

The **Vector2 Barycentric** method takes three vectors specifying the Cartesian coordinates of the triangle vertices, **V1**, **V2**, and **V3**, and two areal coordinates **b2** and **b3** of some point **P** (**b2** is the *amount1* argument, and **b3** is the *amount2* argument). The **b2** coordinate relates to vertex **V2**, and the **b3** coordinate relates to **V3**.

Barycentric then calculates the Cartesian coordinate of **P** as follows:

$$P_x = ((1 - b_2 - b_3) * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}) ;$$

$$P_y = ((1 - b_2 - b_3) * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}) ;$$

Thus, to calculate the 2D Cartesian coordinates of **P**, you would pass the coordinates of the triangle vertices to **Barycentric** together with the appropriate normalized barycentric coordinates of **P**.

The following relationships may be useful.

- If (*amount1* <= 0) and (*amount2* >= 0) and ($1 - \text{amount1} - \text{amount2} >= 0$), then the point is inside the triangle defined by *value1*, *value2*, and *value3*.
- If (*amount1* == 0) and (*amount2* >= 0) and ($1 - \text{amount1} - \text{amount2} >= 0$), then the point is on the line defined by *value1* and *value3*.
- If (*amount1* >= 0) and (*amount2* == 0) and ($1 - \text{amount1} - \text{amount2} >= 0$), then the point is on the line defined by *value1* and *value2*.
- If (*amount1* >= 0) and (*amount2* >= 0) and ($1 - \text{amount1} - \text{amount2} == 0$), then the point is on the line defined by *value2* and *value3*.

Barycentric coordinates are a form of general coordinates. In this context, using barycentric coordinates represents a change in coordinate systems. What holds true for Cartesian coordinates holds true for barycentric coordinates.

Vector2.DistanceSquared Method (Vector2, Vector2)

Calculates the distance between two vectors squared.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static float DistanceSquared (  
    Vector2 value1,  
    Vector2 value2  
)
```

Parameters

value1

Source vector.

value2

Source vector.

Return Value

The distance between the source vectors squared.

Remarks

Distance is calculated with the formula:

$$\sqrt{(a - b)^2}$$

Distance squared is the value before taking the square root. Distance squared can often be used in place of distance if relative comparisons are being made. For example, consider three points A, B, and C. To determine whether B or C is further from A, compare the distance between A and B to the distance between A and C. Calculating the two distances involves two square roots, which are computationally expensive. However, using distance squared provides the same information and avoids calculating two square roots.

Vector2.Dot Method

Calculates the dot product of two vectors. If the two vectors are unit vectors, the dot product returns a floating point value between -1 and 1 that can be used to determine some properties of the angle between two vectors. For example, it can show whether the vectors are orthogonal, parallel, or have an acute or obtuse angle between them.

Overload List

Name	Description
Vector2.Dot (Vector2, Vector2)	Calculates the dot product of two vectors. If the two vectors are unit vectors, the dot product returns a floating point value between -1 and 1 that can be used to determine some properties of the angle between two vectors. For example, it can show whether the vectors are orthogonal, parallel, or have an acute or obtuse angle between them.
Vector2.Dot (Vector2, Vector2, Single)	Calculates the dot product of two vectors and writes the result to a user-specified variable. If the two vectors are unit vectors, the dot product returns a floating point value between -1 and 1 that can be used to determine some properties of the angle between two vectors. For example, it can show whether the vectors are orthogonal, parallel, or have an acute or obtuse angle between them.

Remarks

The dot product is also known as the inner product.

For any two vectors, the dot product is defined as:

$$(\text{vector1.X} * \text{vector2.X}) + (\text{vector1.Y} * \text{vector2.Y})$$

The result of this calculation, plus or minus some margin to account for floating point error, is equal to:

$$\text{Length}(\text{vector1}) * \text{Length}(\text{vector2}) * \text{System.Math.Cos}(\text{theta})$$

Here, *theta* is the angle between the two vectors.

If *vector1* and *vector2* are unit vectors, the length of each vector will be equal to 1. So, when *vector1* and *vector2* are unit vectors, the dot product is simply equal to the cosine of the angle between the two vectors. The following calculation:

$$\text{Vector2.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}())$$

Is equivalent to:

$$\text{System.Math.Cos}(\text{theta})$$

Therefore, if *vector1* and *vector2* are unit vectors (i.e., we've called [Normalize](#) on each vector to make it a unit vector), without knowing the value of *theta* or using a potentially processor-intensive trigonometric function, the dot product can tell us the following things:

- If $\text{Vector2.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}()) > 0$, the angle between the two vectors is less than 90 degrees.
- If $\text{Vector2.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}()) < 0$, the angle between the two vectors is more than 90 degrees.
- If $\text{Vector2.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}()) == 0$, the angle between the two vectors is 90 degrees; that is, the vectors are orthogonal.
- If $\text{Vector2.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}()) == 1$, the angle between the two vectors is 0 degrees; that is, the vectors point in the same direction and are parallel.
- If $\text{Vector2.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}()) == -1$, the angle between the two vectors is 180 degrees; that is, the vectors point in opposite directions and are parallel.

⚠Caution

Because of floating point error, two orthogonal vectors may not return a dot product that is exactly zero. It might be zero plus some amount of floating point error. In your code, you will want to determine what amount of error is acceptable in your calculation, and take that into account when you do your comparisons.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static float Dot (
    Vector2 value1,
    Vector2 value2
)
```

Parameters

value1

Source vector.

value2

Source vector.

Return Value

The dot product of the two vectors.

Remarks

The dot product is also known as the inner product.

For any two vectors, the dot product is defined as:

$$(\text{vector1.X} * \text{vector2.X}) + (\text{vector1.Y} * \text{vector2.Y})$$

The result of this calculation, plus or minus some margin to account for floating point error, is equal to:

$$\text{Length}(\text{vector1}) * \text{Length}(\text{vector2}) * \text{System.Math.Cos}(\text{theta})$$

Here, *theta* is the angle between the two vectors.

If *vector1* and *vector2* are unit vectors, the length of each vector will be equal to 1. So, when *vector1* and *vector2* are unit vectors, the dot product is simply equal to the cosine of the angle between the two vectors. The following calculation:

```
Vector2.Dot( vector1.Normalize(), vector2.Normalize() )
```

Is equivalent to:

```
System.Math.Cos( theta )
```

Therefore, if *vector1* and *vector2* are unit vectors (i.e., we've called [Normalize](#) on each vector to make it a unit vector), without knowing the value of *theta* or using a potentially processor-intensive trigonometric function, the dot product can tell us the following things:

- If `Vector2.Dot(vector1.Normalize(), vector2.Normalize()) > 0`, the angle between the two vectors is less than 90 degrees.
- If `Vector2.Dot(vector1.Normalize(), vector2.Normalize()) < 0`, the angle between the two vectors is more than 90 degrees.
- If `Vector2.Dot(vector1.Normalize(), vector2.Normalize()) == 0`, the angle between the two vectors is 90 degrees; that is, the vectors are orthogonal.
- If `Vector2.Dot(vector1.Normalize(), vector2.Normalize()) == 1`, the angle between the two vectors is 0 degrees; that is, the vectors point in the same direction and are parallel.
- If `Vector2.Dot(vector1.Normalize(), vector2.Normalize()) == -1`, the angle between the two vectors is 180 degrees; that is, the vectors point in opposite directions and are parallel.

⚠ Caution

Because of floating point error, two orthogonal vectors may not return a dot product that is exactly zero. It might be zero plus some amount of floating point error. Vector2.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

Object to make the comparison with.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Vector2.Equals Method (Vector2)

Determines whether the specified [Object](#) is equal to the [Vector2](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    Vector2 other  
)
```

Parameters

other

The [Object](#) to compare with the current [Vector2](#).

Return Value

true if the specified [Object](#) is equal to the current [Vector2](#); **false** otherwise.

Vector2.Hermite Method (Vector2, Vector2, Vector2, Vector2, Single)

Performs a Hermite spline interpolation.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector2 Hermite (  
    Vector2 value1,  
    Vector2 tangent1,  
    Vector2 value2,  
    Vector2 tangent2,  
    float amount  
)
```

Parameters

value1

Source position vector.

tangent1

Source tangent vector.

value2

Source position vector.

tangent2

Source tangent vector.

amount

Weighting factor.

Return Value

The result of the Hermite spline interpolation.

Vector2.Hermite Method (Vector2, Vector2, Vector2, Vector2, Single, Vector2)

Performs a Hermite spline interpolation.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Hermite (  
    ref Vector2 value1,  
    ref Vector2 tangent1,  
    ref Vector2 value2,  
    ref Vector2 tangent2,  
    float amount,  
    out Vector2 result  
)
```

Parameters

value1

Source position vector.

tangent1

Source tangent vector.

value2

Source position vector.

tangent2

Source tangent vector.

amount

Weighting factor.

result

[[OutAttribute](#)] The result of the Hermite spline interpolation.

Vector2.Lerp Method (Vector2, Vector2, Single)

Performs a linear interpolation between two vectors.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector2 Lerp (  
    Vector2 value1,  
    Vector2 value2,  
    float amount  
)
```

Parameters

value1

Source vector.

value2

Source vector.

amount

Value between 0 and 1 indicating the weight of *value2*.

Return Value

The linear interpolation of the two vectors.

Remarks

This method performs the linear interpolation based on the following formula.

$$\text{value1} + (\text{value2} - \text{value1}) * \text{amount}$$

Passing *amount* a value of 0 will cause *value1* to be returned; a value of 1 will cause *value2* to be returned.

Vector2.op_Division Method (Vector2, Vector2)

Divides the components of a vector by the components of another vector.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector2 op_Division (  
    Vector2 value1,  
    Vector2 value2  
)
```

Parameters

value1

Source vector.

value2

Divisor vector.

Return Value

The result of dividing the vectors.

Remarks

Division of a vector by another vector is not mathematically defined. This method simply divides each component of *a* by the matching component of *b*.

Parameters

vector

Source vector.

normal

Normal of *vector*.

result

[[OutAttribute](#)] The created reflect vector.

Vector2.SmoothStep Method (Vector2, Vector2, Single)

Interpolates between two values using a cubic equation.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector2 SmoothStep (  
    Vector2 value1,  
    Vector2 value2,  
    float amount  
)
```

Parameters

value1

Source value.

value2

Source value.

amount

Weighting value.

Return Value

Interpolated value.

Vector2.SmoothStep Method (Vector2, Vector2, Single, Vector2)

Interpolates between two values using a cubic equation.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void SmoothStep (  
    ref Vector2 value1,  
    ref Vector2 value2,  
    float amount,  
    out Vector2 result  
)
```

Parameters

value1

Source value.

value2

Source value.

amount

Weighting value.

result

[[OutAttribute](#)] The interpolated value.

Vector2.Transform Method

Transforms one or more [Vector2](#)s by a [Matrix](#) or [Quaternion](#).

Overload List

Name	Description
Vector2.Transform (Vector2, Matrix)	Transforms the vector (x, y, 0, 1) by the specified matrix.
Vector2.Transform (Vector2, Matrix, Vector2)	Transforms a Vector2 by the given Matrix .
Vector2.Transform (Vector2, Quaternion)	Transforms a single Vector2 , or the vector normal (x, y, 0, 0), by a specified Quaternion rotation.
Vector2.Transform (Vector2, Quaternion, Vector2)	Transforms a Vector2 , or the vector normal (x, y, 0, 0), by a specified Quaternion rotation.
Vector2.Transform (Vector2[], Int32, Matrix, Vector2[], Int32, Int32)	Transforms a specified range in an array of Vector2 s by a specified Matrix and places the results in a specified range in a destination array.
Vector2.Transform (Vector2[], Int32, Quaternion, Vector2[], Int32, Int32)	Transforms a specified range in an array of Vector2 s by a specified Quaternion and places the results in a specified range in a destination array.
Vector2.Transform (Vector2[], Matrix, Vector2[])	Transforms an array of Vector2 s by a specified Matrix .
Vector2.Transform (Vector2[], Quaternion, Vector2[])	Transforms an array of Vector2 s by a specified Quaternion .

Vector2.Transform Method (Vector2, Matrix, Vector2)

Transforms a [Vector2](#) by the given [Matrix](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Transform (  
    ref Vector2 position,  
    ref Matrix matrix,  
    out Vector2 result  
)
```

Parameters

position

The source [Vector2](#).

matrix

The transformation [Matrix](#).

result

[[OutAttribute](#)] The [Vector2](#) resulting from the transformation.

Exceptions

Exception type	Condition
ArgumentException	The target array size must be equal or larger than the source array size.
ArgumentNullException	<i>sourceArray</i> or <i>destinationArray</i> is null .

Vector2.Transform Method (Vector2, Quaternion)

Transforms a single [Vector2](#), or the vector normal (x, y, 0, 0), by a specified [Quaternion](#) rotation.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector2 Transform (  
    Vector2 value,  
    Quaternion rotation  
)
```

Parameters

value

The vector to rotate.

rotation

The [Quaternion](#) rotation to apply.

Return Value

Returns a new [Vector2](#) containing the result of the rotation.

Exceptions

Exception type	Condition
ArgumentException	<i>destinationArray</i> is too small to contain the result.

Vector2.Transform Method (Vector2[], Int32, Matrix, Vector2[], Int32, Int32)

Transforms a specified range in an array of [Vector2s](#) by a specified [Matrix](#) and places the results in a specified range in a destination array.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Transform (
    Vector2[] sourceArray,
    int sourceIndex,
    ref Matrix matrix,
    Vector2[] destinationArray,
    int destinationIndex,
    int length
)
```

Parameters

sourceArray

The source array.

sourceIndex

The index of the first [Vector2](#) to transform in the source array.

matrix

The [Matrix](#) to transform by.

destinationArray

The destination array into which the resulting [Vector2s](#) will be written.

destinationIndex

The index of the position in the destination array where the first result [Vector2](#) should be written.

length

The number of [Vector2s](#) to be transformed.

Exceptions

Exception type	Condition
ArgumentException	<i>destinationArray</i> is too small to contain the result or the combination of <i>sourceIndex</i> and <i>length</i> was greater than <i>sourceArray.Length</i> .
ArgumentNullException	<i>sourceArray</i> or <i>destinationArray</i> is null .

Vector3 Members

The following tables list the members exposed by the Vector3 type.

Public Constructors

	Name	Description
	Vector3	Overloaded. Initializes a new instance of Vector3 .

Public Fields

	Name	Description
	X	Gets or sets the x-component of the vector.
	Y	Gets or sets the y-component of the vector.
	Z	Gets or sets the z-component of the vector.

Public Properties

	Name	Description
	Backward	Returns a unit Vector3 designating backward in a right-handed coordinate system (0, 0, 1).
	Down	Returns a unit Vector3 designating down (0, -1, 0).
	Forward	Returns a unit Vector3 designating forward in a right-handed coordinate system(0, 0, -1).
	Left	Returns a unit Vector3 designating left (-1, 0, 0).
	One	Returns a Vector3 with ones in all of its components.
	Right	Returns a unit Vector3 pointing to the right (1, 0, 0).
	UnitX	Returns the x unit Vector3 (1, 0, 0).
	UnitY	Returns the y unit Vector3 (0, 1, 0).
	UnitZ	Returns the z unit Vector3 (0, 0, 1).
	Up	Returns a unit vector designating up (0, 1, 0).
	Zero	Returns a Vector3 with all of its components set to zero.

Public Methods

	Name	Description
	Add	Overloaded. Adds two vectors.
	Barycentric	Overloaded. Returns a Vector3 containing the 3D Cartesian coordinates of a point specified in Barycentric coordinates relative to a 3D triangle.
	CatmullRom	Overloaded. Performs a Catmull-Rom interpolation using the specified positions.
	Clamp	Overloaded. Restricts a value to be within a specified range.
	Cross	Overloaded. Calculates the cross product of two vectors.
	Distance	Overloaded. Calculates the distance between two vectors.
	DistanceSquared	Overloaded. Calculates the distance between two vectors squared.
	Divide	Overloaded. Divide a vector by a scalar or another vector.
	Dot	Overloaded. Calculates the dot product of two vectors. If the two vectors are unit vectors, the dot product returns a floating point value between -1 and 1 that can be used to determine some properties of the angle between two vectors. For example, it can show whether the vectors are orthogonal, parallel, or have an acute or obtuse angle between them.
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code of the vector object.

GetTy pe	(Inherited from Object .)
Herm ite	Overloaded. Performs a Hermite spline interpolation.
Lengt h	Calculates the length of the vector.
Lengt hSqu ared	Calculates the length of the vector squared.
Lerp	Overloaded. Performs a linear interpolation between two vectors.
Max	Overloaded. Returns a vector that contains the highest value from each matching pair of components.
Min	Overloaded. Returns a vector that contains the lowest value from each matching pair of components.
Multi ply	Overloaded. Multiplies a vector by a scalar or another vector.
Nega te	Overloaded. Returns a vector pointing in the opposite direction.
Norm alize	Overloaded. Creates a unit vector from the specified vector. The result is a vector one unit in length pointing in the same direction as the original vector.
op_A dditio n	Adds two vectors.
op_Di vision	Overloaded. Divides a vector by a scalar or another vector.
op_E qualit y	Tests vectors for equality.
op_In equal ity	Tests vectors for inequality.
op_M ultipl y	Overloaded. Multiplies a vector by a scalar or another vector.
op_S ubtra ction	Subtracts a vector from a vector.
op_U nary Nega tion	Returns a vector pointing in the opposite direction.
Refer enceE quals	(Inherited from Object .)
Refle ct	Overloaded. Returns the reflection of a vector off a surface that has the specified normal.
Smoo thSte p	Overloaded. Interpolates between two values using a cubic equation.
Subtr act	Overloaded. Subtracts a vector from a vector.
ToStri ng	Retrieves a string representation of the current object.
Trans form	Overloaded. Transforms a Vector3 or array of Vector3 s by a specified Matrix or Quaternion .

 TransformNormal	Overloaded. Transforms a vector normal by a matrix.
---	---

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Vector3 Constructor (Vector2, Single)

Initializes a new instance of [Vector3](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 (  
    Vector2 value,  
    float z  
)
```

Parameters

value

A vector containing the values to initialize x and y components with.

z

Initial value for the z-component of the vector.

Vector3 Methods

Public Methods

	Name	Description
	Add	Overloaded. Adds two vectors.
	Barycentric	Overloaded. Returns a Vector3 containing the 3D Cartesian coordinates of a point specified in Barycentric coordinates relative to a 3D triangle.
	CatmullRom	Overloaded. Performs a Catmull-Rom interpolation using the specified positions.
	Clamp	Overloaded. Restricts a value to be within a specified range.
	Cross	Overloaded. Calculates the cross product of two vectors.
	Distance	Overloaded. Calculates the distance between two vectors.
	DistanceSquared	Overloaded. Calculates the distance between two vectors squared.
	Divide	Overloaded. Divide a vector by a scalar or another vector.
	Dot	Overloaded. Calculates the dot product of two vectors. If the two vectors are unit vectors, the dot product returns a floating point value between -1 and 1 that can be used to determine some properties of the angle between two vectors. For example, it can show whether the vectors are orthogonal, parallel, or have an acute or obtuse angle between them.
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code of the vector object.
	GetType	(Inherited from Object .)
	Hermite	Overloaded. Performs a Hermite spline interpolation.
	Length	Calculates the length of the vector.
	LengthSquared	Calculates the length of the vector squared.
	Lerp	Overloaded. Performs a linear interpolation between two vectors.
	Max	Overloaded. Returns a vector that contains the highest value from each matching pair of components.
	Min	Overloaded. Returns a vector that contains the lowest value from each matching pair of components.
	Multiply	Overloaded. Multiplies a vector by a scalar or another vector.
	Negate	Overloaded. Returns a vector pointing in the opposite direction.
	Normalize	Overloaded. Creates a unit vector from the specified vector. The result is a vector one unit in length pointing in the same direction as the original vector.
	op_Addition	Adds two vectors.

 op_Division	Overloaded. Divides a vector by a scalar or another vector.
 op_Equality	Tests vectors for equality.
 op_Inequality	Tests vectors for inequality.
 op_Multiply	Overloaded. Multiplies a vector by a scalar or another vector.
 op_Subtraction	Subtracts a vector from a vector.
 UnaryNegation	Returns a vector pointing in the opposite direction.
 ReferenceEquals	(Inherited from Object .)
 Reflect	Overloaded. Returns the reflection of a vector off a surface that has the specified normal.
 SmoothStep	Overloaded. Interpolates between two values using a cubic equation.
 Subtract	Overloaded. Subtracts a vector from a vector.
 ToString	Retrieves a string representation of the current object.
 Transform	Overloaded. Transforms a Vector3 or array of Vector3 s by a specified Matrix or Quaternion .
 TransformNormal	Overloaded. Transforms a vector normal by a matrix.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Vector3.Barycentric Method (Vector3, Vector3, Vector3, Single, Single)

Returns a [Vector3](#) containing the 3D Cartesian coordinates of a point specified in Barycentric coordinates relative to a 3D triangle.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 Barycentric (
    Vector3 value1,
    Vector3 value2,
    Vector3 value3,
    float amount1,
    float amount2
)
```

Parameters

value1

A [Vector3](#) containing the 3D Cartesian coordinates of vertex 1 of the triangle.

value2

A [Vector3](#) containing the 3D Cartesian coordinates of vertex 2 of the triangle.

value3

A [Vector3](#) containing the 3D Cartesian coordinates of vertex 3 of the triangle.

amount1

Barycentric coordinate b_2 , which expresses the weighting factor toward vertex 2 (specified in *value2*).

amount2

Barycentric coordinate b_3 , which expresses the weighting factor toward vertex 3 (specified in *value3*).

Return Value

A new [Vector3](#) containing the 3D Cartesian coordinates of the specified point.

Remarks

About Barycentric Coordinates

Given a triangle with vertices **V1**, **V2**, and **V3**, any point **P** on the plane of that triangle can be specified by 3 weighting factors **b1**, **b2**, and **b3**, each of which indicates how much relative influence the corresponding triangle vertex contributes to the location of the point, as specified in the following formulas:

$$\begin{aligned} P_x &= (b_1 * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}); \\ P_y &= (b_1 * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}); \\ P_z &= (b_1 * V_{1z}) + (b_2 * V_{2z}) + (b_3 * V_{3z}); \end{aligned}$$

Such triple weighting factors **b1**, **b2**, and **b3** are called *Barycentric coordinates*.

Barycentric coordinates express relative weights, meaning that $(k * b_1)$, $(k * b_2)$, and $(k * b_3)$ are also coordinates of the same point as **b1**, **b2**, and **b3** for any positive value of **k**.

If a set of Barycentric coordinates is normalized so that $b_1 + b_2 + b_3 = 1$, the resulting coordinates are unique for the point in question, and are known as *areal* coordinates. When normalized in this way, only two coordinates are needed, say **b2** and **b3**, since **b1** equals $(1 - b_2 - b_3)$.

What Vector3 Barycentric Does

The Vector3 [Barycentric](#) method takes three vectors specifying the Cartesian coordinates of the triangle vertices, **V1**, **V2**, and **V3**, and two areal coordinates **b2** and **b3** of some point **P** (**b2** is the *amount1* argument and **b3** is the *amount2* argument). The **b2** coordinate relates to vertex **V2**, and the **b3** coordinate relates to **V3**.

[Barycentric](#) then calculates the Cartesian coordinate of **P** as follows:

$$\begin{aligned}
 P_x &= ((1 - b_2 - b_3) * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}) ; \\
 P_y &= ((1 - b_2 - b_3) * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}) ; \\
 P_z &= ((1 - b_2 - b_3) * V_{1z}) + (b_2 * V_{2z}) + (b_3 * V_{3z}) ;
 \end{aligned}$$

Thus, to calculate the 3D Cartesian coordinates of **P**, you would pass the coordinates of the triangle vertices to [Barycentric](#) together with the appropriate normalized Barycentric (areal) coordinates of **P**.

The following relationships may be useful:

- If (*amount1* <= 0) and (*amount2* >= 0) and (1 - *amount1* - *amount2* >= 0), then the point is inside the triangle defined by *value1*, *value2*, and *value3*.
- If (*amount1* == 0) and (*amount2* >= 0) and (1 - *amount1* - *amount2* >= 0), then the point is on the line defined by *value1* and *value3*.
- If (*amount1* >= 0) and (*amount2* == 0) and (1 - *amount1* - *amount2* >= 0), then the point is on the line defined by *value1* and *value2*.
- If (*amount1* >= 0) and (*amount2* >= 0) and (1 - *amount1* - *amount2* == 0), then the point is on the line defined by *value2* and *value3*.

Barycentric coordinates are a form of general coordinates. In this context, using barycentric coordinates represents a change in coordinate systems. What holds true for Cartesian coordinates holds true for barycentric coordinates.

Vector3.Barycentric Method (Vector3, Vector3, Vector3, Single, Single, Vector3)

Returns a [Vector3](#) containing the 3D Cartesian coordinates of a point specified in barycentric (areal) coordinates relative to a 3D triangle.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Barycentric (
    ref Vector3 value1,
    ref Vector3 value2,
    ref Vector3 value3,
    float amount1,
    float amount2,
    out Vector3 result
)
```

Parameters

value1

A [Vector3](#) containing the 3D Cartesian coordinates of vertex 1 of the triangle.

value2

A [Vector3](#) containing the 3D Cartesian coordinates of vertex 2 of the triangle.

value3

A [Vector3](#) containing the 3D Cartesian coordinates of vertex 3 of the triangle.

amount1

Barycentric coordinate **b2**, which expresses the weighting factor toward vertex 2 (specified in *value2*).

amount2

Barycentric coordinate **b3**, which expresses the weighting factor toward vertex 3 (specified in *value3*).

result

[[OutAttribute](#)] The 3D Cartesian coordinates of the specified point are placed in this [Vector3](#) on exit.

Remarks

About Barycentric Coordinates

Given a triangle with vertices **V1**, **V2**, and **V3**, any point **P** on the plane of that triangle can be specified by three weighting factors **b1**, **b2**, and **b3**, each of which indicates how much relative influence the corresponding triangle vertex contributes to the location of the point, as specified in the following formulas:

$$\begin{aligned} P_x &= (b_1 * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}); \\ P_y &= (b_1 * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}); \\ P_z &= (b_1 * V_{1z}) + (b_2 * V_{2z}) + (b_3 * V_{3z}); \end{aligned}$$

Such triple weighting factors **b1**, **b2**, and **b3** are called *barycentric coordinates*.

Barycentric coordinates express relative weights, meaning that **(k * b1)**, **(k * b2)**, and **(k * b3)** are also coordinates of the same point as **b1**, **b2**, and **b3** for any positive value of **k**.

If a set of barycentric coordinates is normalized so that **b1 + b2 + b3 = 1**, the resulting coordinates are unique for the point in question, and are known as *areal* coordinates. When normalized in this way, only two coordinates are needed, say **b2** and **b3**, since **b1** equals **(1 - b2 - b3)**.

What Vector3 Barycentric Does

The Vector3 [Barycentric](#) method takes three vectors specifying the Cartesian coordinates of the triangle vertices, **V1**, **V2**, and **V3**, and two areal coordinates **b2** and **b3** of some point **P** (**b2** is the *amount1* argument and **b3** is the *amount2* argument). The **b2** coordinate relates to vertex **V2**, and the **b3** coordinate relates to **V3**.

[Barycentric](#) then calculates the Cartesian coordinate of **P** as follows:

$$\begin{aligned} P_x &= ((1 - b_2 - b_3) * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}); \\ P_y &= ((1 - b_2 - b_3) * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}); \\ P_z &= ((1 - b_2 - b_3) * V_{1z}) + (b_2 * V_{2z}) + (b_3 * V_{3z}); \end{aligned}$$

Thus, to calculate the 3D Cartesian coordinates of **P**, you would pass the coordinates of the triangle vertices to [Barycentric](#) together with the appropriate normalized Barycentric (areal) coordinates of **P**.

The following relationships may be useful.

- If $(amount1 \leq 0)$ and $(amount2 \geq 0)$ and $(1 - amount1 - amount2 \geq 0)$, then the point is inside the triangle defined by *value1*, *value2*, and *value3*.
- If $(amount1 == 0)$ and $(amount2 \geq 0)$ and $(1 - amount1 - amount2 \geq 0)$, then the point is on the line defined by *value1* and *value3*.
- If $(amount1 \geq 0)$ and $(amount2 == 0)$ and $(1 - amount1 - amount2 \geq 0)$, then the point is on the line defined by *value1* and *value2*.
- If $(amount1 \geq 0)$ and $(amount2 \geq 0)$ and $(1 - amount1 - amount2 == 0)$, then the point is on the line defined by *value2* and *value3*.

Vector3.DistanceSquared Method (Vector3, Vector3)

Calculates the distance between two vectors squared.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static float DistanceSquared (  
    Vector3 value1,  
    Vector3 value2  
)
```

Parameters

value1

Source vector.

value2

Source vector.

Return Value

The distance between the source vectors squared.

Remarks

Distance is calculated with the following formula:

$$\sqrt{(a - b)^2}$$

Distance squared is the value before taking the square root. Distance squared can often be used in place of distance if relative comparisons are being made. For example, consider three points A, B, and C. To determine whether B or C is further from A, compare the distance between A and B to the distance between A and C. Calculating the two distances involves two square roots, which are computationally expensive. However, using distance squared provides the same information and avoids calculating two square roots.

Vector3.Divide Method (Vector3, Vector3)

Divides the components of a vector by the components of another vector.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 Divide (  
    Vector3 value1,  
    Vector3 value2  
)
```

Parameters

value1

Source vector.

value2

Divisor vector.

Return Value

The result of dividing the vectors.

Remarks

Division of a vector by another vector is not mathematically defined. This method simply divides each component of *a* by the matching component of *b*.

Vector3.Dot Method

Calculates the dot product of two vectors. If the two vectors are unit vectors, the dot product returns a floating point value between -1 and 1 that can be used to determine some properties of the angle between two vectors. For example, it can show whether the vectors are orthogonal, parallel, or have an acute or obtuse angle between them.

Overload List

Name	Description
Vector3.Dot (Vector3, Vector3)	Calculates the dot product of two vectors. If the two vectors are unit vectors, the dot product returns a floating point value between -1 and 1 that can be used to determine some properties of the angle between two vectors. For example, it can show whether the vectors are orthogonal, parallel, or have an acute or obtuse angle between them.
Vector3.Dot (Vector3, Vector3, Single)	Calculates the dot product of two vectors and writes the result to a user-specified variable. If the two vectors are unit vectors, the dot product returns a floating point value between -1 and 1 that can be used to determine some properties of the angle between two vectors. For example, it can show whether the vectors are orthogonal, parallel, or have an acute or obtuse angle between them.

Remarks

The dot product is also known as the inner product.

For any two vectors, the dot product is defined as:

```
Vector3.Dot( vector1, vector2 ) == (vector1.X * vector2.X) + (vector1.Y * vector2.Y) + (vector1.Z * vector2.Z)
```

The result of this calculation, plus or minus some margin to account for floating point error, is equal to:

```
Length( vector1 ) * Length( vector2 ) * System.Math.Cos( theta )
```

Here, *theta* is the angle between the two vectors.

If *vector1* and *vector2* are unit vectors, the length of each vector will be equal to 1. So, when *vector1* and *vector2* are unit vectors, the dot product is simply equal to the cosine of the angle between the two vectors. The following calculation:

```
Vector3.Dot( vector1.Normalize(), vector2.Normalize() )
```

Is equivalent to:

```
System.Math.Cos( theta )
```

Therefore, if *vector1* and *vector2* are unit vectors (i.e., we've called [Normalize](#) on each vector to make it a unit vector), without knowing the value of *theta* or using a potentially processor-intensive trigonometric function, the dot product can tell us the following things:

- If `Vector3.Dot(vector1.Normalize(), vector2.Normalize()) > 0`, the angle between the two vectors is less than 90 degrees.
- If `Vector3.Dot(vector1.Normalize(), vector2.Normalize()) < 0`, the angle between the two vectors is more than 90 degrees.
- If `Vector3.Dot(vector1.Normalize(), vector2.Normalize()) == 0`, the angle between the two vectors is 90 degrees; that is, the vectors are orthogonal.
- If `Vector3.Dot(vector1.Normalize(), vector2.Normalize()) == 1`, the angle between the two vectors is 0 degrees; that is, the vectors point in the same direction and are parallel.
- If `Vector3.Dot(vector1.Normalize(), vector2.Normalize()) == -1`, the angle between the two vectors is 180 degrees; that is, the vectors point in opposite directions and are parallel.

⚠Caution

Because of floating point error, two orthogonal vectors may not return a dot product that is exactly zero. It might be zero plus some amount of floating point error. In your code, you will want to determine what amount of error is acceptable in your calculation, and take that into account when you do your comparisons.

Vector3.Dot Method (Vector3, Vector3)

Calculates the dot product of two vectors. If the two vectors are unit vectors, the dot product returns a floating point value between -1 and 1 that can be used to determine some properties of the angle between two vectors. For example, it can show whether the vectors are orthogonal, parallel, or have an acute or obtuse angle between them.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static float Dot (
    Vector3 vector1,
    Vector3 vector2
)
```

Parameters

vector1

Source vector.

vector2

Source vector.

Return Value

The dot product of the two vectors.

Remarks

The dot product is also known as the inner product.

For any two vectors, the dot product is defined as:

$$\text{Vector3.Dot}(\text{vector1}, \text{vector2}) == (\text{vector1.X} * \text{vector2.X}) + (\text{vector1.Y} * \text{vector2.Y}) + (\text{vector1.Z} * \text{vector2.Z})$$

The result of this calculation, plus or minus some margin to account for floating point error, is equal to:

$$\text{Length}(\text{vector1}) * \text{Length}(\text{vector2}) * \text{System.Math.Cos}(\text{theta})$$

Here, *theta* is the angle between the two vectors.

If *vector1* and *vector2* are unit vectors, the length of each vector will be equal to 1. So, when *vector1* and *vector2* are unit vectors, the dot product is simply equal to the cosine of the angle between the two vectors. The following calculation:

$$\text{Vector3.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}())$$

Is equivalent to:

$$\text{System.Math.Cos}(\text{theta})$$

Therefore, if *vector1* and *vector2* are unit vectors (i.e., we've called [Normalize](#) on each vector to make it a unit vector), without knowing the value of *theta* or using a potentially processor-intensive trigonometric function, the dot product can tell us the following things:

- If $\text{Vector3.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}()) > 0$, the angle between the two vectors is less than 90 degrees.
- If $\text{Vector3.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}()) < 0$, the angle between the two vectors is more than 90 degrees.
- If $\text{Vector3.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}()) == 0$, the angle between the two vectors is 90 degrees; that is, the vectors are orthogonal.
- If $\text{Vector3.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}()) == 1$, the angle between the two vectors is 0 degrees; that is, the vectors point in the same direction and are parallel.
- If $\text{Vector3.Dot}(\text{vector1.Normalize}(), \text{vector2.Normalize}()) == -1$, the angle between the two vectors is 180 degrees; that is, the vectors point in opposite directions and are parallel.

⚠ Caution

Because of floating point error, two orthogonal vectors may not return a dot product that is exactly zero. It might be zero plus some amount of floating point error. In your code, you will want to determine what amount of error is acceptable in your calculation, and take that into account when you do your comparisons.

Vector3.Normalize Method

Creates a unit vector from the specified vector. The result is a vector one unit in length pointing in the same direction as the original vector.

Overload List

Name	Description
Vector3.Normalize ()	Turns the current vector into a unit vector. The result is a vector one unit in length pointing in the same direction as the original vector.
Vector3.Normalize (Vector3)	Creates a unit vector from the specified vector. The result is a vector one unit in length pointing in the same direction as the original vector.
Vector3.Normalize (Vector3, Vector3)	Creates a unit vector from the specified vector, writing the result to a user-specified variable. The result is a vector one unit in length pointing in the same direction as the original vector.

Vector3.Normalize Method (Vector3)

Creates a unit vector from the specified vector. The result is a vector one unit in length pointing in the same direction as the original vector.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 Normalize (  
    Vector3 value  
)
```

Parameters

value

The source [Vector3](#).

Return Value

The created unit vector.

Vector3.Normalize Method (Vector3, Vector3)

Creates a unit vector from the specified vector, writing the result to a user-specified variable. The result is a vector one unit in length pointing in the same direction as the original vector.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Normalize (  
    ref Vector3 value,  
    out Vector3 result  
)
```

Parameters

value

Source vector.

result

[[OutAttribute](#)] The normalized vector.

Vector3.op_Addition Method

Adds two vectors.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 op_Addition (  
    Vector3 value1,  
    Vector3 value2  
)
```

Parameters

value1

Source vector.

value2

Source vector.

Return Value

Sum of the vectors.

Vector3.op_Division Method (Vector3, Single)

Divides a vector by a scalar value.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 op_Division (  
    Vector3 value,  
    float divider  
)
```

Parameters

value

Source vector.

divider

The divisor.

Return Value

The source vector divided by *div*.

Vector3.op_Division Method (Vector3, Vector3)

Divides the components of a vector by the components of another vector.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 op_Division (  
    Vector3 value1,  
    Vector3 value2  
)
```

Parameters

value1

Source vector.

value2

Divisor vector.

Return Value

The result of dividing the vectors.

Remarks

Division of a vector by another vector is not mathematically defined. This method simply divides each component of *a* by the matching component of *b*.

Vector3.op_Equality Method

Tests vectors for equality.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Vector3 value1,  
    Vector3 value2  
)
```

Parameters

value1

Source vector.

value2

Source vector.

Return Value

true if the vectors are equal; **false** otherwise.

Vector3.op_Multiply Method (Vector3, Vector3)

Multiplies the components of two vectors by each other.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 op_Multiply (  
    Vector3 value1,  
    Vector3 value2  
)
```

Parameters

value1

Source vector.

value2

Source vector.

Return Value

Result of the multiplication.

Remarks

Multiplication performed by this method is not vector multiplication (dot product and cross product) but multiplication of the corresponding components of each vector.

[Microsoft.Xna.Framework Namespace](#)

Vector3.Reflect Method (Vector3, Vector3)

Returns the reflection of a vector off a surface that has the specified normal.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 Reflect (
    Vector3 vector,
    Vector3 normal
)
```

Parameters

vector

Source vector.

normal

Normal of the surface.

Return Value

The reflected vector.

Remarks [Reflect](#) only gives the direction of a reflection off a surface, it does not determine whether the original vector was close enough to the surface to hit it.

Example Determining the position of a moving particle taking into account a surface being struck.

C#

```
static Nullable<float> RayPlaneIntersection(
    ref Ray ray, ref Plane plane)
{
    Vector3 PointOnPlane = plane.D * plane.Normal;
    float DotNormalDir = Vector3.Dot(plane.Normal, ray.Direction);
    if (DotNormalDir == 0) return null;
    float d = Vector3.Dot(plane.Normal, PointOnPlane - ray.Position) /
        DotNormalDir;
    return d;
}

// Set the position of the particle.
Vector3 position = new Vector3(-19, 0, -3);
// Set the direction in which the particle is moving.
Vector3 direction = new Vector3(1, 0, 0);
// Set the speed at which the particle is moving.
float speed = 4.0f;

//Define a plane with a slope of -1 with respect to the xz-axis
//and passing through (-5, 0, -5).
Plane surface = new Plane(new Vector3(-1f / (float)Math.Sqrt(2), 0,
    -1f / (float)Math.Sqrt(2)), 5f * (float)Math.Sqrt(2));

void MoveParticle()
{
    Ray ray = new Ray(position, direction);

    bool intersected = true;

    Nullable<float> collisionDistance =
        RayPlaneIntersection(ref ray, ref surface);

    // The direction of movement is parallel to the plane.
    if (collisionDistance.HasValue == false)
    {
        intersected = false;
    }
    // The intersection is opposite the direction of movement.
```

```

else if ((collisionDistance.Value <= 0 && speed > 0) ||
(collisionDistance.Value > 0 && speed <= 0))
{
    intersected = false;
}
// The intersection is further away than the distance moved.
else if (Math.Abs(collisionDistance.Value) > Math.Abs(speed))
{
    intersected = false;
}

// The particle hit the surface, so reflect it off the surface.
if (intersected == true)
{
    // If the vector position + direction * speed passes through
    // the plane, calculate the reflection.
    Vector3 reflectionVector =
        Vector3.Reflect(direction, surface.Normal);

    // Calculate the distance left to move after hitting the surface
    float lengthOfReflection = (speed - collisionDistance.Value);
    Vector3 newPosition = position + direction *
        collisionDistance.Value + lengthOfReflection *
        reflectionVector;
    position = newPosition;
    direction = reflectionVector;
}
else // There is no intersection, so just move normally.
{
    position += direction * speed;
}
}

```

Vector3.Transform Method (Vector3[], Int32, Matrix, Vector3[], Int32, Int32)

Applies a specified transform [Matrix](#) to a specified range of an array of [Vector3](#)s and writes the results into a specified range of a destination array.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Transform (
    Vector3[] sourceArray,
    int sourceIndex,
    ref Matrix matrix,
    Vector3[] destinationArray,
    int destinationIndex,
    int length
)
```

Parameters

sourceArray

The source array.

sourceIndex

The index in the source array at which to start.

matrix

The transform [Matrix](#) to apply.

destinationArray

The existing destination array.

destinationIndex

The index in the destination array at which to start.

length

The number of [Vector3](#)s to transform.

Exceptions

Exception type	Condition
ArgumentException	<i>destinationArray</i> is too small to contain the result or the combination of <i>sourceIndex</i> and <i>length</i> was greater than <i>sourceArray.Length</i> .
ArgumentNullException	<i>sourceArray</i> or <i>destinationArray</i> is null .

    Vector3[] destinationArray,
    int destinationIndex,
    int length
)
```

Parameters

sourceArray

The source array.

sourceIndex

The index in the source array at which to start.

rotation

The [Quaternion](#) rotation to apply.

destinationArray

The existing destination array.

destinationIndex

The index in the destination array at which to start.

length

The number of [Vector3s](#) to transform.

Exceptions

Exception type	Condition
ArgumentException	<i>destinationArray</i> is too small to contain the result or the combination of <i>sourceIndex</i> and <i>length</i> was greater than <i>sourceArray.Length</i> .
ArgumentNullException	<i>sourceArray</i> or <i>destinationArray</i> is null .

Vector3.Transform Method (Vector3[], Matrix, Vector3[])

Transforms a source array of [Vector3](#)s by a specified [Matrix](#) and writes the results to an existing destination array.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Transform (  
    Vector3[] sourceArray,  
    ref Matrix matrix,  
    Vector3[] destinationArray  
)
```

Parameters

sourceArray

The source array.

matrix

The transform [Matrix](#) to apply.

destinationArray

An existing destination array into which the transformed [Vector3](#)s are written.

Exceptions

Exception type	Condition
ArgumentException	<i>destinationArray</i> is too small to contain the result.
ArgumentNullException	<i>sourceArray</i> or <i>destinationArray</i> is null .

Transforms a specified range in an array of [3D vector](#) normals by a specified [Matrix](#) and writes the results to a specified range in a destination array.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void TransformNormal (
    Vector3[] sourceArray,
    int sourceIndex,
    ref Matrix matrix,
    Vector3[] destinationArray,
    int destinationIndex,
    int length
)
```

Parameters

sourceArray

The source array of [Vector3](#) normals.

sourceIndex

The starting index in the source array.

matrix

The transform [Matrix](#) to apply.

destinationArray

The destination [Vector3](#) array.

destinationIndex

The starting index in the destination array.

length

The number of vectors to transform.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<i>destinationArray</i> is too small to contain the result or the combination of <i>sourceIndex</i> and <i>length</i> was greater than <i>sourceArray.Length</i> .
ArgumentNullException	<i>sourceArray</i> or <i>destinationArray</i> is null .

Vector3 Properties

Public Properties

	Name	Description
 S	Backward	Returns a unit Vector3 designating backward in a right-handed coordinate system (0, 0, 1).
 S	Down	Returns a unit Vector3 designating down (0, -1, 0).
 S	Forward	Returns a unit Vector3 designating forward in a right-handed coordinate system(0, 0, -1).
 S	Left	Returns a unit Vector3 designating left (-1, 0, 0).
 S	One	Returns a Vector3 with ones in all of its components.
 S	Right	Returns a unit Vector3 pointing to the right (1, 0, 0).
 S	UnitX	Returns the x unit Vector3 (1, 0, 0).
 S	UnitY	Returns the y unit Vector3 (0, 1, 0).
 S	UnitZ	Returns the z unit Vector3 (0, 0, 1).
 S	Up	Returns a unit vector designating up (0, 1, 0).
 S	Zero	Returns a Vector3 with all of its components set to zero.

Vector3.Backward Property

Returns a unit [Vector3](#) designating backward in a right-handed coordinate system (0, 0, 1).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 Backward { get; }
```

Property Value

A unit [Vector3](#) pointing backward.

Remarks

The XNA Framework uses a right-handed coordinate system, with the positive x-axis pointing to the right, the positive y-axis pointing up, and the positive z-axis pointing toward the observer.

Vector3.Down Property

Returns a unit [Vector3](#) designating down (0, -1, 0).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 Down { get; }
```

Property Value

A unit [Vector3](#) pointing down.

Remarks

The XNA Framework uses a right-handed coordinate system, with the positive x-axis pointing to the right, the positive y-axis pointing up, and the positive z-axis pointing toward the observer.

Vector3.Forward Property

Returns a unit [Vector3](#) designating forward in a right-handed coordinate system(0, 0, -1).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 Forward { get; }
```

Property Value

A unit [Vector3](#) pointing forward.

Remarks

The XNA Framework uses a right-handed coordinate system, with the positive x-axis pointing to the right, the positive y-axis pointing up, and the positive z-axis pointing toward the observer.

Vector3.Left Property

Returns a unit [Vector3](#) designating left (-1, 0, 0).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 Left { get; }
```

Property Value

A unit [Vector3](#) pointing left.

Remarks

The XNA Framework uses a right-handed coordinate system, with the positive x-axis pointing to the right, the positive y-axis pointing up, and the positive z-axis pointing toward the observer.

Vector3.Right Property

Returns a unit [Vector3](#) pointing to the right (1, 0, 0).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector3 Right { get; }
```

Property Value

A unit [Vector3](#) pointing to the right.

Remarks

The XNA Framework uses a right-handed coordinate system, with the positive x-axis pointing to the right, the positive y-axis pointing up, and the positive z-axis pointing toward the observer.

Vector4 Members

The following tables list the members exposed by the Vector4 type.

Public Constructors

	Name	Description
	Vector4	Overloaded. Initializes a new instance of Vector4 .

Public Fields

	Name	Description
	W	Gets or sets the w-component of the vector.
	X	Gets or sets the x-component of the vector.
	Y	Gets or sets the y-component of the vector.
	Z	Gets or sets the z-component of the vector.

Public Properties

	Name	Description
	One	Returns a Vector4 with all of its components set to one.
	UnitW	Returns the Vector4 (0, 0, 0, 1).
	UnitX	Returns the Vector4 (1, 0, 0, 0).
	UnitY	Returns the Vector4 (0, 1, 0, 0).
	UnitZ	Returns the Vector4 (0, 0, 1, 0).
	Zero	Returns a Vector4 with all of its components set to zero.

Public Methods

	Name	Description
	Add	Overloaded. Adds two vectors.
	Barycentric	Overloaded. Returns a Vector4 containing the 4D Cartesian coordinates of a point specified in barycentric (a real) coordinates relative to a 4D triangle.
	CatmullRom	Overloaded. Performs a Catmull-Rom interpolation using the specified positions.
	Clamp	Overloaded. Restricts a value to be within a specified range.
	Distance	Overloaded. Calculates the distance between two vectors.
	DistanceSquared	Overloaded. Calculates the distance between two vectors squared.
	Divide	Overloaded. Divide a vector by a scalar or another vector.
	Dot	Overloaded. Calculates the dot product of two vectors.
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code of this object.
	GetType	(Inherited from Object .)
	Hermite	Overloaded. Performs a Hermite spline interpolation.
	Length	Calculates the length of the vector.
	LengthSquared	Calculates the length of the vector squared.
	Lerp	Overloaded. Performs a linear interpolation between two vectors.
	Max	Overloaded. Returns a vector that contains the highest value from each matching pair of components.
	Min	Overloaded. Returns a vector that contains the lowest value from each matching pair of components.
	Multiply	Overloaded. Multiplies a vector by a scalar or another vector.
	Negate	Overloaded. Returns a vector pointing in the opposite direction.

 Normalize	Overloaded. Creates a unit vector from the specified vector.
 op_Addition	Adds two vectors.
 op_Division	Overloaded. Divides a vector by a scalar or another vector.
 op_Equality	Tests vectors for equality.
 op_Inequality	Tests vectors for inequality.
 op_Multiply	Overloaded. Multiplies a vector by a scalar or another vector.
 op_Subtraction	Subtracts a vector from a vector.
 op_UnaryNegation	Returns a vector pointing in the opposite direction.
 ReferenceEquals	(Inherited from Object .)
 SmoothStep	Overloaded. Interpolates between two values using a cubic equation.
 Subtract	Overloaded. Subtracts a vector from a vector.
 ToString	Retrieves a string representation of the current object.
 Transform	Overloaded. Transforms one or more vectors by a specified Matrix or Quaternion and returns the results in Vector4 form.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Vector4.Barycentric Method (Vector4, Vector4, Vector4, Single, Single)

Returns a [Vector4](#) containing the 4D Cartesian coordinates of a point specified in barycentric (areal) coordinates relative to a 4D triangle.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector4 Barycentric (
    Vector4 value1,
    Vector4 value2,
    Vector4 value3,
    float amount1,
    float amount2
)
```

Parameters

value1

A [Vector4](#) containing the 4D Cartesian coordinates of vertex 1 of the triangle.

value2

A [Vector4](#) containing the 4D Cartesian coordinates of vertex 2 of the triangle.

value3

A [Vector4](#) containing the 4D Cartesian coordinates of vertex 3 of the triangle.

amount1

Barycentric coordinate **b2**, which expresses the weighting factor toward vertex 2 (specified in *value2*).

amount2

Barycentric coordinate **b3**, which expresses the weighting factor toward vertex 3 (specified in *value3*).

Return Value

A new [Vector4](#) containing the 4D Cartesian coordinates of the specified point.

Remarks

About Barycentric Coordinates

Given a triangle with vertices **V1**, **V2**, and **V3**, any point **P** on the plane of that triangle can be specified by 3 weighting factors **b1**, **b2**, and **b3**, each of which indicates how much relative influence the corresponding triangle vertex contributes to the location of the point, as specified in the following formulas.

$$\begin{aligned} P_x &= (b_1 * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}); \\ P_y &= (b_1 * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}); \\ P_z &= (b_1 * V_{1z}) + (b_2 * V_{2z}) + (b_3 * V_{3z}); \\ P_w &= (b_1 * V_{1w}) + (b_2 * V_{2w}) + (b_3 * V_{3w}); \end{aligned}$$

Such triple weighting factors **b1**, **b2**, and **b3** are called *barycentric coordinates*.

Barycentric coordinates express relative weights, meaning that **(k * b1)**, **(k * b2)**, and **(k * b3)** are also coordinates of the same point as **b1**, **b2**, and **b3** for any positive value of **k**.

If a set of barycentric coordinates is normalized so that **b1 + b2 + b3 = 1**, the resulting coordinates are unique for the point in question, and are known as *areal* coordinates. When normalized in this way, only two coordinates are needed, say **b2** and **b3**, since **b1** equals **(1 - b2 - b3)**.

What Vector4 Barycentric Does

The Vector4 [Barycentric](#) method takes three vectors specifying the Cartesian coordinates of the triangle vertices, **V1**, **V2**, and **V3**, and two areal coordinates **b2** and **b3** of some point **P** (**b2** is the *amount1* argument and **b3** is the *amount2* argument). The **b2** coordinate relates to vertex **V2**, and the **b3** coordinate relates to **V3**.

[Barycentric](#) then calculates the Cartesian coordinate of **P** as follows:

$$\begin{aligned}
 P_x &= ((1 - b_2 - b_3) * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}); \\
 P_y &= ((1 - b_2 - b_3) * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}); \\
 P_z &= ((1 - b_2 - b_3) * V_{1z}) + (b_2 * V_{2z}) + (b_3 * V_{3z}); \\
 P_w &= ((1 - b_2 - b_3) * V_{1w}) + (b_2 * V_{2w}) + (b_3 * V_{3w});
 \end{aligned}$$

Thus, to calculate the 3D Cartesian coordinates of **P**, you would pass the coordinates of the triangle vertices to [Barycentric](#) together with the appropriate normalized barycentric (areal) coordinates of **P**.

The following relationships may be useful.

- If $((amount1 \leq 0) \text{ and } (amount2 \geq 0) \text{ and } (1 - amount1 - amount2 \geq 0))$, then the point is inside the triangle defined by *value1*, *value2*, and *value3*.
- If $((amount1 == 0) \text{ and } (amount2 \geq 0) \text{ and } (1 - amount1 - amount2 \geq 0))$, then the point is on the line defined by *value1* and *value3*.
- If $((amount1 \geq 0) \text{ and } (amount2 == 0) \text{ and } (1 - amount1 - amount2 \geq 0))$, then the point is on the line defined by *value1* and *value2*.
- If $((amount1 \geq 0) \text{ and } (amount2 \geq 0) \text{ and } (1 - amount1 - amount2 == 0))$, then the point is on the line defined by *value2* and *value3*.

Barycentric coordinates are a form of general coordinates. In this context, using barycentric coordinates represents a change in coordinate systems. What holds true for Cartesian coordinates holds true for barycentric coordinates.

Vector4.Barycentric Method (Vector4, Vector4, Vector4, Single, Single, Vector4)

Returns a [Vector4](#) containing the 4D Cartesian coordinates of a point specified in Barycentric (areal) coordinates relative to a 4D triangle.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Barycentric (
    ref Vector4 value1,
    ref Vector4 value2,
    ref Vector4 value3,
    float amount1,
    float amount2,
    out Vector4 result
)
```

Parameters

value1

A [Vector4](#) containing the 4D Cartesian coordinates of vertex 1 of the triangle.

value2

A [Vector4](#) containing the 4D Cartesian coordinates of vertex 2 of the triangle.

value3

A [Vector4](#) containing the 4D Cartesian coordinates of vertex 3 of the triangle.

amount1

Barycentric coordinate **b2**, which expresses the weighting factor toward vertex 2 (specified in *value2*).

amount2

Barycentric coordinate **b3**, which expresses the weighting factor toward vertex 3 (specified in *value3*).

result

[[OutAttribute](#)] The 4D Cartesian coordinates of the specified point are placed in this [Vector4](#) on exit.

Remarks

About Barycentric Coordinates

Given a triangle with vertices **V1**, **V2**, and **V3**, any point **P** on the plane of that triangle can be specified by three weighting factors **b1**, **b2**, and **b3**, each of which indicates how much relative influence the corresponding triangle vertex contributes to the location of the point, as specified in the following formulas.

$$\begin{aligned} P_x &= (b_1 * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}); \\ P_y &= (b_1 * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}); \\ P_z &= (b_1 * V_{1z}) + (b_2 * V_{2z}) + (b_3 * V_{3z}); \\ P_w &= (b_1 * V_{1w}) + (b_2 * V_{2w}) + (b_3 * V_{3w}); \end{aligned}$$

Such triple weighting factors **b1**, **b2**, and **b3** are called *barycentric coordinates*.

Barycentric coordinates express relative weights, meaning that **(k * b1)**, **(k * b2)**, and **(k * b3)** are also coordinates of the same point as **b1**, **b2**, and **b3** for any positive value of **k**.

If a set of barycentric coordinates is normalized so that **b1 + b2 + b3 = 1**, the resulting coordinates are unique for the point in question, and are known as *areal* coordinates. When normalized in this way, only two coordinates are needed, say **b2** and **b3**, since **b1** equals **(1 - b2 - b3)**.

What Vector4 Barycentric Does

The **Vector4 Barycentric** method takes three vectors specifying the Cartesian coordinates of the triangle vertices, **V1**, **V2**, and **V3**, and two areal coordinates **b2** and **b3** of some point **P** (**b2** is the *amount1* argument and **b3** is the *amount2* argument). The **b2** coordinate relates to vertex **V2**, and the **b3** coordinate relates to **V3**.

Barycentric then calculates the Cartesian coordinate of **P** as follows:

$$\begin{aligned}
 P_x &= ((1 - b_2 - b_3) * V_{1x}) + (b_2 * V_{2x}) + (b_3 * V_{3x}) ; \\
 P_y &= ((1 - b_2 - b_3) * V_{1y}) + (b_2 * V_{2y}) + (b_3 * V_{3y}) ; \\
 P_z &= ((1 - b_2 - b_3) * V_{1z}) + (b_2 * V_{2z}) + (b_3 * V_{3z}) ; \\
 P_w &= ((1 - b_2 - b_3) * V_{1w}) + (b_2 * V_{2w}) + (b_3 * V_{3w}) ;
 \end{aligned}$$

Thus, to calculate the 3D Cartesian coordinates of **P**, you would pass the coordinates of the triangle vertices to **Barycentric** together with the appropriate normalized barycentric (areal) coordinates of **P**.

The following relationships may be useful.

- If ((*amount1* <= 0) and (*amount2* >= 0) and (1 - *amount1* - *amount2* >= 0)), then the point is inside the triangle defined by *value1*, *value2*, and *value3*.
- If ((*amount1* == 0) and (*amount2* >= 0) and (1 - *amount1* - *amount2* >= 0)), then the point is on the line defined by *value1* and *value3*.
- If ((*amount1* >= 0) and (*amount2* == 0) and (1 - *amount1* - *amount2* >= 0)), then the point is on the line defined by *value1* and *value2*.
- If ((*amount1* >= 0) and (*amount2* >= 0) and (1 - *amount1* - *amount2* == 0)), then the point is on the line defined by *value2* and *value3*.

Barycentric coordinates are a form of general coordinates. In this context, using barycentric coordinates represents a change in coordinate systems. What holds true for Cartesian coordinates holds true for barycentric coordinates.

Vector4.DistanceSquared Method (Vector4, Vector4)

Calculates the distance between two vectors squared.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static float DistanceSquared (  
    Vector4 value1,  
    Vector4 value2  
)
```

Parameters

value1

Source vector.

value2

Source vector.

Return Value

The distance between the source vectors squared.

Remarks

Distance is calculated with the following formula:

$$\sqrt{(a - b)^2}$$

Distance squared is the value before taking the square root. Distance squared can often be used in place of distance if relative comparisons are being made. For example, consider three points A, B, and C. To determine whether B or C is further from A, compare the distance between A and B to the distance between A and C. Calculating the two distances involves two square roots, which are computationally expensive. However, using distance squared provides the same information and avoids calculating two square roots.

Vector4.Hermite Method (Vector4, Vector4, Vector4, Vector4, Single, Vector4)

Performs a Hermite spline interpolation.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Hermite (  
    ref Vector4 value1,  
    ref Vector4 tangent1,  
    ref Vector4 value2,  
    ref Vector4 tangent2,  
    float amount,  
    out Vector4 result  
)
```

Parameters

value1

Source position vector.

tangent1

Source tangent vector.

value2

Source position vector.

tangent2

Source tangent vector.

amount

Weighting factor.

result

[[OutAttribute](#)] The result of the Hermite spline interpolation.

Vector4.Lerp Method

Performs a linear interpolation between two vectors.

Overload List

Name	Description
Vector4.Lerp (Vector4, Vector4, Single)	Performs a linear interpolation between two vectors.
Vector4.Lerp (Vector4, Vector4, Single, Vector4)	Performs a linear interpolation between two vectors.

See Also

Reference

[Vector4 Structure](#)

[Vector4 Members](#)

[Microsoft.Xna.Framework Namespace](#)

Vector4.Lerp Method (Vector4, Vector4, Single)

Performs a linear interpolation between two vectors.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector4 Lerp (  
    Vector4 value1,  
    Vector4 value2,  
    float amount  
)
```

Parameters

value1

Source vector.

value2

Source vector.

amount

Value between 0 and 1 indicating the weight of *value2*.

Return Value

The linear interpolation of the two vectors.

Remarks

This method performs the linear interpolation based on the following formula.

$$\text{value1} + (\text{value2} - \text{value1}) * \text{amount}$$

Passing *amount* a value of 0 will cause *value1* to be returned; a value of 1 will cause *value2* to be returned.

Vector4.op_Division Method (Vector4, Vector4)

Divides the components of a vector by the components of another vector.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector4 op_Division (  
    Vector4 value1,  
    Vector4 value2  
)
```

Parameters

value1

Source vector.

value2

Divisor vector.

Return Value

The result of dividing the vectors.

Remarks

Division of a vector by another vector is not mathematically defined. This method simply divides each component of *a* by the matching component of *b*.

Vector4.Transform (Vector3, Quaternion, Vector4)	Transforms a Vector3 by a specified Quaternion into a Vector4 .
Vector4.Transform (Vector4, Matrix)	Transforms a Vector4 by the specified Matrix .
Vector4.Transform (Vector4, Matrix, Vector4)	Transforms a Vector4 by the given Matrix .
Vector4.Transform (Vector4, Quaternion)	Transforms a Vector4 by a specified Quaternion .
Vector4.Transform (Vector4, Quaternion, Vector4)	Transforms a Vector4 by a specified Quaternion .
Vector4.Transform (Vector4[], Int32, Matrix, Vector4[], Int32, Int32)	Transforms a specified range in an array of Vector4 s by a specified Matrix into a specified range in a destination array.
Vector4.Transform (Vector4[], Int32, Quaternion, Vector4[], Int32, Int32)	Transforms a specified range in an array of Vector4 s by a specified Quaternion into a specified range in a destination array.
Vector4.Transform (Vector4[], Matrix, Vector4[])	Transforms an array of Vector4 s by a specified Matrix .
Vector4.Transform (Vector4[], Quaternion, Vector4[])	Transforms an array of Vector4 s by a specified Quaternion .

Vector4.Transform Method (Vector2, Matrix)

Transforms a [Vector2](#) by the given [Matrix](#).

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Vector4 Transform (  
    Vector2 position,  
    Matrix matrix  
)
```

Parameters

position

The source [Vector2](#).

matrix

The transformation [Matrix](#).

Return Value

The transformed [Vector4](#).

Vector4.Transform Method (Vector4[], Int32, Matrix, Vector4[], Int32, Int32)

Transforms a specified range in an array of [Vector4s](#) by a specified [Matrix](#) into a specified range in a destination array.

Namespace: Microsoft.Xna.Framework

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Transform (
    Vector4[] sourceArray,
    int sourceIndex,
    ref Matrix matrix,
    Vector4[] destinationArray,
    int destinationIndex,
    int length
)
```

Parameters

sourceArray

The array of [Vector4s](#) containing the range to transform.

sourceIndex

The index in the source array of the first [Vector4](#) to transform.

matrix

The transform [Matrix](#) to apply.

destinationArray

The existing destination array of [Vector4s](#) into which to write the results.

destinationIndex

The index in the destination array of the first result [Vector4](#) to write.

length

The number of [Vector4s](#) to transform.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<i>destinationArray</i> is too small to contain the result or the combination of <i>sourceIndex</i> and <i>length</i> was greater than <i>sourceArray.Length</i> .
ArgumentNullException	<i>sourceArray</i> or <i>destinationArray</i> is null .

Microsoft.Xna.Framework.Audio Namespace

Contains low-level application programming interface (API) methods that can load and manipulate XACT-created project and content files to play audio.

Classes

Name	Description
 AudioEmitter	Represents a 3D audio emitter.
 AudioEngine	Represents the audio engine. Applications use the methods of the audio engine to instantiate and manipulate core audio objects.
 AudioListener	Represents a 3D audio listener.
 Cue	Defines methods for managing the playback of sounds.
 InstancePlayLimitException	The exception that is thrown when there is an attempt to play more than 16 SoundEffectInstance sounds concurrently.
 NoAudioHardwareException	The exception that is thrown when no audio hardware is present, or when audio hardware is installed, but the device drivers for the audio hardware are not present or enabled.
 SoundBank	Represents a sound bank, which is a collection of cues.
 SoundEffect	Provides a loaded sound resource.
 SoundEffectInstance	Provides a single playing, paused, or stopped instance of a SoundEffect sound.
 WaveBank	Represents a wave bank, which is a collection of wave files.

Structures

Name	Description
 AudioCategory	Represents a particular category of sounds.
 RendererDetail	Represents an audio renderer, which is a device that can render audio to a user.

Enumerations

Name	Description
 AudioStopOptions	Controls how Cue objects should stop when Stop is called.
 SoundState	Current state (playing, paused, or stopped) of a SoundEffectInstance .

AudioCategory Members

The following tables list the members exposed by the AudioCategory type.

Public Properties

	Name	Description
	Name	Specifies the friendly name of this category.

Public Methods

	Name	Description
	Equals	Overloaded. Determines whether two instances of AudioCategory are equal.
	GetHashCode	Gets the hash code for this instance.
	GetType	(Inherited from Object .)
	Sop_Equality	Determines whether the specified AudioCategory instances are equal.
	Sop_Inequality	Determines whether the specified AudioCategory instances are not equal.
	Pause	Pauses all sounds associated with this category.
	ReferenceEquals	(Inherited from Object .)
	Resume	Resumes all paused sounds associated with this category.
	SetVolume	Sets the volume of all sounds associated with this category.
	Stop	Stops all sounds associated with this category.
	ToString	Returns a String representation of this AudioCategory .

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

AudioCategory.Equals Method (AudioCategory)

Determines whether the specified [AudioCategory](#) is equal to this [AudioCategory](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    AudioCategory other  
)
```

Parameters

other

[AudioCategory](#) to compare with this instance.

Return Value

true if the objects are equal; **false** otherwise.

AudioCategory.Equals Method (Object)

Determines whether the specified [Object](#) is equal to this [AudioCategory](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

[Object](#) to compare with this instance.

Return Value

true if the objects are equal; **false** otherwise.

AudioCategory.op_Equality Method

Determines whether the specified [AudioCategory](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    AudioCategory value1,  
    AudioCategory value2  
)
```

Parameters

value1

Object to the left of the equality operator.

value2

Object to the right of the equality operator.

Return Value

true if the objects are equal; **false** otherwise.

See Also

AudioCategory.op_Inequality Method

Determines whether the specified [AudioCategory](#) instances are not equal.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    AudioCategory value1,  
    AudioCategory value2  
)
```

Parameters

value1

Object to the left of the inequality operator.

value2

Object to the right of the inequality operator.

Return Value

true if the objects are not equal; **false** otherwise.

AudioCategory.SetVolume Method

Sets the volume of all sounds associated with this category.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetVolume (  
    float volume  
)
```

Parameters

volume

Volume amplitude multiplier. *volume* is normally between 0.0 (silence) and 1.0 (full volume), but can range from 0.0f to `float.MaxValue`.

Volume levels map to decibels (dB) as shown in the following table.

Volume	Description
0.0f	-96 dB (silence)
1.0f	+0 dB (full volume as authored)
2.0f	+6 dB (6 dB greater than authored)

AudioCategory.Stop Method

Stops all sounds associated with this category.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Stop (  
    AudioStopOptions options  
)
```

Parameters

options

Enumerated value specifying how the sounds should be stopped.

AudioEmitter Members

The following tables list the members exposed by the AudioEmitter type.

Public Constructors

Name	Description
 AudioEmitter	Initializes a new instance of this class.

Public Properties

Name	Description
 DopplerScale	Gets or sets a scalar applied to the level of Doppler effect calculated between this and any AudioListener .
 Forward	Gets or sets the forward orientation vector for this emitter.
 Position	Gets or sets the position of this emitter.
 Up	Gets or sets the upward orientation vector for this emitter.
 Velocity	Gets or sets the velocity vector of this emitter.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

	Up	Gets or sets the upward orientation vector for this emitter.
	Velocity	Gets or sets the velocity vector of this emitter.

See Also

Reference

[AudioEmitter Class](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

AudioEmitter.DopplerScale Property

Gets or sets a scalar applied to the level of Doppler effect calculated between this and any [AudioListener](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float DopplerScale { get; set; }
```

Property Value

The Doppler scale value.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	The doppler scale of an audio emitter must be greater than or equal to zero.

Remarks

By default, this value is 1.0.

This value determines how much to modify the calculated Doppler effect between this object and a [AudioListener](#). Values below 1.0 scale down the Doppler effect to make it less apparent. Values above 1.0 exaggerate the Doppler effect. A value of 1.0 leaves the effect unmodified.

Note that this value modifies only the calculated Doppler between this object and a [AudioListener](#). The calculated Doppler is a product of the relationship between [AudioEmitter.Velocity](#) and [AudioListener.Velocity](#). If the calculation yields a result of no Doppler effect, this value has no effect.

See Also

Reference

[AudioEmitter Class](#)

[AudioEmitter Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AudioEmitter.Forward Property

Gets or sets the forward orientation vector for this emitter.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 Forward { get; set; }
```

Property Value

The forward orientation vector.

Remarks

By default, this value is [Vector3.Forward](#). In most cases, it is not necessary to modify this value.

Doppler values between an [AudioEmitter](#) and an [AudioListener](#) are calculated by the relationship between [AudioListener.Velocity](#) and [AudioEmitter.Velocity](#) with respect to the axes defined by the [Forward](#) and [Up](#) vectors of each.

The values of the [Forward](#) and [Up](#) vectors must be orthonormal (at right angles to one another). Behavior is undefined if these vectors are not orthonormal.

See Also

Reference

[AudioEmitter Class](#)

[AudioEmitter Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AudioEmitter.Position Property

Gets or sets the position of this emitter.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 Position { get; set; }
```

Property Value

The position vector.

Remarks

By default, the value of this property is [Vector3.Zero](#).

The relative positions of an [AudioEmitter](#) and an [AudioListener](#) are used to determine speaker positioning of a sound.

See Also

Tasks

[How To: Apply Basic 3D Positional Effects to a SoundEffect](#)

[How To: Apply Basic 3D Positional Effects to a Cue](#)

Reference

[AudioEmitter Class](#)

[AudioEmitter Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AudioEmitter.Up Property

Gets or sets the upward orientation vector for this emitter.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 Up { get; set; }
```

Property Value

The upward orientation vector.

Remarks

By default, this value is [Vector3.Up](#). In most cases, it is not necessary to modify this value.

Doppler values between an [AudioEmitter](#) and an [AudioListener](#) are calculated by the relationship between [AudioListener.Velocity](#) and [AudioEmitter.Velocity](#) with respect to the axes defined by the [Forward](#) and [Up](#) vectors of each.

The values of the [Forward](#) and [Up](#) vectors must be orthonormal (at right angles to one another). Behavior is undefined if these vectors are not orthonormal.

See Also

Reference

[AudioEmitter Class](#)

[AudioEmitter Members](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AudioEmitter.Velocity Property

Gets or sets the velocity vector of this emitter.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 Velocity { get; set; }
```

Property Value

The velocity vector.

Remarks

By default, the value of this property is [Vector3.Zero](#).

The Doppler effect value applied to a [Cue](#) is based on the relative [Velocity](#) values of the [AudioEmitter](#) and [AudioListener](#), scaled by the [DopplerScale](#) value.

The [Velocity](#) property is used only to calculate Doppler values. It is not applied to the [Position](#) vector or otherwise used to set game state. You must set [Velocity](#) and [Position](#) each frame to maintain accurate 3D audio values in your game.

AudioEngine Constructor (String)

Initializes a new instance of this class, using a path to an XACT global settings file.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public AudioEngine (  
    string settingsFile  
)
```

Parameters

settingsFile

Path to a global settings file.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>settingsFile</i> parameter is null .
ArgumentException	XACT could not load the data provided. Make sure you are using the correct version of the XACT tool.
InvalidOperationException	The engine could not be created.

See Also

Reference

[AudioEngine Class](#)

[AudioEngine Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

AudioEngine Constructor (String, TimeSpan, String)

Initializes a new instance of this class, using a settings file, a specific audio renderer, and a specific speaker configuration.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public AudioEngine (
    string settingsFile,
    TimeSpan lookAheadTime,
    string rendererId
)
```

Parameters

settingsFile

Path to a global settings file.

lookAheadTime

Interactive audio and branch event look-ahead time, in milliseconds.

rendererId

A string that specifies the audio renderer to use.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>settingsFile</i> parameter is null .
ArgumentException	XACT could not load the data provided. Make sure you are using the correct version of the XACT tool.
InvalidOperationException	The engine could not be created.

Remarks

The *lookAheadTime* parameter specifies how far ahead the audio engine will look when determining when to transition to another sound. For sounds linked to Play events that use a wave variation list, this parameter should be set to greater than 250 milliseconds. Doing so should give the audio engine enough time to prepare streamed data before it is needed for the loop iteration.

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 Velocity { get; set; }
```

Property Value

The velocity vector.

Remarks

By default, the value of this property is [Vector3.Zero](#).

The Doppler effect value applied to a [Cue](#) is based on the relative [Velocity](#) values of the [AudioEmitter](#) and [AudioListener](#), scaled by the [DopplerScale](#) value.

The [Velocity](#) property is used only to calculate Doppler values. It is not applied to the [Position](#) vector or otherwise used to set game state. You must set [Velocity](#) and [Position](#) each frame to maintain accurate 3D audio values in your game.

AudioStopOptions Enumeration

Controls how [Cue](#) objects should stop when [Stop](#) is called.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum AudioStopOptions
```

Members

Member name	Description
AsAuthored	Indicates the cue should stop normally, playing any release phase or transition specified in the content.
Immediate	Indicates the cue should stop immediately, ignoring any release phase or transition specified in the content.

Cue Class

Defines methods for managing the playback of sounds.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class Cue : IDisposable
```

Remarks

Cues are what programmers use to play sounds. Cues are typically played when certain game events occur, such as footsteps or gunshots. A cue is composed of one or more sounds, so when the cue is triggered, the set of associated sounds is heard.

A sound specifies how one or more waves should be played. A sound also has specific properties such as volume and pitch. The sound designer can adjust these properties.

The advantage to using the Audio API to reference cues rather than specific sounds is that an audio designer can reassign sounds to a cue in the sound bank without programmer intervention. For example, a sound designer can try various gunshot waves associated with a particular game event without requiring the programmer to change code or rename sounds.

Cues and sounds are referenced through [SoundBank](#) objects. The waves that compose a sound are referenced through [WaveBank](#) objects.

Cue Members

The following tables list the members exposed by the Cue type.

Public Properties

Name	Description
 IsCreated	Returns whether the cue has been created.
 IsDisposed	Gets a value indicating whether the object has been disposed.
 IsPaused	Returns whether the cue is currently paused.
 IsPlaying	Returns whether the cue is playing.
 IsPrepared	Returns whether the cue is prepared to play.
 IsPreparing	Returns whether the cue is preparing to play.
 IsStopped	Returns whether the cue is currently stopped.
 IsStopping	Returns whether the cue is stopping playback.
 Name	Returns the friendly name of the cue.

Public Methods

Name	Description
 Apply3D	Calculates the 3D audio values between an AudioEmitter and an AudioListener object, and applies the resulting values to this Cue .
 Dispose	Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 GetVariable	Gets a cue-instance variable value based on its friendly name.
 Pause	Pauses playback.
 Play	Requests playback of a prepared or preparing Cue .
 ReferenceEquals	(Inherited from Object .)
 Resume	Resumes playback of a paused Cue .
 SetVariable	Sets the value of a cue-instance variable based on its friendly name.
 Stop	Stops playback of a Cue .
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	Releases unmanaged resources and performs other cleanup operations before garbage collection reclaims the Cue .
 MemberwiseClone	(Inherited from Object .)

Public Events

Name	Description
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime (CLR).

Reference

[Cue Class](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Cue.Apply3D Method

Calculates the 3D audio values between an [AudioEmitter](#) and an [AudioListener](#) object, and applies the resulting values to this [Cue](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Apply3D (
    AudioListener listener,
    AudioEmitter emitter
)
```

Parameters

listener

The listener to calculate.

emitter

The emitter to calculate.

Exceptions

Exception type	Condition
ArgumentNullException	Both <i>listener</i> and <i>emitter</i> must be non- null .
InvalidOperationException	You must call the Cue.Apply3D method before you call the Cue.Play method.

Remarks

If you want to apply 3D effects to a [Cue](#), you must call this method before you call the [Play](#) method. Not doing so will throw an exception the next time [Apply3D](#) is called.

Calling this method automatically sets the speaker mix for any sound played by this cue to a value calculated by the difference in [Position](#) values between *listener* and *emitter*. In preparation for the mix, the sound is converted to monoaural. Any stereo information in the sound is discarded.

Calling this method sets the cue-instance variables *Distance*, *DopplerPitchScalar*, and *OrientationAngle* to the resulting values of the 3D calculation between *listener* and *emitter*. These values do not modify sound attenuation over distance, or pitch shifting via Doppler values, on their own. You must set up a Runtime Parameter Curve (RPC) that defines how to map the cue-instance variable values to pitch and volume shifts, and associate sounds to these curves in the Microsoft Cross-Platform Audio Creation Tool (XACT). For information on doing so, see [How To: Apply Attenuation and Doppler 3D Audio Effects](#).

Example

When first retrieving a [Cue](#) object using [SoundBank.GetCue](#), you must call [Cue.Apply3D](#) before calling [Cue.Play](#), if you want to apply 3D effects to the cue.

C#

```
// 3D audio objects
AudioEmitter emitter = new AudioEmitter();
AudioListener listener = new AudioListener();
Cue cue;

protected override void Initialize()
{
    base.Initialize();

    // Initialize audio objects
    engine = new AudioEngine("Content\\Audio\\3DAudio.xgs");
    soundBank = new SoundBank(engine, "Content\\Audio\\Sound Bank.xsb");
    waveBank = new WaveBank(engine, "Content\\Audio\\Wave Bank.xwb");

    // Get the cue and play it.
    // For 3D cues, you must call Apply3D before calling Play.
    cue = soundBank.GetCue("buzz");
    cue.Apply3D(listener, emitter);
```

```
    cue.Play();  
}
```

Once you have called [Cue.Apply3D](#) then [Cue.Play](#), you can call [Cue.Apply3D](#) each [Game.Update](#) loop after specifying new positions and velocities for the *listener* and *emitter* objects.

C#

```
protected override void Update(GameTime gameTime)  
{  
    // Allow the game to exit.  
    if (GamePad.GetState(PlayerIndex.One).Buttons.Back ==  
        ButtonState.Pressed)  
        this.Exit();  
  
    // Move the object around in a circle.  
    Vector3 objectPos = new Vector3(  
        (float)Math.Cos(gameTime.TotalGameTime.Seconds) / 2,  
        0,  
        (float)Math.Sin(gameTime.TotalGameTime.Seconds));  
  
    // Apply 3D settings to the cue.  
    emitter.Position = objectPos;  
    cue.Apply3D(listener, emitter);  
  
    // Update the audio engine  
    engine.Update();  
  
    base.Update(gameTime);  
}
```

Reference

[Cue Class](#)

[Cue Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

Cue.Dispose Method

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[Cue Class](#)

[Cue Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

Cue.Finalize Method

Releases unmanaged resources and performs other cleanup operations before garbage collection reclaims the [Cue](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [FinalizeSystem.Object.Finalize](#). Application code should not call this method. The object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

For more information, see [Finalize Methods and Destructors, Cleaning Up Unmanaged Resources](#), and [Overriding the Finalize Method](#).

Cue.GetVariable Method

Gets a cue-instance variable value based on its friendly name.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float GetVariable (  
    string name  
)
```

Parameters

name

Friendly name of the variable.

Return Value

Value of the variable.

Remarks

Cue-instance variables are useful when multiple instantiations of a single cue (and its associated sounds) are required (for example, a "car" cue where there may be more than one car at any given time). While a global variable allows multiple audio elements to be controlled in unison, a cue instance variable grants discrete control of each instance of a cue, even for each copy of the same cue.

The friendly name is a text string that the designer can associate with the cue when it is built.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>name</i> parameter is null .

Cue.SetVariable Method

Sets the value of a cue-instance variable based on its friendly name.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetVariable (  
    string name,  
    float value  
)
```

Parameters

name

Friendly name of the variable to set.

value

Value to assign to the variable.

RemarksThe friendly name is a text string that the designer can associate with the cue when it is built.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>name</i> parameter is null .

Cue.Stop Method

Stops playback of a [Cue](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Stop (  
    AudioStopOptions options  
)
```

Parameters

options

Enumerated value specifying how the sound should stop. If set to **None**, the sound will play any release phase or transition specified in the audio designer. If set to **Immediate**, the sound will stop immediately, ignoring any release phases or transitions.

Returns whether the cue is prepared to play.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsPrepared { get; }
```

Property Value

true if the cue is prepared to play; **false** otherwise.

Remarks

This property returns **true** only if the cue is prepared but has not yet been played. Cues that are played return **true** for [IsPlaying](#) if they are currently playing or **true** for [IsStopped](#) if they are stopped.

InstancePlayLimitException Class

The exception that is thrown when there is an attempt to play more than 16 [SoundEffectInstance](#) sounds concurrently.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[SerializableAttribute]  
public sealed class InstancePlayLimitException : ExternalException
```

Remarks

Only 16 [SoundEffectInstance](#) sounds can be playing at one time. If an attempt is made to play more than 16, this exception is thrown. Paused or stopped [SoundEffectInstance](#) objects do not count against this limit.

InstancePlayLimitException Constructor (String)

Initializes a new instance of the [InstancePlayLimitException](#) class with a specified error message.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public InstancePlayLimitException (  
    string message  
)
```

Parameters

message

A [String](#) that describes the error. The content of *message* is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

Remarks

The [Message](#) property of the new instance is initialized to *message*.

The [InnerException](#) property of the new instance is initialized to **null**.

InstancePlayLimitException Constructor (String, Exception)

Initializes a new instance of the [InstancePlayLimitException](#) class with a specified error message and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public InstancePlayLimitException (  
    string message,  
    Exception inner  
)
```

Parameters

message

Error message that explains the reason for the exception.

inner

[Exception](#) that is the cause of the current exception. If *innerException* is not **null**, the current exception is raised in a catch block that handles the inner exception.

[NoAudioHardwareException Class](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

NoAudioHardwareException Constructor

Initializes a new instance of this class.

Overload List

Name	Description
NoAudioHardwareException ()	Initializes a new instance of this class.
NoAudioHardwareException (String)	Initializes a new instance of this class with a specified error message.
NoAudioHardwareException (String, Exception)	Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

NoAudioHardwareException Constructor (String)

Initializes a new instance of this class with a specified error message.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public NoAudioHardwareException (  
    string message  
)
```

Parameters

message

A message that describes the error.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

NoAudioHardwareException Constructor (String, Exception)

Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public NoAudioHardwareException (  
    string message,  
    Exception inner  
)
```

Parameters

message

A message that describes the error.

inner

The exception that is the cause of the current exception. If the *inner* parameter is not a null reference, the current exception is raised in a catch block that handles the inner exception.

RendererDetail.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

Object to compare to this object.

Return Value

true if the objects are the same; **false** otherwise.

See Also

RendererDetail.op_Equality Method

Compares two objects to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    RendererDetail left,  
    RendererDetail right  
)
```

Parameters

left

Object to the left of the equality operator.

right

Object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

See Also

Reference

RendererDetail.op_Inequality Method

Compares two objects to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    RendererDetail left,  
    RendererDetail right  
)
```

Parameters

left

Object to the left of the inequality operator.

right

Object to the right of the inequality operator.

Return Value

true if the objects are different; **false** otherwise.

SoundBank Constructor

Initializes a new instance of this class using a sound bank from file.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SoundBank (  
    AudioEngine audioEngine,  
    string filename  
)
```

Parameters

audioEngine

Audio engine that will be associated with this sound bank.

filename

Path to the sound bank file.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>audioEngine</i> or <i>filename</i> parameter is null .
ArgumentException	XACT could not load the data provided. Make sure you are using the correct version of the XACT tool.
InvalidOperationException	Unable to create the SoundBank resource.

SoundBank.GetCue Method

Gets a cue from the sound bank.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Cue GetCue (
    string name
)
```

Parameters

name

Friendly name of the cue to get.

Return Value

Cue object.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>name</i> parameter is null .

Remarks

Each [Cue](#) instance that you retrieve is unique, even when retrieving multiple cues with the same name. This allows multiple instances of the same [Cue](#) to exist and play simultaneously.

The [Cue](#) instance that you retrieve using this method is valid only as long as it is in scope. If the [Cue](#) instance is allowed to go out of scope, such as in the case of the [Cue](#) being retrieved and played without otherwise being stored, the [Cue](#) is marked to be disposed by the garbage collector. This will result in the [Cue](#) stopping playback at an indeterminate time when the garbage collector disposes of the [Cue](#). To prevent this behavior, store [Cue](#) objects to prevent them from falling out of scope. Alternatively, you can call [PlayCue](#) to play a cue immediately that will not fall out of scope.

SoundBank.PlayCue Method

Plays a cue.

Overload List

Name	Description
SoundBank.PlayCue (String)	Plays a cue.
SoundBank.PlayCue (String, AudioListener, AudioEmitter)	Plays a cue using 3D positional information specified in an AudioListener and AudioEmitter .

See Also

Tasks

[How To: Play a Sound Using XACT](#)

Reference

[SoundBank Class](#)

[SoundBank Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

SoundBank.PlayCue Method (String)

Plays a cue.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void PlayCue (  
    string name  
)
```

Parameters

name

Name of the cue to play.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>name</i> parameter is null .
InvalidOperationException	The <i>name</i> parameter specifies a cue that does not exist.

Remarks

Each [Cue](#) instance that you play is unique, even when playing multiple cues with the same name. This allows multiple instances of the same [Cue](#) to play simultaneously.

Calling this method does not return a [Cue](#) object. Therefore, once the cue has started playing, it cannot be controlled through any methods of [Cue](#), such as [Stop](#), [Pause](#), or [Resume](#). The cue will play until its authored end, at which point it will be released.

Because no [Cue](#) object is retrieved, cues played using this method are also unable to use [Apply3D](#) to apply 3D effects to the cue. To retrieve a cue that you can control during playback, or apply 3D effects to, use [GetCue](#).

[SoundBank.PlayCue Method](#)

[SoundBank Class](#)

[SoundBank Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

SoundBank.PlayCue Method (String, AudioListener, AudioEmitter)

Plays a cue using 3D positional information specified in an [AudioListener](#) and [AudioEmitter](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void PlayCue (
    string name,
    AudioListener listener,
    AudioEmitter emitter
)
```

Parameters

name

Name of the cue to play.

listener

[AudioListener](#) that specifies listener 3D audio information.

emitter

[AudioEmitter](#) that specifies emitter 3D audio information.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>name</i> parameter is null .
InvalidOperationException	The <i>name</i> parameter specifies a cue that does not exist.

Remarks

The 3D audio information in the specified *listener* and *emitter* is used to initialize the cue instance and apply a static positional 3D audio effect (the direction from which the player hears the sound). Position and velocity are *not* updated over time; the 3D audio effects are calculated based on the emitter and listener position at the time of the call. Typically, this is used for short-lived sounds, or when the object and listener are stationary for the duration of the sound but placed somewhere in the world space.

For example, a sound that is played off to the right will continue to sound as if it is coming from the right, even if the listener moves or turns. For very short sounds, this may be imperceptible and thus acceptable. As another example, a voice that comes from the player's vehicle will always be the same distance and direction relative to the player, so static positioning in this case would be correct.

Attenuation and doppler effects, if enabled, will also be static for the duration of the sound.

To enable dynamic 3D audio when the emitter or listener are moving, use [GetCue](#) and [Apply3D](#) instead.

Each [Cue](#) instance that you play is unique, even when playing multiple cues with the same name. This allows multiple instances of the same [Cue](#) to play simultaneously.

Calling this method does not return a [Cue](#) object. Therefore, once the cue has started playing, it cannot be controlled through any methods of [Cue](#), such as [Stop](#), [Pause](#), or [Resume](#). The cue will play until its authored end, at which point it will be released.

Because no [Cue](#) object is retrieved, cues played using this method are also unable to use [Apply3D](#) to apply dynamic 3D effects to the cue. To retrieve a cue that you can control during playback, or apply dynamic 3D effects to, use [GetCue](#).

For more information about 3D audio, see [How To: Apply Basic 3D Positional Effects to a Cue](#) and [How To: Apply Attenuation and Doppler 3D Audio Effects](#).

Platforms Xbox 360, Windows XP SP2, Windows Vista

SoundBank.IsInUse Property

Returns whether the sound bank is currently in use.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsInUse { get; }
```

Property Value

true if the sound bank is in use; **false** otherwise.

Remarks

This value will return **true** if the sound bank is currently referenced by at least one valid cue instance or other client. For example, the game itself might reference the sound bank.

SoundEffect Class

Provides a loaded sound resource. You can play multiple instances of the **SoundEffect** by calling [Play](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class SoundEffect : IDisposable
```

Remarks

A **SoundEffect** contains the audio data and metadata (such as wave data and loop information) loaded from a sound file. You can create multiple [SoundEffectInstance](#) objects, and play them from a single **SoundEffect**. These objects share the resources of that **SoundEffect**.

You can create a **SoundEffect** by calling [ContentManager.Load](#). When you make that call, use the type **SoundEffect** and the asset name of an audio file. The audio file must be part of the **Content** project. Be sure to use the **SoundEffect - XNA Framework** content processor.

The only limit to the number of loaded **SoundEffect** objects is memory. A loaded **SoundEffect** will continue to hold its memory resources throughout its lifetime. All [SoundEffectInstance](#) objects created from a **SoundEffect** share memory resources. When a **SoundEffect** object is destroyed, all [SoundEffectInstance](#) objects previously created by that **SoundEffect** will stop playing and become invalid.

SoundEffect Members

The following tables list the members exposed by the SoundEffect type.

Public Properties

	Name	Description
	S DistanceScale	Gets or sets a value that adjusts the effect of distance calculations on the sound (emitter).
	S DopplerScale	Gets or sets a value that adjusts the effect of doppler calculations on the sound (emitter).
	Duration	Gets the duration of the SoundEffect .
	IsDisposed	Gets a value that indicates whether the object is disposed.
	S MasterVolume	Gets or sets the master volume that affects all SoundEffectInstance sounds.
	Name	Gets or sets the asset name of the SoundEffect .
	S SpeedOfSound	Returns the speed of sound: 343.5 meters per second.

Public Methods

	Name	Description
	CreateInstance	Creates a new SoundEffectInstance for this SoundEffect .
	Dispose	Releases the resources used by the SoundEffect .
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	Play	Overloaded. Plays this sound.
	Play3D	Overloaded. Returns a playing SoundEffectInstance (XNA Game Studio 3.0 only).
	ReferenceEquals	(Inherited from Object .)
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	Releases unmanaged resources and performs other cleanup operations before the SoundEffect is reclaimed by garbage collection.
	MemberwiseClone	(Inherited from Object .)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SoundEffect.Dispose Method

Releases the resources used by the [SoundEffect](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call **Dispose** only when you are finished using the **SoundEffect**. The **Dispose** method leaves the **SoundEffect** in an unusable state. After calling **Dispose**, you must release all references to the **SoundEffect** in order for the garbage collector to reclaim the memory that the **SoundEffect** was occupying. For more information, see [Cleaning Up Unmanaged Resources](#) and [Implementing a Dispose Method](#).

SoundEffect.Finalize Method

Releases unmanaged resources and performs other cleanup operations before the [SoundEffect](#) is reclaimed by garbage collection.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [FinalizeSystem.Object.Finalize](#). Application code should not call this method. The object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

For more information, see [Finalize Methods and Destructors, Cleaning Up Unmanaged Resources](#), and [Overriding the Finalize Method](#).

SoundEffect.Play Method

Plays this sound.

Overload List

Name	Description
SoundEffect.Play ()	Creates a new SoundEffectInstance , and plays it.
SoundEffect.Play (Single)	Creates a new SoundEffectInstance , and plays it at the specified volume (XNA Game Studio 3.0 only).
SoundEffect.Play (Single, Single, Single)	Creates a new SoundEffectInstance , and plays it using the specified volume, pitch, and panning.
SoundEffect.Play (Single, Single, Single, Boolean)	Creates a new SoundEffectInstance , and plays it using the specified volume, pitch, panning, and loop control (XNA Game Studio 3.0 only).

SoundEffect.Play Method ()

Creates a new [SoundEffectInstance](#), and plays it.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Play ()
```

Return Value

true if the sound is playing back successfully; otherwise, **false**.

Remarks

Play will return **false** if there are too many sounds already playing.

To loop a sound or apply 3D effects, call [CreateInstance](#) instead of **Play**, and [SoundEffectInstance.Play](#).

SoundEffect.Play Method (Single)

Creates a new [SoundEffectInstance](#), and plays it at the specified volume (XNA Game Studio 3.0 only).

⚠ Caution

This method is available only when developing for XNA Game Studio 3.0.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SoundEffectInstance Play (  
    float volume  
)
```

Parameters

volume

Volume, ranging from 0.0f (silence) to 1.0f (full volume). 1.0f is full volume relative to [SoundEffect.MasterVolume](#).

Return Value

A new, playing, [SoundEffectInstance](#).

See Also

Reference

SoundEffect.Play Method (Single, Single, Single)

Creates a new [SoundEffectInstance](#), and plays it using the specified volume, pitch, and panning.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Play (  
    float volume,  
    float pitch,  
    float pan  
)
```

Parameters

volume

Volume, ranging from 0.0f (silence) to 1.0f (full volume). 1.0f is full volume relative to [SoundEffect.MasterVolume](#).

pitch

Pitch adjustment, ranging from -1.0f (down one octave) to 1.0f (up one octave). 0.0f is unity (normal) pitch.

pan

Panning, ranging from -1.0f (full left) to 1.0f (full right). 0.0f is centered.

Return Value

true if the sound is playing back successfully; otherwise, **false**.

Remarks

Play will return **false** if there are too many sounds already playing.

To loop a sound or apply 3D effects, call [CreateInstance](#) instead of **Play**, and [SoundEffectInstance.Play](#).

SoundEffect.Play Method (Single, Single, Single, Boolean)

Creates a new [SoundEffectInstance](#), and plays it using the specified volume, pitch, panning, and loop control (XNA Game Studio 3.0 only).

⚠Caution

This method is available only when developing for XNA Game Studio 3.0. For XNA Game Studio 3.1 or later, please use [SoundEffectInstance.IsLooped](#). For more information, please see [How To: Loop a Sound](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SoundEffectInstance Play (  
    float volume,  
    float pitch,  
    float pan,  
    bool loop  
)
```

Parameters

volume

Volume, ranging from 0.0f (silence) to 1.0f (full volume). 1.0f is full volume relative to [SoundEffect.MasterVolume](#).

pitch

Pitch adjustment, ranging from -1.0f (down one octave) to 1.0f (up one octave). 0.0f is unity (normal) pitch.

pan

Panning, ranging from -1.0f (full left) to 1.0f (full right). 0.0f is centered.

loop

Whether to loop the sound indefinitely, until stopped by the application. Specify **true** to continuously loop the sound's loop region, or **false** to play the entire sound just once.

Return Value

A new, playing, [SoundEffectInstance](#).

Remarks

If *loop* is **true**, the sound's loop region will play continuously until stopped with a call to [Stop](#) or [Pause](#) on the returned [SoundEffectInstance](#). The loop region as authored in the sound file is used. If the sound file has no loop region, the entire sound is looped.

Returns a playing [SoundEffectInstance](#) at the specified position using the specified values for volume, pitch, and looping (XNA Game Studio 3.0 only).

⚠Caution

This method is available only when developing for XNA Game Studio 3.0. For XNA Game Studio 3.1 or later, please use [SoundEffectInstance.Apply3D](#). For more information, please see [How To: Apply Basic 3D Positional Effects to a SoundEffect](#).

📌Zune Specific Information

3D audio is not supported. All 3D audio effects are mapped to the volume and pan properties used by [SoundEffectInstance Properties](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SoundEffectInstance Play3D (  
    AudioListener listener,  
    AudioEmitter emitter,  
    float volume,  
    float pitch,  
    bool loop  
)
```

Parameters

listener

Listener position.

emitter

Position of the emitter.

volume

Volume to use when beginning playback. Ranging from 0.0f (silence) to 1.0f (full volume). 1.0f is full volume relative to [SoundEffect.MasterVolume](#).

pitch

Pitch adjustment, ranging from -1.0f (down one octave) to 1.0f (up one octave). 0.0f is unity (normal) pitch.

loop

Whether to loop the sound indefinitely, until stopped by the application. Specify **true** to continuously loop the sound's loop region, or **false** to play the entire sound just once.

Return Value

A playing [SoundEffectInstance](#) at the specified position using the specified values for volume, pitch, and looping.

SoundEffect.Play3D Method (AudioListener[], AudioEmitter, Single, Single, Boolean)

Returns a playing [SoundEffectInstance](#) at the specified positions using the specified values for volume, pitch, and looping (XNA Game Studio 3.0 only).

⚠Caution

This method is available only when developing for XNA Game Studio 3.0. For XNA Game Studio 3.1 or later, please use [SoundEffectInstance.Apply3D](#). For more information, please see [How To: Apply Basic 3D Positional Effects to a SoundEffect](#).

📌Zune Specific Information

3D audio is not supported. All 3D audio effects are mapped to the volume and pan properties used by [SoundEffectInstance Properties](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SoundEffectInstance Play3D (  
    AudioListener[] listeners,  
    AudioEmitter emitter,  
    float volume,  
    float pitch,  
    bool loop  
)
```

Parameters

listeners

Positions of each listener.

emitter

Position of the emitter.

volume

Volume to use when beginning playback. Ranging from 0.0f (silence) to 1.0f (full volume). 1.0f is full volume relative to [SoundEffect.MasterVolume](#).

pitch

Pitch adjustment, ranging from -1.0f (down one octave) to 1.0f (up one octave). 0.0f is unity (normal) pitch.

loop

Whether to loop the sound indefinitely, until stopped by the application. Specify **true** to continuously loop the sound's loop region, or **false** to play the entire sound just once.

Return Value

A playing [SoundEffectInstance](#) at the specified positions using the specified values for volume, pitch, and looping.

Remarks

Use this method when there is more than one [AudioListener](#) listening. For example, this can be useful for split screen games when there are two players in the game world at the same time.

SoundEffect Properties

Public Properties

	Name	Description
 S	DistanceScale	Gets or sets a value that adjusts the effect of distance calculations on the sound (emitter).
 S	DopplerScale	Gets or sets a value that adjusts the effect of doppler calculations on the sound (emitter).
	Duration	Gets the duration of the SoundEffect .
	IsDisposed	Gets a value that indicates whether the object is disposed.
 S	MasterVolume	Gets or sets the master volume that affects all SoundEffectInstance sounds.
	Name	Gets or sets the asset name of the SoundEffect .
 S	SpeedOfSound	Returns the speed of sound: 343.5 meters per second.

See Also

Reference

[SoundEffect Class](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

SoundEffect.DistanceScale Property

Gets or sets a value that adjusts the effect of distance calculations on the sound (emitter).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static float DistanceScale { get; set; }
```

Property Value

A value that adjustments the effect of Distance and Doppler calculations on the sound (emitter).

Remarks

If sounds are attenuating too fast, which means the sounds get quiet too quickly as they move away from the listener, you need to increase the DistanceScale. If sounds are not attenuating fast enough, decrease the DistanceScale.

Adjustment	Effect
DistanceScale = 0.0	Invalid (DistanceScale will be reset to default of 1.0)
0.0 < DistanceScale <= 1.0	Increases the effect of distance attenuation
DistanceScale = 1.0	No scaling (this is the default setting)
DistanceScale > 1.0	Decrease the effect of distance attenuation

Distance attenuation is calculated using the inverse square law:

$$\text{volume} = 1.0 / \text{distance}$$

Adding DistanceScale into the equations give:

```
If (distance > DistanceScale)
volume = DistanceScale / distance
else
volume = 1.0
```

See Also

Reference

[SoundEffect Class](#)

[SoundEffect Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SoundEffect.DopplerScale Property

Gets or sets a value that adjusts the effect of doppler calculations on the sound (emitter).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static float DopplerScale { get; set; }
```

Property Value

A value that adjusts the effect of doppler calculations on the sound (emitter).

Remarks

DopplerScale changes the relative velocities of emitters and listeners.

If sounds are shifting (pitch) too much for the given relative velocity of the emitter and listener, decrease the DopplerScale. If sounds are not shifting enough for the given relative velocity of the emitter and listener, increase the DopplerScale.

Adjustment	Effect
DopplerScale = 0	No Doppler will be applied
$0.0 < \text{DopplerScale} \leq 1.0$	Decreases the effect of Doppler
DopplerScale = 1.0	No scaling (default)
DopplerScale > 1.0	Increase the effect of Doppler

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SoundEffect.Duration Property

Gets the duration of the [SoundEffect](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TimeSpan Duration { get; }
```

Property Value

A [TimeSpan](#) that represents the duration of the [SoundEffect](#).

Remarks

This is a read-only property. The sound duration is initialized from the sound file and cannot be changed. For information about authoring and adding sound files, see [How To: Add a Sound File to Your Game Using XACT](#).

SoundEffect.IsDisposed Property

Gets a value that indicates whether the object is disposed.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsDisposed { get; }
```

Property Value

true if the object is disposed; **false** otherwise.

See Also

Reference

[SoundEffect Class](#)

[SoundEffect Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SoundEffect.MasterVolume Property

Gets or sets the master volume that affects all [SoundEffectInstance](#) sounds.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static float MasterVolume { get; set; }
```

Property Value

Volume, ranging from 0.0f (silence) to 1.0f (current device volume). 1.0f is full volume relative to the current device volume.

Remarks

The sound effect master volume affects all sound effect instances, including currently playing instances and newly created instances. Each [SoundEffectInstance](#) also has its own volume ([SoundEffectInstance.Volume](#)) that is relative to the master volume.

You can adjust the volume of all sounds effects by changing **MasterVolume**. You can adjust the volume of an individual [SoundEffectInstance](#) by changing [SoundEffectInstance.Volume](#), or by specifying an instance volume when you call [Play](#) to create the instance.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SoundEffect.Name Property

Gets or sets the asset name of the [SoundEffect](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Name { get; set; }
```

Property Value

Asset name of the [SoundEffect](#).

See Also

Reference

[SoundEffect Class](#)

[SoundEffect Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SoundEffect.SpeedOfSound Property

Returns the speed of sound: 343.5 meters per second.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static float SpeedOfSound { get; set; }
```

Property Value

The speed of sound: 343.5 meters per second.

Remarks

Use this value to simulate different environments. A smaller speed of sound will exaggerate the doppler effect. A higher speed of sound will reduce the doppler effect. Speed of sound has no impact on distance attenuation.

See Also

Reference

[SoundEffect Class](#)

[SoundEffect Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SoundEffectInstance Class

Provides a single playing, paused, or stopped instance of a [SoundEffect](#) sound.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class SoundEffectInstance : IDisposable
```

Remarks

You can create a **SoundEffectInstance** by calling [SoundEffect.CreateInstance](#). Initially, the **SoundEffectInstance** is created as stopped, but you can play it by calling [Play](#).

You can modify the volume, panning, and pitch of the **SoundEffectInstance** by setting the [Volume](#), [Pitch](#), and [Pan](#) properties.

On Zune, a game can have a maximum of 16 total playing [SoundEffectInstance](#) instances at one time, combined across *all* loaded [SoundEffect](#) objects. The only limit to the total number of loaded **SoundEffectInstance** and **SoundEffect** objects is available memory. However, the user can play only 16 sound effects at one time. Attempts to play a **SoundEffectInstance** beyond this limit will fail. On Windows, there is no hard limit. Playing too many instances can lead to performance degradation. On Xbox 360, the limit is 300 sound effect instances loaded or playing. Dispose of old instances if you need more.

Note

Unlike other platforms, the Xbox 360 has a limit to how many sound effect instances can exist in memory at one time.

SoundEffectInstance Members

The following tables list the members exposed by the SoundEffectInstance type.

Public Properties

Name	Description
 IsDisposed	Gets a value that indicates whether the object is disposed.
 IsLooped	Gets a value that indicates whether looping is enabled for the SoundEffectInstance .
 Pan	Gets or sets the panning for the SoundEffectInstance .
 Pitch	Gets or sets the pitch adjustment for the SoundEffectInstance .
 State	Gets the current state (playing, paused, or stopped) of the SoundEffectInstance .
 Volume	Gets or sets the volume of the SoundEffectInstance .

Public Methods

Name	Description
 Apply3D	Overloaded. Applies 3D position to the sound.
 Dispose	Releases the resources used by the Dispose.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 Pause	Pauses a SoundEffectInstance .
 Play	Plays or resumes a SoundEffectInstance .
 ReferenceEquals	(Inherited from Object .)
 Resume	Resumes playback for a SoundEffectInstance .
 Stop	Overloaded. Stops playing a SoundEffectInstance .
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	Releases unmanaged resources and performs other cleanup operations before the SoundEffectInstance is reclaimed by garbage collection.
 MemberwiseClone	(Inherited from Object .)

SoundEffectInstance.Apply3D Method (AudioListener, AudioEmitter)

Applies 3D positioning to the sound using a single listener.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Apply3D (  
    AudioListener listener,  
    AudioEmitter emitter  
)
```

Parameters

listener

Position of the listener.

emitter

Position of the emitter.

SoundEffectInstance.Dispose Method

Releases the resources used by the **Dispose**.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call **Dispose** only when you are finished using the **SoundEffectInstance**. The **Dispose** method leaves the **SoundEffectInstance** in an unusable state. After calling **Dispose**, you must release all references to the **SoundEffectInstance** in order for the garbage collector to reclaim the memory that the **SoundEffectInstance** was occupying. For more information, see [Cleaning Up Unmanaged Resources](#) and [Implementing a Dispose Method](#).

```

Remarks

If the [SoundEffectInstance](#) is paused, **Play** resumes playing it at the last played position. If the **SoundEffectInstance** is stopped, **Play** begins to play it.

On Zune, a game can have a maximum of 16 total playing **SoundEffectInstance** instances at one time, combined across *all* loaded [SoundEffect](#) objects. The only limit to the total number of loaded **SoundEffectInstance** and **SoundEffect** objects is available memory. However, the user can play only 16 sound effects at one time. Attempts to play a **SoundEffectInstance** beyond this limit will fail. On Windows, there is no hard limit. Playing too many instances can lead to performance degradation. On Xbox 360, the limit is 300 sound effect instances loaded *or* playing. Dispose of old instances if you need more.

SoundEffectInstance.Stop Method (Boolean)

Stops playing a [SoundEffectInstance](#), either immediately or as authored.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Stop (  
    bool immediate  
)
```

Parameters

immediate

Whether to stop playing immediately, or to break out of the loop region and play the release. Specify **true** to stop playing immediately, or **false** to break out of the loop region and play the release phase (the remainder of the sound).

SoundEffectInstance.IsLooped Property

Gets a value that indicates whether looping is enabled for the [SoundEffectInstance](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsLooped { get; set; }
```

Property Value

true if the [SoundEffectInstance](#) has looping enabled; otherwise, **false**.

Remarks

If you want to make a sound play continuously until stopped, be sure to set **IsLooped** to **true** before you call [SoundEffect.Play](#).

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float Pitch { get; set; }
```

Property Value

Pitch adjustment, ranging from -1.0f (down one octave) to 1.0f (up one octave). 0.0f is unity (normal) pitch.

WaveBank Members

The following tables list the members exposed by the WaveBank type.

Public Constructors

Name	Description
 WaveBank	Overloaded. Initializes a new instance of this class.

Public Properties

Name	Description
 IsDisposed	Gets a value that indicates whether the object is disposed.
 IsInUse	Returns whether the wave bank is currently in use.
 IsPrepared	Returns whether the wave bank is prepared to play.

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)

Public Events

Name	Description
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime (CLR).

[Audio Overview](#)

Reference

[WaveBank Class](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

WaveBank Constructor

Initializes a new instance of this class.

Overload List

Name	Description
WaveBank (AudioEngine, String)	Initializes a new, in-memory instance of this class using a specified AudioEngine and path to a wave bank file.
WaveBank (AudioEngine, String, Int32, Int16)	Initializes a new, streaming instance of this class, using a provided AudioEngine and streaming wave bank parameters.

See Also

Reference

[WaveBank Class](#)

[WaveBank Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

WaveBank Constructor (AudioEngine, String)

Initializes a new, in-memory instance of this class using a specified [AudioEngine](#) and path to a wave bank file.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public WaveBank (
    AudioEngine audioEngine,
    string nonStreamingWaveBankFilename
)
```

Parameters

audioEngine

Instance of an [AudioEngine](#) to associate this wave bank with.

nonStreamingWaveBankFilename

Path to the wave bank file to load.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>audioEngine</i> or <i>nonStreamingWaveBankFilename</i> parameter is null .
InvalidOperationException	Unable to create the WaveBank resource.

Remarks

This constructor generates an in-memory version of a wave bank. The entire wave bank contents are held in memory.

See Also

Reference

[WaveBank Class](#)

[WaveBank Members](#)

[Microsoft.Xna.Framework.Audio Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

WaveBank Constructor (AudioEngine, String, Int32, Int16)

Initializes a new, streaming instance of this class, using a provided [AudioEngine](#) and streaming wave bank parameters.

Namespace: Microsoft.Xna.Framework.Audio

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public WaveBank (
    AudioEngine audioEngine,
    string streamingWaveBankFilename,
    int offset,
    short packetSize
)
```

Parameters

audioEngine

Instance of an [AudioEngine](#) to associate this wave bank with.

streamingWaveBankFilename

Path to the wave bank file to stream from.

offset

Offset within the wave bank data file. This offset must be DVD sector aligned.

packetSize

Stream packet size, in sectors, to use for each stream. The minimum value is 2.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>audioEngine</i> or <i>nonStreamingWaveBankFilename</i> parameter is null .
InvalidOperationException	Unable to create the WaveBank resource.

Remarks

This constructor constructs a streaming wave bank whose contents are streamed from storage as needed.

When setting *packetSize*, note that the size of a DVD sector is 2,048 bytes. Therefore, setting this value to 2 would result in a packet size of 4,096 bytes. Setting it to 3 would specify packets of 6,144 bytes, setting it to 4 would specify packets of 8,192 bytes, and so on. The optimal DVD size is a multiple of 16 (1 DVD block = 16 DVD sectors).

After creating a streaming wave bank, you must call [Update](#) at least once from the [AudioEngine](#) that was used to create the streaming wave bank before attempting to play a wave from the wave bank. This properly prepares the wave bank for use. Attempts to play waves out of any wave bank before the wave bank is prepared will result in an error.

Microsoft.Xna.Framework.Content Namespace

Contains the run-time components of the Content Pipeline.

Classes

Name	Description
 ContentLoadException	Exception used to report errors from the ContentManager.Load method.
 ContentManager	The ContentManager is the run-time component which loads managed objects from the binary files produced by the design time content pipeline. It also manages the lifespan of the loaded objects, disposing the content manager will also dispose any assets which are themselves IDisposable .
 ContentReader	A worker object that implements most of ContentManager.Load . A new ContentReader is constructed for each asset loaded.
 ContentSerializerAttribute	A custom Attribute that marks a field or property to control how it is serialized or to indicate that protected or private data should be included in serialization.
 ContentSerializerCollectionItemNameAttribute	A custom Attribute that marks a collection class to specify the XML element name for each item in the collection.
 ContentSerializerIgnoreAttribute	A custom Attribute that marks public fields or properties to prevent them from being serialized.
 ContentSerializerRuntimeTypeAttribute	A custom Attribute that specifies the corresponding run-time type of this object.
 ContentSerializerTypeVersionAttribute	A custom Attribute that specifies the corresponding run-time type version of this object.
 ContentTypeReader	Worker for reading a specific managed type from a binary format. Derive from this class to add new data types to the content pipeline system.
 ContentTypeReader	Worker for reading a specific managed type from a binary format.
 ContentTypeReaderManager	A manager that constructs and keeps track of type reader objects.
 ResourceContentManager	Subclass of ContentManager , which is specialized to read from .resx resource files rather than directly from individual files on disk.

Parameters

serviceProvider

The service provider that the [ContentManager](#) should use to locate services.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>serviceProvider</i> parameter is null .

Remarks

⚠ Caution

When creating a new [ContentManager](#), if no instance of [Game](#) is otherwise required by the application, it is often better to create a new class that implements the [IServiceProvider](#) interface rather than creating an instance of [Game](#) just to create a new instance of [GraphicsDeviceManager](#).

By default, the [ContentManager](#) searches for content in the directory where the executable is located.

Example

To create a [ContentManager](#) that uses [Game.Services](#):

C#

```
ContentManager contentManager = new ContentManager( Services );
```

ContentManager Constructor (IServiceProvider, String)

Initializes a new instance of [ContentManager](#).

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ContentManager (
    IServiceProvider serviceProvider,
    string rootDirectory
)
```

Parameters

serviceProvider

The service provider the [ContentManager](#) should use to locate services.

rootDirectory

The root directory to search for content.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>serviceProvider</i> or <i>rootDirectory</i> parameter is null .

Remarks

⚠ Caution

When creating a new [ContentManager](#), if no instance of [Game](#) is otherwise required by the application, it is often better to create a new class that implements the [IServiceProvider](#) interface rather than creating an instance of [Game](#) just to create a new instance of [GraphicsDeviceManager](#).

Example

To create a [ContentManager](#) that uses [Game.Services](#) and searches for resources from the root of the C: drive:

C#

```
ContentManager contentManager = new ContentManager( Services, "C:\\\" );
```

ContentManager Methods

Public Methods

Name	Description
 Dispose	Overloaded. Releases the resources used by the ContentManager class.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 Load	Loads an asset that has been processed by the Content Pipeline.
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)
 Unload	Disposes all data that was loaded by this ContentManager .

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)
 OpenStream	Opens a stream for reading the specified asset. Derived classes can replace this to implement pack files or asset compression.
 ReadAsset	Low-level worker method that reads asset data.

ContentManager.Dispose Method

Releases the resources used by the [ContentManager](#) class.

Overload List

Name	Description
ContentManager.Dispose ()	Releases all resources used by the ContentManager class.
ContentManager.Dispose (Boolean)	Releases the unmanaged resources used by the ContentManager and optionally releases the managed resources.

See Also

Reference

[ContentManager Class](#)

[ContentManager Members](#)

[Microsoft.Xna.Framework.Content Namespace](#)

ContentManager.Dispose Method ()

Releases all resources used by the [ContentManager](#) class.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[ContentManager Members](#)

[Microsoft.Xna.Framework.Content Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

ContentManager.Dispose Method (Boolean)

Releases the unmanaged resources used by the [ContentManager](#) and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool disposing  
)
```

Parameters

disposing

true to release both managed and unmanaged resources; **false** to release only unmanaged resources.

See Also

Reference

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

ContentManager.Load Generic Method

Loads an asset that has been processed by the Content Pipeline.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public virtual T Load<T> (
    string assetName
)
```

Type Parameters

T

The type of asset to load. [Model](#), [Effect](#), [SpriteFont](#), [Texture](#), [Texture2D](#), [Texture3D](#) and [TextureCube](#) are all supported by default by the standard Content Pipeline processor, but additional types may be loaded by extending the processor.

Parameters

assetName

Asset name, relative to the loader root directory, and not including the .xnb file extension.

Return Value

The loaded asset. Repeated calls to load the same asset will return the same object instance.

Exceptions

Exception type	Condition
ObjectDisposedException	Load was called after the ContentManager was disposed.
ArgumentNullException	The <i>assetName</i> argument is null .
ContentLoadException	The type of the <i>assetName</i> in the file does not match the type of asset requested as specified by <i>T</i> .

Remarks

Before a [ContentManager](#) can load an asset, you need to add the asset to your game project using the steps described in [Adding Game Assets to Your Game](#).

The following are the Content Pipeline run-time classes supported by **Load** and the file formats they are associated with.

Effect Class	.fx
Model Class	.fbx, .x
SpriteFont Class	.bmp, .spritefont, .dds, .dib, .hdr, .jpg, .pfm, .png, .ppm, and .tga  Note The default content processor for .bmp files is the texture processor. To process a .bmp file for use as a Sprite Font, click Sprite Font Texture - XNA Framework in the Properties pane for the .bmp file after it has been added to the project.
Texture Class, Texture2D Class	.bmp, .dds, .dib, .hdr, .jpg, .pfm, .png, .ppm, and .tga
Texture3D Class, TextureCube Class	.dds

Note that these are the formats of the original assets; after processing, all assets will be .xnb files.

Example

To load a [Model](#) from the directory .\content\models\ with the asset name of "box":

C#

```
Model model = contentManager.Load<Model>( ".\\content\\models\\box" );
```

ContentManager.OpenStream Method

Opens a stream for reading the specified asset. Derived classes can replace this to implement pack files or asset compression.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual Stream OpenStream (  
    string assetName  
)
```

Parameters

assetName

The name of the asset being read.

Return Value

The opened stream.

Exceptions

Exception type	Condition
ContentLoadException	Unable to open the file containing <i>assetName</i> , or the file was not found.

See Also

Reference

[ContentManager Members](#)

[Microsoft.Xna.Framework.Content Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

ContentManager.ReadAsset Generic Method

Low-level worker method that reads asset data.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected T ReadAsset<T> (
    string assetName,
    Action<IDisposable> recordDisposableObject
)
```

Type Parameters

T

Type of the asset specified for loading.

Parameters

assetName

The name of the asset to be loaded from disk.

recordDisposableObject

Delegate function for handling the disposition of assets. If *recordDisposableObject* is **null**, the default lifespan tracking and management is used, so unloading or disposing of the content manager frees everything that has been loaded through it. If *recordDisposableObject* specifies a valid delegate, that delegate is used instead of the default lifespan tracking and is called every time the loader encounters a type that implements [IDisposable](#). You must use your own code to unload assets loaded in this fashion, since [ContentManager's Unload](#) method will not be aware of them.

Return Value

Returns the loaded asset.

Exceptions

Exception type	Condition
ObjectDisposedException	ReadAsset was called after the ContentManager was disposed.
ArgumentNullException	The <i>assetName</i> argument is null .

Remarks

This protected method loads an .xnb file from disk. Unlike [ContentManager's Load](#) method, it always returns a new copy of the specified asset, even if the asset has been loaded previously.

You can customize how shared assets are managed by overriding [ContentManager's Load](#) method. In your own `Load` method, keep track of what has been loaded, and call **ReadAsset** when you need a new asset from disk.

ContentReader Members

The following tables list the members exposed by the ContentReader type.

Public Properties

Name	Description
 AssetName	Gets the name of the asset currently being read by this ContentReader .
 BaseStream	(Inherited from BinaryReader .)
 ContentManager	Gets the ContentManager associated with the ContentReader .

Public Methods

Name	Description
 Close	(Inherited from BinaryReader .)
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 PeekChar	(Inherited from BinaryReader .)
 Read	(Inherited from BinaryReader .)
 ReadBoolean	(Inherited from BinaryReader .)
 ReadByte	(Inherited from BinaryReader .)
 ReadBytes	(Inherited from BinaryReader .)
 ReadChar	(Inherited from BinaryReader .)
 ReadChars	(Inherited from BinaryReader .)
 ReadColor	Reads a Color value from the currently open stream.
 ReadDecimal	(Inherited from BinaryReader .)
 ReadDouble	Reads a double value from the currently open stream.
 ReadExternalReference	Reads a link to an external file.
 ReadInt16	(Inherited from BinaryReader .)
 ReadInt32	(Inherited from BinaryReader .)
 ReadInt64	(Inherited from BinaryReader .)
 ReadMatrix	Reads a Matrix value from the currently open stream.
 ReadObject	Overloaded. Reads a single managed object from the current stream. Can be called recursively.
 ReadQuaternion	Reads a Quaternion value from the current stream.
 ReadRawObject	Overloaded. Reads a single managed object from the current stream as an instance of the specified type. If a base class of the actual object type is specified only data from the base type will be read.
 ReadSByte	(Inherited from BinaryReader .)
 ReadSharedResource	Reads a shared resource ID, and records it for subsequent fix-up.
 ReadSingle	Reads a float value from the currently open stream.
 ReadString	(Inherited from BinaryReader .)
 ReadUInt16	(Inherited from BinaryReader .)
 ReadUInt32	(Inherited from BinaryReader .)
 ReadUInt64	(Inherited from BinaryReader .)
 ReadVector2	Reads a Vector2 value from the current stream.
 ReadVector3	Reads a Vector3 value from the current stream.
 ReadVector4	Reads a Vector4 value from the current stream.
 ReferenceEquals	(Inherited from Object .)

 [ToString](#) (Inherited from [Object](#).)

Protected Methods

Name	Description

ContentReader.AssetName Property

Gets the name of the asset currently being read by this [ContentReader](#).

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string AssetName { get; }
```

Property Value

Name of the asset currently being read by this [ContentReader](#).

Remarks

AssetName can be useful to include in the exception message if a custom [ContentTypeReader](#) encounters an error.

ContentSerializerAttribute Members

The following tables list the members exposed by the ContentSerializerAttribute type.

Public Constructors

Name	Description
 ContentSerializerAttribute	Creates a new instance of ContentSerializerAttribute .

Public Properties

Name	Description
 AllowNull	Get or set a value indicating whether this member can have a null value (default=true).
 CollectionItemName	Gets or sets the XML element name for each item in a collection (default = "Item").
 ElementName	Gets or sets the XML element name (default=name of the managed type member).
 FlattenContent	Gets or sets a value indicating whether to write member contents directly into the current XML context rather than wrapping the member in a new XML element (default=false).
 HasCollectionItemName	Indicates whether an explicit CollectionItemName string is being used or the default value.
 Optional	Indicates whether to write this element if the member is null and skip past it if not found when deserializing XML (default=false).
 SharedResource	Indicates whether this member is referenced from multiple parents and should be serialized as a unique ID reference (default=false).
 TypeId	(Inherited from Attribute .)

Public Methods

Name	Description
 Clone	Creates a copy of the ContentSerializerAttribute .
 Equals	(Inherited from Object .)
 GetCustomAttribute	(Inherited from Attribute .)
 GetCustomAttributes	(Inherited from Attribute .)
 GetType	(Inherited from Object .)
 IsDefaultAttribute	(Inherited from Attribute .)
 IsDefined	(Inherited from Attribute .)
 Match	(Inherited from Attribute .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

ContentSerializerAttribute.AllowNull Property

Get or set a value indicating whether this member can have a null value (default=true).

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool AllowNull { get; set; }
```

Property Value

Value indicating whether this member can have a null value.

Example

[ContentSerializerAttribute](#) with [AllowNull](#) set to **false**.

C#

```
[ContentSerializerAttribute( AllowNull = false )]
```

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

ContentSerializerAttribute.CollectionItemName Property

Gets or sets the XML element name for each item in a collection (default = "Item").

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string CollectionItemName { get; set; }
```

Property Value

The XML element name for each item in the collection.

Exceptions

Exception type	Condition
ArgumentNullException	<i>CollectionItemName</i> is null .

Example

[ContentSerializerAttribute](#) with [CollectionItemName](#) set to the string "PlayerName":

C#

```
[ContentSerializerAttribute( CollectionItemName = "PlayerName" )]
```

ContentSerializerAttribute.ElementName Property

Gets or sets the XML element name (default=name of the managed type member).

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string ElementName { get; set; }
```

Property Value

The XML element name.

Example

[ContentSerializerAttribute](#) with [ElementName](#) set to the string "PlayerName".

C#

```
[ContentSerializerAttribute( ElementName = "PlayerName" )]
```

ContentSerializerAttribute.FlattenContent Property

Gets or sets a value indicating whether to write member contents directly into the current XML context rather than wrapping the member in a new XML element (default=false).

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool FlattenContent { get; set; }
```

Property Value

Value indicating whether to write member contents directly into the current XML context rather than wrapping the member in a new XML element.

Example

[ContentSerializerAttribute](#) with [FlattenContent](#) set **true**.

C#

```
[ContentSerializerAttribute( FlattenContent = true )]
```

ContentSerializerAttribute.HasCollectionItemName Property

Indicates whether an explicit CollectionItemName string is being used or the default value.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool HasCollectionItemName { get; }
```

Property Value

true if an explicit CollectionItemName string is being used; **false** otherwise.

Example

[ContentSerializerAttribute](#) with [HasCollectionItemName](#) set **true**.

C#

```
[ContentSerializerAttribute( HasCollectionItemName = true )]
```

ContentSerializerAttribute.Optional Property

Indicates whether to write this element if the member is **null** and skip past it if not found when deserializing XML (default=false).

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Optional { get; set; }
```

Property Value

true if the member should be skipped when **null**.

Example

[ContentSerializerAttribute](#) with [Optional](#) set **true**.

C#

```
[ContentSerializerAttribute( Optional = true )]
```

ContentSerializerAttribute.SharedResource Property

Indicates whether this member is referenced from multiple parents and should be serialized as a unique ID reference (default=false).

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SharedResource { get; set; }
```

Property Value

true if this member is referenced from multiple parents; **false** otherwise.

Example

[ContentSerializerAttribute](#) with [SharedResource](#) set **true**.

C#

```
[ContentSerializerAttribute( SharedResource = true )]
```

ContentSerializerRuntimeTypeAttribute Class

A custom [Attribute](#) that specifies the corresponding run-time type of this object. For more information, see [Automatic Serialization of .XNB Files](#).

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class ContentSerializerRuntimeTypeAttribute : Attribute
```

Remarks

You can apply multiple instances of this attribute to a single class, thus specifying different strong names for each target platform. If you don't specify the target platform, a single attribute provides a strong name for all platforms.

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected internal abstract Object Read (  
    ContentReader input,  
    Object existingInstance  
)
```

Parameters

input

The [ContentReader](#) used to read the object.

existingInstance

The object receiving the data, or **null** if a new instance of the object should be created.

Return Value

The object that was read.

ContentTypeReader.CanDeserializeIntoExistingObject Property

Determines if deserialization into an existing object is possible.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public virtual bool CanDeserializeIntoExistingObject { get; }
```

Property Value

true if the object can be deserialized into; **false** otherwise.

ContentTypeReader.TargetType Property

Gets the type handled by this reader component.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Type TargetType { get; }
```

Property Value

The type handled by this reader component.

ContentTypeReader.Read Method (ContentReader, Object)

Reads an object from the current stream.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected internal override Object Read (  
    ContentReader input,  
    Object existingInstance  
)
```

Parameters

input

The [ContentReader](#) used to read the object.

existingInstance

An existing object to read into.

Return Value

The object that was read.

Exceptions

Exception type	Condition
ContentLoadException	Error loading the object. File contains an object of a type other than the type requested.

ContentTypeReaderManager.GetTypeReader Method

Looks up a reader for the specified type.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ContentTypeReader GetTypeReader (  
    Type targetType  
)
```

Parameters

targetType

The type the reader will handle.

Return Value

The created [ContentTypeReader](#).

Exceptions

Exception type	Condition
ContentLoadException	Cannot find the requested ContentTypeReader .
ArgumentNullException	<i>targetType</i> cannot be null .

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ResourceContentManager (
    IServiceProvider serviceProvider,
    ResourceManager resourceManager
)
```

Parameters

serviceProvider

The service provider the [ContentManager](#) should use to locate services.

resourceManager

The resource manager for the [ResourceContentManager](#) to read from.

Exceptions

Exception type	Condition
ArgumentNullException	<i>resourceManager</i> is null .

ResourceContentManager.OpenStream Method

Opens a stream for reading the specified resource. Derived classes can replace this to implement pack files or asset compression.

Namespace: Microsoft.Xna.Framework.Content

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override Stream OpenStream (  
    string assetName  
)
```

Parameters

assetName

The name of the asset being read.

Return Value

The opened stream.

Exceptions

Exception type	Condition
ContentLoadException	Error loading <i>assetName</i> . The resource was not a binary resource, or the resource was not found.

Microsoft.Xna.Framework.Design Namespace

Note

This namespace is available only when developing for Windows.

Provides a unified way of converting types of values to other types.

Classes

Name	Description
 BoundingBoxConverter	Provides a unified way of converting BoundingBox values to other types, as well as for accessing standard values and subproperties.
 BoundingSphereConverter	Provides a unified way of converting BoundingSphere values to other types, as well as for accessing standard values and subproperties.
 ColorConverter	Provides a unified way of converting Color values to other types, as well as for accessing standard values and subproperties.
 MathTypeConverter	Provides a unified way of converting math type values to other types, as well as for accessing standard values and subproperties.
 MatrixConverter	Provides a unified way of converting Matrix values to other types, as well as for accessing standard values and subproperties.
 PlaneConverter	Provides a unified way of converting Plane values to other types, as well as for accessing standard values and subproperties.
 PointConverter	Provides a unified way of converting Point values to other types, as well as for accessing standard values and subproperties.
 QuaternionConverter	Provides a unified way of converting Quaternion values to other types, as well as for accessing standard values and subproperties.
 RayConverter	Provides a unified way of converting Ray values to other types, as well as for accessing standard values and subproperties.
 RectangleConverter	Provides a unified way of converting Rectangle values to other types, as well as for accessing standard values and subproperties.
 Vector2Converter	Provides a unified way of converting Vector2 values to other types, as well as for accessing standard values and subproperties.
 Vector3Converter	Provides a unified way of converting Vector3 values to other types, as well as for accessing standard values and subproperties.
 Vector4Converter	Provides a unified way of converting Vector4 values to other types, as well as for accessing standard values and subproperties.

BoundingBoxConverter Class

Note

This class is available only when developing for Windows.

Provides a unified way of converting [BoundingBox](#) values to other types, as well as for accessing standard values and subproperties.

Namespace: Microsoft.Xna.Framework.Design

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class BoundingBoxConverter : MathTypeConverter
```

BoundingBoxConverter.ConvertTo Method (ITypeDescriptorContext, CultureInfo, Object, Type)

Note

This method is available only when developing for Windows.

Converts the given value object to the specified type, using the specified context and culture information.

Namespace: Microsoft.Xna.Framework.Design

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override Object ConvertTo (  
    ITypeDescriptorContext context,  
    CultureInfo culture,  
    Object value,  
    Type destinationType  
)
```

Parameters

context

The format context.

culture

The culture to use in the conversion.

value

The object to convert.

destinationType

The destination type.

Return Value

The converted value.

Exceptions

Exception type	Condition
ArgumentNullException	<i>destinationType</i> is null .

BoundingBoxConverter.CreateInstance Method (ITypeDescriptorContext, IDictionary)

Note

This method is available only when developing for Windows.

Creates an instance of the type that this [BoundingBoxConverter](#) is associated with, using the specified context, given a set of property values for the object.

Namespace: Microsoft.Xna.Framework.Design

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override Object CreateInstance (  
    ITypeDescriptorContext context,  
    IDictionary propertyValues  
)
```

Parameters

context

The format context.

propertyValues

The new property values.

Return Value

An object representing *propertyValues*, or **null** if the object cannot be created.

PlaneConverter.ConvertTo Method (ITypeDescriptorContext, CultureInfo, Object, Type)

Note

This method is available only when developing for Windows.

Converts the given value object to the specified type, using the specified context and culture information.

Namespace: Microsoft.Xna.Framework.Design

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override Object ConvertTo (  
    ITypeDescriptorContext context,  
    CultureInfo culture,  
    Object value,  
    Type destinationType  
)
```

Parameters

context

The format context.

culture

The culture to use in the conversion.

value

The object to convert.

destinationType

The destination type.

Return Value

The converted value.

Exceptions

Exception type	Condition
ArgumentNullException	<i>destinationType</i> is null .

PlaneConverter.CreateInstance Method (ITypeDescriptorContext, IDictionary)

Note

This method is available only when developing for Windows.

Creates an instance of the type that this [PlaneConverter](#) is associated with, using the specified context, given a set of property values for the object.

Namespace: Microsoft.Xna.Framework.Design

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override Object CreateInstance (  
    ITypeDescriptorContext context,  
    IDictionary propertyValues  
)
```

Parameters

context

The format context.

propertyValues

The new property values.

Return Value

An object representing *propertyValues*, or **null** if the object cannot be created.

RayConverter.CreateInstance Method (ITypeDescriptorContext, IDictionary)

Note

This method is available only when developing for Windows.

Creates an instance of the type that this [RayConverter](#) is associated with, using the specified context, given a set of property values for the object.

Namespace: Microsoft.Xna.Framework.Design

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override Object CreateInstance (  
    ITypeDescriptorContext context,  
    IDictionary propertyValues  
)
```

Parameters

context

The format context.

propertyValues

The new property values.

Return Value

An object representing *propertyValues*, or **null** if the object cannot be created.

C#

```
public override Object ConvertFrom (  
    ITypeDescriptorContext context,  
    CultureInfo culture,  
    Object value  
)
```

Parameters

context

The format context.

culture

The current culture.

value

The object to convert.

Return Value

The converted value.

Exceptions

Exception type	Condition
ArgumentException	Invalid string format.

Vector4Converter.ConvertTo Method (ITypeDescriptorContext, CultureInfo, Object, Type)

Note

This method is available only when developing for Windows.

Converts the given value object to the specified type, using the specified context and culture information.

Namespace: Microsoft.Xna.Framework.Design

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override Object ConvertTo (  
    ITypeDescriptorContext context,  
    CultureInfo culture,  
    Object value,  
    Type destinationType  
)
```

Parameters

context

The format context.

culture

The culture to use in the conversion.

value

The object to convert.

destinationType

The destination type.

Return Value

The converted value.

Exceptions

Exception type	Condition
ArgumentNullException	<i>destinationType</i> is null .

Microsoft.Xna.Framework.GamerServices Namespace

Contains classes that implement various services related to gamers. These services communicate directly with the gamer, the gamer's data, or otherwise reflect choices the gamer makes. Gamer services include input device and profile data APIs.

Classes

Name	Description
 AvatarAnimation	Provides methods and properties for animating an avatar using standard animations (for example, celebrate).
 AvatarDescription	Provides access to the methods and properties of the description data for an avatar.
 AvatarRenderer	Provides properties and methods for rendering a standard avatar.
 FriendCollection	Represents the complete friends list of a local gamer.
 FriendGamer	Provides the presence information of a friend of the local gamer.
 GameDefaults	Describes a gamer's preferred settings.
 Gamer	Abstract base class for types that represent game players (profiles that have an associated gamertag). The concrete types SignedInGamer and NetworkGamer derive from this.
 GamerCollection	Represents a collection of gamers. This collection cannot be modified and is updated automatically during the call to Update .
 GamerPresence	Provides properties to set the rich presence state for a locally signed-in gamer profile.
 GamerPrivilegeException	Thrown if a gamer services or multiplayer API is called without a valid, signed-in profile.
 GamerPrivileges	Describes what operations a gamer is allowed to perform.
 GamerProfile	Profile settings describing information about a gamer such as the gamer's motto, reputation, and gamer picture. This data is accessible for both locally signed in profiles and remote gamers that you are playing with in a multiplayer session.
 GamerServicesComponent	Wraps the functionality of the GamerServicesDispatcher .
 GamerServicesDispatcher	Implements the Windows-specific portion of a GamerServicesDispatcher class.
 GamerServicesNotAvailableException	Thrown if the gamer services system cannot be successfully initialized.
 Guide	Provides access to the Guide user interface.
 GuideAlreadyVisibleException	Thrown if an attempt is made to display a component of the Guide user interface when a Guide component is already displayed.
 SignedInEventArgs	Represents the arguments passed to a SignedIn event.
 SignedInGamer	Represents a gamer (a profile that has an associated gamertag) on the local system.
 SignedInGamerCollection	Represents a collection of gamers on the local system.
 SignedOutEventArgs	Represents the arguments passed to a SignedOut event.

Structures

Name	Description
 AvatarExpression	Contains the various components of the avatar's face, such as the left and right eyebrows.
 GamerCollection.GamerCollectionEnumerator	Provides the ability to iterate through the gamers in an GamerCollection .

Enumerations

Name	Description
 AvatarAnimationPreset	Defines standard animations for avatars.
 AvatarBodyType	Defines the body type of the avatar.
 AvatarBone	Defines a list of the useful bones of the avatar model.
 AvatarEye	Defines the standard animation textures for an avatar's eyes.

 AvatarEyebrow	Defines the standard animation textures for an avatar's eyebrows.
 AvatarMouth	Defines the standard animation textures for an avatar's mouth.
 ControllerSensitivity	Indicates how sensitive this gamer prefers controller input to be.
 GameDifficulty	Indicates how difficult this gamer likes things to be.
 GamerPresenceMode	Settings defining the status string that will appear when you view a friend through the Xbox LIVE Guide or on Xbox.com. Use the PresenceMode property to set this option.
 GamerPrivilegeSetting	Describes the conditions in which a privilege is available.
 GamerZone	This style of social gaming preferred by this Xbox LIVE member.
 MessageBoxIcon	Defines the different icons for a message box.
 NotificationPosition	Determines where notifications appear on the screen.
 RacingCameraAngle	Indicates which camera angle this gamer prefers to use in racing games.

Remarks

Important

Games for Windows - LIVE is not available to finished games. This functionality is not included in the redistributable version of the XNA Framework. A game that attempts to use these components without XNA Game Studio installed will result in a [GamerServicesNotAvailableException](#).

AvatarAnimation Class

Provides methods and properties for animating an avatar using standard animations (for example, celebrate). For more information on the standard animations available to avatars, see [AvatarAnimationPreset](#).

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class AvatarAnimation : IDisposable
```

Remarks

Use this class, in conjunction with [AvatarRenderer](#), to provide standard animations for the avatar model. For more information, see [How To: Render and Animate an Avatar Using AvatarRenderer..](#)

AvatarAnimation Members

The following tables list the members exposed by the AvatarAnimation type.

Public Constructors

Name	Description
 AvatarAnimation	Creates a new instance of AvatarAnimation, and initializes it with the specified animation.

Public Properties

Name	Description
 BoneTransforms	Gets the current position of the bones at the time specified by CurrentPosition .
 CurrentPosition	Gets or sets the current time position in the animation.
 Expression	Gets the expression of the related animation at the current time position.
 IsDisposed	Gets the disposed state of the avatar animation.
 Length	Gets the length of the current animation.

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)
 Update	Updates the current time position of the avatar animation.

Protected Methods

Name	Description
 Finalize	Allows the avatar animation to attempt to free resources, and it performs other cleanup operations before garbage collection reclaims the animation.
 Memberwise Clone	(Inherited from Object .)

Platforms Xbox 360, Windows XP SP2, Windows Vista

AvatarAnimation.Update Method

Updates the current time position of the avatar animation.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Update (  
    TimeSpan elapsedAnimationTime,  
    bool loop  
)
```

Parameters

elapsedAnimationTime

Elapsed time since the last animation frame. This value can be either a positive or negative time span. If the value is negative, animation playback is reversed.

loop

true if the animation playback is to be looped; otherwise, **false**.

AvatarAnimation Properties

Public Properties

	Name	Description
	BoneTransforms	Gets the current position of the bones at the time specified by CurrentPosition .
	CurrentPosition	Gets or sets the current time position in the animation.
	Expression	Gets the expression of the related animation at the current time position.
	IsDisposed	Gets the disposed state of the avatar animation.
	Length	Gets the length of the current animation.

See Also

Reference

[AvatarAnimation Class](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

AvatarAnimation.BoneTransforms Property

Gets the current position of the bones at the time specified by [CurrentPosition](#). The positions are in local bone space relative to their parent bones.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ReadOnlyCollection<Matrix> BoneTransforms { get; }
```

Property Value

Collection of bone transforms.

Remarks

You can pass this matrix list to [AvatarRenderer.Draw](#) using the *bones* parameter. This allows the developer to modify the position of one or more avatar bones before rendering the model.

AvatarDescription Class

Provides access to the methods and properties of the description data for an avatar.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class AvatarDescription
```

Remarks

The **AvatarDescription** object contains an internal data buffer used by the avatar renderer when loading and animating a gamer's avatar. There are also methods for getting the height and gender of the avatar. Use the [Avatar](#) property of a signed-in gamer to retrieve the related **AvatarDescription** object.

AvatarDescription also provides a number of methods that you can use to create a new random **AvatarDescription** object or to retrieve one from an existing avatar description buffer.

Platforms Xbox 360, Windows XP SP2, Windows Vista

AvatarDescription Members

The following tables list the members exposed by the AvatarDescription type.

Public Constructors

	Name	Description
	AvatarDescription	Creates a new instance of AvatarDescription using an existing data buffer.

Public Properties

	Name	Description
	BodyType	Gets the body type of the avatar based on the description data.
	Description	Internal description buffer of the avatar, stored as a byte buffer.
	Height	Height of the avatar, from the feet to the top of the head.
	IsValid	Determines whether the internal data buffer is valid.

Public Methods

	Name	Description
	 CreateRandom	Overloaded. Creates an AvatarDescription object with random gender, features, and clothing.
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

AvatarDescription Constructor

Creates a new instance of **AvatarDescription** using an existing data buffer.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public AvatarDescription (  
    byte[] data  
)
```

Parameters

data

Existing buffer used to store the information of the newly-created avatar.

Use the buffer specified by the [Description](#) property of a valid [AvatarDescription](#) object. Common scenarios include the recreation of random avatars that were created earlier or when avatar description data is sent over a network to all signed-in gamers. Once that data is received, local avatar descriptions and renderers are created for each remote gamer avatar.

Results are undefined if buffers from other sources are used.

Creates an avatar of the specified body type with random features and clothing.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static AvatarDescription CreateRandom (  
    AvatarBodyType bodyType  
)
```

Parameters

bodyType

Body type of the randomly-created avatar.

Return Value

Description of the created avatar.

Remarks

It is possible that a newly-created random [AvatarDescription](#) object could be an invalid avatar description buffer. For instance, the related [AvatarDescription](#) object was created by a call to **CreateRandom**, from within a Windows application.

AvatarDescription.BodyType Property

Gets the body type of the avatar based on the description data.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public AvatarBodyType BodyType { get; }
```

Property Value

Body type of the avatar.

Platforms Xbox 360, Windows XP SP2, Windows Vista

AvatarDescription.Description Property

Internal description buffer of the avatar, stored as a byte buffer.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public byte[] Description { get; }
```

Property Value

Description buffer of the avatar.

See Also

Platforms Xbox 360, Windows XP SP2, Windows Vista

AvatarDescription.Height Property

Height of the avatar, from the feet to the top of the head.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float Height { get; }
```

Property Value

Height, in meters, of the avatar.

See Also

Reference

[AvatarDescription Class](#)

[AvatarDescription Members](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

AvatarDescription.IsValid Property

Determines whether the internal data buffer is valid.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsValid { get; }
```

Property Value

true if the related [AvatarDescription](#) object contains a valid avatar description, usable by an [AvatarRenderer](#) object; otherwise, **false**.

IsValid always returns **false** on Windows because currently there is no Windows-based avatar implementation.

Remarks

This property is provided only as a quick verification method for developers that receive an [AvatarDescription](#) object from the XNA framework. For example, a value of **false** could indicate that the user does not have an avatar.

AvatarRenderer.Draw Method

Draws the avatar to the current render target.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Draw (  
    IList<Matrix> bones,  
    AvatarExpression expression  
)
```

Parameters

bones

Collection of current bone transforms for the avatar. The transforms are in local bone space relative to their parent.

expression

Current expression textures for the avatar.

Remarks

If any avatar assets are not loaded, the standard loading effect is displayed (determined by the renderer's [constructor](#) call). Determine the current loading state by checking the value of the [IsLoaded](#) property.

The avatar model is always rendered as if [FillMode.Solid](#) is the current fill mode value.

AvatarRenderer.IsLoaded Property

Gets the loaded state of the avatar.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsLoaded { get; }
```

Property Value

true if the avatar is loaded; otherwise, **false**.

Remarks

Loading an avatar requires some time for accessing the console's hard drive. It is not instantaneous. However, as a rule, it is not a long period of time.

During this time, the standard loading effect is displayed. For more information, see [AvatarRenderer Constructor \(AvatarDescription, Boolean\)](#).

Note

Calling **IsLoaded** or the [Draw](#) method updates the loading status.

Platforms Xbox 360, Windows XP SP2, Windows Vista

AvatarRenderer.Projection Property

Gets or sets the projection matrix for the avatar.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Matrix Projection { get; set; }
```

Property Value

Projection matrix used by the avatar renderer.

ControllerSensitivity Enumeration

Indicates how sensitive this gamer prefers controller input to be.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum ControllerSensitivity
```

Members

Member name	Description
High	Highly sensitive controller input is preferred.
Low	Below average sensitivity is preferred.
Medium	Average controller sensitivity is preferred.

FriendCollection Members

The following tables list the members exposed by the FriendCollection type.

Public Properties

	Name	Description
	Count	(Inherited from ReadOnlyCollection.)
	IsDisposed	Gets a value that indicates whether the object is disposed.
	Item	(Inherited from ReadOnlyCollection.)

Protected Properties

	Name	Description
	Items	(Inherited from ReadOnlyCollection.)

Public Methods

	Name	Description
	Contains	(Inherited from ReadOnlyCollection.)
	CopyTo	(Inherited from ReadOnlyCollection.)
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object.)
	GetEnumerator	(Inherited from ReadOnlyCollection.)
	GetHashCode	(Inherited from Object.)
	GetType	(Inherited from Object.)
	IndexOf	(Inherited from ReadOnlyCollection.)
	ReferenceEquals	(Inherited from Object.)
	ToString	(Inherited from Object.)

Protected Methods

	Name	Description
	Finalize	Allows this object to free resources and perform other cleanup operations before garbage collection reclaims the object.
	MemberwiseClone	(Inherited from Object.)

	MemberwiseClone	(Inherited from Object .)

See Also

Reference

[FriendCollection Class](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

FriendCollection.Dispose Method

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks Call **Dispose** when you are finished using the [FriendCollection](#). The **Dispose** method leaves the [FriendCollection](#) in an unusable state. After calling **Dispose**, you must release all references to the [FriendCollection](#) so the garbage collector can reclaim the memory that the [FriendCollection](#) was occupying.

Note

Always call **Dispose** before you release your last reference to the [FriendCollection](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [FriendCollection](#) object's [Finalize](#) method.

[Microsoft.Xna.Framework.GamerServices Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

FriendCollection.Finalize Method

Allows this object to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks This method overrides [Finalize](#). Application code should not call this method; an object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [SuppressFinalize](#) method has disabled finalization by the garbage collector.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GameDefaults.SecondaryColor Property

Gets a secondary color selection for the player character.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Nullable<Color> SecondaryColor { get; }
```

Property Value

A secondary color selection for the player character.

GameDifficulty Enumeration

Indicates how difficult this gamer likes things to be.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum GameDifficulty
```

Members

Member name	Description
Easy	Below-average difficulty.
Hard	Above-average difficulty.
Normal	Average difficulty.

Gamer Class

Abstract base class for types that represent game players (profiles that have an associated gamertag). The concrete types [SignedInGamer](#) and [NetworkGamer](#) derive from this.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public abstract class Gamer
```

Gamer Members

The following tables list the members exposed by the Gamer type.

Public Properties

	Name	Description
	Gamertag	Gets the gamertag string.
	IsDisposed	Gets a value indicating whether the object is disposed.
 	SignedInGamers	Represents a collection of all gamers on the local system.
	Tag	Gets or sets a custom object which can be used to attach arbitrary user defined data to the gamer.

Public Methods

	Name	Description
	BeginGetProfile	Starts an asynchronous profile read operation.
	EndGetProfile	Ends an asynchronous profile read operation.
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetProfile	Reads profile data for this gamer.
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	ToString	Retrieves a string representation of this object.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

[Gamer Class](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

Gamer.BeginGetProfile Method

Starts an asynchronous profile read operation.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IAsyncResult BeginGetProfile (  
    AsyncCallback callback,  
    Object asyncState  
)
```

Parameters

callback

The method to be called once the asynchronous operation has finished.

asyncState

State of the asynchronous operation.

Return Value

An [IAsyncResult](#) used to track the progress of the method. Call [EndGetProfile](#) to access these results.

Exceptions

Exception type	Condition
ObjectDisposedException	This object has already been disposed.

Gamer.EndGetProfile Method

Ends an asynchronous profile read operation.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerProfile EndGetProfile (  
    IAsyncResult result  
)
```

Parameters

result

An [IAsyncResult](#) used to track the progress of the operation.

Return Value

The profile data for this gamer.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Gamer.GetProfile Method

Reads profile data for this gamer.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerProfile GetProfile ()
```

Return Value

The profile data for this gamer.

Remarks This operation can take some time if called on a remote gamer instance, in which case you might prefer to use the non-blocking alternative [BeginGetProfile](#), but will complete quickly when used with a locally signed in profile.

Gamer.SignedInGamers Property

Represents a collection of all gamers on the local system. The collection is sorted by the gamer index, skipping non-existent gamer indices. For example, if gamers 1 and 3 are signed in, the collection contains two instances of [SignedInGamer](#), with gamer 1 first in the collection.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static SignedInGamerCollection SignedInGamers { get; }
```

Property Value

Collection of current gamers on the local system.

GamerCollection Generic Class

Represents a collection of gamers. This collection cannot be modified and is updated automatically during the call to [Update](#).

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class GamerCollection<T> : ReadOnlyCollection<T>, IEnumerable<Gamer>, IEnumerable where T : Gamer
```

Remarks

Access this collection using the following methods.

- [AllGamers](#)
- [LocalGamers](#)
- [RemoteGamers](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

GamerCollection.GamerCollectionEnumerator.Dispose Method

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[GamerCollection.GamerCollectionEnumerator Generic Structure](#)

[GamerCollection.GamerCollectionEnumerator Members](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GamerCollection.GamerCollectionEnumerator.MoveNext Method

Advances the enumerator to the next element of the [GamerCollection](#).

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool MoveNext ()
```

Return Value

true if the enumerator was successfully advanced to the next element; **false** if the enumerator has passed the end of the collection.

Exceptions

Exception type	Condition
InvalidOperationException	The collection was modified after the enumerator was created.

Remarks

After an enumerator is created or after a call to the [System.Collections.IEnumerator.Reset Method](#) method, an enumerator is positioned before the first element of the collection, and the first call to the **MoveNext** method moves the enumerator over the first element of the collection.

After the end of the collection is passed, subsequent calls to **MoveNext** return false until [System.Collections.IEnumerator.Reset Method](#) is called.

An enumerator remains valid as long as the collection remains unchanged. If changes, such as adding, modifying, or deleting elements are made to the collection, the enumerator is irrecoverably invalidated and the next call to **MoveNext** or [System.Collections.IEnumerator.Reset Method](#) throws an [InvalidOperationException](#).

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

System.Collections.IEnumerator.Reset Method

Sets the enumerator to its initial position, which is before the first element in the [GamerCollection](#).

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private void System.Collections.IEnumerator.Reset ()
```

Exceptions

Exception type	Condition
InvalidOperationException	The collection was modified after the enumerator was created.

Remarks

An enumerator remains valid as long as the collection remains unchanged. If you make changes to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated, and the next call to the [MoveNext](#) method or the **System.Collections.IEnumerator.Reset** method throws an [InvalidOperationException](#).

Note

Notes to Implementers: All calls to **System.Collections.IEnumerator.Reset** must result in the same state for the enumerator. The preferred implementation is to move the enumerator to the beginning of the collection, before the first element. This invalidates the enumerator if the collection has been modified since the enumerator was created, which is consistent with [MoveNext](#) and [Current](#).

[SignedInGamer.Presence Property](#)

[Gamer.SignedInGamers Property](#)

[GamerPresence Class](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

GamerPresence.PresenceMode Property

Gets or sets the current presence mode for this gamer. You will see this status string when you view a friend through the Guide or on Xbox.com.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerPresenceMode PresenceMode { get; set; }
```

Property Value

The current presence mode for this gamer.

Remarks

Zune Specific Information

Setting presence information is not supported on the Zune platform. On the Zune platform, setting presence information for a signed-in gamer will not change the presence information on Xbox LIVE.

Some of the presence mode options include a number that can be set using the [PresenceValue](#) property:

- [GamerPresenceMode.Stage](#)
- [GamerPresenceMode.Level](#)
- [GamerPresenceMode.Score](#)
- [GamerPresenceMode.CoopStage](#)
- [GamerPresenceMode.CoopLevel](#)
- [GamerPresenceMode.VersusScore](#)

Note

A game title will not be displayed in a player's presence information on the Xbox LIVE service until that game passes peer review. Once a game passes peer review, the presence information for a player shows three things: a confirmation the player is playing an Xbox LIVE Indie Game, the game's title, and the presence information set by [SignedInGamer.Presence](#). For example:

```
Xbox LIVE Indie Game
My Game Title
Fighting the Boss
```

While a game is in development, but before the game passes peer review, the presence information indicates the developer is using the XNA Creators Club, as shown:

```
XNA Creators Club
creators.xna.com
Fighting the Boss
```

GamerPresence.PresenceValue Property

Gets or sets a custom presence value. You can insert this into the presence string if you select one of the presence modes that includes a value. For example, you might select [GamerPresenceMode.Score](#) or [GamerPresenceMode.Level](#).

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int PresenceValue { get; set; }
```

Property Value

A custom presence value, which indicates a stage, score, or level to display as a part of the presence string.

Remarks

Zune Specific Information

Setting presence information is not supported on the Zune platform. On the Zune platform, setting presence information for a signed-in gamer will not change the presence information on Xbox LIVE.

The following [GamerPresenceMode](#) settings, specified in [PresenceMode](#), may include a numeric value as specified by [PresenceValue](#):

- [GamerPresenceMode.Stage](#)
- [GamerPresenceMode.Level](#)
- [GamerPresenceMode.Score](#)
- [GamerPresenceMode.CoopStage](#)
- [GamerPresenceMode.CoopLevel](#)
- [GamerPresenceMode.VersusScore](#)

GamerPrivilegeException Constructor (SerializationInfo, StreamingContext)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of **GamerPrivilegeException** with the specified streaming context.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected GamerPrivilegeException (  
    SerializationInfo info,  
    StreamingContext context  
)
```

Parameters

info

Describes the gamer services or multiplayer API being accessed when the exception occurred.

context

Describes the stream where the exception occurred.

GamerPrivileges Class

Describes what operations a gamer is allowed to perform.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class GamerPrivileges
```

Remarks

GamerPrivileges can be defined by parental control settings, and will also be set automatically in response to things like age, region, and whether the gamer has a LIVE Gold or LIVE Silver account. Games do not need to explicitly check privileges, because a [GamerPrivilegeException](#) will be thrown if they try to perform an unsupported operation, but these privilege bits may be useful to detect that an operation is unavailable before calling it so as to grey-out the relevant menu option.

GamerPrivileges.AllowCommunication Property

Checks whether this gamer is allowed to send and receive communications using voice, text, messaging, or game invites.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerPrivilegeSetting AllowCommunication { get; }
```

Property Value

true if this gamer is allowed to send and receive communications using voice, text, messaging, or game invites; **false** otherwise.

Remarks

Titles do not need to do anything special to disable voice if this privilege is disabled. The framework will handle that automatically.

GamerPrivileges.AllowOnlineSessions Property

Checks whether this gamer is allowed to play in online multiplayer sessions.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool AllowOnlineSessions { get; }
```

Property Value

true if this gamer is allowed to play in online multiplayer sessions; **false** otherwise.

Remarks

This may be disabled based on parental control settings. Also, it is disabled if the gamer does not have a Xbox LIVE Gold or LIVE Silver membership. This property does not affect system link sessions, which are always available.

While in limited trial mode, this property will return **false**, which means gamers won't be able to use the Xbox LIVE servers to connect to other machines over the Internet. It is possible that the game may change from trial mode at any time, including during actual gameplay. For more information, please see [Guide.IsTrialMode](#).

GamerServicesComponent Constructor

Creates a new [GamerServicesComponent](#).

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerServicesComponent (
    Game game
)
```

Parameters

game

The game that will be associated with this component.

Exceptions

Exception type	Condition
GamerServicesNotAvailableException	<ul style="list-style-type: none"> If the current game uses the XNA Framework Redistributable. This file does not include Games for Windows – LIVE functionality. If another Games for Windows – LIVE title is running already.
ArgumentNullException	<i>serviceProvider</i> is null .
InvalidOperationException	The gamer services functionality is already initialized.

Remarks

Important

Games for Windows - LIVE is not available to finished games. This functionality is not included in the redistributable version of the XNA Framework. A game that attempts to use these components without XNA Game Studio installed will result in a [GamerServicesNotAvailableException](#).

GamerServicesDispatcher Class

Implements the Windows-specific portion of a **GamerServicesDispatcher** class.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static class GamerServicesDispatcher
```

Remarks

Use the [GamerServicesDispatcher](#) class to access gamer services functionality from your game. This functionality includes, among other services, displaying the guide from your game, determining which profiles are checked in, and determining the privileges for a specific gamer profile.

During startup of your game, initialize an instance of **GamerServicesDispatcher**. During the lifetime of your game, call [Update](#) for every frame.

Commonly, you do not directly interact with the **GamerServicesDispatcher** object. Instead, use the [GamerServicesComponent](#) class, which wraps the functionality of **GamerServicesDispatcher**. However, for applications that do not use the default game template, you must interact with the **GamerServicesDispatcher** instance of your application.

GamerServicesDispatcher.Initialize Method

Initializes gamer services functionality for the game.

Call this method during startup of your game.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Initialize (
    IServiceProvider serviceProvider
)
```

Parameters

serviceProvider

The service provider to be used when locating additional services services. For example, [IGraphicsDeviceService](#).

Exceptions

Exception type	Condition
GamerServicesNotAvailableException	<ul style="list-style-type: none"> If the current game uses the XNA Framework Redistributable. This file does not include Games for Windows – LIVE functionality. If another Games for Windows – LIVE title is running already.
ArgumentNullException	<i>serviceProvider</i> is null .
InvalidOperationException	The gamer services functionality is already initialized.

Remarks

Important

Games for Windows - LIVE is not available to finished games. This functionality is not included in the redistributable version of the XNA Framework. A game that attempts to use these components without XNA Game Studio installed will result in a [GamerServicesNotAvailableException](#).

GamerServicesDispatcher Events

Public Events

	Name	Description
 S	InstallingTitleUpdate	Notifies the game when a Games for Windows - LIVE title update is being installed.

See Also

Reference

[GamerServicesDispatcher Class](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

GamerServicesDispatcher.InstallingTitleUpdate Event

Notifies the game when a Games for Windows - LIVE title update is being installed.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static event EventHandler<EventArgs> InstallingTitleUpdate
```

Remarks Gamer services and networking functionality is no longer available after this event has been raised: games should typically exit in response to **InstallingTitleUpdate**. If you are using the [GamerServicesComponent](#), this event is automatically hooked up to call [Exit](#), so you do not need to do anything special to handle title updates.

GamerServicesNotAvailableException Class

Thrown if the [gamer services](#) system cannot be successfully initialized.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[SerializableAttribute]  
public class GamerServicesNotAvailableException : Exception
```

Remarks

The following are likely causes for this exception.

- If the current game uses the [XNA Framework Redistributable](#). This file does not include Games for Windows – LIVE functionality.
- If another Games for Windows – LIVE title is running already.

Important

Games for Windows - LIVE is not available to finished games. This functionality is not included in the redistributable version of the XNA Framework. A game that attempts to use these components without XNA Game Studio installed will result in a [GamerServicesNotAvailableException](#).

Guide.BeginShowKeyboardInput Method

Begins the process for displaying a dialog for keyboard input from a gamer. The display operation is performed asynchronously.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IAsyncResult BeginShowKeyboardInput (
    PlayerIndex player,
    string title,
    string description,
    string defaultText,
    AsyncCallback callback,
    Object state
)
```

Parameters

player

Index of the player providing input. For Windows-based XNA games, the only valid option is **PlayerIndex.One**.

title

Title of the dialog box.

description

Text of the dialog box.

defaultText

Text displayed when the dialog box is initially shown.

callback

The method to be called once the asynchronous operation has finished.

state

A user-created object uniquely identifying this request.

Return Value

An [IAsyncResult](#) used to track the progress of the method.

Exceptions

Exception type	Condition
ArgumentException	<i>title</i> , <i>description</i> , or <i>defaultText</i> is larger than the maximum allowed string length of 260 characters.
ArgumentOutOfRangeException	<i>player</i> is not a valid value. For Windows-based XNA games, the only valid option is PlayerIndex.One .

[Guide Class](#)

[Guide Members](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

Guide.BeginShowMessageBox Method (PlayerIndex, String, String, Generic IEnumerable, Int32, MessageBoxIcon, AsyncCallback, Object)

Begins the process of displaying a message box for a particular player.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IAsyncResult BeginShowMessageBox (
    PlayerIndex player,
    string title,
    string text,
    IEnumerable<string> buttons,
    int focusButton,
    MessageBoxIcon icon,
    AsyncCallback callback,
    Object state
)
```

Parameters

player

Target player of the message box. On Windows, the only valid option is **PlayerIndex.One**.

title

Title of the message box.

text

Text that will be displayed by the message box.

buttons

Captions for the message box buttons. The maximum number is three.

focusButton

Zero-based index specifying which button has the focus.

icon

Type of icon displayed in the message box.

callback

Method to be called once the asynchronous operation has finished.

state

User-created object uniquely identifying this request.

Return Value

An [IAsyncResult](#) used to track the progress of the method.

Exceptions

Exception type	Condition
InvalidOperationException	Either IsInitialized was not called previously, or a Guide user interface screen currently is active.

Remarks

This overload requires that the player for whom the message is targeted responds to the message.

★ Best Practice

You can check [GamerPrivileges.AllowCommunication](#) to determine if a player is allowed to send and receive communications before displaying a menu option that would call this method.

Guide.BeginShowMessageBox Method (String, String, Generic IEnumerable, Int32, MessageBoxIcon, AsyncCallback, Object)

Begins the process of displaying a message box to which any user on the system can respond.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IAsyncResult BeginShowMessageBox (
    string title,
    string text,
    IEnumerable<string> buttons,
    int focusButton,
    MessageBoxIcon icon,
    AsyncCallback callback,
    Object state
)
```

Parameters

title

Title of the message box.

text

Text that will be displayed by the message box.

buttons

Captions for the message box buttons. The maximum number is three.

focusButton

Zero-based index specifying which button has the focus.

icon

Type of icon displayed in the message box.

callback

Method to be called once the asynchronous operation has finished.

state

User-created object uniquely identifying this request.

Return Value

An [IAsyncResult](#) used to track the progress of the method.

Exceptions

Exception type	Condition
InvalidOperationException	Either IsInitialized was not called previously, or a Guide user interface screen currently is active.

Remarks

This overload allows any player on the system to respond to the message.

Begins the process for displaying the storage device selector user interface, specifying the size of the data to be written to the storage device. The display operation is performed asynchronously.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IAsyncResult BeginShowStorageDeviceSelector (  
    int sizeInBytes,  
    int directoryCount,  
    AsyncCallback callback,  
    Object state  
)
```

Parameters

sizeInBytes

Size, in bytes, of the data to write to the storage device.

directoryCount

Number of directories to write to the storage device.

callback

The method to be called once the asynchronous operation has finished.

state

A user-created object uniquely identifying this request.

Return Value

An [IAsyncResult](#) used to track the progress of the method.

Guide.DelayNotifications Method

Delays system notifications for the specified amount of time.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void DelayNotifications (  
    TimeSpan delay  
)
```

Parameters

delay

Time, in seconds, of the delay.

Calling this function while notifications are already delayed has no effect. The maximum delay is 120. If the specified duration exceeds the maximum, the maximum value is used.

Remarks

Use **DelayNotifications** to suppress pop-up notifications during critical times, such as cut scenes. Once the delay interval has passed, any deferred notifications are individually displayed in the order they were sent.

Titles cannot call **DelayNotifications** multiple times in a row. There must be an opportunity for the system application to display notifications to gamers.

C#

```
public static Nullable<int> EndShowMessageBox (  
    IAsyncResult result  
)
```

Parameters

result

The [IAsyncResult](#) returned from [BeginShowMessageBox](#).

Return Value

Remarks

This call blocks until the display operation is finished. Typically, you call this from the callback function specified in the *callback* argument of [BeginShowMessageBox](#).

Each call to [EndShowMessageBox](#) must match an earlier call to [BeginShowMessageBox](#).

Guide.EndShowStorageDeviceSelector Method

Ends the display of the storage selector user interface.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static StorageDevice EndShowStorageDeviceSelector (
    IAsyncResult result
)
```

Parameters

result

The [IAsyncResult](#) returned from [BeginShowStorageDeviceSelector](#).

Return Value

Storage device selected by the gamer, or **null** if the user cancelled the selection.

Guide.Show Method

Note

This method is available only when developing for Zune.

Shows the guide user interface.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Show ()
```

Exceptions

Exception type	Condition
GuideAlreadyVisibleException	The Guide is already being displayed on the target device.

Guide.ShowComposeMessage Method

Shows the **Compose Message** user interface. A gamer uses this user interface to write messages to other gamers.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void ShowComposeMessage (
    PlayerIndex player,
    string text,
    IEnumerable<Gamer> recipients
)
```

Parameters

player

Gamer composing the message.

text

Text of the message.

recipients

Collection of gamers receiving the message.

If this is **null**, the **Select Gamertag** user interface is displayed.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	For Windows applications, this exception is thrown if <i>player</i> is not PlayerIndex.One .
ArgumentException	The message text is null , empty, or exceeds 200 characters. This exception is also thrown if any recipients have a value of null or if there are more than 100 recipients.

Remarks

★ Best Practice

You can check [GamerPrivileges.AllowCommunication](#) to determine if a player is allowed to send and receive communication s prior to displaying a menu option that would call this method.

Guide.ShowFriendRequest Method

Shows the **Friend Request** user interface.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void ShowFriendRequest (  
    PlayerIndex player,  
    Gamer gamer  
)
```

Parameters

player

Index of the player making the request.

The profile specified by *player* must be signed in when calling this function.

gamer

Recipient of the request.

Guide.ShowGameInvite Method

Displays the game invitation user interface.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void ShowGameInvite (  
    PlayerIndex player,  
    IEnumerable<Gamer> recipients  
)
```

Parameters

player

Index of the player initiating the invitation.

recipients

List of gamers who receive the invitation. If **null**, the Guide will prompt the player to specify a recipient.

Remarks

See [How To: Add Support for Game Invitations](#) for more information about adding game invitation support to your title.

★ Best Practice

You can check [GamerPrivileges.AllowCommunication](#) to determine if a player is allowed to send and receive communication s prior to displaying a menu option that would call this method.

Guide.ShowGamerCard Method

Shows the **Gamer Card** user interface.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void ShowGamerCard (  
    PlayerIndex player,  
    Gamer gamer  
)
```

Parameters

player

Index of the player making the request.

The profile specified by *player* must be signed in when calling this function.

gamer

Owner of the gamer card being requested for display.

Remarks

★ Best Practice

You can check [GamerPrivileges.AllowProfileViewing](#) to determine if a player is allowed to send and receive communications prior to displaying a menu option that would call this method.

Guide.ShowMarketplace Method

Displays the marketplace user interface.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void ShowMarketplace (  
    PlayerIndex player  
)
```

Parameters

player

Index of the controller for the player making the request.

Remarks

★ Best Practice

- You can check [GamerPrivileges.AllowPurchaseContent](#) to determine if a player is allowed to purchase content before displaying a menu option that would call this method.
- When a trial game is exiting, you can present a marketplace offer using the [Guide.ShowMarketplace](#) method. You can check if a game is in trial mode using [Guide.IsTrialMode](#), and write code that is performed on game exit in the [Game.Exit](#) method.

Guide.ShowParty Method

Shows the Xbox LIVE Party screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void ShowParty (  
    PlayerIndex player  
)
```

Parameters

player

The player index for whom to bring up the Xbox LIVE Party screen.

Remarks

Shows the Xbox LIVE Party screen, which allows players to invite others to the party, invite party members to the current game session, or to chat with party members.

Note

For LIVE-enabled platforms without LIVE Party support, the **Friends** screen will be shown instead.

Guide.ShowPartySessions Method

Shows the **Play with Party Member** screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void ShowPartySessions (  
    PlayerIndex player  
)
```

Parameters

player

The player index for whom the list of game sessions with party members will be shown.

Remarks

This method brings up the **Play with Party Member** screen, which allows players to join game sessions with fellow party members in the current title.

If the player is not currently in a party, this method will show the Friends screen instead.

Guide.ShowSignIn Method

Shows the user interface a gamer uses for signing into Xbox LIVE.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void ShowSignIn (
    int paneCount,
    bool onlineOnly
)
```

Parameters

paneCount

Number of panes displayed at sign in. Each pane accepts a single gamer.

On Windows, only a single pane can be displayed. On Xbox 360, valid values are 1, 2, and 4.

onlineOnly

Determines the profile types being displayed. **true** if only online profiles are displayed; **false** otherwise. If *onlineOnly* is **true**, local gamers can sign in as guests of a profile currently signed in.

Exceptions

Exception type	Condition
ArgumentException	The <i>paneCount</i> argument is invalid. The valid options for this parameter are 1, 2, and 4.

Guide Properties

Public Properties

	Name	Description
 	IsScreenSaverEnabled	Gets or sets the current state of the screen saver.
 	IsTrialMode	Determines whether the game is running currently in limited trial mode.
 	IsVisible	Determines whether a Guide user interface screen is active.
 	NotificationPosition	Determines where notifications appear on the screen.
 	SimulateTrialMode	Allows titles to simulate trial mode restrictions when testing using the Development configuration.

See Also

Reference

[Guide Class](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

Guide.IsScreenSaverEnabled Property

Gets or sets the current state of the screen saver. This property has no effect for Windows games.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool IsScreenSaverEnabled { get; set; }
```

Property Value

true if the screen saver is enabled; **false** otherwise.

Remarks

The **IsScreenSaverEnabled** property is a per-game property. Disabling the screen saver for this game does not permanently disable the screen saver. Use this method when displaying cutscenes or during other periods where the gamer could become inactive for a long period of time.

See Also

Reference

[Guide Members](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

Guide.IsTrialMode Property

Determines whether the game is running currently in limited trial mode.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool IsTrialMode { get; set; }
```

Property Value

true if the game is running currently in limited trial mode; **false** otherwise.

Remarks

★Best Practice

When a trial game is exiting, you can present a marketplace offer using the [Guide.ShowMarketplace](#) method. You can write code that is performed on game exit in the [Game.Exit](#) method.

Limited Trial Mode

While in trial mode, games will be unable to use the Xbox LIVE servers to connect to other machines over the Internet for player match or ranked network sessions. Note that this does not affect system link sessions, which are always available.

The [Guide.IsTrialMode](#) property always returns **true** when a game begins. [Guide.IsTrialMode](#) may change to **false** shortly after game launch if a license is detected when a player signs in, or it could change at any time after game launch if a license is acquired.

XNA Creators Club games can be launched in simulated trial mode by setting the [Guide.SimulateTrialMode](#) property to **true** when the game starts. During development, when XNA Creators Club games are running on an Xbox 360 console, there is also an option in the dash to launch a game in simulated trial mode.

Indie games downloaded from the Xbox LIVE Marketplace will run in limited trial mode until one of the signed-in gamers acquires a license for the game. Detection of a game license could occur as part of game startup, in response to an in-game purchase, or as part of user signing in.

For Xbox LIVE Indie Games running in trial mode, gameplay will be limited to a short trial period. At the end of the gameplay period, the player will see an expiration screen. The player can then either exit the game via the **B** or **Back** button or use the **X** button to unlock the game. If the player chooses to unlock the game, a **Marketplace** screen will be displayed. The player can then buy the full version of the game.

While the expiration screen shows, [Game.IsActive](#) will return **false**, and all input to the game will be blocked. Rendering can continue. However, the expiration screen obscures most of the rendering process, and any controller vibration will be stopped.

★Best Practice

It is generally a good idea to pause the game when [Game.IsActive](#) is **false**.

For XNA Creators Club games running in simulated trial mode there will be no time limitation applied to gameplay.

Guide.IsVisible Property

Determines whether a Guide user interface screen is active.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool IsVisible { get; set; }
```

Property Value

true if a user interface screen is displayed; **false** otherwise. It is not possible to bring up another Guide user interface screen, if **IsVisible** is **true**.

Exceptions

Exception type	Condition
InvalidOperationException	The gamer services functionality must be initialized before this property is accessed.

Guide.SimulateTrialMode Property

Allows titles to simulate trial mode restrictions when testing using the **Development** configuration. Setting this property to **true** in the game constructor will artificially force [IsTrialMode](#) to return **true**.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool SimulateTrialMode { get; set; }
```

Property Value

true to simulate trial mode restrictions in a **Development** configuration; **false** otherwise.

Remarks

You can set **SimulateTrialMode** to **false** at some later point (perhaps calling the ShowMarketplace API at the same time) to simulate purchasing the full game.

Limited Trial Mode

While in trial mode, games will be unable to use the Xbox LIVE servers to connect to other machines over the Internet for player match or ranked network sessions. Note that this does not affect system link sessions, which are always available.

The [Guide.IsTrialMode](#) property always returns **true** when a game begins. [Guide.IsTrialMode](#) may change to **false** shortly after game launch if a license is detected when a player signs in, or it could change at any time after game launch if a license is acquired.

XNA Creators Club games can be launched in simulated trial mode by setting the [Guide.SimulateTrialMode](#) property to **true** when the game starts. During development, when XNA Creators Club games are running on an Xbox 360 console, there is also an option in the dash to launch a game in simulated trial mode.

Indie games downloaded from the Xbox LIVE Marketplace will run in limited trial mode until one of the signed-in gamers acquires a license for the game. Detection of a game license could occur as part of game startup, in response to an in-game purchase, or as part of user signing in.

For Xbox LIVE Indie Games running in trial mode, gameplay will be limited to a short trial period. At the end of the gameplay period, the player will see an expiration screen. The player can then either exit the game via the **B** or **Back** button or use the **X** button to unlock the game. If the player chooses to unlock the game, a **Marketplace** screen will be displayed. The player can then buy the full version of the game.

While the expiration screen shows, [Game.IsActive](#) will return **false**, and all input to the game will be blocked. Rendering can continue. However, the expiration screen obscures most of the rendering process, and any controller vibration will be stopped.

★ Best Practice

It is generally a good idea to pause the game when [Game.IsActive](#) is **false**.

For XNA Creators Club games running in simulated trial mode there will be no time limitation applied to gameplay.

SignedInGamer Members

The following tables list the members exposed by the SignedInGamer type.

Public Properties

Name	Description
 Avatar	Description data for the avatar that represents the gamer.
 GameDefaults	Describes a gamer's preferred settings.
 Gamertag	(Inherited from Gamer .)
 IsDisposed	(Inherited from Gamer .)
 IsGuest	Determines whether the gamer is the guest of an Xbox LIVE-enabled profile.
 IsSignedInToLive	Determines whether the gamer has an Xbox LIVE-enabled profile.
 PartySize	Gets the current party size.
 PlayerIndex	Gets the index of the gamer.
 Presence	Gets an object that may be used to set the rich presence state for this gamer.
 Privileges	Describes what operations a gamer is allowed to perform.
 SignedInGamers	(Inherited from Gamer .)
 Tag	(Inherited from Gamer .)

Public Methods

Name	Description
 BeginGetProfile	(Inherited from Gamer .)
 EndGetProfile	(Inherited from Gamer .)
 Equals	(Inherited from Object .)
 GetFriends	Reads the friends list of this local gamer. This includes both the gamertags of the friends and their current presence information.
 GetHashCode	(Inherited from Object .)
 GetProfile	(Inherited from Gamer .)
 GetType	(Inherited from Object .)
 IsFriend	Queries whether the specified gamer is a friend of this local gamer.
 ReferenceEquals	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Public Events

Name	Description
 AvatarChanged	Occurs when a gamer's avatar changes.
 SignedIn	Occurs when a new gamer signs into the local system.
 SignedOut	Occurs when a gamer signs out on the local system.

SignedInGamer.GetFriends Method

Reads the friends list of this local gamer. This includes both the gamertags of the friends and their current presence information.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public FriendCollection GetFriends ()
```

Return Value

The friends of this local gamer.

Exceptions

Exception type	Condition
ObjectDisposedException	This object has already been disposed.
GamerPrivilegeException	A signed-in gamer profile is required to perform this operation. A LIVE profile may also be required. There are no profiles currently signed in, or the profile is not signed in to LIVE.

SignedInGamer.IsFriend Method

Queries whether the specified gamer is a friend of this local gamer.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsFriend (
    Gamer gamer
)
```

Parameters

gamer

The gamer to query.

Return Value

true if the specified gamer is a friend of the local gamer; **false** otherwise.

Exceptions

Exception type	Condition
ArgumentNullException	<i>gamer</i> is null .
GamerPrivilegeException	A signed in gamer profile is required to perform this operation. A LIVE profile may also be required. There are no profiles currently signed in, or the profile is not signed in to LIVE.
ObjectDisposedException	The <i>gamer</i> object has already been disposed.

Reference

[SignedInGamer Class](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

SignedInGamer.Avatar Property

Description data for the avatar that represents the gamer.

Windows Specific Information

Avatar-related APIs are exposed on Windows to ease cross-platform development between Windows and the Xbox 360. All avatar-related methods return default values, and rendering methods do not draw anything to the screen.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public AvatarDescription Avatar { get; }
```

Property Value

Description data of the related avatar.

Remarks

It is possible that a newly-created random [AvatarDescription](#) object could be an invalid avatar description buffer. Possible scenarios where this could occur include:

- The associated avatar data, stored on the local storage of the signed-in gamer, is corrupted.
- The signed-in gamer currently has no avatar.

SignedInGamer.GameDefaults Property

Describes a gamer's preferred settings.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GameDefaults GameDefaults { get; }
```

Property Value

The gamer's preferred settings.

RemarksWherever possible, games should default to these values.

SignedInGamer.IsSignedInToLive Property

Determines whether the gamer has an Xbox LIVE-enabled profile.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsSignedInToLive { get; }
```

Property Value

true if the gamer is able to sign in to Xbox LIVE; **false** otherwise.

See Also

SignedInGamer.PartySize Property

Gets the current party size.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int PartySize { get; set; }
```

Property Value

The current number of members in this signed-in gamer's LIVE Party.

Remarks

This is a read-only property. You cannot use it to set the party size. On platforms that do not support LIVE parties, the value of this property is always zero.

See Also

Tasks

SignedInGamer.PlayerIndex Property

Gets the index of the gamer.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public PlayerIndex PlayerIndex { get; }
```

Property Value

Index of the gamer.

Exceptions

Exception type	Condition
ObjectDisposedException	Thrown if the associated profile is no longer valid. For example, the profile may have signed out.

SignedInGamer.Presence Property

Gets an object that may be used to set the rich presence state for this gamer.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerPresence Presence { get; }
```

Property Value

An object that may be used to set the rich presence state for this gamer.

Remarks

Zune Specific Information

Setting presence information is not supported on the Zune platform. On the Zune platform, setting presence information for a signed-in gamer will not change the presence information on Xbox LIVE.

Note

A game title will not be displayed in a player's presence information on the Xbox LIVE service until that game passes peer review. Once a game passes peer review, the presence information for a player shows three things: a confirmation the player is playing an Xbox LIVE Indie Game, the game's title, and the presence information set by [SignedInGamer.Presence](#). For example:

```
Xbox LIVE Indie Game  
My Game Title  
Fighting the Boss
```

While a game is in development, but before the game passes peer review, the presence information indicates the developer is using the XNA Creators Club, as shown:

```
XNA Creators Club  
creators.xna.com  
Fighting the Boss
```

SignedInGamer.Privileges Property

Describes what operations a gamer is allowed to perform.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerPrivileges Privileges { get; }
```

Property Value

The operations a gamer is allowed to perform.

Remarks **Privileges** can be defined by parental control settings, and also will be set automatically in response to things like age, region, and whether the gamer has a LIVE Gold or LIVE Silver membership. Games do not need to explicitly check privileges, because a [GamerPrivilegeException](#) will be thrown if an unsupported operation is selected. However, these privilege bits may be useful to detect that an operation is unavailable before calling it so as to grey-out the relevant menu option.

[SignedInGamer Members](#)

[Microsoft.Xna.Framework.GamerServices Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

SignedInGamer.SignedIn Event

Occurs when a new gamer signs into the local system.

Namespace: Microsoft.Xna.Framework.GamerServices

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static event EventHandler<SignedInEventArgs> SignedIn
```

Remarks

This event is raised during calls to [Update](#). When this event is raised, the [LocalGamers](#) collection will contain the newly signed-in gamer.

Behavior of Local Sessions

XNA Game Studio 3.0 introduces a change in the behavior of network sessions when local profiles sign out in the middle of a session. In previous versions of XNA Game Studio, a session ended whenever a player signed out. Now the session continues even if one or more profiles sign out. Signed-out players are removed from the session, but the session ends only if no suitable players remain in the session.

Microsoft.Xna.Framework.Graphics Namespace

Contains low-level application programming interface (API) methods that take advantage of hardware acceleration capabilities to display 3D objects.

Classes

	Name	Description
	BasicDirectionalLight	Provides methods for manipulating the directional lights used by the BasicEffect class.
	BasicEffect	Represents shader model 1.1 Effect that has optional support for vertex colors, texturing, and lighting.
	ClipPlane	Represents the device clipping plane.
	ClipPlaneCollection	Manipulates a collection of ClipPlane objects.
	CompilationFailedException	The exception that is thrown if the compilation of an effect fails.
	CompilerIncludeHandler	The abstract base class for custom compiler include file handlers.
	DepthStencilBuffer	Queries and prepares depth stencil buffers.
	DeviceLostException	The exception that is thrown when the device has been lost, but cannot be reset at this time. Therefore, rendering is not possible.
	DeviceNotResetException	The exception that is thrown when the device has been lost, but can be reset at this time.
	DeviceNotSupportedException	The exception that is thrown when the graphics device does not support the requested capabilities.
	DeviceStillDrawingException	The error that is thrown when the device is still drawing.
	DriverInternalErrorException	The exception that is thrown when an internal driver error occurs. Applications should destroy and recreate the device when receiving this error.
	DynamicIndexBuffer	Describes the rendering order of the vertices in a vertex buffer.
	DynamicVertexBuffer	Represents a list of 3D vertices to be streamed to the graphics device.
	Effect	Used to set and query effects and choose techniques.
	EffectAnnotation	Represents an annotation to an EffectParameter .
	EffectAnnotationCollection	Manipulates a collection of EffectAnnotation objects.
	EffectFunction	Represents a function on an Effect .
	EffectFunctionCollection	Manipulates a collection of EffectFunction objects.
	EffectParameter	Represents an Effect parameter.
	EffectParameterBlock	Represents an EffectParameter state block.
	EffectParameterCollection	Manipulates a collection of EffectParameter objects.
	EffectPass	Represents an effect pass.

 EffectPassCollection	Manipulates a collection of EffectPass objects.
 EffectPool	Allows applications to share resources between effects.
 EffectTechnique	Represents an effect technique.
 EffectTechniqueCollection	Manipulates a collection of EffectTechnique objects.
 GammaRamp	Contains red, green, and blue ramp data.
 GraphicsAdapter	Provides methods to retrieve and manipulate graphics adapters.
 GraphicsDevice	Performs primitive-based rendering, creates resources, handles system-level variables, adjusts gamma ramp levels, and creates shaders.
 GraphicsDeviceCapabilities	Represents the capabilities of the hardware.
 GraphicsResource	Queries and prepares resources.
 IndexBuffer	Describes the rendering order of the vertices in a vertex buffer.
 Model	Represents a 3D model composed of multiple ModelMesh objects which may be moved independently.
 ModelBone	Represents bone data for a model.
 ModelBoneCollection	Represents a set of bones associated with a model.
 ModelErrorCollection	Represents a collection of effects associated with a model.
 ModelMesh	Represents a mesh that is part of a Model .
 ModelMeshCollection	Represents a collection of ModelMesh objects.
 ModelMeshPart	Represents a batch of geometry information to submit to the graphics device during rendering. Each ModelMeshPart is a subdivision of a ModelMesh object. The ModelMesh class is split into multiple ModelMeshPart objects, typically based on material information.
 ModelMeshPartCollection	Represents a collection of ModelMeshPart objects.
 OcclusionQuery	Used to perform an occlusion query against the latest drawn objects.
 OutOfVideoMemoryException	The exception that is thrown when Direct3D does not have enough display memory to perform the operation.
 PixelShader	Encapsulates the functionality of a pixel shader.
 PresentationParameters	Contains presentation parameters.
 RenderState	Defines the render state of a graphics device.
 RenderTarget	Represents a resource that will be written to at the end of a render pass. This is the base class for RenderTarget2D and RenderTargetCube .
 RenderTarget2D	Represents a 2D texture resource that will be written to at the end of a render pass.
 RenderTargetCube	Represents a cubic texture resource that will be written to at the end of a render pass.
 ResolveTexture2D	Represents a 2D grid of texels.
 ResourceCreatedEventArgs	Contains event data.

ResourceDestroyedEventArgs	Arguments for a ResourceDestroyed event.
SamplerState	Contains sampler states for the device.
SamplerStateCollection	Collection of SamplerState objects.
ShaderCompiler	Compiles and decompiles high-level shader language (HLSL) shaders.
ShaderConstant	Describes a shader constant.
ShaderConstantCollection	Manipulates a collection of ShaderConstant objects.
ShaderConstantTable	Contains the variables that are used by high-level language shaders and effects.
SpriteBatch	Enables a group of sprites to be drawn using the same settings.
SpriteFont	Represents a font texture.
StateBlock	Encapsulates render states.
Texture	Represents a texture resource.
Texture2D	Represents a 2D grid of texels.
Texture3D	Represents a 3D volume of texels.
TextureCollection	Represents a collection of Texture objects.
TextureCube	Represents a set of six 2D textures, one for each face of a cube.
VertexBuffer	Represents a list of 3D vertices to be streamed to the graphics device.
VertexDeclaration	Represents a vertex declaration.
VertexShader	Encapsulates the functionality of a vertex shader.
VertexStream	Represents a vertex stream.
VertexStreamCollection	Collection of VertexStream objects.

Interfaces

Name	Description
IGraphicsDeviceService	Defines a mechanism for retrieving GraphicsDevice objects.

Structures

Name	Description
Color	Represents a color using Red, Green, Blue, and Alpha values.
CompiledEffect	Represents a compiled Effect .
CompiledShader	Represents a compiled shader.
CompilerMacro	Represents a compiler macro.
DisplayMode	Describes the display mode.
DisplayModeCollection	Manipulates a collection of DisplayMode structures.
GraphicsDeviceCapabilities.AddressCaps	Represents the texture addressing capabilities for Texture structures.
GraphicsDeviceCapabilities.BlendCaps	Represents the supported blend capabilities.
GraphicsDeviceCapabilities.CompareCaps	Represents comparison capabilities.
GraphicsDeviceCapabilities.CursorCaps	Represents hardware support for cursors.
GraphicsDeviceCapabilities.DeclarationTypeCaps	Represents data types contained in a vertex declaration.

 GraphicsDeviceCapabilities.DeviceCaps	Represents device-specific capabilities.
 GraphicsDeviceCapabilities.DriverCaps	Represents driver-specific capabilities.
 GraphicsDeviceCapabilities.FilterCaps	Represents texture filter capabilities.
 GraphicsDeviceCapabilities.LineCaps	Represents the capabilities for line-drawing primitives.
 GraphicsDeviceCapabilities.PixelShaderCaps	Represents pixel shader capabilities.
 GraphicsDeviceCapabilities.PrimitiveCaps	Represents driver primitive capabilities.
 GraphicsDeviceCapabilities.RasterCaps	Represents raster-drawing capabilities.
 GraphicsDeviceCapabilities.ShadingCaps	Represents shading operations capabilities
 GraphicsDeviceCapabilities.StencilCaps	Represents driver stencil capabilities.
 GraphicsDeviceCapabilities.TextureCaps	Represents miscellaneous texture-mapping capabilities
 GraphicsDeviceCapabilities.VertexFormatCaps	Represents flexible vertex format capabilities.
 GraphicsDeviceCapabilities.VertexProcessingCaps	Represents vertex processing capabilities.
 GraphicsDeviceCapabilities.VertexShaderCaps	Represents vertex shader version 2_0 extended capabilities.
 GraphicsDeviceCreationParameters	Describes the creation parameters for a device.
 ModelBoneCollection.Enumerator	Provides the ability to iterate through the bones in an ModelBoneCollection .
 ModelEffectCollection.Enumerator	Provides the ability to iterate through the bones in an ModelEffectCollection .
 ModelMeshCollection.Enumerator	Provides the ability to iterate through the bones in an ModelMeshCollection .
 ModelMeshPartCollection.Enumerator	Provides the ability to iterate through the bones in an ModelMeshPartCollection .
 RasterStatus	Describes the raster status.
 ShaderSemantic	Semantics map a parameter to vertex or pixel shader registers. They can also be optional descriptive strings attached to non-register parameters.
 TextureCreationParameters	Describes the parameters to use when initializing a new instance of a texture.
 TextureInformation	Encapsulates information describing texture resources.
 VertexElement	Defines input vertex data to the pipeline.
 VertexPositionColor	Describes a custom vertex format structure that contains position and color information.
 VertexPositionColorTexture	Describes a custom vertex format structure that contains position, color, and one set of texture coordinates.
 VertexPositionNormalTexture	Describes a custom vertex format structure that contains position, normal data, and one set of texture coordinates.
 VertexPositionTexture	Describes a custom vertex format structure that contains position and one set of texture coordinates.
 Viewport	Defines the window dimensions of a render-target surface onto which a 3D volume projects.

Enumerations

Name	Description
 Blend	Defines color blending factors.
 BlendFunction	Defines how to combine a source color with the destination color already on the render target for color blending.
 BufferUsage	Specifies special usage of the buffer contents.

 ClearOptions	Specifies the buffer to use when calling Clear .
 ColorWriteChannels	Defines the color channels that can be chosen for a per-channel write to a render target color buffer.
 CompareFunction	Defines comparison functions that can be chosen for alpha, stencil, or depth-buffer tests.
 CompilerIncludeHandlerType	Identifies an include file as a local or system resource.
 CompilerOptions	Defines optimization options that may be chosen for shader and effect code compilation.
 CubeMapFace	Defines the faces of a cube map in the TextureCube class type.
 CullMode	Defines winding orders that may be used to identify back faces for culling.
 DepthFormat	Defines the format of data in a depth buffer.
 DeviceType	Specifies the type of device driver.
 EffectParameterClass	Defines classes that can be used for effect parameters or shader constants.
 EffectParameterType	Defines types that can be used for effect parameters or shader constants.
 FillMode	Describes options for filling the vertices and lines that define a primitive.
 FilterOptions	Defines modes describing how to filter an image or mipmap when it is minified or magnified to fit a set of vertices.
 FogMode	Defines constants that describe the fog mode.
 GraphicsDeviceStatus	Describes the status of the device.
 ImageFileFormat	Defines supported image file formats that may be used for textures.
 IndexElementSize	Defines the size of an element of an index buffer.
 MultiSampleType	Defines the levels of full-scene multisampling that the game machine can apply.
 PresentInterval	Defines flags that describe the relationship between the adapter refresh rate and the rate at which Present operations are completed.
 PresentOptions	Defines flags that control the behavior of the back buffer and depth buffer.
 PrimitiveType	Defines how data in a vertex stream is interpreted during a draw call.
 QueryUsages	Defines options for querying device resource formats.
 RenderTargetUsage	Determines how render target data is used once a new render target is set.
 ResourceType	Defines resource types.
 SaveStateMode	Defines options for saving the graphics device state before and after an effect technique is applied.
 SetDataOptions	Describes whether existing buffer data will be overwritten or discarded during a SetData operation.
 ShaderProfile	Defines vertex and pixel shader versions.
 ShaderRegisterSet	Defines the data type of a shader register.
 SpriteBlendMode	The following flags are used to specify sprite blending rendering options to the flags parameter in Begin :
 SpriteEffects	Defines sprite mirroring options.
 SpriteSortMode	Defines sprite sort-rendering options.
 StencilOperation	Defines stencil buffer operations.
 SurfaceFormat	Defines various types of surface formats.
 SwapEffect	Defines how the device front buffer and back buffer are to be swapped when Present is called.
 TextureAddressMode	Defines constants that describe supported texture-addressing modes.
 TextureFilter	Defines how a texture will be filtered as it is minified for each mipmap level.
 TextureUsage	Specifies special usage of the texture data.
 TextureWrapCoordinates	Defines supported wrap coordinates.
 VertexElementFormat	Defines vertex element formats.
 VertexElementMethod	Defines the tessellator processing method for a vertex element.
 VertexElementUsage	Defines usage for vertex elements.

BasicDirectionalLight Class

Provides methods for manipulating the directional lights used by the [BasicEffect](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class BasicDirectionalLight
```

BasicEffect Members

The following tables list the members exposed by the BasicEffect type.

Public Constructors

Name	Description
 BasicEffect	Overloaded. Initializes a new instance of the BasicEffect class.

Public Properties

Name	Description
 Alpha	Gets or sets the alpha this effect material.
 AmbientLightColor	Gets or sets the ambient light color of this effect.
 Creator	(Inherited from Effect .)
 CurrentTechnique	(Inherited from Effect .)
 DiffuseColor	Gets or sets the diffuse color of this effect material. Value takes 0 to 1.
 DirectionalLight0	Gets the first directional light for this effect.
 DirectionalLight1	Gets the second directional light for this effect.
 DirectionalLight2	Gets the third directional light for this effect.
 EffectPool	(Inherited from Effect .)
 EmissiveColor	Gets or sets the emissive color of the effect material.
 FogColor	Gets or sets the fog color for this effect.
 FogEnabled	Enables fog for this effect.
 FogEnd	Gets or sets the ending distance of fog.
 FogStart	Gets or sets the fog start distance.
 Functions	(Inherited from Effect .)
 GraphicsDevice	(Inherited from Effect .)
 IsDisposed	(Inherited from Effect .)
 LightingEnabled	Enables lighting for this effect.
 Parameters	(Inherited from Effect .)
 PreferPerPixelLighting	Gets or sets a value indicating that per-pixel lighting should be used if it is available for the current adapter. Per-pixel lighting is available if a graphics adapter supports Pixel Shader Model 2.0.
 Projection	Gets or sets the projection matrix.
 SpecularColor	Gets or sets the specular color of this effect material.
 SpecularPower	Gets or sets the specular power of this effect material.
 Techniques	(Inherited from Effect .)
 Texture	Gets or sets a texture to be applied by this effect.
 TextureEnabled	Enables textures for this effect.
 VertexColorEnabled	Enables use vertex colors for this effect.
 View	Gets or sets the view matrix.
 World	Gets or sets the world matrix.

Public Methods

Name	Description
 Begin	(Inherited from Effect .)
 Clone	Creates a clone of an effect.

 CommitChanges	(Inherited from Effect .)
 CompileEffectFromFile	(Inherited from Effect .)
 CompileEffectFromSource	(Inherited from Effect .)
 Disassemble	(Inherited from Effect .)
 Dispose	(Inherited from Effect .)
 EnableDefaultLighting	Enables default lighting for this effect.
 End	(Inherited from Effect .)
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	MemberwiseClone	(Inherited from Object .)
	raise_Disposing	(Inherited from Effect .)
	raise_Lost	(Inherited from Effect .)
	raise_Reset	(Inherited from Effect .)

Public Events

	Name	Description
	Disposing	(Inherited from Effect .)
	Lost	(Inherited from Effect .)
	Reset	(Inherited from Effect .)

BasicEffect Constructor (GraphicsDevice, EffectPool)

Initializes a new instance of the [BasicEffect](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public BasicEffect (  
    GraphicsDevice device,  
    EffectPool effectPool  
)
```

Parameters

device

The graphics device that will create the effect.

effectPool

Specifies a pool of resources to share between effects.

BasicEffect.Clone Method

Creates a clone of an effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override Effect Clone (  
    GraphicsDevice device  
)
```

Parameters

device

The cloned effect.

Return Value

The device associated with the effect.

BasicEffect.AmbientLightColor Property

Gets or sets the ambient light color of this effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 AmbientLightColor { get; set; }
```

Property Value

The ambient light color of this effect. Valid values are between 0 and 1.

BasicEffect.FogEnabled Property

Enables fog for this effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool FogEnabled { get; set; }
```

Property Value

true to enable fog; **false** otherwise.

See Also

Reference

[BasicEffect Class](#)

[BasicEffect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

BasicEffect.FogEnd Property

Gets or sets the ending distance of fog.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float FogEnd { get; set; }
```

Property Value

Fog end distance specified as a positive value.

See Also

Reference

[BasicEffect Class](#)

[BasicEffect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

BasicEffect.FogStart Property

Gets or sets the fog start distance.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float FogStart { get; set; }
```

Property Value

Fog start distance specified as a positive value. This distance is expressed in world space coordinates.

See Also

Reference

[BasicEffect Class](#)

[BasicEffect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

BasicEffect.LightingEnabled Property

Enables lighting for this effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool LightingEnabled { get; set; }
```

Property Value

true to enable lighting; **false** otherwise.

Remarks The lighting for [BasicEffect](#) is per-vertex and uses three directional lights: [DirectionalLight0](#), [DirectionalLight1](#), and [DirectionalLight2](#).

See Also

Reference

[BasicEffect Class](#)

[BasicEffect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

BasicEffect.PreferPerPixelLighting Property

Gets or sets a value indicating that per-pixel lighting should be used if it is available for the current adapter. Per-pixel lighting is available if a graphics adapter supports Pixel Shader Model 2.0.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool PreferPerPixelLighting { get; set; }
```

Property Value

true to use per-pixel lighting if it is available; **false** to disable per-pixel lighting. The default value is **true**. When **PreferPerPixelLighting** is **true**, if the graphics adapter does not support a minimum of Pixel Shader Model 2.0, [BasicEffect](#) will automatically fall-back to per-vertex lighting. When **PreferPerPixelLighting** is **false**, per-vertex lighting is used regardless of whether per-pixel lighting is supported by the graphics adapter.

Remarks

There are two common types of real-time lighting used in games. Per-vertex lighting is where lighting contributions are determined at each vertex and then the results are interpolated across the triangle. Depending on how tessellated the mesh is, this can result in severe artifacts. Per-pixel lighting interpolates the per-vertex normal across the triangle, but calculates the contribution at each pixel, which results in much smoother lighting, particularly when a specular highlight falls between vertices.

BasicEffect.Projection Property

Gets or sets the projection matrix. Use this matrix to change how a 3D image is converted to a 2D image that is rendered to the computer screen.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Matrix Projection { get; set; }
```

Property Value

The projection matrix.

Enables use vertex colors for this effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool VertexColorEnabled { get; set; }
```

Property Value

true to enable vertex colors; **false** otherwise.

BasicEffect.View Property

Gets or sets the view matrix. Use this matrix to change the position and direction of the camera.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Matrix View { get; set; }
```

Property Value

The view matrix.

Blend Enumeration

Defines color blending factors.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum Blend
```

Members

Member name	Description
Zero	Each component of the color is multiplied by (0, 0, 0, 0).
One	Each component of the color is multiplied by (1, 1, 1, 1).
SourceColor	Each component of the color is multiplied by the source color. This can be represented as (R_S, G_S, B_S, A_S) , where R, G, B, and A respectively stand for the red, green, blue, and alpha source values.
InverseSourceColor	Each component of the color is multiplied by the inverse of the source color. This can be represented as $(1 - R_S, 1 - G_S, 1 - B_S, 1 - A_S)$ where R, G, B, and A respectively stand for the red, green, blue, and alpha destination values.
SourceAlpha	Each component of the color is multiplied by the alpha value of the source. This can be represented as (A_S, A_S, A_S, A_S) , where A_S is the alpha source value.
InverseSourceAlpha	Each component of the color is multiplied by the inverse of the alpha value of the source. This can be represented as $(1 - A_S, 1 - A_S, 1 - A_S, 1 - A_S)$, where A_S is the alpha destination value.
DestinationAlpha	Each component of the color is multiplied by the alpha value of the destination. This can be represented as (A_D, A_D, A_D, A_D) , where A_D is the destination alpha value.
InverseDestinationAlpha	Each component of the color is multiplied by the inverse of the alpha value of the destination. This can be represented as $(1 - A_D, 1 - A_D, 1 - A_D, 1 - A_D)$, where A_D is the alpha destination value.
DestinationColor	Each component color is multiplied by the destination color. This can be represented as (R_D, G_D, B_D, A_D) , where R, G, B, and A respectively stand for red, green, blue, and alpha destination values.
InverseDestinationColor	Each component of the color is multiplied by the inverse of the destination color. This can be represented as $(1 - R_D, 1 - G_D, 1 - B_D, 1 - A_D)$, where $R_D, G_D, B_D,$ and A_D respectively stand for the red, green, blue, and alpha destination values.
SourceAlphaSaturation	Each component of the color is multiplied by either the alpha of the source color, or the inverse of the alpha of the source color, whichever is greater. This can be represented as $(f, f, f, 1)$, where $f = \min(A, 1 - A_D)$.
BothInverseSourceAlpha	(Win32 only) Each component of the source color is multiplied by the inverse of the alpha of the source color, and each component of the destination color is multiplied by the alpha of the source color. This can be represented as $(1 - A_S, 1 - A_S, 1 - A_S, 1 - A_S)$, with a destination blend factor of (A_S, A_S, A_S, A_S) ; the destination blend selection is overridden. This blend mode is supported only for the SourceBlend render state.
BlendFactor	Each component of the color is multiplied by a constant set in BlendFactor .

InverseBlendFactor	Each component of the color is multiplied by the inverse of a constant set in BlendFactor . This blend mode is supported only if SupportsBlendFactor is true in the SourceBlendCapabilities or DestinationBlendCapabilities properties.
BothSourceAlpha	This mode is obsolete. The same effect can be achieved by setting the source and destination blend factors to SourceAlpha and InverseSourceAlpha in separate calls.

Remarks

The alpha value of a color controls its transparency. Enabling alpha blending with [AlphaBlendEnable](#) allows colors, materials, and textures on a surface to be blended with transparency onto another surface.

Alpha blending is determined by the [SourceBlend](#) and [DestinationBlend](#) properties. With the default [BlendFunction](#), the source pixel times the [SourceBlend](#) is added to the destination pixel (the pixel on the back buffer) times the [DestinationBlend](#) to produce a color that is a blend of the two pixel colors. The [BlendFunction](#) determines the operation used on the outcome of the source blend and destination blend components.

BlendFunction Enumeration

Defines how to combine a source color with the destination color already on the render target for color blending.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum BlendFunction
```

Members

Member name	Description
Add	The result is the destination added to the source. <i>Result = (Source Color * Source Blend) + (Destination Color * Destination Blend)</i>
Max	The result is the maximum of the source and destination. <i>Result = max((Source Color * Source Blend), (Destination Color * Destination Blend))</i>
Min	The result is the minimum of the source and destination. <i>Result = min((Source Color * Source Blend), (Destination Color * Destination Blend))</i>
ReverseSubtract	The result is the source subtracted from the destination. <i>Result = (Destination Color * Destination Blend) - (Source Color * Source Blend)</i>
Subtract	The result is the destination subtracted from the source. <i>Result = (Source Color * Source Blend) - (Destination Color * Destination Blend)</i>

Remarks

The alpha value of a color controls its transparency. Enabling alpha blending with [AlphaBlendEnable](#) allows colors, materials, and textures on a surface to be blended with transparency onto another surface.

Alpha blending is determined by the [SourceBlend](#) and [DestinationBlend](#) properties. With the default [BlendFunction](#), the source pixel times the [SourceBlend](#) is added to the destination pixel (the pixel on the back buffer) times the [DestinationBlend](#) to produce a color that is a blend of the two pixel colors. The [BlendFunction](#) determines the operation used on the outcome of the source blend and destination blend components.

BufferUsage Enumeration

Specifies special usage of the buffer contents.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[FlagsAttribute]
public enum BufferUsage
```

Members

Member name	Description
None	None
Points	Indicates that the vertex or index buffer will be used for drawing point sprites. The buffer is loaded in system memory if software vertex processing is needed to emulate point sprites.
WriteOnly	Indicates that the application only writes to the vertex buffer. If specified, the driver chooses the best memory location for efficient writing and rendering. Attempts to read from a write-only vertex buffer fail.

Color Members

The following tables list the members exposed by the Color type.

Public Constructors

	Name	Description
	Color	Overloaded. Initializes a new instance of Color.

Public Properties

	Name	Description
	A	Gets or sets the alpha component value.
	AliceBlue	Gets a system-defined color with the value R:240 G:248 B:255 A:255.
	AntiqueWhite	Gets a system-defined color with the value R:250 G:235 B:215 A:255.
	Aqua	Gets a system-defined color with the value R:0 G:255 B:255 A:255.
	Aquamarine	Gets a system-defined color with the value R:127 G:255 B:212 A:255.
	Azure	Gets a system-defined color with the value R:240 G:255 B:255 A:255.
	B	Gets or sets the blue component value of this Color.
	Beige	Gets a system-defined color with the value R:245 G:245 B:220 A:255.
	Bisque	Gets a system-defined color with the value R:255 G:228 B:196 A:255.
	Black	Gets a system-defined color with the value R:0 G:0 B:0 A:255.
	BlanchedAlmond	Gets a system-defined color with the value R:255 G:235 B:205 A:255.
	Blue	Gets a system-defined color with the value R:0 G:0 B:255 A:255.
	BlueViolet	Gets a system-defined color with the value R:138 G:43 B:226 A:255.
	Brown	Gets a system-defined color with the value R:165 G:42 B:42 A:255.
	BurlyWood	Gets a system-defined color with the value R:222 G:184 B:135 A:255.
	CadetBlue	Gets a system-defined color with the value R:95 G:158 B:160 A:255.
	Chartreuse	Gets a system-defined color with the value R:127 G:255 B:0 A:255.
	Chocolate	Gets a system-defined color with the value R:210 G:105 B:30 A:255.
	Coral	Gets a system-defined color with the value R:255 G:127 B:80 A:255.
	CornflowerBlue	Gets a system-defined color with the value R:100 G:149 B:237 A:255.
	Cornsilk	Gets a system-defined color with the value R:255 G:248 B:220 A:255.
	Crimson	Gets a system-defined color with the value R:220 G:20 B:60 A:255.
	Cyan	Gets a system-defined color with the value R:0 G:255 B:255 A:255.
	DarkBlue	Gets a system-defined color with the value R:0 G:0 B:139 A:255.
	DarkCyan	Gets a system-defined color with the value R:0 G:139 B:139 A:255.
	DarkGoldenrod	Gets a system-defined color with the value R:184 G:134 B:11 A:255.
	DarkGray	Gets a system-defined color with the value R:169 G:169 B:169 A:255.
	DarkGreen	Gets a system-defined color with the value R:0 G:100 B:0 A:255.
	DarkKhaki	Gets a system-defined color with the value R:189 G:183 B:107 A:255.
	DarkMagenta	Gets a system-defined color with the value R:139 G:0 B:139 A:255.
	DarkOliveGreen	Gets a system-defined color with the value R:85 G:107 B:47 A:255.
	DarkOrange	Gets a system-defined color with the value R:255 G:140 B:0 A:255.
	DarkOrchid	Gets a system-defined color with the value R:153 G:50 B:204 A:255.
	DarkRed	Gets a system-defined color with the value R:139 G:0 B:0 A:255.
	DarkSalmon	Gets a system-defined color with the value R:233 G:150 B:122 A:255.
	DarkSeaGreen	Gets a system-defined color with the value R:143 G:188 B:139 A:255.
	DarkSlateBlue	Gets a system-defined color with the value R:72 G:61 B:139 A:255.
	DarkSlateGray	Gets a system-defined color with the value R:47 G:79 B:79 A:255.
	DarkTurquoise	Gets a system-defined color with the value R:0 G:206 B:209 A:255.
	DarkViolet	Gets a system-defined color with the value R:148 G:0 B:211 A:255.
	DeepPink	Gets a system-defined color with the value R:255 G:20 B:147 A:255.
	DeepSkyBlue	Gets a system-defined color with the value R:0 G:191 B:255 A:255.
	DimGray	Gets a system-defined color with the value R:105 G:105 B:105 A:255.
	DodgerBlue	Gets a system-defined color with the value R:30 G:144 B:255 A:255.

 S Firebrick	Gets a system-defined color with the value R:178 G:34 B:34 A:255.
 S FloralWhite	Gets a system-defined color with the value R:255 G:250 B:240 A:255.
 S ForestGreen	Gets a system-defined color with the value R:34 G:139 B:34 A:255.
 S Fuchsia	Gets a system-defined color with the value R:255 G:0 B:255 A:255.
 G	Gets or sets the green component value of this Color .
 S Gainsboro	Gets a system-defined color with the value R:220 G:220 B:220 A:255.
 S GhostWhite	Gets a system-defined color with the value R:248 G:248 B:255 A:255.
 S Gold	Gets a system-defined color with the value R:255 G:215 B:0 A:255.
 S Goldenrod	Gets a system-defined color with the value R:218 G:165 B:32 A:255.
 S Gray	Gets a system-defined color with the value R:128 G:128 B:128 A:255.
 S Green	Gets a system-defined color with the value R:0 G:128 B:0 A:255.
 S GreenYellow	Gets a system-defined color with the value R:173 G:255 B:47 A:255.
 S Honeydew	Gets a system-defined color with the value R:240 G:255 B:240 A:255.
 S HotPink	Gets a system-defined color with the value R:255 G:105 B:180 A:255.
 S IndianRed	Gets a system-defined color with the value R:205 G:92 B:92 A:255.
 S Indigo	Gets a system-defined color with the value R:75 G:0 B:130 A:255.
 S Ivory	Gets a system-defined color with the value R:255 G:255 B:240 A:255.
 S Khaki	Gets a system-defined color with the value R:240 G:230 B:140 A:255.
 S Lavender	Gets a system-defined color with the value R:230 G:230 B:250 A:255.
 S LavenderBlush	Gets a system-defined color with the value R:255 G:240 B:245 A:255.
 S LawnGreen	Gets a system-defined color with the value R:124 G:252 B:0 A:255.
 S LemonChiffon	Gets a system-defined color with the value R:255 G:250 B:205 A:255.
 S LightBlue	Gets a system-defined color with the value R:173 G:216 B:230 A:255.
 S LightCoral	Gets a system-defined color with the value R:240 G:128 B:128 A:255.
 S LightCyan	Gets a system-defined color with the value R:224 G:255 B:255 A:255.
 S LightGoldenrodYellow	Gets a system-defined color with the value R:250 G:250 B:210 A:255.
 S LightGray	Gets a system-defined color with the value R:211 G:211 B:211 A:255.
 S LightGreen	Gets a system-defined color with the value R:144 G:238 B:144 A:255.
 S LightPink	Gets a system-defined color with the value R:255 G:182 B:193 A:255.
 S LightSalmon	Gets a system-defined color with the value R:255 G:160 B:122 A:255.
 S LightSeaGreen	Gets a system-defined color with the value R:32 G:178 B:170 A:255.
 S LightSkyBlue	Gets a system-defined color with the value R:135 G:206 B:250 A:255.
 S LightSlateGray	Gets a system-defined color with the value R:119 G:136 B:153 A:255.
 S LightSteelBlue	Gets a system-defined color with the value R:176 G:196 B:222 A:255.
 S LightYellow	Gets a system-defined color with the value R:255 G:255 B:224 A:255.
 S Lime	Gets a system-defined color with the value R:0 G:255 B:0 A:255.
 S LimeGreen	Gets a system-defined color with the value R:50 G:205 B:50 A:255.
 S Linen	Gets a system-defined color with the value R:250 G:240 B:230 A:255.
 S Magenta	Gets a system-defined color with the value R:255 G:0 B:255 A:255.
 S Maroon	Gets a system-defined color with the value R:128 G:0 B:0 A:255.
 S MediumAquamarine	Gets a system-defined color with the value R:102 G:205 B:170 A:255.
 S MediumBlue	Gets a system-defined color with the value R:0 G:0 B:205 A:255.
 S MediumOrchid	Gets a system-defined color with the value R:186 G:85 B:211 A:255.
 S MediumPurple	Gets a system-defined color with the value R:147 G:112 B:219 A:255.
 S MediumSeaGreen	Gets a system-defined color with the value R:60 G:179 B:113 A:255.
 S MediumSlateBlue	Gets a system-defined color with the value R:123 G:104 B:238 A:255.
 S MediumSpringGreen	Gets a system-defined color with the value R:0 G:250 B:154 A:255.
 S MediumTurquoise	Gets a system-defined color with the value R:72 G:209 B:204 A:255.
 S MediumVioletRed	Gets a system-defined color with the value R:199 G:21 B:133 A:255.
S MidnightBlue	Gets a system-defined color with the value R:25 G:25 B:112 A:255.
S MintCream	Gets a system-defined color with the value R:245 G:255 B:250 A:255.
S MistyRose	Gets a system-defined color with the value R:255 G:228 B:225 A:255.
S Moccasin	Gets a system-defined color with the value R:255 G:228 B:181 A:255.
S NavajoWhite	Gets a system-defined color with the value R:255 G:222 B:173 A:255.

 S Navy	Gets a system-defined color R:0 G:0 B:128 A:255.
 S OldLace	Gets a system-defined color with the value R:253 G:245 B:230 A:255.
 S Olive	Gets a system-defined color with the value R:128 G:128 B:0 A:255.
 S OliveDrab	Gets a system-defined color with the value R:107 G:142 B:35 A:255.
 S Orange	Gets a system-defined color with the value R:255 G:165 B:0 A:255.
 S OrangeRed	Gets a system-defined color with the value R:255 G:69 B:0 A:255.
 S Orchid	Gets a system-defined color with the value R:218 G:112 B:214 A:255.
 S PackedValue	Gets the current color as a packed value.
 S PaleGoldenrod	Gets a system-defined color with the value R:238 G:232 B:170 A:255.
 S PaleGreen	Gets a system-defined color with the value R:152 G:251 B:152 A:255.
 S PaleTurquoise	Gets a system-defined color with the value R:175 G:238 B:238 A:255.
 S PaleVioletRed	Gets a system-defined color with the value R:219 G:112 B:147 A:255.
 S PapayaWhip	Gets a system-defined color with the value R:255 G:239 B:213 A:255.
 S PeachPuff	Gets a system-defined color with the value R:255 G:218 B:185 A:255.
 S Peru	Gets a system-defined color with the value R:205 G:133 B:63 A:255.
 S Pink	Gets a system-defined color with the value R:255 G:192 B:203 A:255.
 S Plum	Gets a system-defined color with the value R:221 G:160 B:221 A:255.
 S PowderBlue	Gets a system-defined color with the value R:176 G:224 B:230 A:255.
 S Purple	Gets a system-defined color with the value R:128 G:0 B:128 A:255.
 R	Gets or sets the red component value of this Color .
 S Red	Gets a system-defined color with the value R:255 G:0 B:0 A:255.
 S RosyBrown	Gets a system-defined color with the value R:188 G:143 B:143 A:255.
 S RoyalBlue	Gets a system-defined color with the value R:65 G:105 B:225 A:255.
 S SaddleBrown	Gets a system-defined color with the value R:139 G:69 B:19 A:255.
 S Salmon	Gets a system-defined color with the value R:250 G:128 B:114 A:255.
 S SandyBrown	Gets a system-defined color with the value R:244 G:164 B:96 A:255.
 S SeaGreen	Gets a system-defined color with the value R:46 G:139 B:87 A:255.
 S SeaShell	Gets a system-defined color with the value R:255 G:245 B:238 A:255.
 S Sienna	Gets a system-defined color with the value R:160 G:82 B:45 A:255.
 S Silver	Gets a system-defined color with the value R:192 G:192 B:192 A:255.
 S SkyBlue	Gets a system-defined color with the value R:135 G:206 B:235 A:255.
 S SlateBlue	Gets a system-defined color with the value R:106 G:90 B:205 A:255.
 S SlateGray	Gets a system-defined color with the value R:112 G:128 B:144 A:255.
 S Snow	Gets a system-defined color with the value R:255 G:250 B:250 A:255.
 S SpringGreen	Gets a system-defined color with the value R:0 G:255 B:127 A:255.
 S SteelBlue	Gets a system-defined color with the value R:70 G:130 B:180 A:255.
 S Tan	Gets a system-defined color with the value R:210 G:180 B:140 A:255.
 S Teal	Gets a system-defined color with the value R:0 G:128 B:128 A:255.
 S Thistle	Gets a system-defined color with the value R:216 G:191 B:216 A:255.
 S Tomato	Gets a system-defined color with the value R:255 G:99 B:71 A:255.
 S TransparentBlack	Gets a system-defined color with the value R:0 G:0 B:0 A:0.
 S TransparentWhite	Gets a system-defined color with the value R:255 G:255 B:255 A:0.
 S Turquoise	Gets a system-defined color with the value R:64 G:224 B:208 A:255.
 S Violet	Gets a system-defined color with the value R:238 G:130 B:238 A:255.
 S Wheat	Gets a system-defined color with the value R:245 G:222 B:179 A:255.
 S White	Gets a system-defined color with the value R:255 G:255 B:255 A:255.
 S WhiteSmoke	Gets a system-defined color with the value R:245 G:245 B:245 A:255.
 S Yellow	Gets a system-defined color with the value R:255 G:255 B:0 A:255.
 S YellowGreen	Gets a system-defined color with the value R:154 G:205 B:50 A:255.

Public Methods

	Name	Description
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code for this instance.
	GetType	(Inherited from Object .)

 Lerp	Linearly interpolates between two colors.
 Op_Equality	Compares two objects to determine whether they are the same.
 Op_Inequality	Compares two objects to determine whether they are different.
 ReferenceEquals	(Inherited from Object .)
 ToString	Gets a string representation of this object.
 ToVector3	Returns the current color as a Vector3 .
 ToVector4	Returns the current color as a Vector4 .

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

Name	Description
 Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4	Returns the packed value of the current color as a Vector4 .

Color Constructor (Byte, Byte, Byte)

Initializes a new instance of [Color](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Color (  
    byte r,  
    byte g,  
    byte b  
)
```

Parameters

r

The red component of a color, between 0 and 255.

g

The green component of a color, between 0 and 255.

b

The blue component of a color, between 0 and 255.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Color (
    byte r,
    byte g,
    byte b,
    byte a
)
```

Parameters

r

The red component of a color, between 0 and 255.

g

The green component of a color, between 0 and 255.

b

The blue component of a color, between 0 and 255.

a

The alpha component of a color, between 0 and 255.

Color.Equals Method (Color)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    Color other  
)
```

Parameters

other

The [Color](#) to compare with the current [Color](#).

Return Value

true if the objects are the same; **false** otherwise.

Color.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [Object](#) to compare with the current [Color](#).

Return Value

true if the objects are the same; **false** otherwise.

Color.GetHashCode Method

Gets the hash code for this instance.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override int GetHashCode ()
```

Return Value

Hash code for this object.

Color.Lerp Method

Linearly interpolates between two colors.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Color Lerp (  
    Color value1,  
    Color value2,  
    float amount  
)
```

Parameters

value1

Source [Color](#).

value2

Source [Color](#).

amount

A value between 0 and 1.0 indicating the weight of **value2**.

Return Value

The interpolated [Color](#).

Remarks

This function linearly interpolates each component of a [Color](#) separately and returns a [Color](#) with the new component values.

Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4 Method

Returns the packed value of the current color as a [Vector4](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private void Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4 (
    Vector4 vector
)
```

Parameters

vector

The packed value of the current color.

Color.op_Equality Method

Compares two objects to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Color a,  
    Color b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

Color.op_Inequality Method

Compares two objects to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    Color a,  
    Color b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are different; **false** otherwise.

Color.ToString Method

Gets a string representation of this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override string ToString ()
```

Return Value

String representation of this object.

Color Properties

Public Properties

	Name	Description
	A	Gets or sets the alpha component value.
	AliceBlue	Gets a system-defined color with the value R:240 G:248 B:255 A:255.
	AntiqueWhite	Gets a system-defined color with the value R:250 G:235 B:215 A:255.
	Aqua	Gets a system-defined color with the value R:0 G:255 B:255 A:255.
	Aquamarine	Gets a system-defined color with the value R:127 G:255 B:212 A:255.
	Azure	Gets a system-defined color with the value R:240 G:255 B:255 A:255.
	B	Gets or sets the blue component value of this Color .
	Beige	Gets a system-defined color with the value R:245 G:245 B:220 A:255.
	Bisque	Gets a system-defined color with the value R:255 G:228 B:196 A:255.
	Black	Gets a system-defined color with the value R:0 G:0 B:0 A:255.
	BlanchedAlmond	Gets a system-defined color with the value R:255 G:235 B:205 A:255.
	Blue	Gets a system-defined color with the value R:0 G:0 B:255 A:255.
	BlueViolet	Gets a system-defined color with the value R:138 G:43 B:226 A:255.
	Brown	Gets a system-defined color with the value R:165 G:42 B:42 A:255.
	BurlyWood	Gets a system-defined color with the value R:222 G:184 B:135 A:255.
	CadetBlue	Gets a system-defined color with the value R:95 G:158 B:160 A:255.
	Chartreuse	Gets a system-defined color with the value R:127 G:255 B:0 A:255.
	Chocolate	Gets a system-defined color with the value R:210 G:105 B:30 A:255.
	Coral	Gets a system-defined color with the value R:255 G:127 B:80 A:255.
	CornflowerBlue	Gets a system-defined color with the value R:100 G:149 B:237 A:255.
	Cornsilk	Gets a system-defined color with the value R:255 G:248 B:220 A:255.
	Crimson	Gets a system-defined color with the value R:220 G:20 B:60 A:255.
	Cyan	Gets a system-defined color with the value R:0 G:255 B:255 A:255.
	DarkBlue	Gets a system-defined color with the value R:0 G:0 B:139 A:255.
	DarkCyan	Gets a system-defined color with the value R:0 G:139 B:139 A:255.
	DarkGoldenrod	Gets a system-defined color with the value R:184 G:134 B:11 A:255.
	DarkGray	Gets a system-defined color with the value R:169 G:169 B:169 A:255.
	DarkGreen	Gets a system-defined color with the value R:0 G:100 B:0 A:255.
	DarkKhaki	Gets a system-defined color with the value R:189 G:183 B:107 A:255.
	DarkMagenta	Gets a system-defined color with the value R:139 G:0 B:139 A:255.
	DarkOliveGreen	Gets a system-defined color with the value R:85 G:107 B:47 A:255.
	DarkOrange	Gets a system-defined color with the value R:255 G:140 B:0 A:255.
	DarkOrchid	Gets a system-defined color with the value R:153 G:50 B:204 A:255.
	DarkRed	Gets a system-defined color with the value R:139 G:0 B:0 A:255.
	DarkSalmon	Gets a system-defined color with the value R:233 G:150 B:122 A:255.
	DarkSeaGreen	Gets a system-defined color with the value R:143 G:188 B:139 A:255.
	DarkSlateBlue	Gets a system-defined color with the value R:72 G:61 B:139 A:255.
	DarkSlateGray	Gets a system-defined color with the value R:47 G:79 B:79 A:255.
	DarkTurquoise	Gets a system-defined color with the value R:0 G:206 B:209 A:255.
	DarkViolet	Gets a system-defined color with the value R:148 G:0 B:211 A:255.
	DeepPink	Gets a system-defined color with the value R:255 G:20 B:147 A:255.
	DeepSkyBlue	Gets a system-defined color with the value R:0 G:191 B:255 A:255.
	DimGray	Gets a system-defined color with the value R:105 G:105 B:105 A:255.
	DodgerBlue	Gets a system-defined color with the value R:30 G:144 B:255 A:255.
	Firebrick	Gets a system-defined color with the value R:178 G:34 B:34 A:255.
	FloralWhite	Gets a system-defined color with the value R:255 G:250 B:240 A:255.
	ForestGreen	Gets a system-defined color with the value R:34 G:139 B:34 A:255.
	Fuchsia	Gets a system-defined color with the value R:255 G:0 B:255 A:255.
	G	Gets or sets the green component value of this Color .

 S Gainsboro	Gets a system-defined color with the value R:220 G:220 B:220 A:255.
 S GhostWhite	Gets a system-defined color with the value R:248 G:248 B:255 A:255.
 S Gold	Gets a system-defined color with the value R:255 G:215 B:0 A:255.
 S Goldenrod	Gets a system-defined color with the value R:218 G:165 B:32 A:255.
 S Gray	Gets a system-defined color with the value R:128 G:128 B:128 A:255.
 S Green	Gets a system-defined color with the value R:0 G:128 B:0 A:255.
 S GreenYellow	Gets a system-defined color with the value R:173 G:255 B:47 A:255.
 S Honeydew	Gets a system-defined color with the value R:240 G:255 B:240 A:255.
 S HotPink	Gets a system-defined color with the value R:255 G:105 B:180 A:255.
 S IndianRed	Gets a system-defined color with the value R:205 G:92 B:92 A:255.
 S Indigo	Gets a system-defined color with the value R:75 G:0 B:130 A:255.
 S Ivory	Gets a system-defined color with the value R:255 G:255 B:240 A:255.
 S Khaki	Gets a system-defined color with the value R:240 G:230 B:140 A:255.
 S Lavender	Gets a system-defined color with the value R:230 G:230 B:250 A:255.
 S LavenderBlush	Gets a system-defined color with the value R:255 G:240 B:245 A:255.
 S LawnGreen	Gets a system-defined color with the value R:124 G:252 B:0 A:255.
 S LemonChiffon	Gets a system-defined color with the value R:255 G:250 B:205 A:255.
 S LightBlue	Gets a system-defined color with the value R:173 G:216 B:230 A:255.
 S LightCoral	Gets a system-defined color with the value R:240 G:128 B:128 A:255.
 S LightCyan	Gets a system-defined color with the value R:224 G:255 B:255 A:255.
 S LightGoldenrodYellow	Gets a system-defined color with the value R:250 G:250 B:210 A:255.
 S LightGray	Gets a system-defined color with the value R:211 G:211 B:211 A:255.
 S LightGreen	Gets a system-defined color with the value R:144 G:238 B:144 A:255.
 S LightPink	Gets a system-defined color with the value R:255 G:182 B:193 A:255.

 S LightSlateGray	Gets a system-defined color with the value R:119 G:136 B:153 A:255.
 S LightSteelBlue	Gets a system-defined color with the value R:176 G:196 B:222 A:255.
 S LightYellow	Gets a system-defined color with the value R:255 G:255 B:224 A:255.
 S Lime	Gets a system-defined color with the value R:0 G:255 B:0 A:255.
 S LimeGreen	Gets a system-defined color with the value R:50 G:205 B:50 A:255.
 S Linen	Gets a system-defined color with the value R:250 G:240 B:230 A:255.
 S Magenta	Gets a system-defined color with the value R:255 G:0 B:255 A:255.
 S Maroon	Gets a system-defined color with the value R:128 G:0 B:0 A:255.
 S MediumAquamarine	Gets a system-defined color with the value R:102 G:205 B:170 A:255.
 S MediumBlue	Gets a system-defined color with the value R:0 G:0 B:205 A:255.
 S MediumOrchid	Gets a system-defined color with the value R:186 G:85 B:211 A:255.
 S MediumPurple	Gets a system-defined color with the value R:147 G:112 B:219 A:255.
 S MediumSeaGreen	Gets a system-defined color with the value R:60 G:179 B:113 A:255.
 S MediumSlateBlue	Gets a system-defined color with the value R:123 G:104 B:238 A:255.
 S MediumSpringGreen	Gets a system-defined color with the value R:0 G:250 B:154 A:255.
 S MediumTurquoise	Gets a system-defined color with the value R:72 G:209 B:204 A:255.
 S MediumVioletRed	Gets a system-defined color with the value R:199 G:21 B:133 A:255.
 S MidnightBlue	Gets a system-defined color with the value R:25 G:25 B:112 A:255.
 S MintCream	Gets a system-defined color with the value R:245 G:255 B:250 A:255.
 S MistyRose	Gets a system-defined color with the value R:255 G:228 B:225 A:255.
 S Moccasin	Gets a system-defined color with the value R:255 G:228 B:181 A:255.
 S NavajoWhite	Gets a system-defined color with the value R:255 G:222 B:173 A:255.
S Navy	Gets a system-defined color R:0 G:0 B:128 A:255.
S OldLace	Gets a system-defined color with the value R:253 G:245 B:230 A:255.
S Olive	Gets a system-defined color with the value R:128 G:128 B:0 A:255.
S OliveDrab	Gets a system-defined color with the value R:107 G:142 B:35 A:255.
S Orange	Gets a system-defined color with the value R:255 G:165 B:0 A:255.

 OrangeRed	Gets a system-defined color with the value R:255 G:69 B:0 A:255.
 Orchid	Gets a system-defined color with the value R:218 G:112 B:214 A:255.
 PackedValue	Gets the current color as a packed value.
 PaleGoldenrod	Gets a system-defined color with the value R:238 G:232 B:170 A:255.
 PaleGreen	Gets a system-defined color with the value R:152 G:251 B:152 A:255.
 PaleTurquoise	Gets a system-defined color with the value R:175 G:238 B:238 A:255.
 PaleVioletRed	Gets a system-defined color with the value R:219 G:112 B:147 A:255.
 PapayaWhip	Gets a system-defined color with the value R:255 G:239 B:213 A:255.
 PeachPuff	Gets a system-defined color with the value R:255 G:218 B:185 A:255.
 Peru	Gets a system-defined color with the value R:205 G:133 B:63 A:255.
 Pink	Gets a system-defined color with the value R:255 G:192 B:203 A:255.
 Plum	Gets a system-defined color with the value R:221 G:160 B:221 A:255.
 PowderBlue	Gets a system-defined color with the value R:176 G:224 B:230 A:255.
 Purple	Gets a system-defined color with the value R:128 G:0 B:128 A:255.
 R	Gets or sets the red component value of this Color .
 Red	Gets a system-defined color with the value R:255 G:0 B:0 A:255.
 RosyBrown	Gets a system-defined color with the value R:188 G:143 B:143 A:255.
 RoyalBlue	Gets a system-defined color with the value R:65 G:105 B:225 A:255.
 SaddleBrown	Gets a system-defined color with the value R:139 G:69 B:19 A:255.
 Salmon	Gets a system-defined color with the value R:250 G:128 B:114 A:255.
 SandyBrown	Gets a system-defined color with the value R:244 G:164 B:96 A:255.
 SeaGreen	Gets a system-defined color with the value R:46 G:139 B:87 A:255.
 SeaShell	Gets a system-defined color with the value R:255 G:245 B:238 A:255.
 Sienna	Gets a system-defined color with the value R:160 G:82 B:45 A:255.
 Silver	Gets a system-defined color with the value R:192 G:192 B:192 A:255.
 SkyBlue	Gets a system-defined color with the value R:135 G:206 B:235 A:255.
 SlateBlue	Gets a system-defined color with the value R:106 G:90 B:205 A:255.
 SlateGray	Gets a system-defined color with the value R:112 G:128 B:144 A:255.
 Snow	Gets a system-defined color with the value R:255 G:250 B:250 A:255.
 SpringGreen	Gets a system-defined color with the value R:0 G:255 B:127 A:255.
 SteelBlue	Gets a system-defined color with the value R:70 G:130 B:180 A:255.
 Tan	Gets a system-defined color with the value R:210 G:180 B:140 A:255.
 Teal	Gets a system-defined color with the value R:0 G:128 B:128 A:255.
 Thistle	Gets a system-defined color with the value R:216 G:191 B:216 A:255.
 Tomato	Gets a system-defined color with the value R:255 G:99 B:71 A:255.
 TransparentBlack	Gets a system-defined color with the value R:0 G:0 B:0 A:0.
 TransparentWhite	Gets a system-defined color with the value R:255 G:255 B:255 A:0.
 Turquoise	Gets a system-defined color with the value R:64 G:224 B:208 A:255.
 Violet	Gets a system-defined color with the value R:238 G:130 B:238 A:255.
 Wheat	Gets a system-defined color with the value R:245 G:222 B:179 A:255.
 White	Gets a system-defined color with the value R:255 G:255 B:255 A:255.
 WhiteSmoke	Gets a system-defined color with the value R:245 G:245 B:245 A:255.
 Yellow	Gets a system-defined color with the value R:255 G:255 B:0 A:255.
 YellowGreen	Gets a system-defined color with the value R:154 G:205 B:50 A:255.

Color.A Property

Gets or sets the alpha component value.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public byte A { get; set; }
```

Property Value

The alpha component value of this [Color](#).

ColorWriteChannels Enumeration

Defines the color channels that can be chosen for a per-channel write to a render target color buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[FlagsAttribute]
public enum ColorWriteChannels
```

Members

Member name	Description
All	All buffer channels.
Alpha	Alpha channel of a buffer.
Blue	Blue channel of a buffer.
Green	Green channel of a buffer.
None	No channel selected.
Red	Red channel of a buffer.

CompareFunction Enumeration

Defines comparison functions that can be chosen for alpha, stencil, or depth-buffer tests.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum CompareFunction
```

Members

Member name	Description
Always	Always pass the test.
Equal	Accept the new pixel if its value is equal to the value of the current pixel.
Greater	Accept the new pixel if its value is greater than the value of the current pixel.
GreaterEqual	Accept the new pixel if its value is greater than or equal to the value of the current pixel.
Less	Accept the new pixel if its value is less than the value of the current pixel.
LessEqual	Accept the new pixel if its value is less than or equal to the value of the current pixel.
Never	Always fail the test.
NotEqual	Accept the new pixel if its value does not equal the value of the current pixel.

CompilationFailedException Class

Note

This class is available only when developing for Windows.

The exception that is thrown if the compilation of an effect fails.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[SerializableAttribute]  
public sealed class CompilationFailedException : ExternalException
```

CompilationFailedException Constructor ()

Note

This constructor is available only when developing for Windows.

Initializes a new instance of this class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public CompilationFailedException ()
```

See Also

Reference

[CompilationFailedException Class](#)

[CompilationFailedException Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

PlatformsWindows XP SP2, Windows Vista

CompilationFailedException Constructor (String)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of this class with a specified error message.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public CompilationFailedException (  
    string message  
)
```

Parameters

message

A message that describes the error.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

The following table shows the initial property values for an instance of [CompilationFailedException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

CompilationFailedException Constructor (String, Exception)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of the [CompilationFailedException](#) class with a specified error message and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public CompilationFailedException (  
    string message,  
    Exception inner  
)
```

Parameters

message

A message that describes the error.

inner

The exception that is the cause of the current exception. If the *inner* parameter is not a null reference, the current exception is raised in a catch block that handles the inner exception.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

An exception that is thrown as a direct result of a previous exception should include a reference to the previous exception in the [InnerException](#) property. The [InnerException](#) property returns the same value that is passed into the constructor, or a null reference if the [InnerException](#) property does not supply the inner exception value to the constructor.

The following table shows the initial property values for an instance of [CompilationFailedException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

CompiledShader Members

The following tables list the members exposed by the CompiledShader type.

Public Constructors

Name	Description
 CompiledShader	Initializes a new instance of the CompiledShader class.

Public Properties

Name	Description
 ErrorsAndWarnings	Gets the first compile error message that occurred.
 ShaderSize	Gets the size of the shader byte code, in bytes.
 ShaderVersion	Gets the shader version of the compiled shader.
 Success	Returns a value indicating whether the shader compilation was successful.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetInputSemantics	Gets the semantics for the shader inputs. Use this method to determine the input vertex format.
 GetOutputSemantics	Gets the semantics for all shader output elements.
 GetSamplers	Gets the sampler names referenced in a shader.
 GetShaderCode	Gets the compiled shader code.
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	Returns a String that represents the current CompiledShader .

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

CompiledShader Constructor

Note

This constructor is available only when developing for Windows.

Initializes a new instance of the [CompiledShader](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public CompiledShader (  
    byte[] compiledShaderCode,  
    string errors  
)
```

Parameters

compiledShaderCode

The compiled shader to encapsulate.

errors

String containing at least the first compile error message that occurred. This includes effect compiler errors and high-level language compile errors.

CompiledShader.GetInputSemantics Method

Note

This method is available only when developing for Windows.

Gets the semantics for the shader inputs. Use this method to determine the input vertex format.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ShaderSemantic[] GetInputSemantics ()
```

Return Value

An array of shader semantics.

CompilerOptions Enumeration

Defines optimization options that may be chosen for shader and effect code compilation.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[FlagsAttribute]
public enum CompilerOptions
```

Members

Member name	Description
AvoidFlowControl	Hints to the compiler to avoid using flow-control instructions.
Debug	Inserts debug file name, line numbers, and type and symbol information during shader compile.
ForcePixelShaderSoftwareNoOptimizations	Forces the compiler to compile against the next highest available software target for pixel shaders. This flag also turns optimizations off and debugging on.
ForceVertexShaderSoftwareNoOptimizations	Forces the compiler to compile against the next highest available software target for vertex shaders. This flag also turns optimizations off and debugging on.
None	No options specified.
NoPreShader	Disables preshaders. The compiler will not pull out static expressions for evaluation on the host CPU. Additionally, the compiler will not lift any expressions when compiling stand-alone functions.
NotCloneable	Indicates the effect will be non-cloneable and will not contain any shader binary data. Setting this flag reduces effect memory usage by about 50 percent because it eliminates the need for the effect system to keep a copy of the shaders in memory.
PackMatrixColumnMajor	Unless explicitly specified, matrices will be packed in column major order (each vector will be in a single column) when passed to and from the shader. This is generally more efficient because it allows vector-matrix multiplication to be performed using a series of dot products.
PackMatrixRowMajor	Unless explicitly specified, matrices will be packed in row major order (each vector will be in a single row) when passed to or from the shader.
PartialPrecision	Forces all computations in the resulting shader to occur at partial precision. This may result in faster evaluation of shaders on some hardware.
PreferFlowControl	Hints to the compiler to prefer using flow-control instructions.
SkipOptimization	Instructs the compiler to skip optimization steps during code generation. Unless you are trying to isolate a problem in your code and you suspect the compiler, using this option is not recommended.
SkipValidation	Do not validate the generated code against known capabilities and constraints. This option is recommended only when compiling shaders that are known to work (that is, shaders that have compiled before without this option). Shaders are always validated by the runtime before they are set to the device.

DepthFormat Enumeration

Defines the format of data in a depth buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum DepthFormat
```

Members

Member name	Description
Depth15Stencil1	A 16-bit depth-buffer bit depth in which 15 bits are reserved for the depth channel and 1 bit is reserved for the stencil channel.
Depth16	A 16-bit depth-buffer bit depth.
Depth24	A 32-bit depth-buffer bit depth that uses 24 bits for the depth channel.
Depth24Stencil4	A 32-bit depth-buffer bit depth that uses 24 bits for the depth channel and 4 bits for the stencil channel.
Depth24Stencil8	A non-lockable format that contains 24 bits of depth (in a 24-bit floating-point format – 20E4) and 8 bits of stencil.
Depth24Stencil8Single	A 32-bit depth-buffer bit depth that uses 24 bits for the depth channel and 8 bits for the stencil channel.
Depth32	a 32-bit depth-buffer bit depth.
Unknown	Format is unknown.

RemarksAll depth-stencil formats except **Depth16Lockable** indicate no particular bit ordering per pixel, and the driver is allowed to consume more than the indicated number of bits per depth channel (but not stencil channel).

DepthStencilBuffer Class

Queries and prepares depth stencil buffers.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class DepthStencilBuffer : IDisposable
```

Remarks

A depth stencil buffer is where depth and stencil data are kept for a render target. The depth buffer is used to determine which 3D objects appear behind other 3D objects; the stencil buffer is used for special effects. Depth stencil buffers are often created at the same time render targets are created. Depth stencil buffers must be recreated when the device is reset. The [DepthStencilBuffer](#) property on [GraphicsDevice](#) points to the current **DepthStencilBuffer**.

To use a **DepthStencilBuffer**, you must:

1. Create the **DepthStencilBuffer**.

C#

```
shadowDepthBuffer =
    GfxComponent.CreateDepthStencil(shadowRenderTarget,
    DepthFormat.Depth24Stencil8Single);
```

C#

```
public static DepthStencilBuffer CreateDepthStencil(
    RenderTarget2D target)
{
    return new DepthStencilBuffer(target.GraphicsDevice, target.Width,
        target.Height, target.GraphicsDevice.DepthStencilBuffer.Format,
        target.MultiSampleType, target.MultiSampleQuality);
}
public static DepthStencilBuffer CreateDepthStencil(
    RenderTarget2D target, DepthFormat depth)
{
    if (GraphicsAdapter.DefaultAdapter.CheckDepthStencilMatch(
        DeviceType.Hardware,
        GraphicsAdapter.DefaultAdapter.CurrentDisplayMode.Format,
        target.Format,
        depth))
    {
        return new DepthStencilBuffer(target.GraphicsDevice,
            target.Width, target.Height, depth,
            target.MultiSampleType, target.MultiSampleQuality);
    }
    else
        return CreateDepthStencil(target);
}
```

2. Set the **DepthStencilBuffer** using [DepthStencilBuffer](#). It is a good idea to cache the current **DepthStencilBuffer** beforehand.

C#

```
// Cache the current depth buffer
DepthStencilBuffer old = GraphicsDevice.DepthStencilBuffer;
// Set our custom depth buffer
```

```
GraphicsDevice.DepthStencilBuffer = shadowDepthBuffer;
```

3. Draw into your **DepthStencilBuffer**.

C#

```
// Render the shadow map  
GraphicsDevice.Clear(Color.Black);  
DrawScene(MyEffect.shadowMap);
```

4. Reset the original **DepthStencilBuffer**.

C#

```
// Reset the depth buffer  
GraphicsDevice.DepthStencilBuffer = old;
```

Custom depth stencil buffers are normally used in conjunction with a custom [RenderTarget](#). [How To: Create a Depth Texture](#) has an example of this.

DepthStencilBuffer Members

The following tables list the members exposed by the DepthStencilBuffer type.

Public Constructors

Name	Description
 DepthStencilBuffer	Overloaded. Initializes a new instance of the DepthStencilBuffer class.

Public Properties

Name	Description
 Format	Gets the data format of this depth stencil buffer.
 GraphicsDevice	Gets the graphics device associated with this depth stencil buffer.
 Height	Gets the height, in pixels, of the surface.
 IsContentLost	Determines if the buffer data has been lost due to a lost device event.
 IsDisposed	Gets a value that indicates whether the object is disposed.
 MultiSampleQuality	Gets the number of quality stops available for a given multisample type.
 MultiSampleType	Gets the levels of full-scene multisampling that the device can apply.
 Name	Gets the name of this depth stencil buffer.
 Tag	Gets the resource tag for this depth stencil buffer.
 Width	Returns the width, in pixels, of this DepthStencilBuffer .

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_ContentLost	Occurs when content is about to be lost on a GraphicsDevice .
 raise_Disposing	Raises the Disposing event when called from within a derived class.

Public Events

Name	Description
 ContentLost	Occurs when resources are lost (for example, when the current device is lost).
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime (CLR).

Syntax

C#

```
public DepthStencilBuffer (
    GraphicsDevice graphicsDevice,
    int width,
    int height,
    DepthFormat format
)
```

Parameters

graphicsDevice

The graphics device that will display the depth stencil buffer.

width

Width, in pixels, of the depth stencil buffer. You can use **graphicsDevice.PresentationParameters.BackBufferWidth** to get the current screen width.

height

Height, in pixels, of the depth stencil buffer. You can use **graphicsDevice.PresentationParameters.BackBufferHeight** to get the current screen height.

format

The format of the data to be placed in this depth stencil buffer. Use [CheckDepthStencilMatch](#) to determine if a particular depth format is usable in a render target.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentOutOfRangeException	<i>width</i> and <i>height</i> are less than or equal to zero. <i>width</i> and <i>height</i> must be greater than zero.
ArgumentException	One of the following conditions is true: <ul style="list-style-type: none"> The device does not support creating a depth buffer of the given format. <i>format</i> is DepthFormat.Unknown. Textures cannot be created using DepthFormat.Unknown. <i>width</i> is larger than MaxTextureWidth. <i>height</i> is larger than MaxTextureHeight.
InvalidOperationException	Unable to create this DepthStencilBuffer resource.

Example

C#

```
shadowDepthBuffer =
    GfxComponent.CreateDepthStencil(shadowRenderTarget,
    DepthFormat.Depth24Stencil8Single);
```

C#

```
public static DepthStencilBuffer CreateDepthStencil(
    RenderTarget2D target)
{
    return new DepthStencilBuffer(target.GraphicsDevice, target.Width,
```

```
        target.Height, target.GraphicsDevice.DepthStencilBuffer.Format,
        target.MultiSampleType, target.MultiSampleQuality);
    }
    public static DepthStencilBuffer CreateDepthStencil(
        RenderTarget2D target, DepthFormat depth)
    {
        if (GraphicsAdapter.DefaultAdapter.CheckDepthStencilMatch(
            DeviceType.Hardware,
            GraphicsAdapter.DefaultAdapter.CurrentDisplayMode.Format,
            target.Format,
            depth))
        {
            return new DepthStencilBuffer(target.GraphicsDevice,
                target.Width, target.Height, depth,
                target.MultiSampleType, target.MultiSampleQuality);
        }
        else
            return CreateDepthStencil(target);
    }
}
```

Reference

[CheckDepthStencilMatch](#)

[DepthStencilBuffer Class](#)

[DepthStencilBuffer Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

DepthStencilBuffer Constructor (GraphicsDevice, Int32, Int32, DepthFormat, MultiSampleType, Int32)

Initializes a new instance of the [DepthStencilBuffer](#) class, specifying the multisample type and quality.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DepthStencilBuffer (
    GraphicsDevice graphicsDevice,
    int width,
    int height,
    DepthFormat format,
    MultiSampleType multiSampleType,
    int multiSampleQuality
)
```

Parameters

graphicsDevice

The graphics device that will display the depth stencil buffer.

width

Width, in pixels, of the depth stencil buffer. You can use **graphicsDevice.PresentationParameters.BackBufferWidth** to get the current screen width.

height

Height, in pixels, of the depth stencil buffer. You can use **graphicsDevice.PresentationParameters.BackBufferHeight** to get the current screen height.

format

The format of the data to be placed in this depth stencil buffer. Use [CheckDepthStencilMatch](#) to determine if a particular depth format is usable in a render target.

multiSampleType

The levels of full-scene multisampling that the device can apply. You can use **graphicsDevice.PresentationParameters.MultiSampleType** to get the [MultiSampleType](#) of the back buffer.

multiSampleQuality

The number of quality stops available for a given multisample type. You can use **graphicsDevice.PresentationParameters.MultiSampleQuality** to get the multisample quality of the back buffer.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentOutOfRangeException	<i>width</i> and <i>height</i> are less than or equal to zero. <i>width</i> and <i>height</i> must be greater than zero.
ArgumentException	One of the following conditions is true: <ul style="list-style-type: none"> The graphics device does not support creating a depth buffer of the given format. <i>format</i> is DepthFormat.Unknown. Textures cannot be created using DepthFormat.Unknown. <i>width</i> is larger than MaxTextureWidth. <i>height</i> is larger than MaxTextureHeight.
InvalidOperationException	Unable to create this DepthStencilBuffer resource.

Example

C#

```
shadowDepthBuffer =
    GfxComponent.CreateDepthStencil(shadowRenderTarget,
```

```
DepthFormat.Depth24Stencil8Single);
```

C#

```
public static DepthStencilBuffer CreateDepthStencil(
    RenderTarget2D target)
{
    return new DepthStencilBuffer(target.GraphicsDevice, target.Width,
        target.Height, target.GraphicsDevice.DepthStencilBuffer.Format,
        target.MultiSampleType, target.MultiSampleQuality);
}
public static DepthStencilBuffer CreateDepthStencil(
    RenderTarget2D target, DepthFormat depth)
{
    if (GraphicsAdapter.DefaultAdapter.CheckDepthStencilMatch(
        DeviceType.Hardware,
        GraphicsAdapter.DefaultAdapter.CurrentDisplayMode.Format,
        target.Format,
        depth))
    {
        return new DepthStencilBuffer(target.GraphicsDevice,
            target.Width, target.Height, depth,
            target.MultiSampleType, target.MultiSampleQuality);
    }
    else
        return CreateDepthStencil(target);
}
```

DepthStencilBuffer.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[DepthStencilBuffer Class](#)

[DepthStencilBuffer Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

DepthStencilBuffer.Dispose Method (Boolean)

Releases the unmanaged resources used by this object and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[[MarshalAsAttribute\(U1\)](#)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [DepthStencilBuffer](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

DepthStencilBuffer.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

RemarksThis method overrides [Finalize](#). Application code should not call this method; an object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [SuppressFinalize](#) method has disabled finalization by the garbage collector.

DepthStencilBuffer.raise_ContentLost Method

Note

This method is available only when developing for Windows.

Occurs when content is about to be lost on a [GraphicsDevice](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void raise_ContentLost (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

The source of this event.

value1

The event arguments that are associated with the action that raised the event.

DepthStencilBuffer.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the [Disposing](#) event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

DepthStencilBuffer Properties

Public Properties

	Name	Description
	Format	Gets the data format of this depth stencil buffer.
	GraphicsDevice	Gets the graphics device associated with this depth stencil buffer.
	Height	Gets the height, in pixels, of the surface.
	IsContentLost	Determines if the buffer data has been lost due to a lost device event.
	IsDisposed	Gets a value that indicates whether the object is disposed.
	MultiSampleQuality	Gets the number of quality stops available for a given multisample type.
	MultiSampleType	Gets the levels of full-scene multisampling that the device can apply.
	Name	Gets the name of this depth stencil buffer.
	Tag	Gets the resource tag for this depth stencil buffer.
	Width	Returns the width, in pixels, of this DepthStencilBuffer .

DeviceLostException Constructor

Initializes a new instance of this class.

Overload List

Name	Description
DeviceLostException ()	Initializes a new instance of this class.
DeviceLostException (String)	Initializes a new instance of this class with a specified error message.
DeviceLostException (String, Exception)	Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

See Also

Reference

[DeviceLostException Class](#)

[DeviceLostException Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

DeviceLostException Constructor ()

Initializes a new instance of this class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DeviceLostException ()
```

Remarks

This constructor initializes the [Message](#) property of the new instance to a system-supplied message that describes the error, such as "The device has been lost but cannot be reset at this time." This message takes into account the current system culture.

The following table shows the initial property values for an instance of [DeviceLostException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

See Also

Reference

[DeviceLostException Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

DeviceLostException Constructor (String)

Initializes a new instance of this class with a specified error message.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DeviceLostException (  
    string message  
)
```

Parameters

message

A message that describes the error.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

The following table shows the initial property values for an instance of [DeviceLostException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

DeviceLostException Constructor (String, Exception)

Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DeviceLostException (  
    string message,  
    Exception inner  
)
```

Parameters

message

A message that describes the error.

inner

The exception that is the cause of the current exception. If the *inner* parameter is not a null reference, the current exception is raised in a catch block that handles the inner exception.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

An exception that is thrown as a direct result of a previous exception should include a reference to the previous exception in the [InnerException](#) property. The [InnerException](#) property returns the same value that is passed into the constructor, or a null reference if the [InnerException](#) property does not supply the inner exception value to the constructor.

The following table shows the initial property values for an instance of [DeviceLostException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

DeviceNotResetException Constructor (String, Exception)

Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DeviceNotResetException (  
    string message,  
    Exception inner  
)
```

Parameters

message

A message that describes the error.

inner

The exception that is the cause of the current exception. If the *inner* parameter is not a null reference, the current exception is raised in a catch block that handles the inner exception.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

An exception that is thrown as a direct result of a previous exception should include a reference to the previous exception in the [InnerException](#) property. The [InnerException](#) property returns the same value that is passed into the constructor, or a null reference if the [InnerException](#) property does not supply the inner exception value to the constructor.

The following table shows the initial property values for an instance of [DeviceNotResetException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

DeviceStillDrawingException Constructor ()

Initializes a new instance of this class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DeviceStillDrawingException ()
```

Remarks

This constructor initializes the [Message](#) property of the new instance to a system-supplied message that describes the error, such as "The device has been lost but cannot be reset at this time." This message takes into account the current system culture.

The following table shows the initial property values for an instance of [DeviceStillDrawingException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

DeviceStillDrawingException Constructor (String, Exception)

Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DeviceStillDrawingException (  
    string message,  
    Exception inner  
)
```

Parameters

message

A message that describes the error.

inner

The exception that is the cause of the current exception. If the *inner* parameter is not a null reference, the current exception is raised in a catch block that handles the inner exception.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

An exception that is thrown as a direct result of a previous exception should include a reference to the previous exception in the [InnerException](#) property. The [InnerException](#) property returns the same value that is passed into the constructor, or a null reference if the [InnerException](#) property does not supply the inner exception value to the constructor.

The following table shows the initial property values for an instance of [DeviceStillDrawingException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

DisplayModeCollection.GetHashCode Method

Gets the hash code for this instance.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override int GetHashCode ()
```

Return Value

Hash code for this object.

DisplayModeCollection.op_Equality Method

Compares two objects to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    DisplayModeCollection left,  
    DisplayModeCollection right  
)
```

Parameters

left

Object to the left of the equality operator.

right

Object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

DisplayModeCollection.op_Inequality Method

Compares two objects to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    DisplayModeCollection left,  
    DisplayModeCollection right  
)
```

Parameters

left

The object to the left of the inequality operator.

right

The object to the right of the inequality operator.

Return Value

true if the objects are different; **false** otherwise.

[Microsoft.Xna.Framework.Graphics Namespace](#)

DriverInternalErrorException Constructor ()

Initializes a new instance of this class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DriverInternalErrorException ()
```

Remarks

This constructor initializes the [Message](#) property of the new instance to a system-supplied message that describes the error, such as "Internal driver error." This message takes into account the current system culture.

The following table shows the initial property values for an instance of [DriverInternalErrorException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

DriverInternalErrorException Constructor (String)

Initializes a new instance of this class with a specified error message.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DriverInternalErrorException (  
    string message  
)
```

Parameters

message

A message that describes the error.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

The following table shows the initial property values for an instance of [DriverInternalErrorException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

DriverInternalErrorException Constructor (String, Exception)

Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DriverInternalErrorException (
    string message,
    Exception inner
)
```

Parameters

message

A message that describes the error.

inner

The exception that is the cause of the current exception. If the *inner* parameter is not a null reference, the current exception is raised in a catch block that handles the inner exception.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

An exception that is thrown as a direct result of a previous exception should include a reference to the previous exception in the [InnerException](#) property. The [InnerException](#) property returns the same value that is passed into the constructor, or a null reference if the [InnerException](#) property does not supply the inner exception value to the constructor.

The following table shows the initial property values for an instance of [DriverInternalErrorException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

DynamicIndexBuffer Constructor (GraphicsDevice, Int32, BufferUsage, IndexElementSize)

Initializes a new instance of **DynamicIndexBuffer** with the specified parameters.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DynamicIndexBuffer (
    GraphicsDevice graphicsDevice,
    int sizeInBytes,
    BufferUsage usage,
    IndexElementSize elementSize
)
```

Parameters

graphicsDevice

The associated graphics device of the index buffer.

sizeInBytes

The size, in bytes, of the index buffer.

usage

A set of options identifying the behaviors of this index buffer resource.

elementSize

The size, in bits, of an index element.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentOutOfRangeException	One of the following conditions is true: <ul style="list-style-type: none"> The <i>elementSize</i> parameter is invalid. Index buffers can only be created for indices which are sixteen or thirty-two bits in length. The <i>sizeInBytes</i> parameter is invalid. The resource size must be greater than zero. The <i>sizeInBytes</i> parameter is invalid. The total size of the index buffer must be an even multiple of the index element size (either 16 or 32 bits).
InvalidOperationException	This resource could not be created.

Syntax

C#

```
public DynamicIndexBuffer (
    GraphicsDevice graphicsDevice,
    Type indexType,
    int elementCount,
    BufferUsage usage
)
```

Parameters

graphicsDevice

The associated graphics device of the index buffer.

indexType

Type to use for index values.

elementCount

Number of indices in the buffer.

usage

A set of options identifying the behaviors of this index buffer resource.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentOutOfRangeException	The <i>elementCount</i> parameter is invalid. It must be greater than zero, and the index must be sixteen or thirty-two bits in length. Index buffers can only be created for indices that are sixteen or thirty-two bits in length.
InvalidOperationException	This resource could not be created.

DynamicIndexBuffer.raise_ContentLost Method

Note

This method is available only when developing for Windows.

Occurs after content is lost from a graphics device failure, allowing an application to re-create all resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void raise_ContentLost (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

The source of this event.

value1

The event arguments that are associated with the action that raised the event.

[Microsoft.Xna.Framework.Graphics Namespace](#)

DynamicIndexBuffer.SetData Generic Method (Int32, T[], Int32, Int32, SetDataOptions)

Copies array data to the index buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (  
    int offsetInBytes,  
    T[] data,  
    int startIndex,  
    int elementCount,  
    SetDataOptions options  
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

offsetInBytes

Number of bytes into the index buffer where copying will start.

data

The array of data to copy.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

options

Specifies whether existing data in the buffer will be kept after this operation. [Discard](#) is not valid on Xbox 360, but dynamic geometry may be rendered on the Xbox 360 by using [DrawUserIndexedPrimitives](#) instead of setting the data for the index buffer.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

DynamicIndexBuffer.SetData Generic Method (T[], Int32, Int32, SetDataOptions)

Copies array data to the index buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (  
    T[] data,  
    int startIndex,  
    int elementCount,  
    SetDataOptions options  
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

data

The array of data to copy.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

options

Specifies whether existing data in the buffer will be kept after this operation. [Discard](#) is not valid on Xbox 360, but dynamic geometry may be rendered on the Xbox 360 by using [DrawUserIndexedPrimitives](#) instead of setting the data for the index buffer.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

DynamicVertexBuffer Class

Represents a list of 3D vertices to be streamed to the graphics device. Use **DynamicVertexBuffer** for dynamic vertex arrays and [VertexBuffer](#) for non-dynamic vertex arrays.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class DynamicVertexBuffer : VertexBuffer
```

Remarks

In situations where your game frequently modifies a vertex buffer, it is recommended that the buffer be instantiated or derived from **DynamicVertexBuffer** instead of the [VertexBuffer](#) class. **DynamicVertexBuffer** is optimized for frequent vertex data modification. However, to fully maximize the benefits of this class, your data must be restored after any occurrence of a [ContentLost](#) event. This event occurs whenever the related graphics device is lost. After resetting the graphics device and restoring any static resources, the [ContentLost](#) event handler is then called. Calling [SetData](#) inside this handler restores any dynamic resource data.

You can declare the event handler after constructing your dynamic vertex buffer. For example, the following code sample first constructs a dynamic vertex buffer (called `vertexBuffer`), declares a [ContentLost](#) event handler (called `vertexBuffer_ContentLost`). The final step initializes the data with a call to [SetData](#). This is necessary for correct restoration of any existing particles after a lost device event.

```
vertexBuffer = new DynamicVertexBuffer(GraphicsDevice, size, BufferUsage.Points);  
vertexBuffer.ContentLost += new EventHandler(vertexBuffer_ContentLost);  
vertexBuffer.SetData(particles);
```

DynamicVertexBuffer Constructor (GraphicsDevice, Int32, BufferUsage)

Initializes a new instance of **DynamicVertexBuffer** with the specified parameters.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DynamicVertexBuffer (  
    GraphicsDevice graphicsDevice,  
    int sizeInBytes,  
    BufferUsage usage  
)
```

Parameters

graphicsDevice

The graphics device to associate with this vertex buffer.

sizeInBytes

The number of bytes to allocate for this vertex buffer resource.

usage

A set of options identifying the behaviors of this vertex buffer resource. It is good practice to match the *usage* parameter with the *createOptions* parameter in the [GraphicsDevice](#) constructor.

Exceptions

Exception type	Condition
ArgumentNullException	The <i>graphicsDevice</i> must not be null when creating new resources.
ArgumentOutOfRangeException	<i>sizeInBytes</i> must be greater than zero.
InvalidOperationException	This resource could not be created.

DynamicVertexBuffer.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Dispose (  
    bool  
)
```

Parameters

[[MarshalAsAttribute\(U1\)](#)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

DynamicVertexBuffer.raise_ContentLost Method

Note

This method is available only when developing for Windows.

Occurs after content is lost from a graphics device failure, allowing an application to re-create all resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void raise_ContentLost (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

The source of this event.

value1

The event arguments that are associated with the action that raised the event.

DynamicVertexBuffer.SetData Method

Copies array data to the vertex buffer.

Overload List

Name	Description
DynamicVertexBuffer.SetData (Int32, T[], Int32, Int32, Int32, SetDataOptions)	Copies array data to the vertex buffer.
DynamicVertexBuffer.SetData (T[], Int32, Int32, SetDataOptions)	Copies array data to the vertex buffer.
DynamicVertexBuffer.SetData (Int32, T, Int32, Int32, Int32)	(Inherited from VertexBuffer.)
DynamicVertexBuffer.SetData (T)	(Inherited from VertexBuffer.)
DynamicVertexBuffer.SetData (T, Int32, Int32)	(Inherited from VertexBuffer.)

Reference

[DynamicVertexBuffer Class](#)

[DynamicVertexBuffer Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

DynamicVertexBuffer.SetData Generic Method (Int32, T[], Int32, Int32, Int32, SetDataOptions)

Copies array data to the vertex buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (  
    int offsetInBytes,  
    T[] data,  
    int startIndex,  
    int elementCount,  
    int vertexStride,  
    SetDataOptions options  
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

offsetInBytes

Number of bytes into the index buffer where copying will start.

data

The array of data to copy.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

vertexStride

The size, in bytes, of the elements in the vertex buffer.

options

Specifies whether existing data in the buffer will be kept after this operation. [Discard](#) is not valid on Xbox 360, but dynamic geometry may be rendered on the Xbox 360 by using [DrawUserIndexedPrimitives](#) instead of setting the data for the vertex buffer.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

DynamicVertexBuffer.SetData Generic Method (T[], Int32, Int32, SetDataOptions)

Copies array data to the vertex buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (  
    T[] data,  
    int startIndex,  
    int elementCount,  
    SetDataOptions options  
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

data

The array of data to copy.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

options

Specifies whether existing data in the buffer will be kept after this operation. [Discard](#) is not valid on Xbox 360, but dynamic geometry may be rendered on the Xbox 360 by using [DrawUserIndexedPrimitives](#) instead of setting the data for the vertex buffer.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

[Effect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

Effect Members

The following tables list the members exposed by the Effect type.

Public Constructors

	Name	Description
	Effect	Overloaded. Initializes a new instance of this class.

Public Properties

	Name	Description
	Creator	Gets the name of the effect creator.
	CurrentTechnique	Gets or sets the active technique.
	EffectPool	Gets an EffectPool representing the pool of shared parameters.
	Functions	Gets a collection of functions that can render the effect.
	GraphicsDevice	Gets the graphics device that created the effect.
	IsDisposed	Gets a value that indicates whether the object is disposed.
	Parameters	Gets a collection of parameters used for this effect.
	Techniques	Gets a collection of techniques that are defined for this effect.

Public Methods

	Name	Description
	Begin	Overloaded. Begins application of the active technique.
	Clone	Creates a clone of an effect.
	CommitChanges	Propagates the state change that occurs inside of an active pass to the device before rendering.
	CompileEffectFromFile	Overloaded. Compiles an effect from a file or stream containing the effect source code.
	CompileEffectFromSource	Compiles an effect from a string containing the effect source code.
	Disassemble	Overloaded. Disassembles an effect.
	Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
	End	Ends the application of the current technique.
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	ToString	Retrieves a string representation of this object.

Protected Methods

	Name	Description
	Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
	MemberwiseClone	(Inherited from Object .)
	raise_Disposing	Raises the Disposing event when called from within a derived class.
	raise_Lost	Raises an Lost event when called from within a derived class.
	raise_Reset	Raises an Reset event when called from within a derived class.

Public Events

	Name	Description
	Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime (CLR).
	Lost	Occurs when an object is lost, normally just before a device is reset.
	Reset	Occurs after the device is reset.

Reference

[Effect Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Effect Constructor

Initializes a new instance of this class.

Overload List

Name	Description
Effect (GraphicsDevice, Byte[], CompilerOptions, EffectPool)	Initializes a new instance of this class from a compiled effect, specifying the compiled effect as a byte array.
Effect (GraphicsDevice, Effect)	Initializes a new instance of this class, specifying the graphics device to associate with this effect and the effect to clone.
Effect (GraphicsDevice, Stream, CompilerOptions, EffectPool)	Initializes a new instance of this class from a compiled effect, specifying the compiled effect as a stream.
Effect (GraphicsDevice, Stream, Int32, CompilerOptions, EffectPool)	Initializes a new instance of this class from a compiled effect, specifying the compiled effect as a stream, as well as the number of bytes in the stream.
Effect (GraphicsDevice, String, CompilerOptions, EffectPool)	Initializes a new instance of this class from a compiled effect, specifying the compiled effect by file name.

Tip

In most cases, it is preferable to initialize a new instance of an effect using the [ContentManager.Load<Effect>](#) method rather than using the **Effect** constructors. For an example of initializing an effect with this method, please see [How To: Create and Apply Custom Effects](#).

Reference

[Effect Class](#)

[Effect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Effect Constructor (GraphicsDevice, Byte[], CompilerOptions, EffectPool)

Initializes a new instance of this class from a compiled effect, specifying the compiled effect as a byte array.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Effect (
    GraphicsDevice graphicsDevice,
    byte[] effectCode,
    CompilerOptions options,
    EffectPool pool
)
```

Parameters

graphicsDevice

The graphics device that will create the effect.

effectCode

Byte array containing the compiled byte code.

options

Compilation optimization options.

pool

Specifies a pool of resources to share between effects.

Exceptions

Exception type	Condition
ArgumentNullException	<i>effectCode</i> or <i>graphicsDevice</i> is null .
InvalidOperationException	One of the following conditions is true: <ul style="list-style-type: none"> The code contained in <i>effectCode</i> is not compiled. Creating an effect requires that the shader code has been compiled. The code contained in <i>effectCode</i> does not have a size that is a multiple of four bytes. Effect and shader code must have a size that is a multiple of four bytes. Unable to create the effect resource on the graphics device.
ObjectDisposedException	Effect was called after <i>pool</i> was disposed.

Remarks

Tip

In most cases, it is preferable to initialize a new instance of an effect using the [ContentManager.Load<Effect>](#) method rather than using the **Effect** constructors. For an example of initializing an effect with this method, see [How To: Create and Apply Custom Effects](#).

Obtaining the compiled byte code for *effectCode* is a two-part process. First, you must compile the effect by using the static method [Effect.CompileEffectFromFile](#) or [Effect.CompileEffectFromSource](#), either of which returns an instance of [CompiledEffect](#). [CompiledEffect.GetEffectCode](#) returns the compiled byte code from the compiled effect.

Effect Constructor (GraphicsDevice, Stream, CompilerOptions, EffectPool)

Initializes a new instance of this class from a compiled effect, specifying the compiled effect as a stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Effect (
    GraphicsDevice graphicsDevice,
    Stream effectCodeFileStream,
    CompilerOptions options,
    EffectPool pool
)
```

Parameters

graphicsDevice

The graphics device that will create the effect.

effectCodeFileStream

Stream containing the compiled byte code.

options

Compilation optimization options.

pool

Specifies a pool of resources to share between effects.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null . The graphics device must not be null when creating new resources.
ObjectDisposedException	Effect was called after <i>pool</i> was disposed.
InvalidOperationException	<ul style="list-style-type: none"> The code contained in <i>effectCodeFileStream</i> is not compiled. Creating an effect requires that the shader code has been compiled. Effect.CompileEffectFromFile Method (Stream, CompilerMacro[], CompilerIncludeHandler, CompilerOptions, TargetPlatform)

Note

This method is available only when developing for Windows.

Compiles an effect from a stream containing the effect source code.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static CompiledEffect CompileEffectFromFile (
    Stream effectFileStream,
    CompilerMacro[] preprocessorDefines,
    CompilerIncludeHandler includeHandler,
    CompilerOptions options,
    TargetPlatform platform
)
```

Parameters

effectFileStream

File stream containing the effect source code.

preprocessorDefines

Describes preprocessor definitions used by an effect object.

includeHandler

User-implemented interface to provide callbacks for **#include** directives during shader compilation.

options

Compilation optimization options.

platform

The target platform for the compilation.

Return Value

The compiled effect.

Exceptions

Exception type	Condition
ArgumentNullException	<i>effectFileStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>effectFileStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>effectFileStream</i> does not contain enough data to support this call.

    CompilerIncludeHandler includeHandler,
    CompilerOptions options,
    TargetPlatform platform
)
```

Parameters

effectFileStream

File stream containing the effect source code.

numberBytes

The number of bytes in *effectFileStream*.

preprocessorDefines

Describes preprocessor definitions used by an effect object.

includeHandler

User-implemented interface to provide callbacks for **#include** directives during shader compilation.

options

Compilation optimization options.

platform

The target platform for the compilation.

Return Value

The compiled effect.

Exceptions

Exception type	Condition
ArgumentNullException	<i>effectFileStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>effectFileStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>effectFileStream</i> does not contain enough data to support this call.

Effect.CompileEffectFromFile Method (String, CompilerMacro[], CompilerIncludeHandler, CompilerOptions, TargetPlatform)

Note

This method is available only when developing for Windows.

Compiles an effect from a file containing the effect source code.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static CompiledEffect CompileEffectFromFile (
    string effectFile,
    CompilerMacro[] preprocessorDefines,
    CompilerIncludeHandler includeHandler,
    CompilerOptions options,
    TargetPlatform platform
)
```

Parameters

effectFile

The name of the file containing the effect source code.

preprocessorDefines

Describes preprocessor definitions used by an effect object.

includeHandler

User-implemented interface to provide callbacks for **#include** directives during shader compilation.

options

Compilation optimization options.

platform

The target platform for the compilation.

Return Value

The compiled effect.

Exceptions

Exception type	Condition
ArgumentException	<i>effectFile</i> is a zero-length string, contains only white space, or contains one or more invalid characters as defined by InvalidPathChars .
ArgumentNullException	<i>effectFile</i> is null .
PathTooLongException	The specified path, file name, or both exceed the system-defined maximum length. For example, on Windows-based platforms, paths must be less than 248 characters, and file names must be less than 260 characters.
DirectoryNotFoundException	The specified path is invalid (for example, it is on an unmapped drive).
UnauthorizedAccessException	The <i>effectFile</i> parameter specifies a directory, or the caller does not have the required permission to access the file specified by <i>filename</i> .
FileNotFoundException	The file specified in <i>effectFile</i> was not found.
NotSupportedException	<i>effectFile</i> is in an invalid format.

Effect.CompileEffectFromSource Method

Note

This method is available only when developing for Windows.

Compiles an effect from a string containing the effect source code.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static CompiledEffect CompileEffectFromSource (  
    string effectFileSource,  
    CompilerMacro[] preprocessorDefines,  
    CompilerIncludeHandler includeHandler,  
    CompilerOptions options,  
    TargetPlatform platform  
)
```

Parameters

effectFileSource

String containing the effect source code.

preprocessorDefines

Describes preprocessor definitions used by an effect object.

includeHandler

User-implemented interface to provide callbacks for **#include** directives during shader compilation.

options

Compilation optimization options.

platform

The target platform for the compilation.

Return Value

The compiled effect.

Effect.Disassemble Method (Boolean)

Note

This method is available only when developing for Windows.

Disassembles this effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Disassemble (  
    bool enableColorCode  
)
```

Parameters

enableColorCode

[[MarshalAsAttribute\(U1\)](#)] **true** to enable color coding to make the disassembly easier to read.

Return Value

A string that contains the effect assembly (ASM).

Exceptions

Exception type	Condition
InsufficientMemoryException	Microsoft Direct3D could not allocate sufficient memory to complete the call.

Effect.Disassemble Method (Effect, Boolean)

Note

This method is available only when developing for Windows.

Disassembles an effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static string Disassemble (  
    Effect effect,  
    bool enableColorCode  
)
```

Parameters

effect

The effect to disassemble.

enableColorCode

[[MarshalAsAttribute](#)(U1)] **true** to enable color coding to make the disassembly easier to read.

Return Value

A string that contains the effect assembly (ASM).

Exceptions

Exception type	Condition
InsufficientMemoryException	Microsoft Direct3D could not allocate sufficient memory to complete the call.

Effect.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
Effect.Dispose ()	Immediately releases the unmanaged resources used by this object.
Effect.Dispose (Boolean)	Releases the unmanaged resources used by the Effect and optionally releases the managed resources.

See Also

Reference

[Effect Class](#)

[Effect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Effect.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[Effect Class](#)

[Effect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

Effect.Dispose Method (Boolean)

Releases the unmanaged resources used by the [Effect](#) and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[[MarshalAsAttribute](#)(U1)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [Effect](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

Effect.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the [Disposing](#) event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

See Also

Effect Properties

Public Properties

	Name	Description
	Creator	Gets the name of the effect creator.
	CurrentTechnique	Gets or sets the active technique.
	EffectPool	Gets an EffectPool representing the pool of shared parameters.
	Functions	Gets a collection of functions that can render the effect.
	GraphicsDevice	Gets the graphics device that created the effect.
	IsDisposed	Gets a value that indicates whether the object is disposed.
	Parameters	Gets a collection of parameters used for this effect.
	Techniques	Gets a collection of techniques that are defined for this effect.

See Also

Reference

[Effect Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Effect.Creator Property

Gets the name of the effect creator.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Creator { get; }
```

Property Value

The name of the effect creator.

See Also

Reference

[Effect Class](#)

[Effect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

Effect.CurrentTechnique Property

Gets or sets the active technique.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public EffectTechnique CurrentTechnique { get; set; }
```

Property Value

The current technique.

Exceptions

Exception type	Condition
ArgumentNullException	<i>CurrentTechnique</i> is null . <i>CurrentTechnique</i> cannot be null .

Remarks

If there are multiple techniques in an effect and you want to use a new technique in the next pass, you must set

CurrentTechnique to the new technique before making the rendering pass. It is not enough to call the [EffectPass.Begin](#) method of the next technique.

Note

The [BasicEffect](#) class, which is derived from [Effect](#) and inherits the [Techniques](#) collection, contains only one available technique to set as the active technique. The active technique applies the settings that have been set as the properties of the [BasicEffect](#).

Example

```
effect.CurrentTechnique = effect.Techniques["TransformTechnique"];
```

Platforms Xbox 360, Windows XP SP2, Windows Vista

Effect.GraphicsDevice Property

Gets the graphics device that created the effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GraphicsDevice GraphicsDevice { get; }
```

Property Value

The graphics device that created the effect.

See Also

Reference

[Effect Class](#)

[Effect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

Effect.IsDisposed Property

Gets a value that indicates whether the object is disposed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsDisposed { get; }
```

Property Value

true if the object is disposed; **false** otherwise.

See Also

Reference

[Effect Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

Effect.Parameters Property

Gets a collection of parameters used for this effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public EffectParameterCollection Parameters { get; }
```

Property Value

The collection of parameters used for this effect.

See Also

Tasks

[How To: Create and Apply Custom Effects](#)

[How To: Create Custom Texture Effects](#)

[How To: Use EffectParameters and EffectTechniques](#)

Reference

[Effect Class](#)

[Effect Members](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

Effect.Techniques Property

Gets a collection of techniques that are defined for this effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public EffectTechniqueCollection Techniques { get; }
```

Property Value

A collection of techniques that are defined for this effect.

Remarks

Note

The [BasicEffect](#) class, which is derived from [Effect](#) and inherits the [Techniques](#) collection, contains only one available technique which will apply the settings which have been set as the properties of the [BasicEffect](#).

Example In this example, an effect file is shown that defines a single technique called *TransformTechnique*.

```
uniform extern float4x4 WorldViewProj : WORLDVIEWPROJECTION;

struct VS_OUTPUT
{
    float4 position : POSITION;
    float4 color : COLOR0;
};

VS_OUTPUT Transform(
    float4 Pos : POSITION,
    float4 Color : COLOR0 )
{
    VS_OUTPUT Out = (VS_OUTPUT)0;

    Out.position = mul(Pos, WorldViewProj);
    Out.color = Color;

    return Out;
}

float4 PixelShader( VS_OUTPUT vsout ) : COLOR
{
    return vsout.color;
}

technique TransformTechnique
{
    pass P0
    {
        vertexShader = compile vs_2_0 Transform();
        pixelShader = compile ps_1_1 PixelShader();
    }
}
```

When this effect file is loaded as an [Effect](#) by the [ContentManager](#), this technique may be set as the active technique by setting [CurrentTechnique](#) to `effect.Techniques["TransformTechnique"]`.

Effect.Disposing Event

Occurs when [Dispose](#) is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime (CLR).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public event EventHandler Disposing
```

Remarks [IsDisposed](#) indicates whether that object has been disposed.

Example

To add an event handler that listens for the **Disposing** event, use the following C# code.

C#

```
obj.Disposing += new System.EventHandler( this.OnDisposing );
```

Effect.Lost Event

Occurs when an object is lost, normally just before a device is reset.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public event EventHandler Lost
```

Example

To add an event handler that listens for a **Lost** event, use the following C# code.

C#

```
effect.Lost += new System.EventHandler( this.LostEventHandler );
```

Platforms Xbox 360, Windows XP SP2, Windows Vista

EffectAnnotation.ParameterClass Property

Gets the parameter class of this effect annotation.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public EffectParameterClass ParameterClass { get; }
```

Property Value

The parameter class of this effect annotation.

See Also

Reference

[EffectAnnotation Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

EffectAnnotation.ParameterType Property

Gets the parameter type of this effect annotation.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public EffectParameterType ParameterType { get; }
```

Property Value

The parameter type of this effect annotation.

See Also

EffectAnnotation.RowCount Property

Gets the row count of this effect annotation.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int RowCount { get; }
```

Property Value

The row count of this effect annotation.

EffectAnnotation.Semantic Property

Gets the semantic of this effect annotation.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Semantic { get; }
```

Property Value

The semantic of this effect annotation.

EffectAnnotationCollection Members

The following tables list the members exposed by the EffectAnnotationCollection type.

Public Properties

	Name	Description
	Count	Gets the number of EffectAnnotation objects in this EffectAnnotationCollection .
	Item	Overloaded. Gets an EffectAnnotation object.

Public Methods

	Name	Description
	Equals	(Inherited from Object .)
	GetEnumerator	Returns an enumerator that can iterate through the EffectAnnotationCollection .
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

EffectParameter Class

Represents an [Effect](#) parameter.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class EffectParameter
```

Remarks Creating and assigning a **EffectParameter** instance for each technique in your [Effect](#) is significantly faster than using the [Parameters](#) indexed property on [Effect](#).

Example

To use a **EffectParameter** you must:

1. Create a **EffectParameter** for each parameter in your [Effect](#) that you will be setting in [Draw](#) or [Update](#).

C#

```
public EffectParameter mWorld;
public EffectParameter mCameraView;
public EffectParameter CameraPos;
public EffectParameter mCameraProj;
```

2. Assign an [Effect](#) parameter to your **EffectParameter**.

C#

```
mWorld = effect.Parameters["g_mWorld"];
mCameraView = effect.Parameters["g_mCameraView"];
CameraPos = effect.Parameters["g_CameraPos"];
mCameraProj = effect.Parameters["g_mCameraProj"];
```

3. Call [SetValue](#) on your **EffectParameter** to change the parameter value.

C#

```
MyEffect.CameraPos.SetValue(CameraPos);
MyEffect.mCameraView.SetValue(view);
MyEffect.mCameraProj.SetValue(projection);
MyEffect.LightPos.SetValue(LightPos);
MyEffect.mLightView.SetValue(Matrix.CreateLookAt(LightPos,
    bounds.Center, Vector3.Up));
```

EffectParameter Members

The following tables list the members exposed by the EffectParameter type.

Public Properties

Name	Description
 Annotations	Gets the collection of EffectAnnotation objects for this parameter.
 ColumnCount	Gets the number of columns in the parameter description.
 Elements	Gets the collection of effect parameters.
 Name	Gets the name of the parameter.
 ParameterClass	Gets the class of the parameter.
 ParameterType	Gets the type of the parameter.
 RowCount	Gets the number of rows in the parameter description.
 Semantic	Gets the semantic meaning, or usage, of the parameter.
 StructureMembers	Gets the collection of structure members.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 GetValueBoolean	Gets the value of the EffectParameter as a Boolean.
 GetValueBooleanArray	Gets the value of the EffectParameter as an array of Boolean.
 GetValueInt32	Gets the value of the EffectParameter as an Int32.
 GetValueInt32Array	Gets the value of the EffectParameter as an array of Int32.
 GetValueMatrix	Gets the value of the EffectParameter as a Matrix .
 GetValueMatrixArray	Gets the value of the EffectParameter as an array of Matrix .
 GetValueMatrixTranspose	Gets the value of the EffectParameter as a Matrix transpose.
 GetValueMatrixTransposeArray	Gets the value of the EffectParameter as an array of Matrix transpose.
 GetValueQuaternion	Gets the value of the EffectParameter as a Quaternion .
 GetValueQuaternionArray	Gets the value of the EffectParameter as an array of Quaternion .
 GetValueSingle	Gets the value of the EffectParameter as a Single.
 GetValueSingleArray	Gets the value of the EffectParameter as an array of Single.
 GetValueString	Gets the value of the EffectParameter as a String.
 GetValueTexture2D	Gets the value of the EffectParameter as a Texture2D .
 GetValueTexture3D	Gets the value of the EffectParameter as a Texture3D .
 GetValueTextureCube	Gets the value of the EffectParameter as a TextureCube .
 GetValueVector2	Gets the value of the EffectParameter as a Vector2 .
 GetValueVector2Array	Gets the value of the EffectParameter as an array of Vector2 .
 GetValueVector3	Gets the value of the EffectParameter as a Vector3 .
 GetValueVector3Array	Gets the value of the EffectParameter as an array of Vector3 .
 GetValueVector4	Gets the value of the EffectParameter as a Vector4 .
 GetValueVector4Array	Gets the value of the EffectParameter as an array of Vector4 .
 ReferenceEquals	(Inherited from Object .)
 SetArrayRange	Sets the range of an array to pass to the device.
 SetValue	Overloaded. Sets the value of the EffectParameter .
 SetValueTranspose	Overloaded. Sets the value of the EffectParameter .
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

EffectParameter.GetValueBoolean Method

Gets the value of the [EffectParameter](#) as a [Boolean](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool GetValueBoolean ()
```

Return Value

The value of the [EffectParameter](#) as a [Boolean](#).

Exceptions

Exception type	Condition
InvalidCastException	Unable to cast this EffectParameter to type Boolean .

Remarks

Getting the value of an effect parameter is a slow operation. Avoid high-frequency calls.

EffectParameter.GetValueBooleanArray Method

Gets the value of the [EffectParameter](#) as an array of [Boolean](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool[] GetValueBooleanArray (  
    int count  
)
```

Parameters

count

The number of elements in the array.

Return Value

The value of the [EffectParameter](#) as an array of [Boolean](#).

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	When attempting to call GetValueBooleanArray which returns an array, you must request that at least one member be returned.

Remarks

Getting the value of an effect parameter is a slow operation. Avoid high-frequency calls.

EffectParameter.GetValueSingleArray Method

Gets the value of the [EffectParameter](#) as an array of [Single](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float[] GetValueSingleArray (  
    int count  
)
```

Parameters

count

The number of elements in the array.

Return Value

The value of the [EffectParameter](#) as an array of [Single](#).

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<i>count</i> is less than or equal to zero. <i>count</i> must be greater than or equal to one.
InvalidCastException	Unable to cast this EffectParameter to an array of type Single .

Remarks

Getting the value of an effect parameter is a slow operation. Avoid high-frequency calls.

EffectParameter.GetValueString Method

Gets the value of the [EffectParameter](#) as an [String](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string GetValueString ()
```

Return Value

The value of the [EffectParameter](#) as an [String](#).

Exceptions

Exception type	Condition
InvalidCastException	Unable to cast this EffectParameter to type String .

Remarks

Getting the value of an effect parameter is a slow operation. Avoid high-frequency calls.

EffectParameter.GetValueTexture2D Method

Gets the value of the [EffectParameter](#) as a [Texture2D](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Texture2D GetValueTexture2D ()
```

Return Value

The value of the [EffectParameter](#) as a [Texture2D](#).

Exceptions

Exception type	Condition
InvalidOperationException	The resource is not of type ResourceType.Texture2D .
InvalidCastException	Unable to cast this EffectParameter to type Texture2D .

Remarks

Getting the value of an effect parameter is a slow operation. Avoid high-frequency calls.

Gets the value of the [EffectParameter](#) as a [Texture3D](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Texture3D GetValueTexture3D ()
```

Return Value

The value of the [EffectParameter](#) as a [Texture3D](#).

Exceptions

Exception type	Condition
InvalidOperationException	The resource is not of type ResourceType.Texture3D .
InvalidCastException	Unable to cast this EffectParameter to type Texture3D .

Remarks

Getting the value of an effect parameter is a slow operation. Avoid high-frequency calls.

EffectParameter.GetValueTextureCube Method

Gets the value of the [EffectParameter](#) as a [TextureCube](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TextureCube GetValueTextureCube ()
```

Return Value

The value of the [EffectParameter](#) as a [TextureCube](#).

Exceptions

Exception type	Condition
InvalidOperationException	The resource is not of type ResourceType.TextureCube .
InvalidCastException	Unable to cast this EffectParameter to type TextureCube .

Remarks

Getting the value of an effect parameter is a slow operation. Avoid high-frequency calls.

Gets the name of the parameter.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Name { get; }
```

Property Value

The name of the parameter.

See Also

Reference

[EffectParameter Class](#)

[EffectParameter Members](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

EffectParameter.ParameterClass Property

Gets the class of the parameter.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public EffectParameterClass ParameterClass { get; }
```

Property Value

The parameter class.

EffectParameter.RowCount Property

Gets the number of rows in the parameter description.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int RowCount { get; }
```

Property Value

The number of rows in the parameter description.

See Also

EffectParameter.Semantic Property

Gets the semantic meaning, or usage, of the parameter.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Semantic { get; }
```

Property Value

The semantic meaning of the parameter.

EffectParameter.StructureMembers Property

Gets the collection of structure members.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public EffectParameterCollection StructureMembers { get; }
```

Property Value

The collection of structure members.

EffectParameterBlock Members

The following tables list the members exposed by the EffectParameterBlock type.

Public Constructors

Name	Description
 EffectParameterBlock	Initializes a new instance of the EffectParameterBlock class.

Public Methods

Name	Description
 Apply	Applies the parameter changes in the EffectParameterBlock to the current effect state.
 Begin	Begins capturing parameter state changes from the parent Effect .
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 End	Stops capturing state changes from the parent Effect .
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)

EffectParameterBlock Constructor

Initializes a new instance of the [EffectParameterBlock](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public EffectParameterBlock (  
    Effect parent  
)
```

Parameters

parent

The [Effect](#) used to generate the [EffectParameterBlock](#).

See Also

Reference

Platforms Xbox 360, Windows XP SP2, Windows Vista

EffectParameterBlock.Begin Method

Begins capturing parameter state changes from the parent [Effect](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Begin ()
```

Exceptions

Exception type	Condition
InvalidOperationException	Begin has been called before calling End after the last call to Begin . Begin cannot be called again until End has been successfully called.

EffectParameterBlock.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[EffectParameterBlock Class](#)

[EffectParameterBlock Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

EffectParameterBlock.Dispose Method (Boolean)

Releases the unmanaged resources used by the [EffectParameterBlock](#) and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\]](#) **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [EffectParameterBlock](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

See Also

Reference

EffectParameterClass Enumeration

Defines classes that can be used for effect parameters or shader constants.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum EffectParameterClass
```

Members

Member name	Description
MatrixColumns	Constant is a column major matrix.
MatrixRows	Constant is a row major matrix.
Object	Constant is either a texture, a shader, or a string.
Scalar	Constant is a scalar.
Struct	Constant is a structure.
Vector	Constant is a vector.

EffectParameterCollection.GetParameterBySemantic Method

Gets the handle of a top-level parameter or a structure member parameter by looking up its semantic with a case-insensitive search.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public EffectParameter GetParameterBySemantic (  
    string semantic  
)
```

Parameters

semantic

The name of the semantic to search for.

Return Value

The first parameter that matches the semantic, or **null** if no matching parameter was found.

Remarks

Getting an effect parameter by semantic is a slow operation. Avoid-high frequency calls.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum EffectParameterType
```

Members

Member name	Description
Bool	Parameter is a Boolean. Any nonzero value passed in will be mapped to 1 (TRUE) before being written into the constant table; otherwise, the value will be set to 0 in the constant table.
Int32	Parameter is an integer. Any floating-point values passed in will be rounded off (to zero decimal places) before being written into the constant table.
PixelShader	Parameter is a pixel shader.
Sampler	Parameter is a sampler.
Sampler1D	Parameter is a 1D sampler.
Sampler2D	Parameter is a 2D sampler.
Sampler3D	Parameter is a 3D sampler.
SamplerCube	Parameter is a cube sampler.
Single	Parameter is a floating-point number.
String	Parameter is a string.
Texture	Parameter is a texture.
Texture1D	Parameter is a 1D texture.
Texture2D	Parameter is a 2D texture.
Texture3D	Parameter is a 3D texture.
TextureCube	Parameter is a cube texture.
VertexShader	Parameter is a vertex shader.
Void	Parameter is a void pointer.

EffectPass Class

Represents an effect pass.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class EffectPass
```

Remarks

An effect pass represents a single pass for a related effect. Effects can have a single pass or multiple passes. Use the [Passes](#) property to determine the number of passes for a related effect technique.

	MemberwiseClone	(Inherited from Object .)

See Also

Reference

[EffectPass Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

EffectPass.Begin Method

Begins a pass within the active technique.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Begin ()
```

Exceptions

Exception type	Condition
InvalidOperationException	Begin has been called before calling End after the last call to Begin . Begin cannot be called again until End has been successfully called.

Remarks

An application sets one active pass (within one active technique) in the effect system by calling [Begin](#). An application signals the end of the active pass by calling [End](#). [Begin](#) and [End](#) must occur in a matching pair, within a matching pair of [Effect.Begin](#) and [Effect.End](#) calls.

If the application changes any effect state using any of the [Effect](#) methods inside of a [Begin/End](#) matching pair, the application must call [CommitChanges](#) to set the update the device with the state changes. If no state changes occur within a [Begin](#) and [End](#) matching pair, it is not necessary to call [CommitChanges](#).

EffectPass.End Method

Ends a pass within the active technique.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void End ()
```

Exceptions

Exception type	Condition
InvalidOperationException	End was called, but Begin has not yet been called. Begin must be called successfully before End can be called.

Remarks

An application signals the end of rendering an active pass by calling [End](#). Each [End](#) must be part of a matching pair of [Begin](#) and [End](#) calls.

[Begin](#) and [End](#) must occur in a matching pair, within a matching pair of [Effect.Begin](#) and [Effect.End](#) calls.

If the application changes any effect state using any of the [Effect](#) methods inside of a [Begin/End](#) matching pair, the application must call [CommitChanges](#) to set the update the device with the state changes. If no state changes occur within a [Begin](#) and [End](#) matching pair, it is not necessary to call [CommitChanges](#).

EffectPool Class

Allows applications to share resources between effects.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class EffectPool : IDisposable
```

Remarks

Effect pools allow different effects to share variables, textures, and shaders between them. This means that for common variables, the data needs to be set only once per frame, rather than once per effect invocation. An effect pool effectively consists of two parts. There is the effect pool itself, and the effects that are part of the pool.

A good example of sharing variables would be the projection matrix of the view. In many cases, the projection matrix is constant over an entire frame. However, every effect used in the frame needs that matrix at some point. If there are several hundred effects running per scene, you would have to set that matrix for each effect. However, by using effect pools, you set the projection matrix once, and that value is automatically used by every effect in the pool when needed.

Note

The content manager uses a static [EffectPool](#) when loading all effects. This supports the usage of shared parameters across all effects loaded by the content manager.

For each effect pool, parameters with the same name, type, and semantic are automatically shared across all effects in that pool. An easy way to implement this is an include file that declares each effect variable to be shared and then include that variable file in each effect file needing those variables.

For an example of effect pools, see Shader Series 1: Vertex Lighting, located at <http://creators.xna.com>.

EffectPool Members

The following tables list the members exposed by the EffectPool type.

Public Constructors

Name	Description
 EffectPool	Initializes a new instance of this class.

Public Properties

Name	Description
 IsDisposed	Gets a value that indicates whether the object is disposed.

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_Disposing	Raises the Disposing event when called from within a derived class.

Public Events

Name	Description
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

See Also

Reference

EffectPool.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
EffectPool.Dispose ()	Immediately releases the unmanaged resources used by this object.
EffectPool.Dispose (Boolean)	Immediately releases the unmanaged resources used by this object.

Remarks

Call [Dispose](#) when you are finished using the [EffectPool](#). The [Dispose](#) method leaves the [EffectPool](#) in an unusable state. After calling [Dispose](#), you must release all references to the [EffectPool](#) so the garbage collector can reclaim the memory that the [EffectPool](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [EffectPool](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [EffectPool](#) object's [Finalize](#) method.

See Also

Reference

[EffectPool Class](#)

EffectPool.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call [Dispose](#) when you are finished using the [EffectPool](#). The [Dispose](#) method leaves the [EffectPool](#) in an unusable state. After calling [Dispose](#), you must release all references to the [EffectPool](#) so the garbage collector can reclaim the memory that the [EffectPool](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [EffectPool](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [EffectPool](#) object's [Finalize](#) method.

Reference

[EffectPool Class](#)

[EffectPool Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

EffectPool.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[[MarshalAsAttribute\(U1\)](#)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [EffectPool](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

See Also

Reference

[EffectPool Class](#)

[EffectPool Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

EffectPool.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

EffectPool.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the Disposing event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

[EffectPool Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

EffectPool.IsDisposed Property

Gets a value that indicates whether the object is disposed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsDisposed { get; }
```

Property Value

true if the object is disposed; **false** otherwise.

See Also

Reference

[EffectPool Class](#)

[EffectPool Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

EffectPool Events

Public Events

	Name	Description
	Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

See Also

Reference

[EffectPool Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

EffectPool.Disposing Event

Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public event EventHandler Disposing
```

Remarks [IsDisposed](#) indicates whether that object has been disposed.

Example

To add an event handler that listens for the **Disposing** event, use the following C# code.

```
obj.Disposing += new System.EventHandler( this.OnDisposing );
```

See Also

Platforms Xbox 360, Windows XP SP2, Windows Vista

EffectTechnique Class

Represents an effect technique.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class EffectTechnique
```

Remarks Creating and assigning a **EffectTechnique** instance for each technique in your **Effect** is significantly faster than using the **Techniques** indexed property on **Effect**.

Example

To use a **EffectTechnique** you must:

1. Create a **EffectTechnique** for each technique in your **Effect**.

C#

```
public EffectTechnique texture;
public EffectTechnique shadows;
public EffectTechnique shadowMap;
```

2. Assign an **Effect** technique to your **EffectTechnique**.

C#

```
texture = effect.Techniques["TextureRender"];
shadowMap = effect.Techniques["ShadowMapRender"];
shadows = effect.Techniques["ShadowRender"];
```

3. Assign your **EffectTechnique** to the **CurrentTechnique** of your **Effect** before drawing.

C#

```
private void DrawScene(EffectTechnique technique)
{
    MyEffect.mWorld.SetValue(terrainWorld);
    MyEffect.MeshTexture.SetValue(terrainTex);
    foreach (ModelMesh mesh in terrain.Meshes)
    {
        foreach (Effect effect in mesh.Effects)
        {
            effect.CurrentTechnique = technique;
            mesh.Draw();
        }
    }
}
```

EffectTechnique.IsParameterUsed Method

Determines whether a given [EffectParameter](#) is used by this technique.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsParameterUsed (  
    EffectParameter parameter  
)
```

Parameters

parameter

The effect parameter to check.

Return Value

true if the parameter is used by this technique; **false** otherwise.

Exceptions

Exception type	Condition
ArgumentNullException	<i>parameter</i> is null .

See Also

Reference

EffectTechnique.Passes Property

Gets the collection of [EffectPass](#) objects this rendering technique requires.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public EffectPassCollection Passes { get; }
```

Property Value

The collection of [EffectPass](#) objects this rendering technique requires.

Remarks

Some video cards can render two textures in a single pass. However, if a card does not have this capability, it is often possible to render the same effect in two passes, using one texture for each pass.

FillMode Enumeration

Describes options for filling the vertices and lines that define a primitive.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum FillMode
```

Members

Member name	Description
Point	Draw a point at each vertex.
Solid	Draw solid faces for each primitive.
WireFrame	Draw lines connecting the vertices that define a primitive face.

See Also

Reference

Platforms Xbox 360, Windows XP SP2, Windows Vista

FilterOptions Enumeration

Note

This enumeration is available only when developing for Windows.

Defines modes describing how to filter an image or mipmap when it is minified or magnified to fit a set of vertices.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[FlagsAttribute]
public enum FilterOptions
```

Members

Member name	Description
Box	Each pixel is computed by averaging a 2×2(×2) box of pixels from the source image. This filter works only when the dimensions of the destination are half those of the source, as is the case with mipmaps.
Dither	Resulting image must be dithered using a 4×4 ordered dither algorithm. This happens when converting from one format to another.
DitherDiffusion	Do diffuse dithering on the image when changing from one format to another.
Linear	Bilinear interpolation filtering is used as a texture magnification or minification filter. A weighted average of a 2×2 area of texels surrounding the desired pixel is used. The texture filter to use between mipmap levels is trilinear mipmap interpolation. The rasterizer interpolates pixel color in a linear manner, using the texels of the two nearest textures.
Mirror	Same as specifying the MirrorU , MirrorV , and MirrorW flags. This flag is always used internally for this function.
MirrorU	Pixels off the edge of the texture on the u-axis should be mirrored, not wrapped.
MirrorV	Pixels off the edge of the texture on the v-axis should be mirrored, not wrapped.
MirrorW	Pixels off the edge of the texture on the w-axis should be mirrored, not wrapped.
None	Mipmapping disabled. The rasterizer uses the magnification filter instead.
Point	Each destination pixel is computed by sampling the nearest pixel from the source image.
Srgb	Same as specifying SrgbIn SrgbOut .
SrgbIn	Input data is in sRGB (gamma 2.2) color space.
SrgbOut	Output data is in sRGB (gamma 2.2) color space.
Triangle	Each pixel in the source image contributes equally to the destination image. This is the slowest of the filters.

Remarks Each valid filter must contain exactly one of the following flags: **None**, **Point**, **Linear**, **Triangle**, or **Box**. In addition, the bitwise OR operator can be used to specify zero or more of the following optional flags with a valid filter: **MirrorU**, **MirrorV**, **MirrorW**, **Mirror**, or **Dither**.

FogMode Enumeration

Note

This enumeration is available only when developing for Windows.

Defines constants that describe the fog mode.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum FogMode
```

Members

Member name	Description
Exponent	Fog effect intensifies exponentially, according to the following formula. $f = \frac{1}{e^{d \times density}}$
ExponentSquare	Fog effect intensifies exponentially with the square of the distance, according to the following formula. $f = \frac{1}{e^{(d \times density)^2}}$
Linear	Fog effect intensifies in a linear manner between the start and end points, according to the following formula. $f = \frac{end - d}{end - start}$
None	No fog effect.

Remarks

Fog can be considered a measure of visibility. The lower the fog value produced by a fog equation, the less visible an object is.

GammaRamp.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
GammaRamp.Dispose ()	Immediately releases the unmanaged resources used by this object.
GammaRamp.Dispose (Boolean)	Immediately releases the unmanaged resources used by this object.

Remarks

Call [Dispose](#) when you are finished using the [GammaRamp](#). The [Dispose](#) method leaves the [GammaRamp](#) in an unusable state. After calling [Dispose](#), you must release all references to the [GammaRamp](#) so the garbage collector can reclaim the memory that the [GammaRamp](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [GammaRamp](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [GammaRamp](#) object's [Finalize](#) method.

GammaRamp.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call [Dispose](#) when you are finished using the [GammaRamp](#). The [Dispose](#) method leaves the [GammaRamp](#) in an unusable state. After calling [Dispose](#), you must release all references to the [GammaRamp](#) so the garbage collector can reclaim the memory that the [GammaRamp](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [GammaRamp](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [GammaRamp](#) object's [Finalize](#) method.

GammaRamp.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool disposing  
)
```

Parameters

disposing

[[MarshalAsAttribute\(U1\)](#)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [GammaRamp](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

GraphicsAdapter Members

The following tables list the members exposed by the GraphicsAdapter type.

Public Properties

	Name	Description
	Adapters	Collection of available adapters on the system.
	CurrentDisplayMode	Gets the current display mode.
	DefaultAdapter	Gets the default adapter.
	Description	Retrieves a string used for presentation to the user.
	DeviceId	Retrieves a value that is used to help identify a particular chip set.
	DeviceIdentifier	Retrieves a globally unique identifier (GUID) object that can be used to check changes in the driver and chip set.
	DeviceName	Retrieves a string that contains the device name for a Microsoft Windows Graphics Device Interface (GDI).
	DriverDll	Retrieves a string that is used to present the driver name to the user.
	DriverVersion	Retrieves a value that identifies the version of the Microsoft Direct3D driver.
	IsDefaultAdapter	Determines if this instance of GraphicsAdapter is the default adapter.
	IsWideScreen	Determines if the graphics adapter is in widescreen mode.
	MonitorHandle	Retrieves the handle of the monitor associated with the Microsoft Direct3D object.
	Revision	Retrieves a value used to help identify the revision level of a particular chip set.
	SubSystemId	Retrieves a value used to identify the subsystem.
	SupportedDisplayModes	Returns a collection of supported display modes for the current adapter.
	VendorId	Retrieves a value used to identify the manufacturer.

Public Methods

	Name	Description
	CheckDepthStencilMatch	Tests whether a depth stencil format is compatible with a render target format in a particular display mode.
	CheckDeviceFormat	Overloaded. Determines whether a surface or depth buffer format is available as a specified resource type and can be used as a texture, depth-stencil buffer, render target, or any combination of the three, on a device representing the current adapter.
	CheckDeviceFormatConversion	Tests a device to determine whether it supports conversion from one display format to another.
	CheckDeviceMultiSampleType	Overloaded. Verifies whether a multisample technique is available on a specified device.
	CheckDeviceType	Determines whether a hardware-accelerated device type can be used on the current adapter.
	Dispose	Overloaded. Releases all resources used by the GraphicsAdapter class.
	Equals	Overloaded. Determines whether two instances of GraphicsAdapter are equal.
	GetCapabilities	Returns the capabilities of a device.
	GetHashCode	Gets the hash code for this instance.
	GetType	(Inherited from Object .)
	IsDeviceTypeAvailable	Determines whether a requested device type is available.
	op_Equality	Compares two objects to determine whether they are the same.
	op_Inequality	Compares two objects to determine whether they are different.

 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
	MemberwiseClone	(Inherited from Object .)

[GraphicsAdapter Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

GraphicsAdapter.CheckDepthStencilMatch Method

Tests whether a depth stencil format is compatible with a render target format in a particular display mode.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool CheckDepthStencilMatch (
    DeviceType deviceType,
    SurfaceFormat adapterFormat,
    SurfaceFormat renderTargetFormat,
    DepthFormat depthStencilFormat
)
```

Parameters

deviceType

The device type.

adapterFormat

The format of the display mode into which the adapter will be placed.

renderTargetFormat

The format of the render-target surface to be tested.

depthStencilFormat

The format of the depth stencil surface to be tested.

Return Value

true if the format is compatible; **false** otherwise.

Exceptions

Exception type	Condition
DeviceNotSupportedException	(Xbox 360) Hardware is the only device type supported on this platform.
InvalidOperationException	An error has occurred.

Remarks

CheckDepthStencilMatch enables applications to work with hardware that requires that certain depth formats work only with certain render target formats.

Note

The following surface formats are not supported on the Xbox 360 platform for any [ResourceType](#), including textures:

- [SurfaceFormat.Bgr24](#)
- [SurfaceFormat.Bgra2338](#)
- [SurfaceFormat.Bgr233](#)
- [SurfaceFormat.NormalizedByte2Computed](#)
- [SurfaceFormat.LuminanceAlpha8](#)
- [SurfaceFormat.Palette8](#)
- [SurfaceFormat.PaletteAlpha16](#)
- [SurfaceFormat.Multi2Bgra32](#)
- [SurfaceFormat.Depth15Stencil1](#)
- [SurfaceFormat.Depth24Stencil4](#)

Example

C#

```
public static DepthStencilBuffer CreateDepthStencil(
    RenderTarget2D target)
{
    return new DepthStencilBuffer(target.GraphicsDevice, target.Width,
        target.Height, target.GraphicsDevice.DepthStencilBuffer.Format,
        target.MultiSampleType, target.MultiSampleQuality);
}
```

```
}  
public static DepthStencilBuffer CreateDepthStencil(  
    RenderTarget2D target, DepthFormat depth)  
{  
    if (GraphicsAdapter.DefaultAdapter.CheckDepthStencilMatch(  
        DeviceType.Hardware,  
        GraphicsAdapter.DefaultAdapter.CurrentDisplayMode.Format,  
        target.Format,  
        depth))  
    {  
        return new DepthStencilBuffer(target.GraphicsDevice,  
            target.Width, target.Height, depth,  
            target.MultiSampleType, target.MultiSampleQuality);  
    }  
    else  
        return CreateDepthStencil(target);  
}
```

GraphicsAdapter.CheckDeviceFormat Method (DeviceType, SurfaceFormat, TextureUsage, QueryUsages, ResourceType, DepthFormat)

Verifies whether a depth buffer format is available as a specified resource type and can be used as a texture, depth-stencil buffer, render target, or any combination of the three, on a device representing the current adapter.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool CheckDeviceFormat (
    DeviceType deviceType,
    SurfaceFormat adapterFormat,
    TextureUsage usage,
    QueryUsages queryUsages,
    ResourceType resourceType,
    DepthFormat checkFormat
)
```

Parameters

deviceType

The type of device to check.

adapterFormat

The format of the display mode into which the adapter will be placed.

usage

A set of options identifying the behaviors of this surface resource.

queryUsages

The type of query to issue.

resourceType

A resource type requested for use with the queried format.

checkFormat

The format of the depth buffer surface identified by *usage*.

Return Value

true if the surface format is available as the specified resource and format type; **false** otherwise.

Exceptions

Exception type	Condition
DeviceNotSupportedException	(Xbox 360) Hardware is the only device type supported on this platform.

Remarks

Note

The following surface formats are not supported on the Xbox 360 platform for any [ResourceType](#), including textures:

- [SurfaceFormat.Bgr24](#)
- [SurfaceFormat.Bgra2338](#)

        TextureUsage.None,
        QueryUsages.None,
        ResourceType.RenderTarget,
        surface))
    {
        // Fall back to current display format
        surface = device.DisplayMode.Format;
    }
    // Or it can't accept that surface format
    // with the current AA settings
    else if (!GraphicsAdapter.DefaultAdapter.CheckDeviceMultiSampleType(
        DeviceType.Hardware, surface,
        device.PresentationParameters.IsFullScreen, type))
    {
        // Fall back to no antialiasing
        type = MultiSampleType.None;
    }

    int width, height;

    // See if we can use our buffer size as our texture
    CheckTextureSize(device.PresentationParameters.BackBufferWidth,
        device.PresentationParameters.BackBufferHeight,
        out width, out height);

    // Create our render target
    return new RenderTarget2D(device,
        width, height, numberLevels, surface,
        type, 0);
}

```

GraphicsAdapter.CheckDeviceFormatConversion Method

Tests a device to determine whether it supports conversion from one display format to another.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool CheckDeviceFormatConversion (
    DeviceType deviceType,
    SurfaceFormat sourceFormat,
    SurfaceFormat targetFormat
)
```

Parameters

deviceType

Type of device to check.

sourceFormat

Source adapter format.

targetFormat

Target adapter format.

Return Value

true if the method succeeds; **false** if it fails.

Exceptions

Exception type	Condition
DeviceNotSupportedException	(Xbox 360) Hardware is the only device type supported on this platform.
InvalidOperationException	An error has occurred.

Remarks

Using **CheckDeviceFormatConversion** to test for compatibility between a back buffer and the display format returns appropriate values. This means that the call reflects device capabilities. If the device cannot render to the requested back buffer format, the call still returns **false**. If the device can render to the format but cannot perform the color-converting presentation, the return value is also **false**. Applications can discover hardware support for the presentation itself by calling **CheckDeviceFormatConversion**. No software emulation for the color-converting presentation itself is offered.

Color conversion is restricted to certain source and target formats. The source format must be a four-character code (FOURCC) format or a valid back-buffer format, and the target format must be one of the following unsigned formats.

SurfaceFormat.Bgr555	SurfaceFormat.Bgra5551	SurfaceFormat.Bgr565
SurfaceFormat.Bgr24	SurfaceFormat.Bgr32	SurfaceFormat.Color
SurfaceFormat.Bgra1010102	SurfaceFormat.Rgba64	SurfaceFormat.Rgba1010102
SurfaceFormat.Rgba32	SurfaceFormat.Rgb32	SurfaceFormat.HalfVector4
SurfaceFormat.Vector4

GraphicsAdapter.CheckDeviceMultiSampleType Method

Verifies whether a multisample technique is available on a specified device.

Overload List

Name	Description
GraphicsAdapter.CheckDeviceMultiSampleType (DeviceType, SurfaceFormat, Boolean, MultiSampleType)	Verifies whether a multisample technique is available on a specified game machine.
GraphicsAdapter.CheckDeviceMultiSampleType (DeviceType, SurfaceFormat, Boolean, MultiSampleType, Int32)	Verifies whether a multisample technique is available on a specified game machine, optionally returning the number of quality stops available for the specified technique.

Remarks This method is intended for use with both render-target and depth-stencil surfaces because they must be created multisampled to be used together.

GraphicsAdapter.CheckDeviceMultiSampleType Method (DeviceType, SurfaceFormat, Boolean, MultiSampleType)

Verifies whether a multisample technique is available on a specified game machine.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool CheckDeviceMultiSampleType (
    DeviceType deviceType,
    SurfaceFormat surfaceFormat,
    bool isFullScreen,
    MultiSampleType sampleType
)
```

Parameters

deviceType

The type of device to check.

surfaceFormat

The format of the surface to be multisampled.

isFullScreen

[[MarshalAsAttribute\(U1\)](#)] **true** to inquire about windowed multisampling; **false** to inquire about full-screen multisampling.

sampleType

The multisampling technique to test.

Return Value

true if the technique is available; **false** otherwise.

Exceptions

Exception type	Condition
DeviceNotSupportedException	(Xbox 360) Hardware is the only device type supported on this platform.

Example

Call **CheckDeviceMultiSampleType** in your [PreparingDeviceSettings](#) handler.

C#

```
int quality = 0;
GraphicsAdapter adapter = e.GraphicsDeviceInformation.Adapter;
SurfaceFormat format = adapter.CurrentDisplayMode.Format;
// Check for 4xAA
if (adapter.CheckDeviceMultiSampleType(DeviceType.Hardware, format,
    false, MultiSampleType.FourSamples, out quality))
{
    // even if a greater quality is returned, we only want quality 0
    pp.MultiSampleQuality = 0;
    pp.MultiSampleType =
        MultiSampleType.FourSamples;
}
// Check for 2xAA
else if (adapter.CheckDeviceMultiSampleType(DeviceType.Hardware,
    format, false, MultiSampleType.TwoSamples, out quality))
{
    // even if a greater quality is returned, we only want quality 0
    pp.MultiSampleQuality = 0;
    pp.MultiSampleType =
        MultiSampleType.TwoSamples;
}
return;
#endif
}
```

Exceptions

Exception type	Condition
DeviceNotSupportedException	(Xbox 360) Hardware is the only device type supported on this platform.
InvalidOperationException	An error has occurred.

Example

Call **CheckDeviceMultiSampleType** in your [PreparingDeviceSettings](#) handler.

C#

```
int quality = 0;
GraphicsAdapter adapter = e.GraphicsDeviceInformation.Adapter;
SurfaceFormat format = adapter.CurrentDisplayMode.Format;
// Check for 4xAA
if (adapter.CheckDeviceMultiSampleType(DeviceType.Hardware, format,
    false, MultiSampleType.FourSamples, out quality))
{
    // even if a greater quality is returned, we only want quality 0
    pp.MultiSampleQuality = 0;
    pp.MultiSampleType =
        MultiSampleType.FourSamples;
}
// Check for 2xAA
else if (adapter.CheckDeviceMultiSampleType(DeviceType.Hardware,
    format, false, MultiSampleType.TwoSamples, out quality))
{
    // even if a greater quality is returned, we only want quality 0
    pp.MultiSampleQuality = 0;
    pp.MultiSampleType =
```

```
        MultiSampleType.TwoSamples;
    }
    return;
#endif
}
```

GraphicsAdapter.CheckDeviceType Method

Determines whether a hardware-accelerated device type can be used on the current adapter.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool CheckDeviceType (
    DeviceType deviceType,
    SurfaceFormat displayFormat,
    SurfaceFormat backBufferFormat,
    bool isFullScreen
)
```

Parameters

deviceType

The type of device to check.

displayFormat

The format of the adapter display mode for which the device type is being checked. For example, some devices operate only in modes of 16 bits per pixel.

backBufferFormat

Format of the back buffer. This value must be one of the render target formats. [DisplayMode](#) can be used to obtain the current format.

For windowed applications, the back-buffer format does not need to match the display-mode format if the hardware supports color conversion. The set of possible back-buffer formats is constrained, but the runtime allows any valid back-buffer format to be presented to any desktop format. Additionally, the device must be operable in desktop mode because devices typically do not operate in modes of 8 bits per pixel.

Full-screen applications cannot perform color conversion.

[SurfaceFormat.Unknown](#) is allowed for windowed mode.

isFullScreen

[[MarshalAsAttribute\(U1\)](#)] **true** if the device type will be used in windowed mode; **false** if the device type will be used in full-screen mode.

Return Value

true if the method succeeds and the device can be used on this adapter; **false** if the method fails. If the method fails, you may check the result code returned by [Manager.CheckDeviceTypeResult](#) to determine the specific reason.

Exceptions

Exception type	Condition
DeviceNotSupportedException	(Xbox 360) Hardware is the only device type supported on this platform.
InvalidOperationException	An error has occurred.

Remarks

A hardware abstraction layer (HAL) device type requires hardware acceleration. Applications can use **CheckDeviceType** to determine whether the hardware and drivers necessary to support a HAL device are present.

Full-screen applications should not specify a *displayFormat* that contains an alpha channel; doing so results in a failed call. Note that an alpha channel can be present in the back buffer, but the two display formats must be identical in all other respects. For example, if *displayFormat* = [SurfaceFormat.Bgr555](#), valid values for *backBufferFormat* include [SurfaceFormat.Bgr555](#) and [SurfaceFormat.Bgra5551](#), but exclude [SurfaceFormat.Bgr565](#).

Using **CheckDeviceType** to test for compatibility between a back buffer that differs from the display format returns appropriate values. This means that the call reflects device capabilities. No software emulation for the color-converting presentation itself is offered.

GraphicsAdapter.Dispose Method

Releases all resources used by the [GraphicsAdapter](#) class.

Overload List

Name	Description
GraphicsAdapter.Dispose ()	Releases all resources used by the GraphicsAdapter class.
GraphicsAdapter.Dispose (Boolean)	Releases all resources used by the GraphicsAdapter class.

See Also

Reference

[GraphicsAdapter Class](#)

[GraphicsAdapter Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

GraphicsAdapter.Dispose Method ()

Releases all resources used by the [GraphicsAdapter](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call [Dispose](#) when you are finished using the [GraphicsAdapter](#). The [Dispose](#) method leaves the [GraphicsAdapter](#) in an unusable state. After calling [Dispose](#), you must release all references to the [GraphicsAdapter](#) so the garbage collector can reclaim the memory that the [GraphicsAdapter](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [GraphicsAdapter](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [GraphicsAdapter](#) object's [Finalize](#) method.

GraphicsAdapter.Dispose Method (Boolean)

Note

This method is available only when developing for Windows.

Releases all resources used by the [GraphicsAdapter](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\] true](#) to release both managed and unmanaged resources; **false** to release only unmanaged resources.

GraphicsAdapter.Equals Method (Object)

Determines whether the specified [Object](#) is equal to the [GraphicsAdapter](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [Object](#) to compare with the current [GraphicsAdapter](#).

Return Value

true if the objects are the same; **false** otherwise.

GraphicsAdapter.GetCapabilities Method

Returns the capabilities of a device.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GraphicsDeviceCapabilities GetCapabilities (  
    DeviceType deviceType  
)
```

Parameters

deviceType

The device to query.

Return Value

The capabilities of the specified device.

Exceptions

Exception type	Condition
DeviceNotSupportedException	(Xbox 360) Hardware is the only device type supported on this platform.

GraphicsAdapter.IsDeviceTypeAvailable Method

Determines whether a requested device type is available.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsDeviceTypeAvailable (  
    DeviceType deviceType  
)
```

Parameters

deviceType

The device type to request.

Return Value

true if the requested device type is available; **false** otherwise.

GraphicsAdapter.op_Equality Method

Compares two objects to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    GraphicsAdapter left,  
    GraphicsAdapter right  
)
```

Parameters

left

The object to the left of the equality operator.

right

The object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

GraphicsAdapter.op_Inequality Method

Compares two objects to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    GraphicsAdapter left,  
    GraphicsAdapter right  
)
```

Parameters

left

The object to the left of the inequality operator.

right

The object to the right of the inequality operator.

Return Value

true if the objects are different; **false** otherwise.

GraphicsAdapter Properties

Public Properties

	Name	Description
	Adapters	Collection of available adapters on the system.
	CurrentDisplayMode	Gets the current display mode.
	DefaultAdapter	Gets the default adapter.
	Description	Retrieves a string used for presentation to the user.
	DeviceId	Retrieves a value that is used to help identify a particular chip set.
	DeviceIdentifier	Retrieves a globally unique identifier (GUID) object that can be used to check changes in the driver and chip set.
	DeviceName	Retrieves a string that contains the device name for a Microsoft Windows Graphics Device Interface (GDI).
	DriverDll	Retrieves a string that is used to present the driver name to the user.
	DriverVersion	Retrieves a value that identifies the version of the Microsoft Direct3D driver.
	IsDefaultAdapter	Determines if this instance of GraphicsAdapter is the default adapter.
	IsWideScreen	Determines if the graphics adapter is in widescreen mode.
	MonitorHandle	Retrieves the handle of the monitor associated with the Microsoft Direct3D object.
	Revision	Retrieves a value used to help identify the revision level of a particular chip set.
	SubSystemId	Retrieves a value used to identify the subsystem.
	SupportedDisplayModes	Returns a collection of supported display modes for the current adapter.
	VendorId	Retrieves a value used to identify the manufacturer.

GraphicsAdapter.DeviceIdentifier Property

Retrieves a globally unique identifier (GUID) object that can be used to check changes in the driver and chip set.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Guid DeviceIdentifier { get; }
```

Property Value

A unique identifier for the driver and chip set pair.

Remarks Use this member to track changes to the driver and chip set to generate a new profile for the graphics subsystem. It also can be used to identify problematic drivers.

GraphicsAdapter.Revision Property

Retrieves a value used to help identify the revision level of a particular chip set.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Revision { get; }
```

Property Value

Value used to help identify the revision level of the chip set. This value may be zero if it is unknown.

Remarks The [VendorId](#), [DeviceId](#), [SubSystemId](#), and **Revision** members can be used in tandem to identify particular chip sets.

However, these members should be used with caution.

GraphicsDevice Members

The following tables list the members exposed by the GraphicsDevice type.

Public Constructors

Name	Description
 GraphicsDevice	Creates a new instance of GraphicsDevice

Public Properties

Name	Description
 ClipPlanes	Retrieves the clipping planes of the current GraphicsDevice.
 CreationParameters	Retrieves the creation parameters of the GraphicsDevice.
 DepthStencilBuffer	Gets or sets the depth stencil surface of this GraphicsDevice .
 DisplayMode	Retrieves the display mode's spatial resolution, color resolution, and refresh frequency.
 DriverLevel	Returns the driver level.
 GraphicsDeviceCapabilities	Gets the capabilities of the graphics device.
 GraphicsDeviceStatus	Retrieves the status of the device
 Indices	Gets or sets index data.
 IsDisposed	Gets a value that indicates whether the object is disposed.
 PixelShader	Gets or sets the current pixel shader.
 PresentationParameters	Gets the presentation parameters associated with this graphics device.
 RasterStatus	Retrieves information that describes the raster of the monitor on which the swap chain is presented.
 RenderState	Retrieves a render-state value for a GraphicsDevice.
 SamplerStates	Retrieves a collection of SamplerState objects for the current GraphicsDevice .
 ScissorRectangle	Gets or sets the rectangle used for scissor testing.
 Textures	Returns the collection of textures that have been assigned to the texture stages of the device.
 VertexDeclaration	Gets or sets a vertex shader declaration.
 VertexSamplerStates	Gets the collection of vertex sampler states.
 VertexShader	Gets or sets the current vertex shader.
 VertexTextures	Gets the collection of vertex textures that support texture lookup in the vertex shader using the texldl - vs texture load statement. The vertex engine contains four texture sampler stages.
 Vertices	Gets the vertex stream collection.
 Viewport	Gets or sets a viewport identifying the portion of the render target to receive draw calls.

Public Methods

Name	Description
 Clear	Overloaded. Clears the viewport depth buffer, and erases the stencil buffer.
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 DrawIndexedPrimitives	Renders the specified geometric primitive, based on indexing into an array of vertices.
 DrawPrimitives	Renders a sequence of non-indexed geometric primitives of the specified type from the current set of data input streams.
 DrawUserIndexedPrimitives	Overloaded. Renders the specified geometric primitive with data specified by the user.
 DrawUserPrimitives	Renders the given geometric primitive with data specified by the user.
 Equals	(Inherited from Object .)
 EvictManagedResources	Evicts all managed resources, including Microsoft Direct3D resources and those that are driver managed.
 GetGammaRamp	Gets the gamma correction ramp.
 GetHashCode	(Inherited from Object .)

GetPixelShaderBooleanConstant	Gets an array of Boolean values from the pixel shader constant Boolean registers.
GetPixelShaderInt32Constant	Gets an array of Int32 values from the pixel shader constant integer registers.
GetPixelShaderMatrixArrayConstant	Gets an array of Matrix values from the pixel shader constant float registers.
GetPixelShaderMatrixConstant	Gets a Matrix value from the pixel shader constant float registers.
GetPixelShaderQuaternionArrayConstant	Gets an array of Quaternion values from the pixel shader constant float registers.
GetPixelShaderQuaternionConstant	Gets a Quaternion value from the pixel shader constant float registers.
GetPixelShaderSingleConstant	Gets an array of Single values from the pixel shader constant float registers.
GetPixelShaderVector2ArrayConstant	Gets an array of Vector2 values from the pixel shader constant float registers.
GetPixelShaderVector2Constant	Gets a Vector2 value from the pixel shader constant float registers.
GetPixelShaderVector3ArrayConstant	Gets an array of Vector3 values from the pixel shader constant float registers.
GetPixelShaderVector3Constant	Gets a Vector3 value from the pixel shader constant float registers.
GetPixelShaderVector4ArrayConstant	Gets an array of Vector4 values from the pixel shader constant float registers.
GetPixelShaderVector4Constant	Gets a Vector4 value from the pixel shader constant float registers.
GetRenderTarget	Gets a render target surface.
GetType	(Inherited from Object .)
GetVertexShaderBooleanConstant	Gets an array of Boolean values from the vertex shader constant Boolean registers.
GetVertexShaderInt32Constant	Gets an array of Int32 values from the vertex shader constant integer registers.
GetVertexShaderMatrixArrayConstant	Gets an array of Matrix values from the vertex shader constant float registers.
GetVertexShaderMatrixConstant	Gets a Matrix value from the vertex shader constant float registers.
GetVertexShaderQuaternionArrayConstant	Gets an array of Quaternion values from the vertex shader constant float registers.
GetVertexShaderQuaternionConstant	Gets a Quaternion value from the vertex shader constant float registers.
GetVertexShaderSingleConstant	Gets an array of Single values from the vertex shader constant float registers.
GetVertexShaderVector2ArrayConstant	Gets an array of Vector2 values from the vertex shader constant float registers.
GetVertexShaderVector2Constant	Gets a Vector2 value from the vertex shader constant float registers.
GetVertexShaderVector3ArrayConstant	Gets an array of Vector3 values from the vertex shader constant float registers.
GetVertexShaderVector3Constant	Gets a Vector3 value from the vertex shader constant float registers.
GetVertexShaderVector4ArrayConstant	Gets an array of Vector4 values from the vertex shader constant float registers.
GetVertexShaderVector4Constant	Gets a Vector4 value from the vertex shader constant float registers.
Present	Overloaded. Presents the display with the contents of the next buffer in the sequence of back buffers owned by the GraphicsDevice .
ReferenceEquals	(Inherited from Object .)
Reset	Overloaded. Resets the presentation parameters for the current GraphicsDevice .

 ResolveBackBuffer	Overloaded. Copies the current back buffer contents to a texture.
 SetGammaRamp	Sets the gamma correction ramp.
 SetPixelShaderConstant	Overloaded. Sets a pixel shader constant.
 SetRenderTarget	Overloaded. Sets a new color buffer for a GraphicsDevice.
 SetVertexShaderConstant	Overloaded. Sets a vertex shader constant.
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_DeviceLost	Occurs when a GraphicsDevice is about to be lost (for example, immediately before a reset).
 raise_DeviceReset	Occurs after a GraphicsDevice is reset, allowing an application to re-create all resources.
 raise_DeviceResetting	Occurs when a GraphicsDevice is resetting
 raise_Disposing	Raises the Disposing event when called from within a derived class.
 raise_ResourceCreated	Occurs when ResourceCreated is called.
 raise_ResourceDestroyed	Occurs when ResourceDestroyed is called.

Public Events

Name	Description
 DeviceLost	Occurs when a GraphicsDevice is about to be lost (for example, immediately before a reset).
 DeviceReset	Occurs after a GraphicsDevice is reset, allowing an application to recreate all resources.
 DeviceResetting	Occurs when a GraphicsDevice is resetting, allowing the application to cancel the default handling of the reset.
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.
 ResourceCreated	Occurs when a resource is created.
 ResourceDestroyed	Occurs when a resource is destroyed.

Reference

[GraphicsDevice Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

GraphicsDevice Constructor

Creates a new instance of [GraphicsDevice](#)

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GraphicsDevice (
    GraphicsAdapter adapter,
    DeviceType deviceType,
    IntPtr renderWindowHandle,
    PresentationParameters presentationParameters
)
```

Parameters

adapter

The display adapter.

deviceType

The desired device type.

renderWindowHandle

The focus window.

presentationParameters

The presentation parameters for the device to be created.

Exceptions

Exception type	Condition
ArgumentNullException	<i>adapter</i> or <i>presentationParameters</i> is null .
ArgumentOutOfRangeException	One of the following conditions is true: <ul style="list-style-type: none"> PresentationParameters.MultiSampleType contains an invalid value. The only valid MultiSampleType values on the Xbox 360 are MultiSampleType.None, MultiSampleType.TwoSamples, or MultiSampleType.FourSamples. For Windows-based applications, CheckDeviceMultiSampleType may be used to find valid values for this parameter. The back-buffer dimensions requested in PresentationParameters.BackBufferWidth and PresentationParameters.BackBufferHeight are too large for this graphics adapter.
InvalidOperationException	PresentationParameters.EnableAutoDepthStencil is true , but PresentationParameters.AutoDepthStencilFormat is not a valid value.
DeviceNotSupportedException	The graphics adapter does not support the requested capabilities. For Xbox 360, DeviceType.Hardware is the only device type supported on this platform.

Remarks

When you create a new XNA Framework game using XNA Game Studio, the game derives from [Game](#) and contains a member variable that is a [GraphicsDeviceManager](#). This [GraphicsDeviceManager](#) automatically creates the best device that is available for the application and exposes it as the [GraphicsDeviceManager.GraphicsDevice](#) property. If you wish to change the settings used to create the device, you can create a custom [PreparingDeviceSettings](#) event handler for the graphics device manager with the settings you require for your application. For more information on using the [PreparingDeviceSettings](#) event handler, see [GraphicsDeviceManager](#).

Note

If a graphics device has been constructed without the [GraphicsDeviceManager](#), it is necessary to manually call [Present](#) subsequent to any draw calls to present the back buffer.

GraphicsDevice Methods

Public Methods

Name	Description
Clear	Overloaded. Clears the viewport depth buffer, and erases the stencil buffer.
Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
DrawIndexedPrimitives	Renders the specified geometric primitive, based on indexing into an array of vertices.
DrawPrimitives	Renders a sequence of non-indexed geometric primitives of the specified type from the current set of data input streams.
DrawUserIndexedPrimitives	Overloaded. Renders the specified geometric primitive with data specified by the user.
DrawUserPrimitives	Renders the given geometric primitive with data specified by the user.
Equals	(Inherited from Object .)
EvictManagedResources	Evicts all managed resources, including Microsoft Direct3D resources and those that are driver managed.
GetGammaRamp	Gets the gamma correction ramp.
GetHashCode	(Inherited from Object .)
GetPixelShaderBooleanConstant	Gets an array of Boolean values from the pixel shader constant Boolean registers.
GetPixelShaderInt32Constant	Gets an array of Int32 values from the pixel shader constant integer registers.
GetPixelShaderMatrixArrayConstant	Gets an array of Matrix values from the pixel shader constant float registers.
GetPixelShaderMatrixConstant	Gets a Matrix value from the pixel shader constant float registers.
GetPixelShaderQuaternionArrayConstant	Gets an array of Quaternion values from the pixel shader constant float registers.
GetPixelShaderQuaternionConstant	Gets a Quaternion value from the pixel shader constant float registers.
GetPixelShaderSingleConstant	Gets an array of Single values from the pixel shader constant float registers.
GetPixelShaderVector2ArrayConstant	Gets an array of Vector2 values from the pixel shader constant float registers.
GetPixelShaderVector2Constant	Gets a Vector2 value from the pixel shader constant float registers.
GetPixelShaderVector3ArrayConstant	Gets an array of Vector3 values from the pixel shader constant float registers.
GetPixelShaderVector3Constant	Gets a Vector3 value from the pixel shader constant float registers.
GetPixelShaderVector4ArrayConstant	Gets an array of Vector4 values from the pixel shader constant float registers.
GetPixelShaderVector4Constant	Gets a Vector4 value from the pixel shader constant float registers.
GetRenderTarget	Gets a render target surface.
GetType	(Inherited from Object .)
GetVertexShaderBooleanConstant	Gets an array of Boolean values from the vertex shader constant Boolean registers.
GetVertexShaderInt32Constant	Gets an array of Int32 values from the vertex shader constant integer registers.
GetVertexShaderMatrixArrayConstant	Gets an array of Matrix values from the vertex shader constant float registers.
GetVertexShaderMatrixConstant	Gets a Matrix value from the vertex shader constant float registers.
GetVertexShaderQuaternionArrayConstant	Gets an array of Quaternion values from the vertex shader constant float registers.
GetVertexShaderQuaternionConstant	Gets a Quaternion value from the vertex shader constant float registers.

 GetVertexShaderSingleConstant	Gets an array of Single values from the vertex shader constant float registers.
 GetVertexShaderVector2ArrayConstant	Gets an array of Vector2 values from the vertex shader constant float registers.
 GetVertexShaderVector2Constant	Gets a Vector2 value from the vertex shader constant float registers.
 GetVertexShaderVector3ArrayConstant	Gets an array of Vector3 values from the vertex shader constant float registers.
 GetVertexShaderVector3Constant	Gets a Vector3 value from the vertex shader constant float registers.
 GetVertexShaderVector4ArrayConstant	Gets an array of Vector4 values from the vertex shader constant float registers.
 GetVertexShaderVector4Constant	Gets a Vector4 value from the vertex shader constant float registers.
 Present	Overloaded. Presents the display with the contents of the next buffer in the sequence of back buffers owned by the GraphicsDevice .
 ReferenceEquals	(Inherited from Object .)
 Reset	Overloaded. Resets the presentation parameters for the current GraphicsDevice .
 ResolveBackBuffer	Overloaded. Copies the current back buffer contents to a texture.
 SetGammaRamp	Sets the gamma correction ramp.
 SetPixelShaderConstant	Overloaded. Sets a pixel shader constant.
 SetRenderTarget	Overloaded. Sets a new color buffer for a GraphicsDevice .
 SetVertexShaderConstant	Overloaded. Sets a vertex shader constant.
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_DeviceLost	Occurs when a GraphicsDevice is about to be lost (for example, immediately before a reset).
 raise_DeviceReset	Occurs after a GraphicsDevice is reset, allowing an application to re-create all resources.
 raise_DeviceResetting	Occurs when a GraphicsDevice is resetting
 raise_Disposing	Raises the Disposing event when called from within a derived class.
 raise_ResourceCreated	Occurs when ResourceCreated is called.
 raise_ResourceDestroyed	Occurs when ResourceDestroyed is called.

GraphicsDevice.Clear Method

Clears the viewport depth buffer, and erases the stencil buffer.

Overload List

Name	Description
GraphicsDevice.Clear (ClearOptions, Color, Single, Int32)	Clears the viewport to a specified color, clears the depth buffer, and erases the stencil buffer.
GraphicsDevice.Clear (ClearOptions, Color, Single, Int32, Rectangle[])	Clears a set of regions to a specified color, clears the depth buffer, and erases the stencil buffer.
GraphicsDevice.Clear (ClearOptions, Vector4, Single, Int32)	Clears the viewport to a specified color, clears the depth buffer, and erases the stencil buffer.
GraphicsDevice.Clear (ClearOptions, Vector4, Single, Int32, Rectangle[])	Clears a set of regions to a specified color, clears the depth buffer, and erases the stencil buffer.
GraphicsDevice.Clear (Color)	Clears the viewport to a specified color.

Remarks This method fails if [ClearOptions.ZBuffer](#) or [ClearOptions.Stencil](#) is specified when the render target does not have an attached depth buffer. Similarly, the method fails if [ClearOptions.Stencil](#) is specified when the depth-buffer format does not contain stencil buffer information.

GraphicsDevice.Clear Method (ClearOptions, Color, Single, Int32)

Clears the viewport to a specified color, clears the depth buffer, and erases the stencil buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Clear (
    ClearOptions options,
    Color color,
    float depth,
    int stencil
)
```

Parameters

options

Flags indicating which surfaces to clear.

color

Color value to which the render target surface is cleared.

depth

New depth value that this method stores in the depth buffer. This parameter can be in the range of 0.0 through 1.0 (for z-based or w-based depth buffers). A value of 0.0 represents the nearest distance to the viewer; a value of 1.0 represents the farthest distance.

stencil

Integer value to store in each stencil-buffer entry. This parameter can be in the range of 0 through $2n-1$, where n is the bit depth of the stencil buffer.

Exceptions

Exception type	Condition
InvalidOperationException	No DepthStencilBuffer surface exists, or the active render target and depth stencil surface do not have the same pixel size and multisampling type. Unable to clear the depth or stencil buffer.
ObjectDisposedException	Clear was called after this GraphicsDevice was disposed.

Clears the viewport to a specified color, clears the depth buffer, and erases the stencil buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Clear (
    ClearOptions options,
    Vector4 color,
    float depth,
    int stencil
)
```

Parameters

options

The surfaces to clear.

color

Color value to which the render target surface is cleared.

depth

New z value that this method stores in the depth buffer. This parameter can be in the range of 0.0 through 1.0 (for z-based or w-based depth buffers). A value of 0.0 represents the nearest distance to the viewer; a value of 1.0 represents the farthest distance.

stencil

Integer value to store in each stencil-buffer entry. This parameter can be in the range of 0 through $2n-1$, where n is the bit depth of the stencil buffer.

Exceptions

Exception type	Condition
InvalidOperationException	No DepthStencilBuffer surface exists, or the active render target and depth stencil surface do not have the same pixel size and multisampling type. Unable to clear the depth or stencil buffer.

GraphicsDevice.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
GraphicsDevice.Dispose ()	Immediately releases the unmanaged resources used by this object.
GraphicsDevice.Dispose (Boolean)	Immediately releases the unmanaged resources used by this object.

Remarks

Call [Dispose](#) when you are finished using the [GraphicsDevice](#). The [Dispose](#) method leaves the [GraphicsDevice](#) in an unusable state. After calling [Dispose](#), you must release all references to the [GraphicsDevice](#) so the garbage collector can reclaim the memory that the [GraphicsDevice](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [GraphicsDevice](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [GraphicsDevice](#) object's [Finalize](#) method.

GraphicsDevice.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[[MarshalAsAttribute\(U1\)](#)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [GraphicsDevice](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDevice.DrawIndexedPrimitives Method

Renders the specified geometric primitive, based on indexing into an array of vertices.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void DrawIndexedPrimitives (
    PrimitiveType primitiveType,
    int baseVertex,
    int minVertexIndex,
    int numVertices,
    int startIndex,
    int primitiveCount
)
```

Parameters

primitiveType

Describes the type of primitive to render. [PrimitiveType.PointList](#) is not supported with this method.

baseVertex

Offset to add to each vertex index in the index buffer.

minVertexIndex

Minimum vertex index for vertices used during the call. The *minVertexIndex* parameter and all of the indices in the index stream are relative to the *baseVertex* parameter.

numVertices

A number of vertices used during the call. The first vertex is located at index: $baseVertex + minVertexIndex$.

startIndex

Location in the index array at which to start reading vertices.

primitiveCount

A number of primitives to render. The number of vertices used is a function of *primitiveCount* and *primitiveType*. To determine the maximum number of primitives allowed, check the **MaxPrimitiveCount** property member of the **Capabilities** structure.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<i>primitiveCount</i> is less than or equal to zero. When drawing, at least one primitive must be drawn.
InvalidOperationException	One of the following conditions is true: <ul style="list-style-type: none"> VertexDeclaration is not a valid value. A valid vertex declaration must be set on the device before any draw operations can be performed. A valid vertex shader and pixel shader was not set before calling DrawIndexedPrimitives. Both a valid vertex shader and pixel shader (or valid effect) must be set on the device before any draw operations may be performed. See How To: Use BasicEffect or How To: Create and Apply Custom Effects for more information on applying effects. Vertices is not a valid vertex buffer, or Indices is not a valid index buffer. A valid vertex buffer and a valid index buffer must be set on the device before any draw operations may be performed. The active render target and depth stencil surface do not have the same pixel size and multisampling type.

Example

The vertex stream and index data of the graphics device must be set before any call to [DrawIndexedPrimitives](#). The following example sets the index data and associates a user-created vertex buffer of type **VertexPositionNormalTexture** with vertex stream 0 (zero) of the graphics device.

C#

```
graphics.GraphicsDevice.Vertices[0].SetSource(  
    vertexBuffer, 0,  
    VertexPositionNormalTexture.SizeInBytes);  
  
graphics.GraphicsDevice.Indices = lineListIndexBuffer;
```

Remarks

This method draws indexed primitives from the current set of data input streams.

The *minVertexIndex* and *numVertices* parameters specify the range of vertex indices used for each call to **DrawIndexedPrimitives**. These vertex indices are used to optimize vertex processing of indexed primitives by processing a sequential range of vertices prior to indexing into them. Indices used during this call cannot reference any vertices outside this range.

If no index array is set, **DrawIndexedPrimitives** fails.

Platforms Xbox 360, Windows XP SP2, Windows Vista

GraphicsDevice.DrawPrimitives Method

Renders a sequence of non-indexed geometric primitives of the specified type from the current set of data input streams.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void DrawPrimitives (
    PrimitiveType primitiveType,
    int startVertex,
    int primitiveCount
)
```

Parameters

primitiveType

Describes the type of primitive to render.

startVertex

Index of the first vertex to load. Beginning at *startVertex*, the correct number of vertices is read out of the vertex buffer.

primitiveCount

Number of primitives to render. To determine the maximum number of primitives allowed, check [MaxPrimitiveCount](#). The *primitiveCount* is the number of primitives as determined by the primitive type. If it is a line list, each primitive has two vertices. If it is a triangle list, each primitive has three vertices.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<i>primitiveCount</i> is less than or equal to zero. When drawing, at least one primitive must be drawn.
InvalidOperationException	One of the following conditions is true: <ul style="list-style-type: none"> VertexDeclaration is not a valid value. A valid vertex declaration must be set on the device before any draw operations can be performed. A valid vertex shader and pixel shader was not set before calling DrawPrimitives. Both a valid vertex shader and pixel shader (or valid effect) must be set on the device before any draw operations may be performed. See How To: Use BasicEffect or How To: Create and Apply Custom Effects for more information on applying effects. Vertices is not a valid vertex buffer. A valid vertex buffer must be set on the device before any draw operations may be performed. The active render target and depth stencil surface do not have the same pixel size and multisampling type.

Remarks

DrawPrimitives should not be called with a single triangle at a time.

Example

The vertex stream of the graphics device must be set before any call to [DrawPrimitives](#). The following example associates a user created vertex buffer of type **VertexPositionNormalTexture** with vertex stream 0 (zero) of the graphics device.

C#

```
graphics.GraphicsDevice.Vertices[0].SetSource(
    vertexBuffer, 0,
    VertexPositionNormalTexture.SizeInBytes);
```

GraphicsDevice.DrawUserIndexedPrimitives Generic Method (PrimitiveType, T[], Int32, Int32, Int16[], Int32, Int32)

Renders geometric primitives with indexed data specified by the user, specifying an index buffer as an array of type [Int16](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void DrawUserIndexedPrimitives<T> (
    PrimitiveType primitiveType,
    T[] vertexData,
    int vertexOffset,
    int numVertices,
    short[] indexData,
    int indexOffset,
    int primitiveCount
) where T : ValueType
```

Type Parameters

T

The type of vertex in *vertexData*.

Parameters

primitiveType

Describes the type of primitive to render.

vertexData

The vertex buffer indexed by *indexData*.

vertexOffset

Offset to add to each vertex index in the index buffer.

numVertices

Number of vertices used during this call. The first vertex is located at index *minVertexIndex*.

indexData

A list of indices into the vertex buffer, given in the order that you want the vertices to render. Using an array of type [Int16](#), which uses 16 bits per element, allows you to conserve resources if the index buffer does not require a 32-bit depth array.

indexOffset

Location in the index array at which to start reading vertices.

primitiveCount

Number of primitives to render. The maximum number of primitives allowed is determined by checking [MaxPrimitiveCount](#). (The number of indices is a function of the primitive count and the primitive type.)

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	One of the following conditions is true: <ul style="list-style-type: none"> <i>vertexOffset</i> + <i>numVertices</i> is outside of the range of <i>vertexData</i>. There are not enough indices in <i>indexData</i> based on the number of primitives requested by <i>primitiveCount</i>.
ArgumentNullException	<i>vertexData</i> or <i>indexData</i> is null .
ArgumentOutOfRangeException	One of the following conditions is true: <ul style="list-style-type: none"> <i>indexOffset</i> or <i>vertexOffset</i> is not in a range allowed by <i>indexData</i> or <i>vertexData</i>. <i>primitiveCount</i> or <i>numVertices</i> is less than or equal to zero. When drawing, at least one primitive must be drawn.

InvalidOperationException	<p>One of the following conditions is true:</p> <ul style="list-style-type: none">• VertexDeclaration is not a valid value.     int vertexOffset,
    int primitiveCount
) where T : ValueType
```

Type Parameters

T

Parameters

primitiveType

Describes the type of primitive to render.

vertexData

The vertex data.

vertexOffset

Offset at which to begin reading *vertexData*.

primitiveCount

Number of primitives to render. The maximum number of primitives allowed is determined by checking [MaxPrimitiveCount](#). The number of indices is a function of *primitiveCount* and *primitiveType*.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<i>vertexOffset</i> + <i>numVertices</i> is outside of the range of <i>vertexData</i> .
ArgumentNullException	<i>vertexData</i> is null .
ArgumentOutOfRangeException	One of the following conditions is true: <ul style="list-style-type: none"> <i>primitiveCount</i> is less than or equal to zero. When drawing, at least one primitive must be drawn. <i>vertexOffset</i> is less than zero or greater than the length of <i>vertexData</i>.
InvalidOperationException	One of the following conditions is true: <ul style="list-style-type: none"> VertexDeclaration is not a valid value. A valid vertex declaration must be set on the device before any draw operations can be performed. A valid vertex shader and pixel shader was not set before calling DrawUserPrimitives. Both a valid vertex shader and pixel shader (or valid effect) must be set on the device before any draw operations may be performed. See How To: Use BasicEffect or How To: Create and Apply Custom Effects for more information on applying effects. <i>vertexData</i> is not a valid vertex buffer. A valid vertex buffer must be set on the device before any draw operations may be performed.

Remarks

This method is intended for use when drawing dynamic geometry specified by the user. It supports only a single vertex stream. The effect of this call is to use the provided vertex data pointer and stride for vertex stream 0. It is invalid to have the declaration of the current vertex shader refer to vertex streams other than stream 0.

The vertex data passed to **DrawUserPrimitives** does not need to persist after the call. Access to the data is completed before

returning from the call.

GraphicsDevice.EvictManagedResources Method

Evicts all managed resources, including Microsoft Direct3D resources and those that are driver managed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void EvictManagedResources ()
```

Exceptions

Exception type	Condition
OutOfVideoMemoryException	Direct3D does not have enough display memory to perform the operation.

See Also

[GraphicsDevice Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDevice.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is invoked automatically during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

GraphicsDevice.GetPixelShaderBooleanConstant Method

Gets an array of [Boolean](#) values from the pixel shader constant Boolean registers.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool[] GetPixelShaderBooleanConstant (
    int startRegister,
    int constantCount
)
```

Parameters

startRegister

Pixel shader Boolean constant register of the first constant.

constantCount

Number of [Boolean](#) values to retrieve.

Return Value

Array of [Boolean](#) values retrieved from the constant registers.

Exceptions

Exception type	Condition
InvalidOperationException	The method call is invalid. For example, a method's parameter may have an invalid value.

Gets an array of [Int32](#) values from the pixel shader constant integer registers.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int[] GetPixelShaderInt32Constant (
    int startRegister,
    int constantCount
)
```

Parameters

startRegister

Pixel shader integer register of the first constant.

constantCount

Number of [Int32](#) values to retrieve.

Return Value

Array of [Int32](#) values retrieved from the constant registers.

Exceptions

Exception type	Condition
InvalidOperationException	The method call is invalid. For example, a method's parameter may have an invalid value.

GraphicsDevice.GetRenderTarget Method

Gets a render target surface.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public RenderTarget GetRenderTarget (  
    int renderTargetIndex  
)
```

Parameters

renderTargetIndex

Index of the render target.

Return Value

The render target surface of the current graphics device.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	An invalid render target index was requested. On Xbox 360, there is only one render target available and <i>renderTargetIndex</i> must be zero.

Remarks

The [GraphicsDevice](#) can support multiple render targets. The number of render targets supported by a GraphicsDevice is contained in [MaxSimultaneousRenderTargets](#).

GraphicsDevice.Present Method

Presents the display with the contents of the next buffer in the sequence of back buffers owned by the [GraphicsDevice](#).

Overload List

Name	Description
GraphicsDevice.Present ()	Presents the display with the contents of the next buffer in the sequence of back buffers owned by the GraphicsDevice .
GraphicsDevice.Present (IntPtr)	Specifies the window target for a presentation and presents the display with the contents of the next buffer in the sequence of back buffers owned by the GraphicsDevice .
GraphicsDevice.Present (Nullable<Rectangle>, Nullable<Rectangle>, IntPtr)	Specifies the window target for a presentation and presents the display with the contents of the next buffer in the sequence of back buffers owned by the GraphicsDevice .

Exceptions

Exception type	Condition
DriverInternalErrorException	Internal driver error. Applications should generally shut down when receiving this error.
DeviceLostException	The GraphicsDevice is lost but cannot be reset at this time. Therefore, rendering is not possible.

Remarks

If necessary, a stretch operation is applied to transfer the pixels within the source rectangle to the destination rectangle in the client area of the target window.

GraphicsDevice.Present Method ()

Presents the display with the contents of the next buffer in the sequence of back buffers owned by the [GraphicsDevice](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Present ()
```

Exceptions

Exception type	Condition
ObjectDisposedException	Present was called after the GraphicsDevice was disposed.
DriverInternalErrorException	Internal driver error. Applications should generally shut down when receiving this error.
DeviceLostException	The GraphicsDevice is lost but cannot be reset at this time. Therefore, rendering is not possible.

Example

C#

```
// Create a new render target to receive the drawn data.
renderTarget = new RenderTarget2D(
    graphics.GraphicsDevice,
    // In this case, we are creating
    // a render target to match half of a split screen:
    leftViewport.Width,
    leftViewport.Height,
    // Number of levels in the render target:
    1,
    // Use the same surface format as the back buffer.
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);

// Set the render target on the device.
graphics.GraphicsDevice.SetRenderTarget(0, renderTarget);

// TODO: Add your code to draw to the render target here.
// For example, this could be a call to Mesh.Draw,
// a SpriteBatch Begin-End sequence, or a call to
// DrawIndexedPrimitives, as you would have called them
// in the Draw method of your application.

// Set the device render target back to the back buffer.
graphics.GraphicsDevice.SetRenderTarget(0, null);

// Call GetTexture to retrieve the render target data and save it to a texture.
capturedTexture = renderTarget.GetTexture();

GraphicsDevice.Present Method (IntPtr)

Specifies the window target for a presentation and presents the display with the contents of the next buffer in the sequence of back buffers owned by the [GraphicsDevice](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Present (
    IntPtr overrideWindowHandle
)
```

Parameters

overrideWindowHandle

Destination window containing the client area that is the target for this presentation. If not specified, this is [DeviceWindowHandle](#).

Exceptions

Exception type	Condition
ObjectDisposedException	Present was called after the GraphicsDevice was disposed.
DriverInternalErrorException	Internal driver error. Applications should generally shut down when receiving this error.
DeviceLostException	The GraphicsDevice is lost but cannot be reset at this time. Therefore, rendering is not possible.

Example

C#

```
// Create a new render target to receive the drawn data.
renderTarget = new RenderTarget2D(
    graphics.GraphicsDevice,
    // In this case, we are creating
    // a render target to match half of a split screen:
    leftViewPort.Width,
    leftViewPort.Height,
    // Number of levels in the render target:
    1,
    // Use the same surface format as the back buffer.
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);

// Set the render target on the device.
graphics.GraphicsDevice.SetRenderTarget(0, renderTarget);

// TODO: Add your code to draw to the render target here.
// For example, this could be a call to Mesh.Draw,
// a SpriteBatch Begin-End sequence, or a call to
// DrawIndexedPrimitives, as you would have called them
// in the Draw method of your application.

// Set the device render target back to the back buffer.
graphics.GraphicsDevice.SetRenderTarget(0, null);

// Call GetTexture to retrieve the render target data and save it to a texture.
capturedTexture = renderTarget.GetTexture();
```

GraphicsDevice.Present Method (Nullable<Rectangle>, Nullable<Rectangle>, IntPtr)

Specifies the window target for a presentation and presents the display with the contents of the next buffer in the sequence of back buffers owned by the [GraphicsDevice](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Present (
    Nullable<Rectangle> sourceRectangle,
    Nullable<Rectangle> destinationRectangle,
    IntPtr overrideWindowHandle
)
```

Parameters

sourceRectangle

The source rectangle. If **null**, the entire source surface is presented. If the rectangle exceeds the source surface, the rectangle is clipped to the source surface. This parameter must be **null** unless the swap chain was created with [SwapEffect.Copy](#).

destinationRectangle

The destination rectangle, in window client coordinates. If **null**, the entire client area is filled. If the rectangle exceeds the destination client area, the rectangle is clipped to the destination client area. This parameter must be **null** unless the swap chain was created with [SwapEffect.Copy](#).

overrideWindowHandle

Destination window containing the client area that is the target for this presentation. If not specified, this is [DeviceWindowHandle](#).

Exceptions

Exception type	Condition
ObjectDisposedException	Present was called after the GraphicsDevice was disposed.
DriverInternalErrorException	Internal driver error. Applications should generally shut down when receiving this error.
DeviceLostException	The GraphicsDevice is lost but cannot be reset at this time. Therefore, rendering is not possible.

Example

C#

```
// Create a new render target to receive the drawn data.
renderTarget = new RenderTarget2D(
    graphics.GraphicsDevice,
    // In this case, we are creating
    // a render target to match half of a split screen:
    leftViewPort.Width,
    leftViewPort.Height,
    // Number of levels in the render target:
    1,
    // Use the same surface format as the back buffer.
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);

// Set the render target on the device.
graphics.GraphicsDevice.SetRenderTarget(0, renderTarget);

// TODO: Add your code to draw to the render target here.
// For example, this could be a call to Mesh.Draw,
// a SpriteBatch Begin-End sequence, or a call to
// DrawIndexedPrimitives, as you would have called them
// in the Draw method of your application.

// Set the device render target back to the back buffer.
graphics.GraphicsDevice.SetRenderTarget(0, null);

// Call GetTexture to retrieve the render target data and save it to a texture.
```

```
capturedTexture = renderTarget.GetTexture();
```

GraphicsDevice.raise_DeviceLost Method

Note

This method is available only when developing for Windows.

Occurs when a [GraphicsDevice](#) is about to be lost (for example, immediately before a reset).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_DeviceLost (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

The source of this event.

value1

The event arguments that are associated with the action that raised the event.

GraphicsDevice.raise_DeviceReset Method

Note

This method is available only when developing for Windows.

Occurs after a [GraphicsDevice](#) is reset, allowing an application to re-create all resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_DeviceReset (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

The source of this event.

value1

The event arguments that are associated with the action that raised the event.

GraphicsDevice.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the [Disposing](#) event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

Note

This method is available only when developing for Windows.

Occurs when [ResourceCreated](#) is called.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_ResourceCreated (  
    Object value0,  
    ResourceCreatedEventArgs value1  
)
```

Parameters

value0

The source of the event.

value1

An **EventArgs** object that contains no data.

GraphicsDevice.Reset Method

Resets the presentation parameters for the current GraphicsDevice.

Overload List

Name	Description
GraphicsDevice.Reset ()	Resets the presentation parameters for the current GraphicsDevice .
GraphicsDevice.Reset (GraphicsAdapter)	Resets the presentation parameters for the specified Reset .
GraphicsDevice.Reset (PresentationParameters)	Resets the current GraphicsDevice with the specified PresentationParameters .
GraphicsDevice.Reset (PresentationParameters, GraphicsAdapter)	Resets the specified Reset with the specified presentation parameters.

Exceptions

Exception type	Condition
DeviceLostException	The GraphicsDevice is lost but cannot be reset at this time. Therefore, rendering is not possible.
DriverInternalErrorException	Internal driver error. Applications should generally shut down when receiving this error.
OutOfVideoMemoryException	Direct3D does not have enough display memory to perform the operation.
OutOfMemoryException	Direct3D could not allocate sufficient memory to complete the call.

Remarks

When switching to full screen mode, Microsoft Direct3D tries to find a desktop format that matches the back buffer format, so that back and front buffer formats are identical. This eliminates the need for color conversion.

Calling **Reset** causes all texture memory surfaces and state information to be lost, and managed textures to be flushed from video memory. Before calling **Reset** for a [GraphicsDevice](#), an application should release any explicit render targets, depth stencil surfaces, additional swap chains, state blocks, and default resources associated with the [GraphicsDevice](#).

Swap chains are either full screen or windowed. If the new swap chain is full screen, the adapter is placed in the display mode that matches the new size.

A call to **Reset** fails if made on a different thread than the one used to create the [GraphicsDevice](#) being reset.

Pixel shaders and vertex shaders survive **Reset** calls for DirectX 9.0. They do not need to be re-created explicitly by the application.

Unknown can be specified for the windowed-mode back-buffer format when creating a [GraphicsDevice](#) and **Reset**. This means the application does not have to query the current desktop format before calling a [GraphicsDevice](#) constructor for windowed mode. For full screen mode, the back-buffer format must be specified. Setting [BackBufferCount](#) to 0 results in the creation of one back buffer.

When trying to reset more than one display adapter in a group, pass in an array of [PresentationParameters](#) objects, one for each display in the adapter group.

GraphicsDevice.Reset Method (GraphicsAdapter)

Note

This method is available only when developing for Windows.

Resets the presentation parameters for the specified **Reset**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Reset (  
    GraphicsAdapter graphicsAdapter  
)
```

Parameters

graphicsAdapter

The graphics device being reset.

Exceptions

Exception type	Condition
DeviceLostException	The GraphicsDevice is lost but cannot be reset at this time. Therefore, rendering is not possible.
DriverInternalErrorException	Internal driver error. Applications should generally shut down when receiving this error.
OutOfVideoMemoryException	Direct3D does not have enough display memory to perform the operation.

GraphicsDevice.Reset Method (PresentationParameters)

Resets the current [GraphicsDevice](#) with the specified [PresentationParameters](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Reset (  
    PresentationParameters presentationParameters  
)
```

Parameters

presentationParameters

Describes the new presentation parameters. This value cannot be **null**.

Exceptions

Exception type	Condition
ArgumentNullException	<i>presentationParameters</i> is null .
DeviceLostException	The GraphicsDevice is lost but cannot be reset at this time. Therefore, rendering is not possible.
DriverInternalErrorException	Internal driver error. Applications should generally shut down when receiving this error.
OutOfVideoMemoryException	Direct3D does not have enough display memory to perform the operation.
OutOfMemoryException	Direct3D could not allocate sufficient memory to complete the call.

GraphicsDevice.ResolveBackBuffer Method (ResolveTexture2D)

Copies the current back buffer contents to a texture.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void ResolveBackBuffer (
    ResolveTexture2D resolveTarget
)
```

Parameters

resolveTarget

Texture to update with the resolved back buffer.

Exceptions

Exception type	Condition
InvalidOperationException	ResolveBackBuffer may not be called when the current render target is null . Use ResolveBackBuffer instead.

Remarks

On Xbox 360, the back buffer is cleared when **ResolveBackBuffer** is called.

Example

In this example, a new [Texture2D](#) is created for use as a render target, the data is initialized with a call to [ResolveBackBuffer](#), and the generation of mipmaps for the resolved render target is requested.

C#

```
ResolveTexture2D renderTargetTexture;
renderTargetTexture = new ResolveTexture2D(
    graphics.GraphicsDevice,
    graphics.GraphicsDevice.PresentationParameters.BackBufferWidth,
    graphics.GraphicsDevice.PresentationParameters.BackBufferHeight,
    1,
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);

graphics.GraphicsDevice.ResolveBackBuffer(renderTargetTexture);
renderTargetTexture.GenerateMipMaps( TextureFilter.Linear );
```

GraphicsDevice.ResolveBackBuffer Method (ResolveTexture2D, Int32)

Copies the contents of the back buffer at the specified index to a texture.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void ResolveBackBuffer (
    ResolveTexture2D resolveTarget,
    int backBufferIndex
)
```

Parameters

resolveTarget

Texture to update with the resolved back buffer.

backBufferIndex

Index of the back buffer to resolve.

Exceptions

Exception type	Condition
ArgumentException	One of the following conditions is true: <ul style="list-style-type: none"> <i>backBufferIndex</i> is not valid. Note that on Xbox 360, there is only one back buffer available and <i>backBufferIndex</i> must be zero.
ArgumentNullException	<i>resolveTarget</i> is null
InvalidOperationException	ResolveBackBuffer may not be called when the current render target is null . Use ResolveBackBuffer instead.

Remarks

On Xbox 360, the back buffer is cleared when **ResolveBackBuffer** is called.

Example

In this example, a new [Texture2D](#) is created for use as a render target, the data is initialized with a call to [ResolveBackBuffer](#), and the generation of mipmaps for the resolved render target is requested.

C#

```
ResolveTexture2D renderTargetTexture;
renderTargetTexture = new ResolveTexture2D(
    graphics.GraphicsDevice,
    graphics.GraphicsDevice.PresentationParameters.BackBufferWidth,
    graphics.GraphicsDevice.PresentationParameters.BackBufferHeight,
    1,
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);

graphics.GraphicsDevice.ResolveBackBuffer(renderTargetTexture);
renderTargetTexture.GenerateMipMaps( TextureFilter.Linear );
```

GraphicsDevice.SetGammaRamp Method

Sets the gamma correction ramp.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetGammaRamp (
    bool calibrate,
    GammaRamp ramp
)
```

Parameters

calibrate

[[MarshalAsAttribute\(U1\)](#)] **true** to indicate that correction should be applied. **false** to indicate that no gamma correction should be applied. The supplied gamma table is transferred directly to the [GraphicsDevice](#).

ramp

The gamma correction ramp to set.

Exceptions

Exception type	Condition
ArgumentNullException	<i>ramp</i> is null .
InvalidOperationException	The arrays used in the red, green, and blue components of <i>ramp</i> do not have an array length of 256. Arrays used for gamma ramps must have a length of 256.

Remarks

Gamma correction results in a more consistent display, but can incur processing overhead and should not be used frequently. Short-duration effects, such as flashing the entire screen red, should not be calibrated, but long-duration gamma changes should be. If a gamma calibrator is installed, the ramp is modified before being sent to the [GraphicsDevice](#) to account for the system and monitor response curves. If no calibrator is installed, the ramp is passed directly to the [GraphicsDevice](#).

The gamma ramp takes effect immediately. No wait for a vertical sync operation is performed.

If the [GraphicsDevice](#) does not support gamma ramps in the current presentation mode (full-screen or windowed), no error is returned. Applications can check [SupportsFullScreenGamma](#) and [CanCalibrateGamma](#) to determine the capabilities of the [GraphicsDevice](#) and whether a calibrator is installed.

GraphicsDevice.SetPixelShaderConstant Method (Int32, Vector2)

Sets the specified pixel shader constant float register to a [Vector2](#) value.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetPixelShaderConstant (
    int startRegister,
    Vector2 constantData
)
```

Parameters

startRegister

Zero-based index of the pixel shader constant float register at which to begin setting values.

constantData

The constant data.

Remarks Because the data in the [Vector2](#) type is not large enough to fill the constant float register, the constant data will be padded to fill the register. This means that setting register 0 to a [Vector2](#) containing (1,2) will fill the register with (1,2,0,0).

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<i>constantData</i> is outside the allowable range of values as defined by the invoked method.
InvalidOperationException	The method call is invalid. For example, a method's parameter may have an invalid value.

GraphicsDevice.SetPixelShaderConstant Method (Int32, Vector2[])

Sets the specified pixel shader constant float registers to an array of [Vector2](#) values.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetPixelShaderConstant (
    int startRegister,
    Vector2[] constantData
)
```

Parameters

startRegister

Zero-based index of the pixel shader constant float register at which to begin setting values.

constantData

The constant data.

Remarks Because the data in the [Vector2](#) type is not large enough to fill the constant float registers, the constant data will be padded to fill the registers. This means that setting register 0 to an array of [Vector2](#) values containing (1,2) and (3,4) will fill register 0 with (1,2,0,0) and register 1 with (3,4,0,0).

Exceptions

Exception type	Condition
ArgumentNullException	<i>constantData</i> is null .
ArgumentOutOfRangeException	The graphics buffer is not large enough for this data.

GraphicsDevice.SetPixelShaderConstant Method (Int32, Vector3)

Sets the specified pixel shader constant float register to a [Vector3](#) value.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetPixelShaderConstant (
    int startRegister,
    Vector3 constantData
)
```

Parameters

startRegister

Zero-based index of the pixel shader constant float register at which to begin setting values.

constantData

The constant data.

RemarksBecause the data in the [Vector3](#) type is not large enough to fill the constant float register, the constant data will be padded to fill the register. This means that setting register 0 to a [Vector3](#) containing (1,2,3) will fill the register with (1,2,3,0).

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	The graphics buffer is not large enough for this data.

[What Is a Render Target?](#)

Reference

[GraphicsDevice Class](#)

[GraphicsDevice Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

GraphicsDevice.SetRenderTarget Method (Int32, RenderTarget2D)

Sets a new render target for this **GraphicsDevice**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetRenderTarget (
    int renderTargetIndex,
    RenderTarget2D renderTarget
)
```

Parameters

renderTargetIndex

Index of the render target. The number of render targets supported by a [GraphicsDevice](#) is contained in [MaxSimultaneousRenderTargets](#).

renderTarget

A new render target for the device, or **null** to set the device render target to the back buffer of the device.

Exceptions

Exception type	Condition
ArgumentException	An invalid render target index was requested. On Xbox 360, there is only one render target available and <i>renderTargetIndex</i> must be zero.
ArgumentOutOfRangeException	The render target index must be within the valid range for this device.
ObjectDisposedException	SetRenderTarget was called after this <i>renderTarget</i> was disposed.

Remarks

The following restrictions apply when using this method.

- The multisample type must be the same for the render target and the depth stencil surface.
- The formats must be compatible for the render target and the depth stencil surface. For more information, see [CheckDepthStencilMatch](#).
- The size of the depth stencil surface must be greater than or equal to the size of the render target.

These restrictions are validated only when using the debug runtime when any of the [GraphicsDevice](#) drawing methods are called.

Example

C#

```
// Create a new render target to receive the drawn data.
renderTarget = new RenderTarget2D(
    graphics.GraphicsDevice,
    // In this case, we are creating
    // a render target to match half of a split screen:
    leftViewPort.Width,
    leftViewPort.Height,
    // Number of levels in the render target:
    1,
    // Use the same surface format as the back buffer.
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);

// Set the render target on the device.
graphics.GraphicsDevice.SetRenderTarget(0, renderTarget);

// TODO: Add your code to draw to the render target here.
// For example, this could be a call to Mesh.Draw,
```

```
// a SpriteBatch Begin-End sequence, or a call to
// DrawIndexedPrimitives, as you would have called them
// in the Draw method of your application.

// Set the device render target back to the back buffer.
graphics.GraphicsDevice.SetRenderTarget(0, null);

// Call GetTexture to retrieve the render target data and save it to a texture.
capturedTexture = renderTarget.GetTexture();
```

GraphicsDevice.SetRenderTarget Method (Int32, RenderTargetCube, CubeMapFace)

Sets a new render target for this **GraphicsDevice**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetRenderTarget (
    int renderTargetIndex,
    RenderTargetCube renderTarget,
    CubeMapFace faceType
)
```

Parameters

renderTargetIndex

Index of the render target. The number of render targets supported by a [GraphicsDevice](#) is contained in [MaxSimultaneousRenderTargets](#).

renderTarget

A new render target for the device, or **null** to set the device render target to the back buffer of the device.

faceType

The cube map face type.

Exceptions

Exception type	Condition
ArgumentException	An invalid render target index was requested. On Xbox 360, there is only one render target available and <i>renderTargetIndex</i> must be zero.
ArgumentOutOfRangeException	The render target index must be within the valid range for this device.
ObjectDisposedException	SetRenderTarget was called after this <i>renderTarget</i> was disposed.

Remarks

The following restrictions apply when using this method.

- The multisample type must be the same for the render target and the depth stencil surface.
- The formats must be compatible for the render target and the depth stencil surface. For more information, see [CheckDepthStencilMatch](#).
- The size of the depth stencil surface must be greater than or equal to the size of the render target.

These restrictions are validated only when using the debug runtime when any of the [GraphicsDevice](#) drawing methods are called.

Example

C#

GraphicsDevice Properties

Public Properties

	Name	Description
	ClipPlanes	Retrieves the clipping planes of the current GraphicsDevice.
	CreationParameters	Retrieves the creation parameters of the GraphicsDevice.
	DepthStencilBuffer	Gets or sets the depth stencil surface of this GraphicsDevice .
	DisplayMode	Retrieves the display mode's spatial resolution, color resolution, and refresh frequency.
	DriverLevel	Returns the driver level.
	GraphicsDeviceCapabilities	Gets the capabilities of the graphics device.
	GraphicsDeviceStatus	Retrieves the status of the device
	Indices	Gets or sets index data.
	IsDisposed	Gets a value that indicates whether the object is disposed.
	PixelShader	Gets or sets the current pixel shader.
	PresentationParameters	Gets the presentation parameters associated with this graphics device.
	RasterStatus	Retrieves information that describes the raster of the monitor on which the swap chain is presented.
	RenderState	Retrieves a render-state value for a GraphicsDevice.
	SamplerStates	Retrieves a collection of SamplerState objects for the current GraphicsDevice .
	ScissorRectangle	Gets or sets the rectangle used for scissor testing.
	Textures	Returns the collection of textures that have been assigned to the texture stages of the device.
	VertexDeclaration	Gets or sets a vertex shader declaration.
	VertexSamplerStates	Gets the collection of vertex sampler states.
	VertexShader	Gets or sets the current vertex shader.
	VertexTextures	Gets the collection of vertex textures that support texture lookup in the vertex shader using the texldl - vs texture load statement. The vertex engine contains four texture sampler stages.
	Vertices	Gets the vertex stream collection.
	Viewport	Gets or sets a viewport identifying the portion of the render target to receive draw calls.

[GraphicsDevice Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

GraphicsDevice.CreationParameters Property

Retrieves the creation parameters of the GraphicsDevice.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GraphicsDeviceCreationParameters CreationParameters { get; }
```

Property Value

The creation parameters.

See Also

Reference

[GraphicsDevice Class](#)

[GraphicsDevice Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDevice.DepthStencilBuffer Property

Gets or sets the depth stencil surface of this [GraphicsDevice](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DepthStencilBuffer DepthStencilBuffer { get; set; }
```

Property Value

The depth stencil buffer. If no depth stencil buffer is associated with the [GraphicsDevice](#), the return value is **null**.

Setting this value to **null** disables the depth stencil operation.

Exceptions

Exception type	Condition
ObjectDisposedException	DepthStencilBuffer was called after the GraphicsDevice was disposed.

Remarks

The following restrictions apply when using this property.

- The multisample type must be the same for the render target and the depth stencil surface.
- The formats for the render target and depth stencil surface must be compatible. For more information, see [CheckDepthStencilMatch](#).
- The size of the depth stencil surface must be greater than or equal to the size of the render target.

These restrictions are validated only when using the debug runtime when any of the [GraphicsDevice](#) drawing methods are called.

GraphicsDevice.DisplayMode Property

Retrieves the display mode's spatial resolution, color resolution, and refresh frequency.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DisplayMode DisplayMode { get; }
```

Property Value

Data describing the display mode of the adapter (as opposed to the display mode of the [GraphicsDevice](#), which might not be active if the [GraphicsDevice](#) does not own full-screen mode).

Remarks For a list of all supported display modes for an adapter, see the [SupportedDisplayModes](#) property.

Example

This simple example checks for a supported display mode and sets the back buffer dimensions to match the resolution of the desired display mode.

C#

```
public class Game1 : Microsoft.Xna.Framework.Game
{
    GraphicsDeviceManager graphics;

    public Game1()
    {
        graphics = new GraphicsDeviceManager(this);
        Content.RootDirectory = "Content";

        graphics.PreparingDeviceSettings +=
            new EventHandler<PreparingDeviceSettingsEventArgs>(
                graphics_PreparingDeviceSettings);
    }

    /// <summary>
    /// Modifies the display mode for the graphics device
    /// when it is reset or recreated.
    /// </summary>
    void graphics_PreparingDeviceSettings(object sender,
        PreparingDeviceSettingsEventArgs e)
    {
        foreach (Microsoft.Xna.Framework.Graphics.DisplayMode displayMode
            in GraphicsAdapter.DefaultAdapter.SupportedDisplayModes)
        {
            // If 1080i (Widescreen) format is available,
            // set it to use this format.
            // 1080i is 1920x1080, so check to see if there is a
            // DisplayMode available that matches.
            if (displayMode.Width == 1920 && displayMode.Height == 1080)
            {
                e.GraphicsDeviceInformation.PresentationParameters.
                    BackBufferFormat = displayMode.Format;
                e.GraphicsDeviceInformation.PresentationParameters.
                    BackBufferHeight = displayMode.Height;
                e.GraphicsDeviceInformation.PresentationParameters.
                    BackBufferWidth = displayMode.Width;
                e.GraphicsDeviceInformation.PresentationParameters.
                    FullScreenRefreshRateInHz = displayMode.RefreshRate;
                e.GraphicsDeviceInformation.PresentationParameters.
                    IsFullScreen = true;
            }
        }
    }
}
```

GraphicsDevice.DriverLevel Property

Returns the driver level.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int DriverLevel { get; }
```

Property Value

This method returns the driver version, which is one of the following:

- 700 - Direct3D 7 level driver
- 800 - Direct3D 8 level driver
- 900 - Direct3D 9 level driver

GraphicsDevice.GraphicsDeviceCapabilities Property

Gets the capabilities of the graphics device.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GraphicsDeviceCapabilities GraphicsDeviceCapabilities { get; }
```

Property Value

The capabilities.

GraphicsDevice.GraphicsDeviceStatus Property

Retrieves the status of the device

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GraphicsDeviceStatus GraphicsDeviceStatus { get; }
```

Property Value

The status of the device

See Also

Reference

GraphicsDevice.Indices Property

Gets or sets index data.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IndexBuffer Indices { get; set; }
```

Property Value

The index data.

Exceptions

Exception type	Condition
ObjectDisposedException	Indices was called after this GraphicsDevice was disposed.

Example

The vertex stream and index data of the graphics device must be set before any call to [DrawIndexedPrimitives](#). The following example sets the index data and associates a user-created vertex buffer of type **VertexPositionNormalTexture** with vertex stream 0 (zero) of the graphics device.

C#

```
graphics.GraphicsDevice.Vertices[0].SetSource(  
    vertexBuffer, 0,  
    VertexPositionNormalTexture.SizeInBytes);  
  
graphics.GraphicsDevice.Indices = lineListIndexBuffer;
```

GraphicsDevice.IsDisposed Property

Gets a value that indicates whether the object is disposed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsDisposed { get; }
```

Property Value

true if the object is disposed; **false** otherwise.

GraphicsDevice.PixelShader Property

Gets or sets the current pixel shader.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public PixelShader PixelShader { get; set; }
```

Property Value

The current pixel shader or a pixel shader object to set.

Exceptions

Exception type	Condition
ObjectDisposedException	PixelShader was called after this GraphicsDevice was disposed.

GraphicsDevice.PresentationParameters Property

Gets the presentation parameters associated with this graphics device.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public PresentationParameters PresentationParameters { get; }
```

Property Value

The presentation parameters associated with this graphics device.

GraphicsDevice.RasterStatus Property

Retrieves information that describes the raster of the monitor on which the swap chain is presented.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public RasterStatus RasterStatus { get; }
```

Property Value

Information about the position or other status of the raster on the monitor driven by the current adapter.

GraphicsDevice.RenderState Property

Retrieves a render-state value for a GraphicsDevice.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public RenderState RenderState { get; }
```

Property Value

The render state.

Remarks This method returns the last render state that was set for the GraphicsDevice, or the default GraphicsDevice render state, if not previously set.

See Also

Reference

[GraphicsDevice Class](#)

[GraphicsDevice Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

GraphicsDevice.SamplerStates Property

Retrieves a collection of [SamplerState](#) objects for the current [GraphicsDevice](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SamplerStateCollection SamplerStates { get; }
```

Property Value

The sample states of this [GraphicsDevice](#).

Remarks

This method returns the last sampler state that was set for the [GraphicsDevice](#), or the default [GraphicsDevice](#) sampler state, if not previously set. Programmable shaders reference textures using the sampler number, which is set as the index of a [GraphicsDevice.Textures](#).

GraphicsDevice.ScissorRectangle Property

Gets or sets the rectangle used for scissor testing.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Rectangle ScissorRectangle { get; set; }
```

Property Value

Defines the rendering area within the render target, if scissor testing is enabled.

RemarksThe scissor rectangle is used as a rectangular clipping region. Use [ScissorTestEnable](#) to enable scissor testing.

See Also

Reference

GraphicsDevice.Textures Property

Returns the collection of textures that have been assigned to the texture stages of the device.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TextureCollection Textures { get; }
```

Property Value

The texture collection.

RemarksThe collection of texture stage on the device contains one or more textures (all of the same type and dimensions) that can be accessed by shaders.

Note

At draw time, a texture cannot be simultaneously set as a render target and a texture at a stage.

Example

This C# code demonstrates the setting two elements of the **Textures** collection to two user-created [Texture2D](#) objects named **firstTexture** and **secondTexture**.

C#

```
graphics.GraphicsDevice.Textures[0] = firstTexture;  
graphics.GraphicsDevice.Textures[1] = secondTexture;
```

In the effect file, these textures can be accessed by declaring two sampler variables and setting them to the sampler register numbers that correspond to the index in the texture collection.

```
sampler firstSampler : register(s0);  
sampler secondSampler : register(s1);
```

GraphicsDevice.VertexDeclaration Property

Gets or sets a vertex shader declaration.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public VertexDeclaration VertexDeclaration { get; set; }
```

Property Value

The vertex shader declaration.

Exceptions

Exception type	Condition
ObjectDisposedException	VertexDeclaration was called after this GraphicsDevice was disposed.

RemarksA vertex shader declaration is made up of an array of vertex elements.

GraphicsDevice.VertexSamplerStates Property

Gets the collection of vertex sampler states.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SamplerStateCollection VertexSamplerStates { get; }
```

Property Value

The collection of vertex sampler states.

GraphicsDevice.VertexShader Property

Gets or sets the current vertex shader.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public VertexShader VertexShader { get; set; }
```

Property Value

The [GraphicsDevice](#)'s current vertex shader or a vertex shader object to set.

Exceptions

Exception type	Condition
ObjectDisposedException	VertexShader was called after this GraphicsDevice was disposed.

See Also

Reference

[GraphicsDevice Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

GraphicsDevice.VertexTextures Property

Gets the collection of vertex textures that support texture lookup in the vertex shader using the **texldl** - vs texture load statement. The vertex engine contains four texture sampler stages.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TextureCollection VertexTextures { get; }
```

Property Value

The collection of vertex textures.

See Also

Reference

[GraphicsDevice Class](#)

[GraphicsDevice Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

GraphicsDevice.Vertices Property

Gets the vertex stream collection.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public VertexStreamCollection Vertices { get; }
```

Property Value

The vertex stream collection.

Example

The vertex stream of the graphics device must be set before any call to [DrawPrimitives](#). The following example associates a user created vertex buffer of type **VertexPositionNormalTexture** with vertex stream 0 (zero) of the graphics device.

C#

```
graphics.GraphicsDevice.Vertices[0].SetSource(  
    vertexBuffer, 0,  
    VertexPositionNormalTexture.SizeInBytes);
```

GraphicsDevice.Viewport Property

Gets or sets a viewport identifying the portion of the render target to receive draw calls.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Viewport Viewport { get; set; }
```

Property Value

The viewport to set or get.

Remarks

Viewport can be used to draw on part of the screen. It should be set before any geometry is drawn so the viewport parameters will take effect.

To draw multiple views within a scene, repeat setting **Viewport** and draw a geometry sequence for each view.

Example

This code sample, from [How To: Use Viewports for Split Screen Gaming](#), demonstrates how to use the **Viewport** property to display different scenes to different parts of the screen.

C#

```
Viewport defaultViewport;
Viewport leftViewport;
Viewport rightViewport;
Matrix projectionMatrix;
Matrix halfprojectionMatrix;
protected override void LoadContent()
{
    // Create a new SpriteBatch, which can be used to draw textures.
    spriteBatch = new SpriteBatch(GraphicsDevice);

    defaultViewport = GraphicsDevice.Viewport;
    leftViewport = defaultViewport;
    rightViewport = defaultViewport;
    leftViewport.Width = leftViewport.Width / 2;
    rightViewport.Width = rightViewport.Width / 2;
    rightViewport.X = leftViewport.Width + 1;

    Ring = Content.Load<Model>("redtorus");

    projectionMatrix = Matrix.CreatePerspectiveFieldOfView(
        MathHelper.PiOver4, 4.0f / 3.0f, 1.0f, 10000f);
    halfprojectionMatrix = Matrix.CreatePerspectiveFieldOfView(
        MathHelper.PiOver4, 2.0f / 3.0f, 1.0f, 10000f);
}
protected override void Draw(GameTime gameTime)
{
    GraphicsDevice.Viewport = defaultViewport;
    GraphicsDevice.Clear(Color.CornflowerBlue);

    GraphicsDevice.Viewport = leftViewport;
    DrawScene(gameTime, Camera1.ViewMatrix, halfprojectionMatrix);
    GraphicsDevice.Viewport = rightViewport;
    DrawScene(gameTime, Camera2.ViewMatrix, halfprojectionMatrix);

    base.Draw(gameTime);
}
```

GraphicsDevice Events

Public Events

	Name	Description
	DeviceLost	Occurs when a GraphicsDevice is about to be lost (for example, immediately before a reset).
	DeviceReset	Occurs after a GraphicsDevice is reset, allowing an application to recreate all resources.
	DeviceResetting	Occurs when a GraphicsDevice is resetting, allowing the application to cancel the default handling of the reset.
	Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.
	ResourceCreated	Occurs when a resource is created.
	ResourceDestroyed	Occurs when a resource is destroyed.

GraphicsDevice.DeviceLost Event

Occurs when a GraphicsDevice is about to be lost (for example, immediately before a reset).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public event EventHandler DeviceLost
```

Example

To add an event handler that listens for **DeviceLost**, use the following C# code.

```
[C#]
GraphicsDevice.DeviceLost += new System.EventHandler( this.GraphicsDeviceLostEven
tHandler );
```

See Also

GraphicsDevice.DeviceResetting Event

Occurs when a GraphicsDevice is resetting, allowing the application to cancel the default handling of the reset.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public event EventHandler DeviceResetting
```

Example

To add an event handler that listens for **DeviceResetting**, use the following C# code.

```
[C#]
GraphicsDevice.DeviceResetting += new System.CancelEventHandler( this.GraphicsDev
iceResettingEventHandler );
```

GraphicsDevice.Disposing Event

Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public event EventHandler Disposing
```

Remarks [IsDisposed](#) indicates whether an object has been disposed.

Example

To add an event handler that listens for **Disposing**, use the following C# code.

```
[C#]  
obj.Disposing += new System.EventHandler( this.OnDisposing );
```

GraphicsDeviceCapabilities Members

The following tables list the members exposed by the GraphicsDeviceCapabilities type.

Public Properties

Name	Description
 AdapterOrdinalInGroup	Gets the number indicating the order in which heads are referenced by the API.
 AlphaCompareCapabilities	Gets the alpha-test comparison capabilities.
 CubeTextureFilterCapabilities	Gets texture-filtering capabilities for a cube texture.
 CursorCapabilities	Gets hardware cursor capabilities.
 DeclarationTypeCapabilities	Gets vertex data type capabilities.
 DepthBufferCompareCapabilities	Gets depth buffer comparison capabilities.
 DestinationBlendCapabilities	Gets destination-blending capabilities.
 DeviceCapabilities	Gets graphics device capabilities.
 DeviceType	Returns the type of the current GraphicsDevice .
 DriverCapabilities	Gets device driver capabilities.
 ExtentsAdjust	Gets the number of pixels to adjust the extents rectangle outward to accommodate antialiasing kernels.
 GuardBandBottom	Gets the bottom screen-space coordinate of the guard-band clipping region.
 GuardBandLeft	Gets the left screen-space coordinate of the guard-band clipping region.
 GuardBandRight	Gets the right coordinate of the guard-band clipping region.
 GuardBandTop	Gets the top screen-space coordinate of the guard-band clipping region.
 LineCapabilities	Gets line-drawing primitives capabilities.
 MasterAdapterOrdinal	Gets the master device for this subordinate.
 MaxAnisotropy	Gets the maximum valid value for the MaxAnisotropy texture-stage state.
 MaxPixelShader30InstructionSlots	Gets the maximum number of pixel shader instruction slots supported.
 MaxPixelShaderProfile	Returns the maximum pixel shader profile for this GraphicsDevice .
 MaxPointSize	Gets the maximum size of a point primitive.
 MaxPrimitiveCount	Gets the maximum number of primitives for each DrawPrimitives call.
 MaxSimultaneousRenderTarget	Gets the maximum number of simultaneous render targets.
 MaxSimultaneousTextures	Gets the maximum number of textures that can be simultaneously bound to the fixed-function pipeline sampler stages.
 MaxStreams	Gets the maximum number of concurrent data streams.
 MaxStreamStride	Gets the maximum stride.
 MaxTextureAspectRatio	Gets the maximum texture aspect ratio supported by the hardware.
 MaxTextureHeight	Gets the maximum texture height for this device.
 MaxTextureRepeat	Gets the maximum range of the integer bits of the post-normalized texture coordinates.
 MaxTextureWidth	Gets the maximum texture width for this device.
 MaxUserClipPlanes	Gets the maximum number of user-defined clipping planes supported.
 MaxVertexIndex	Gets the maximum size of indices supported for hardware vertex processing.
 MaxVertexShader30InstructionSlots	Gets the maximum number of vertex shader instruction slots supported.
 MaxVertexShaderConstants	Gets the number of vertex shader registers that are reserved for constants.
 MaxVertexShaderProfile	Returns the maximum vertex shader profile for this GraphicsDevice .
 MaxVertexW	Gets the maximum W-based depth value that the device supports.
 MaxVolumeExtent	Gets the maximum value for any of the three dimensions (width, height, and depth) of a volume texture.
 NumberOfAdaptersInGroup	Gets the number of adapters in this adapter group (only if master).
 PixelShader1xMaxValue	Gets the maximum value of pixel shader arithmetic component.

 PixelShaderCapabilities	Gets the pixel shader 2.0 capabilities.
 PixelShaderVersion	Gets the pixel shader main and sub versions.
 PresentInterval	Gets the rate at which the swap chain's back buffers are presented to the front buffer.
 PrimitiveCapabilities	Gets driver primitive capabilities.
 RasterCapabilities	Gets information on raster-drawing capabilities.
 ShadingCapabilities	Gets shading operations capabilities.
 SourceBlendCapabilities	Gets source-blending capabilities.
 StencilCapabilities	Gets the supported stencil-buffer operations.
 TextureAddressCapabilities	Gets texture-addressing capabilities for texture objects.
 TextureCapabilities	Gets miscellaneous texture-mapping capabilities.
 TextureFilterCapabilities	Gets texture-filtering capabilities for a texture.
 VertexFormatCapabilities	Gets flexible vertex format capabilities.
 VertexProcessingCapabilities	Gets vertex processing capabilities.
 VertexShaderCapabilities	Gets vertex shader version 2.0 extended capabilities.
 VertexShaderVersion	Gets the vertex shader main and sub versions.
 VertexTextureFilterCapabilities	Gets vertex shader texture filter capabilities.
 VolumeTextureAddressCapabilities	Gets texture-addressing capabilities for a volume texture
 VolumeTextureFilterCapabilities	Gets texture-filtering capabilities for a volume texture.

Public Methods

	Name	Description
	Dispose	Overloaded. Releases all resources used by the GraphicsDeviceCapabilities class.
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code for this instance.
	GetType	(Inherited from Object .)
	Op_Equality	Compares two objects to determine whether they are the same.
	Op_Inequality	Compares two objects to determine whether they are different.
	ReferenceEquals	(Inherited from Object .)
	ToString	Retrieves a string representation of this object.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

GraphicsDeviceCapabilities.Dispose Method

Releases all resources used by the [GraphicsDeviceCapabilities](#) class.

Overload List

Name	Description
GraphicsDeviceCapabilities.Dispose ()	Releases all resources used by the GraphicsDeviceCapabilities class.
GraphicsDeviceCapabilities.Dispose (Boolean)	Releases the unmanaged resources used by the GraphicsDeviceCapabilities object and optionally releases the managed resources.

See Also

Reference

[GraphicsDeviceCapabilities Class](#)

GraphicsDeviceCapabilities.Dispose Method ()

Releases all resources used by the [GraphicsDeviceCapabilities](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call [Dispose](#) when you are finished using the [GraphicsDeviceCapabilities](#). The [Dispose](#) method leaves the [GraphicsDeviceCapabilities](#) in an unusable state. After calling [Dispose](#), you must release all references to the [GraphicsDeviceCapabilities](#) so the garbage collector can reclaim the memory that the [GraphicsDeviceCapabilities](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [GraphicsDeviceCapabilities](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [GraphicsDeviceCapabilities](#) object's [Finalize](#) method.

GraphicsDeviceCapabilities.Dispose Method (Boolean)

Note

This method is available only when developing for Windows.

Releases the unmanaged resources used by the [GraphicsDeviceCapabilities](#) object and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\]](#) **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

GraphicsDeviceCapabilities.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [Object](#) to compare with the current [GraphicsDeviceCapabilities](#).

Return Value

true if the objects are the same; **false** otherwise.

GraphicsDeviceCapabilities.op_Equality Method

Compares two objects to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    GraphicsDeviceCapabilities left,  
    GraphicsDeviceCapabilities right  
)
```

Parameters

left

Object to the left of the equality operator.

right

Object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

GraphicsDeviceCapabilities.op_Inequality Method

Compares two objects to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    GraphicsDeviceCapabilities left,  
    GraphicsDeviceCapabilities right  
)
```

Parameters

left

Object to the left of the inequality operator.

right

Object to the right of the inequality operator.

Return Value

true if the objects are different; **false** otherwise.

GraphicsDeviceCapabilities Properties

Public Properties

Name	Description
 AdapterOrdinalInGroup	Gets the number indicating the order in which heads are referenced by the API.
 AlphaCompareCapabilities	Gets the alpha-test comparison capabilities.
 CubeTextureFilterCapabilities	Gets texture-filtering capabilities for a cube texture.
 CursorCapabilities	Gets hardware cursor capabilities.
 DeclarationTypeCapabilities	Gets vertex data type capabilities.
 DepthBufferCompareCapabilities	Gets depth buffer comparison capabilities.
 DestinationBlendCapabilities	Gets destination-blending capabilities.
 DeviceCapabilities	Gets graphics device capabilities.
 DeviceType	Returns the type of the current GraphicsDevice .
 DriverCapabilities	Gets device driver capabilities.
 ExtentsAdjust	Gets the number of pixels to adjust the extents rectangle outward to accommodate antialiasing kernels.
 GuardBandBottom	Gets the bottom screen-space coordinate of the guard-band clipping region.
 GuardBandLeft	Gets the left screen-space coordinate of the guard-band clipping region.
 GuardBandRight	Gets the right coordinate of the guard-band clipping region.
 GuardBandTop	Gets the top screen-space coordinate of the guard-band clipping region.
 LineCapabilities	Gets line-drawing primitives capabilities.
 MasterAdapterOrdinal	Gets the master device for this subordinate.
 MaxAnisotropy	Gets the maximum valid value for the MaxAnisotropy texture-stage state.
 MaxPixelShader30InstructionSlots	Gets the maximum number of pixel shader instruction slots supported.
 MaxPixelShaderProfile	Returns the maximum pixel shader profile for this GraphicsDevice .
 MaxPointSize	Gets the maximum size of a point primitive.
 MaxPrimitiveCount	Gets the maximum number of primitives for each DrawPrimitives call.
 MaxSimultaneousRenderTarget	Gets the maximum number of simultaneous render targets.
 MaxSimultaneousTextures	Gets the maximum number of textures that can be simultaneously bound to the fixed-function pipeline sampler stages.
 MaxStreams	Gets the maximum number of concurrent data streams.
 MaxStreamStride	Gets the maximum stride.
 MaxTextureAspectRatio	Gets the maximum texture aspect ratio supported by the hardware.
 MaxTextureHeight	Gets the maximum texture height for this device.
 MaxTextureRepeat	Gets the maximum range of the integer bits of the post-normalized texture coordinates.
 MaxTextureWidth	Gets the maximum texture width for this device.
 MaxUserClipPlanes	Gets the maximum number of user-defined clipping planes supported.
 MaxVertexIndex	Gets the maximum size of indices supported for hardware vertex processing.
 MaxVertexShader30InstructionSlots	Gets the maximum number of vertex shader instruction slots supported.
 MaxVertexShaderConstants	Gets the number of vertex shader registers that are reserved for constants.
 MaxVertexShaderProfile	Returns the maximum vertex shader profile for this GraphicsDevice .
 MaxVertexW	Gets the maximum W-based depth value that the device supports.
 MaxVolumeExtent	Gets the maximum value for any of the three dimensions (width, height, and depth) of a volume texture.
 NumberOfAdaptersInGroup	Gets the number of adapters in this adapter group (only if master).
 PixelShader1xMaxValue	Gets the maximum value of pixel shader arithmetic component.
 PixelShaderCapabilities	Gets the pixel shader 2.0 capabilities.
 PixelShaderVersion	Gets the pixel shader main and sub versions.

 PresentInterval	Gets the rate at which the swap chain's back buffers are presented to the front buffer.
 PrimitiveCapabilities	Gets driver primitive capabilities.
 RasterCapabilities	Gets information on raster-drawing capabilities.
 ShadingCapabilities	Gets shading operations capabilities.
 SourceBlendCapabilities	Gets source-blending capabilities.
 StencilCapabilities	Gets the supported stencil-buffer operations.
 TextureAddressCapabilities	Gets texture-addressing capabilities for texture objects.
 TextureCapabilities	Gets miscellaneous texture-mapping capabilities.
 TextureFilterCapabilities	Gets texture-filtering capabilities for a texture.
 VertexFormatCapabilities	Gets flexible vertex format capabilities.
 VertexProcessingCapabilities	Gets vertex processing capabilities.
 VertexShaderCapabilities	Gets vertex shader version 2.0 extended capabilities.
 VertexShaderVersion	Gets the vertex shader main and sub versions.
 VertexTextureFilterCapabilities	Gets vertex shader texture filter capabilities.
 VolumeTextureAddressCapabilities	Gets texture-addressing capabilities for a volume texture
 VolumeTextureFilterCapabilities	Gets texture-filtering capabilities for a volume texture.

GraphicsDeviceCapabilities.AdapterOrdinalInGroup Property

Gets the number indicating the order in which heads are referenced by the API.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int AdapterOrdinalInGroup { get; }
```

Property Value

The number indicating the order in which heads are referenced by the API.

Remarks

The value for the master adapter is always 0. These values do not correspond to the adapter ordinals. They apply only to heads within a group.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.AlphaCompareCapabilities Property

Gets the alpha-test comparison capabilities.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public CompareCaps AlphaCompareCapabilities { get; }
```

Property Value

A [GraphicsDeviceCapabilities.CompareCaps](#) representing the alpha-test comparison capabilities of a device.

See Also

Reference

GraphicsDeviceCapabilities.CubeTextureFilterCapabilities Property

Gets texture-filtering capabilities for a cube texture.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public FilterCaps CubeTextureFilterCapabilities { get; }
```

Property Value

A [GraphicsDeviceCapabilities.FilterCaps](#) representing the texture-filtering capabilities for a cube texture of a device.

Remarks

Per-stage filtering capabilities reflect which filtering modes are supported for texture stages when performing multiple-texture blending. This member can be any combination of the per-stage texture-filtering flags defined in

[GraphicsDeviceCapabilities.FilterCaps](#).

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.MasterAdapterOrdinal Property

Gets the master device for this subordinate.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MasterAdapterOrdinal { get; }
```

Property Value

Number indicating the master device. This number is taken from the same space as the adapter values.

Remarks

For multi-head support, one head will be denoted the master head, and all other heads on the same card will be denoted subordinate heads. If more than one multi-head adapter is present in a system, the master and its subordinates from one multi-head adapter are called a group.

Gets the maximum number of pixel shader instruction slots supported.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxPixelShader30InstructionSlots { get; }
```

Property Value

The maximum number of pixel shader instruction slots supported.

Remarks

The maximum value that can be set on this capability is 32,768. Devices that support ps_3_0 are required to support at least 512 instruction slots.

See Also

Reference

[GraphicsDeviceCapabilities Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.MaxSimultaneousRenderTargets Property

Gets the maximum number of simultaneous render targets.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxSimultaneousRenderTargets { get; }
```

Property Value

The maximum number of simultaneous render targets supported by the device.

See Also

Reference

[GraphicsDeviceCapabilities Class](#)

[GraphicsDeviceCapabilities Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.MaxSimultaneousTextures Property

Gets the maximum number of textures that can be simultaneously bound to the fixed-function pipeline sampler stages.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxSimultaneousTextures { get; }
```

Property Value

The maximum number of textures that can be simultaneously bound to the fixed-function pipeline sampler stages.

Remarks

If the same texture is bound to two sampler stages, it counts as two textures.

This value has no meaning in the programmable pipeline where the number of sampler stages is determined by each pixel shader version. Each pixel shader version also determines the number of texture declaration instructions.

GraphicsDeviceCapabilities.MaxStreams Property

Gets the maximum number of concurrent data streams.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxStreams { get; }
```

Property Value

The maximum number of concurrent data streams. The valid range is 1 to 16.

Remarks

If this value is 0, then the driver is not a Direct3D 9 driver.

[GraphicsDeviceCapabilities Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.MaxTextureRepeat Property

Gets the maximum range of the integer bits of the post-normalized texture coordinates.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxTextureRepeat { get; }
```

Property Value

The maximum range of the integer bits of the post-normalized texture coordinates.

Remarks

A texture coordinate is stored as a 32-bit signed integer using 27 bits to store the integer part and 5 bits for the floating-point fraction. The maximum integer index, 227, is used to determine the maximum texture coordinate, depending on how the hardware does texture-coordinate scaling.

Some hardware reports the cap [TextureCaps.SupportsTextureRepeatNotScaledBySize](#). For this case, the device defers scaling texture coordinates by the texture size until after interpolation and application of the texture address mode, so the number of times a texture can be wrapped is given by the integer value in **MaxTextureRepeat**.

Less desirably, on some hardware [TextureCaps.SupportsTextureRepeatNotScaledBySize](#) is not set and the device scales the texture coordinates by the texture size (using the highest level of detail) prior to interpolation. This limits the number of times a texture can be wrapped to **MaxTextureRepeat** / texture size.

For example, assume that **MaxTextureRepeat** is equal to 32K and the size of the texture is 4K. If the hardware sets [TextureCaps.SupportsTextureRepeatNotScaledBySize](#), then the number of times a texture can be wrapped is equal to **MaxTextureRepeat** (32K, in this example). Otherwise, the number of times a texture can be wrapped is equal to **MaxTextureRepeat** divided by texture size, which, in this example, is 32K/4K, or 8.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxUserClipPlanes { get; }
```

Property Value

The maximum number of user-defined clipping planes supported. This number can be 0.

Remarks

For a given physical device, this capability might vary across Direct3D devices, depending on the parameters supplied to the [Device](#) constructor.

GraphicsDeviceCapabilities.MaxVertexIndex Property

Gets the maximum size of indices supported for hardware vertex processing.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxVertexIndex { get; }
```

Property Value

The maximum size of indices supported for hardware vertex processing.

Remarks

It is possible to create 32-bit index buffers; however, you will not be able to render with the index buffer unless this value is greater than 0x0000FFFF.

GraphicsDeviceCapabilities.MaxVertexShader30InstructionSlots Property

Gets the maximum number of vertex shader instruction slots supported.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxVertexShader30InstructionSlots { get; }
```

Property Value

The maximum number of vertex shader instruction slots supported.

Remarks

The maximum value that can be set on this cap is 32,768. Devices that support vs_3_0 are required to support at least 512 instruction slots.

GraphicsDeviceCapabilities.MaxVertexShaderConstants

Property

Gets the number of vertex shader registers that are reserved for constants.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxVertexShaderConstants { get; }
```

Property Value

The number of vertex shader registers that are reserved for constants.

GraphicsDeviceCapabilities.MaxVertexShaderProfile Property

Returns the maximum vertex shader profile for this [GraphicsDevice](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ShaderProfile MaxVertexShaderProfile { get; }
```

Property Value

The maximum vertex shader profile for this [GraphicsDevice](#).

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.MaxVertexW Property

Gets the maximum W-based depth value that the device supports.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float MaxVertexW { get; }
```

Property Value

The maximum W-based depth value that the device supports.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.MaxVolumeExtent Property

Gets the maximum value for any of the three dimensions (width, height, and depth) of a volume texture.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxVolumeExtent { get; }
```

Property Value

The maximum value for any of the three dimensions (width, height, and depth) of a volume texture.

GraphicsDeviceCapabilities.NumberOfAdaptersInGroup Property

Gets the number of adapters in this adapter group (only if master).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int NumberOfAdaptersInGroup { get; }
```

Property Value

The number of adapters in this adapter group (only if master).

Remarks

NumberOfAdaptersInGroup will be 1 for conventional adapters, greater than 1 for the master adapter of a multi-head card, or 0 for a subordinate adapter of a multihead card. Each card can have at most one master, but may have many subordinates.

GraphicsDeviceCapabilities.PixelShader1xMaxValue Property

Gets the maximum value of pixel shader arithmetic component.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float PixelShader1xMaxValue { get; }
```

Property Value

The maximum value of pixel shader arithmetic component.

Remarks

PixelShader1xMaxValue indicates the internal range of values supported for pixel color blending operations. Within the range that they report to, implementations must allow data to pass through pixel processing unmodified (unclamped). Normally, the value of this member is an absolute value. For example, a 1.0 indicates that the range is -1.0 to 1 , and an 8.0 indicates that the range is -8.0 to 8.0 . The value must be greater than or equal to 1.0 for any hardware that supports pixel shaders.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public FilterCaps TextureFilterCapabilities { get; }
```

Property Value

A [GraphicsDeviceCapabilities.FilterCaps](#) representing the texture-filtering capabilities of a device.

Remarks

Per-stage filtering capabilities reflect which filtering modes are supported for texture stages when performing multiple-texture blending. This member can be any combination of the per-stage texture-filtering flags defined in [GraphicsDeviceCapabilities.FilterCaps](#).

GraphicsDeviceCapabilities.AddressCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.AddressCaps type.

Public Properties

Name	Description
 SupportsBorder	Gets a value indicating whether the device supports the setting of coordinates outside the range [0.0, 1.0] to the border color.
 SupportsClamp	Gets a value indicating whether the device supports the clamping of textures to addresses.
 SupportsIndependentUV	Gets a value indicating whether the device can separate the texture-addressing modes of the texture's u and v coordinates.
 SupportsMirror	Gets a value indicating whether a device can mirror textures to addresses.
 SupportsMirrorOnce	Gets a value indicating whether a device can take the absolute value of the texture coordinate (thus, mirroring around 0) and then clamp to the maximum value.
 SupportsWrap	Gets a value indicating whether a device can wrap textures to addresses.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.AddressCaps instances are equal.
 GetHashCode	Gets the hash code for this object.
 GetType	(Inherited from Object .)
 Op_Equality	Determines whether two GraphicsDeviceCapabilities.AddressCaps instances are equal.
 Op_Inequality	Determines whether two GraphicsDeviceCapabilities.AddressCaps instances are unequal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

GraphicsDeviceCapabilities.AddressCaps.Equals Method (Object)

Determines whether two [GraphicsDeviceCapabilities.AddressCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [GraphicsDeviceCapabilities.AddressCaps](#) object this instance is being compared to .

Return Value

true if the instances are equal; **false** otherwise.

GraphicsDeviceCapabilities.AddressCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.AddressCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    AddressCaps left,  
    AddressCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.AddressCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.AddressCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.AddressCaps.op_Inequality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.AddressCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    AddressCaps left,  
    AddressCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.AddressCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.AddressCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.BlendCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.BlendCaps type.

Public Properties

Name	Description
 SupportsBlendFactor	Gets a value indicating that the driver supports the Blend.BlendFactor blend mode.
 SupportsBothInverseSourceAlpha	Gets a value indicating that the driver supports the Blend.BothInverseSourceAlpha blend mode.
 SupportsBothSourceAlpha	Gets a value indicating that the driver supports the Blend.BothSourceAlpha blend mode.
 SupportsDestinationAlpha	Gets a value indicating that the driver supports the Blend.DestinationAlpha blend mode.
 SupportsDestinationColor	Gets a value indicating that the driver supports the Blend.DestinationColor blend mode.
 SupportsInverseDestinationAlpha	Gets a value indicating that the driver supports the Blend.InverseDestinationAlpha blend mode.
 SupportsInverseDestinationColor	Gets a value indicating that the driver supports the Blend.InverseDestinationColor blend mode.
 SupportsInverseSourceAlpha	Gets a value indicating that the driver supports the Blend.InverseSourceAlpha blend mode.
 SupportsInverseSourceColor	Gets a value indicating that the driver supports the Blend.InverseSourceColor blend mode.
 SupportsOne	Gets a value indicating that the driver supports the Blend.One blend mode.
 SupportsSourceAlpha	Gets a value indicating that the driver supports the Blend.SourceAlpha blend mode.
 SupportsSourceAlphaSat	Gets a value indicating that the driver supports the Blend.SourceAlphaSat blend mode.
 SupportsSourceColor	Gets a value indicating that the driver supports the Blend.SourceColor blend mode.
 SupportsZero	Gets a value indicating that the driver supports the Blend.Zero blend mode.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.BlendCaps instances are equal.
 GetHashCode	Gets the hash code for this object.
 GetType	(Inherited from Object .)
 Op_Equality	Determines whether two GraphicsDeviceCapabilities.BlendCaps instances are equal.
 Op_Inequality	Determines whether two GraphicsDeviceCapabilities.BlendCaps instances are unequal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

GraphicsDeviceCapabilities.BlendCaps.Equals Method (Object)

Determines whether two [GraphicsDeviceCapabilities.BlendCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [GraphicsDeviceCapabilities.BlendCaps](#) to compare this instance to.

Return Value

true if the instances are equal; **false** otherwise.

GraphicsDeviceCapabilities.BlendCaps.GetHashCode Method

Gets the hash code for this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override int GetHashCode ()
```

Return Value

The hash code for this object.

GraphicsDeviceCapabilities.BlendCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.BlendCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    BlendCaps left,  
    BlendCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.BlendCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.BlendCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.BlendCaps.op_Inequality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.BlendCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    BlendCaps left,  
    BlendCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.BlendCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.BlendCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.BlendCaps Properties

Public Properties

	Name	Description
	SupportsBlendFactor	Gets a value indicating that the driver supports the Blend.BlendFactor blend mode.
	SupportsBothInverseSourceAlpha	Gets a value indicating that the driver supports the Blend.BothInverseSourceAlpha blend mode.
	SupportsBothSourceAlpha	Gets a value indicating that the driver supports the Blend.BothSourceAlpha blend mode.
	SupportsDestinationAlpha	Gets a value indicating that the driver supports the Blend.DestinationAlpha blend mode.
	SupportsDestinationColor	Gets a value indicating that the driver supports the Blend.DestinationColor blend mode.
	SupportsInverseDestinationAlpha	Gets a value indicating that the driver supports the Blend.InverseDestinationAlpha blend mode.
	SupportsInverseDestinationColor	Gets a value indicating that the driver supports the Blend.InverseDestinationColor blend mode.
	SupportsInverseSourceAlpha	Gets a value indicating that the driver supports the Blend.InverseSourceAlpha blend mode.
	SupportsInverseSourceColor	Gets a value indicating that the driver supports the Blend.InverseSourceColor blend mode.
	SupportsOne	Gets a value indicating that the driver supports the Blend.One blend mode.
	SupportsSourceAlpha	Gets a value indicating that the driver supports the Blend.SourceAlpha blend mode.
	SupportsSourceAlphaSat	Gets a value indicating that the driver supports the Blend.SourceAlphaSat blend mode.
	SupportsSourceColor	Gets a value indicating that the driver supports the Blend.SourceColor blend mode.
	SupportsZero	Gets a value indicating that the driver supports the Blend.Zero blend mode.

GraphicsDeviceCapabilities.BlendCaps.SupportsBlendFactor Property

Gets a value indicating that the driver supports the [Blend.BlendFactor](#) blend mode.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsBlendFactor { get; }
```

Property Value

true if the driver supports the [Blend.BlendFactor](#) blend mode; **false** otherwise.

Remarks

Constant color blending factor used by the frame-buffer blender.

See Also

Reference

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.BlendCaps.SupportsBothInverseSourceAlpha Property

Gets a value indicating that the driver supports the [Blend.BothInverseSourceAlpha](#) blend mode.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsBothInverseSourceAlpha { get; }
```

Property Value

true if the driver supports the [Blend.BothInverseSourceAlpha](#) blend mode; **false** otherwise.

Remarks

Source blend factor is $(1 - A_S, 1 - A_S, 1 - A_S, 1 - A_S)$, and destination blend factor is (A_S, A_S, A_S, A_S) ; the destination blend selection is overridden. This blend mode is supported only for the [SourceBlend](#) render state.

GraphicsDeviceCapabilities.BlendCaps.SupportsBothSourceAlpha Property

Gets a value indicating that the driver supports the [Blend.BothSourceAlpha](#) blend mode.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsBothSourceAlpha { get; }
```

Property Value

true if the driver supports the [Blend.BothSourceAlpha](#) blend mode; **false** otherwise.

Remarks

This mode is obsolete. For DirectX 6 and later, you can achieve the same effect by setting the source and destination blend factors to [Blend.SourceAlpha](#) and [Blend.InverseSourceAlpha](#) in separate calls.

GraphicsDeviceCapabilities.BlendCaps.SupportsDestinationAlpha Property

Gets a value indicating that the driver supports the [Blend.DestinationAlpha](#) blend mode.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsDestinationAlpha { get; }
```

Property Value

true if the driver supports the [Blend.DestinationAlpha](#) blend mode; **false** otherwise.

Remarks

The [Blend.DestinationAlpha](#) blend factor is (A_d, A_d, A_d, A_d) , where A_d is the destination alpha value.

GraphicsDeviceCapabilities.BlendCaps.SupportsDestinationColor Property

Gets a value indicating that the driver supports the [Blend.DestinationColor](#) blend mode.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsDestinationColor { get; }
```

Property Value

true if the driver supports the [Blend.DestinationColor](#) blend mode; **false** otherwise.

Remarks

The [Blend.DestinationColor](#) blend factor is (R_d, G_d, B_d, A_d) , where R, G, B, and A respectively stand for red, green, blue, and alpha destination values.

GraphicsDeviceCapabilities.CompareCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.CompareCaps type.

Public Properties

Name	Description
 SupportsAlways	Gets a value indicating whether always passing the comparison test is supported.
 SupportsEqual	Gets a value indicating whether comparison tests in which the new value equals the current value are supported.
 SupportsGreater	Gets a value indicating whether comparison tests in which the new value is greater than the current value are supported.
 SupportsGreaterEqual	Gets a value indicating whether comparison tests in which the new value is greater than or equal to the current value are supported.
 SupportsLess	Gets a value indicating whether comparison tests in which the new value is less than the current value are supported.
 SupportsLessEqual	Gets a value indicating whether comparison tests in which the new value is less than or equal to the current value are supported.
 SupportsNever	Gets a value indicating whether never passing the comparison test is supported.
 SupportsNotEqual	Gets a value indicating whether comparison tests in which the new value does not equal the current value are supported.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.CompareCaps instances are equal.
 GetHashCode	Gets the hash code for this object.
 GetType	(Inherited from Object .)
 S op_Equality	Determines whether two GraphicsDeviceCapabilities.CompareCaps instances are equal.
 S op_Inequality	Determines whether two GraphicsDeviceCapabilities.CompareCaps instances are unequal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.CompareCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    CompareCaps left,  
    CompareCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.CompareCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.CompareCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.CompareCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    CompareCaps left,  
    CompareCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.CompareCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.CompareCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.CompareCaps.SupportsGreater Property

Gets a value indicating whether comparison tests in which the new value is greater than the current value are supported.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsGreater { get; }
```

Property Value

true if comparison tests in which the new value is greater than the current value are supported; **false** otherwise.

GraphicsDeviceCapabilities.CompareCaps.SupportsGreaterEqual Property

Gets a value indicating whether comparison tests in which the new value is greater than or equal to the current value are supported.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsGreaterEqual { get; }
```

Property Value

true if comparison tests in which the new value is greater than or equal to the current value are supported; **false** otherwise.

GraphicsDeviceCapabilities.CompareCaps.SupportsLess Property

Gets a value indicating whether comparison tests in which the new value is less than the current value are supported.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsLess { get; }
```

Property Value

true if comparison tests in which the new value is less than the current value are supported; **false** otherwise.

GraphicsDeviceCapabilities.CompareCaps.SupportsLessEqual Property

Gets a value indicating whether comparison tests in which the new value is less than or equal to the current value are supported.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsLessEqual { get; }
```

Property Value

true if comparison tests in which the new value is less than or equal to the current value are supported; **false** otherwise.

GraphicsDeviceCapabilities.CompareCaps.SupportsNever Property

Gets a value indicating whether never passing the comparison test is supported.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsNever { get; }
```

Property Value

true if never passing the comparison test is supported; **false** otherwise.

GraphicsDeviceCapabilities.CompareCaps.SupportsNotEqual Property

Gets a value indicating whether comparison tests in which the new value does not equal the current value are supported.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsNotEqual { get; }
```

Property Value

true if comparison tests in which the new value does not equal the current value are supported; **false** otherwise.

GraphicsDeviceCapabilities.CursorCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.CursorCaps type.

Public Properties

	Name	Description
	SupportsColor	Gets a value indicating whether a full-color cursor is supported in hardware in high-resolution modes.
	SupportsLowResolution	Gets a value indicating whether a full-color cursor is supported in hardware in low-resolution modes.

Public Methods

	Name	Description
	Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.CursorCaps instances are equal.
	GetHashCode	Gets the hash code for this object.
	GetType	(Inherited from Object .)
 	Op_Equality	Determines whether two GraphicsDeviceCapabilities.CursorCaps instances are equal.
 	Op_Inequality	Determines whether two GraphicsDeviceCapabilities.CursorCaps instances are unequal.
	ReferenceEquals	(Inherited from Object .)
	ToString	Retrieves a string representation of this object.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

GraphicsDeviceCapabilities.CursorCaps.Equals Method (Object)

Determines whether two [GraphicsDeviceCapabilities.CursorCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [GraphicsDeviceCapabilities.CursorCaps](#) to compare this instance to.

Return Value

true if the instances are equal; **false** otherwise.

GraphicsDeviceCapabilities.CursorCaps.GetHashCode Method

Gets the hash code for this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override int GetHashCode ()
```

Return Value

The hash code for this object.

GraphicsDeviceCapabilities.CursorCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.CursorCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    CursorCaps left,  
    CursorCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.CursorCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.CursorCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.CursorCaps.op_Inequality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.CursorCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    CursorCaps left,  
    CursorCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.CursorCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.CursorCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.CursorCaps.ToString Method

Retrieves a string representation of this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override string ToString ()
```

Return Value

String representation of this object.

GraphicsDeviceCapabilities.CursorCaps.SupportsColor Property

Gets a value indicating whether a full-color cursor is supported in hardware in high-resolution modes.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsColor { get; }
```

Property Value

true if the hardware supports a full-color cursor in high resolution; **false** otherwise.

Remarks

Specifically, this flag indicates that the driver supports at least a hardware color cursor in high-resolution modes (with scan lines greater than or equal to 400).

Gets a value indicating whether a full-color cursor is supported in hardware in low-resolution modes.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsLowResolution { get; }
```

Property Value

true if the hardware supports a full-color cursor in low resolution; **false** otherwise.

Remarks

Specifically, this flag indicates that the driver supports at least a hardware color cursor in low-resolution modes (with scan lines less than 400).

GraphicsDeviceCapabilities.DeviceCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.DeviceCaps type.

Public Properties

Name	Description
 CanDrawSystemToNonLocal	Gets a value indicating whether the device supports blits from system-memory textures to non-local video-memory textures.
 CanRenderAfterFlip	Gets a value indicating whether the device can queue rendering commands after a page flip.
 IsDirect3D9Driver	Gets a value indicating if the device supports copying the contents of a source rectangle to a destination rectangle using a texture as the source.
 SupportsDrawPrimitives2	Gets a value indicating whether the device can support at least a DirectX 5-compliant driver.
 SupportsDrawPrimitives2Ex	Gets a value indicating whether the device can support at least a DirectX 7-compliant driver.
 SupportsDrawPrimitivesTransformedVertex	Gets a value indicating whether the device exports a DrawPrimitives -aware hardware abstraction layer (HAL).
 SupportsExecuteSystemMemory	Gets a value indicating whether the device can use execute buffers from video memory.
 SupportsExecuteVideoMemory	Gets a value indicating whether the device can use execute buffers from video memory.
 SupportsHardwareRasterization	Gets a value indicating whether the device has hardware acceleration for scene rasterization.
 SupportsHardwareTransformAndLight	Gets a value indicating whether the device can support transformation and lighting in hardware.
 SupportsSeparateTextureMemories	Gets a value indicating whether the device is texturing from separate memory pools.
 SupportsStreamOffset	Gets a value indicating whether the device supports stream offsets.
 SupportsTextureNonLocalVideoMemory	Gets a value indicating whether the device can retrieve textures from non-local video memory.
 SupportsTextureSystemMemory	Gets a value indicating whether the device can retrieve textures from system memory.
 SupportsTextureVideoMemory	Gets a value indicating whether the device can retrieve textures from device memory.
 SupportsTransformedVertexSystemMemory	Gets a value indicating whether the device can use buffers from system memory for transformed and lit vertices.
 SupportsTransformedVertexVideoMemory	Gets a value indicating whether the device can use buffers from video memory for transformed and lit vertices.
 VertexElementScanSharesStreamOffset	Gets a value indicating whether the device allows multiple vertex elements to share the same offset in a stream.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.DeviceCaps instances are equal.
 GetType	(Inherited from Object .)
 Op_Equality	Determines whether two GraphicsDeviceCapabilities.DeviceCaps instances are equal.
 Op_Inequality	Determines whether two GraphicsDeviceCapabilities.DeviceCaps instances are unequal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

GraphicsDeviceCapabilities.DeviceCaps.Equals Method (Object)

Determines whether two [GraphicsDeviceCapabilities.DeviceCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [GraphicsDeviceCapabilities.DeviceCaps](#) to compare this instance to.

Return Value

true if the instances are equal; **false** otherwise.

GraphicsDeviceCapabilities.DeviceCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.DeviceCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    DeviceCaps left,  
    DeviceCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.DeviceCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.DeviceCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.DeviceCaps.op_Inequality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.DeviceCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    DeviceCaps left,  
    DeviceCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.DeviceCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.DeviceCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.DeviceCaps Properties

Public Properties

Name	Description
 CanDrawSystemToNonLocal	Gets a value indicating whether the device supports blits from system-memory textures to non-local video-memory textures.
 CanRenderAfterFlip	Gets a value indicating whether the device can queue rendering commands after a page flip.
 IsDirect3D9Driver	Gets a value indicating if the device supports copying the contents of a source rectangle to a destination rectangle using a texture as the source.
 SupportsDrawPrimitives2	Gets a value indicating whether the device can support at least a DirectX 5-compliant driver.
 SupportsDrawPrimitives2Ex	Gets a value indicating whether the device can support at least a DirectX 7-compliant driver.
 SupportsDrawPrimitivesTransformedVertex	Gets a value indicating whether the device exports a DrawPrimitives -aware hardware abstraction layer (HAL).
 SupportsExecuteSystemMemory	Gets a value indicating whether the device can use execute buffers from video memory.
 SupportsExecuteVideoMemory	Gets a value indicating whether the device can use execute buffers from video memory.
 SupportsHardwareRasterization	Gets a value indicating whether the device has hardware acceleration for scene rasterization.
 SupportsHardwareTransformAndLight	Gets a value indicating whether the device can support transformation and lighting in hardware.
 SupportsSeparateTextureMemories	Gets a value indicating whether the device is texturing from separate memory pools.
 SupportsStreamOffset	Gets a value indicating whether the device supports stream offsets.
 SupportsTextureNonLocalVideoMemory	Gets a value indicating whether the device can retrieve textures from non-local video memory.
 SupportsTextureSystemMemory	Gets a value indicating whether the device can retrieve textures from system memory.
 SupportsTextureVideoMemory	Gets a value indicating whether the device can retrieve textures from device memory.
 SupportsTransformedVertexSystemMemory	Gets a value indicating whether the device can use buffers from system memory for transformed and lit vertices.
 SupportsTransformedVertexVideoMemory	Gets a value indicating whether the device can use buffers from video memory for transformed and lit vertices.
 VertexElementScanSharesStreamOffset	Gets a value indicating whether the device allows multiple vertex elements to share the same offset in a stream.

GraphicsDeviceCapabilities.DeviceCaps.CanRenderAfterFlip Property

Gets a value indicating whether the device can queue rendering commands after a page flip.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool CanRenderAfterFlip { get; }
```

Property Value

true if the device can queue rendering commands after a page flip; **false** otherwise.

Remarks

Applications do not change their behavior if this flag is set; this capability means that the device is relatively fast.

GraphicsDeviceCapabilities.DeviceCaps.VertexElementScanSharesStreamOffset Property

Gets a value indicating whether the device allows multiple vertex elements to share the same offset in a stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool VertexElementScanSharesStreamOffset { get; }
```

Property Value

true if the device allows multiple vertex elements to share the same offset in a stream; **false** otherwise.

Remarks

Multiple vertex elements can share the same offset in a stream if **VertexElementScanSharesStreamOffset** is **true** and the vertex declaration does not have an element with [VertexElementUsage.PositionTransformed](#).

GraphicsDeviceCapabilities.DriverCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.DriverCaps type.

Public Properties

Name	Description
 CanAutoGenerateMipMap	Gets a value indicating whether the driver is capable of automatically generating mipmaps.
 CanCalibrateGamma	Gets a value indicating whether the system has a calibrator installed that can automatically adjust the gamma ramp.
 CanManageResource	Gets a value indicating whether the driver is capable of managing resources.
 ReadScanLine	Gets a value indicating whether the display hardware is capable of returning the current scan line.
 SupportsAlphaFullScreenFlipOrDiscard	Gets a value indicating whether the device can respect the AlphaBlendEnable render state in full-screen mode while using the FLIP or DISCARD swap effect.
 SupportsCopyToSystemMemory	Gets a value indicating whether the device can accelerate a memory copy from local video memory to system memory.
 SupportsCopyToVideoMemory	Gets a value indicating whether the device can accelerate a memory copy from system memory to local video memory.
 SupportsDynamicTextures	Gets a value indicating whether the driver supports dynamic textures.
 SupportsFullScreenGamma	Gets a value indicating whether the driver supports dynamic gamma ramp adjustment in full-screen mode.
 SupportsLinearToSrgbPresentation	Gets a value indicating whether the device can perform gamma correction from a windowed back buffer (containing linear content) to an sRGB desktop.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.DriverCaps instances are equal.
 GetHashCode	gets the hash code for this object.
 GetType	(Inherited from Object .)

GraphicsDeviceCapabilities.DriverCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.DriverCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    DriverCaps left,  
    DriverCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.DriverCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.DriverCaps](#) on the left side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.DriverCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    DriverCaps left,  
    DriverCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.DriverCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.DriverCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

```

Property Value

true if the system has a calibrator installed that can automatically adjust the gamma ramp; **false** otherwise.

Remarks

To invoke the calibrator when setting new gamma levels, set *calibrate* to **true** when calling [SetGammaRamp](#). Calibrating gamma ramps incurs some processing overhead and should not be used frequently.

GraphicsDeviceCapabilities.DriverCaps.CanManageResource Property

Gets a value indicating whether the driver is capable of managing resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool CanManageResource { get; }
```

Property Value

true if the driver is capable of managing resources; **false** otherwise.

GraphicsDeviceCapabilities.DriverCaps.ReadScanLine Property

Gets a value indicating whether the display hardware is capable of returning the current scan line.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool ReadScanLine { get; }
```

Property Value

true if the driver display hardware is capable of returning the current scan line; **false** otherwise.

GraphicsDeviceCapabilities.DriverCaps.SupportsCopyToSystemMemory Property

Gets a value indicating whether the device can accelerate a memory copy from local video memory to system memory.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsCopyToSystemMemory { get; }
```

Property Value

true if the device can accelerate a memory copy from local video memory to system memory; **false** otherwise.

Remarks

This setting guarantees that [GetRenderTarget](#) calls will be hardware accelerated. If this setting is **false**, those calls will succeed but will be slower.

GraphicsDeviceCapabilities.FilterCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.FilterCaps type.

Public Properties

Name	Description
 SupportsMagnifyAnisotropic	Gets a value that indicates that the device supports per-stage anisotropic filtering for magnifying textures.
 SupportsMagnifyGaussianQuad	Gets a value indicating whether the device supports per-stage Gaussian quad filtering for magnifying textures.
 SupportsMagnifyLinear	Gets a value that indicates that the device supports per-stage bilinear interpolation filtering for magnifying textures.
 SupportsMagnifyPoint	Gets a value that indicates that the device supports per-stage point-sample filtering for magnifying textures.
 SupportsMagnifyPyramidalQuad	Gets a value that indicates that the device supports per-stage pyramidal sample filtering for magnifying textures.
 SupportsMinifyAnisotropic	Gets a value that indicates that the device supports per-stage anisotropic filtering for minifying textures.
 SupportsMinifyGaussianQuad	Gets a value indicating whether the device supports per-stage Gaussian quad filtering for minifying textures.
 SupportsMinifyLinear	Gets a value that indicates that the device supports per-stage bilinear interpolation filtering for minifying textures.
 SupportsMinifyPoint	Gets a value that indicates whether the device supports per-stage point-sample filtering for minifying textures.
 SupportsMinifyPyramidalQuad	Gets a value that indicates that the device supports per-stage pyramidal sample filtering for minifying textures.
 SupportsMipMapLinear	Gets a value that indicates that the device supports per-stage trilinear interpolation filtering for mipmaps.
 SupportsMipMapPoint	Gets a value that indicates that the device supports per-stage point-sample filtering for mipmaps.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.FilterCaps instances are equal.
 GetHashCode	Gets the hash code for this object.
 GetType	(Inherited from Object .)
 S op_Equality	Determines whether two GraphicsDeviceCapabilities.FilterCaps instances are equal.
 S op_Inequality	Determines whether two GraphicsDeviceCapabilities.FilterCaps instances are unequal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

GraphicsDeviceCapabilities.FilterCaps.Equals Method (Object)

Determines whether two [GraphicsDeviceCapabilities.FilterCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [GraphicsDeviceCapabilities.FilterCaps](#) to compare this instance to.

Return Value

true if the instances are equal; **false** otherwise.

GraphicsDeviceCapabilities.FilterCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.FilterCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    FilterCaps left,  
    FilterCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.FilterCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.FilterCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.FilterCaps.op_Inequality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.FilterCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    FilterCaps left,  
    FilterCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.FilterCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.FilterCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.FilterCaps.SupportsMagnifyAnisotropic Property

Gets a value that indicates that the device supports per-stage anisotropic filtering for magnifying textures.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsMagnifyAnisotropic { get; }
```

Property Value

true if the device supports per-stage anisotropic filtering for magnifying textures; **false** otherwise.

Remarks

Anisotropic filters compensate for distortion caused by the difference in angle between the texture polygon and the plane of the screen.

The anisotropic magnification filter is represented by the [TextureFilter.Anisotropic](#) enumerated value.

Gets a value indicating whether the device supports per-stage Gaussian quad filtering for magnifying textures.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsMagnifyGaussianQuad { get; }
```

Property Value

true if the device supports per-stage Gaussian quad filtering for magnifying textures; **false** otherwise.

Remarks

The Gaussian quad filter is represented by the [TextureFilter.GaussianQuad](#) enumerated value.

Gets a value that indicates that the device supports per-stage bilinear interpolation filtering for magnifying textures.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsMagnifyLinear { get; }
```

Property Value

true if the device supports per-stage bilinear interpolation filtering for magnifying textures; **false** otherwise.

Remarks

The bilinear interpolation mipmapping filter is represented by the [TextureFilter.Linear](#) enumerated value.

Gets a value that indicates that the device supports per-stage point-sample filtering for magnifying textures.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsMagnifyPoint { get; }
```

Property Value

true if the device supports per-stage point-sample filtering for magnifying textures; **false** otherwise.

Remarks

The point-sample magnification filter is represented by the [TextureFilter.Point](#) enumerated value.

Gets a value that indicates that the device supports per-stage pyramidal sample filtering for magnifying textures.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsMagnifyPyramidalQuad { get; }
```

Property Value

true if the device supports per-stage pyramidal sample filtering for magnifying textures; **false** otherwise.

Remarks

The pyramidal sample filter is represented by the [TextureFilter.PyramidalQuad](#) enumerated value.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsMinifyAnisotropic { get; }
```

Property Value

true if the device supports per-stage anisotropic filtering for minifying textures; **false** otherwise.

Remarks

The anisotropic minification filter is represented by the [TextureFilter.Anisotropic](#) enumerated value.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsMinifyGaussianQuad { get; }
```

Property Value

true if the device supports per-stage Gaussian quad filtering for magnifying textures; **false** otherwise.

Remarks

The Gaussian quad filter is represented by the [TextureFilter.GaussianQuad](#) enumerated value.

GraphicsDeviceCapabilities.LineCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.LineCaps type.

Public Properties

	Name	Description
	SupportsAlphaCompare	Gets a value indicating whether the device supports alpha-test comparisons.
	SupportsAntiAlias	Gets a value indicating whether the device supports antialiased lines.
	SupportsBlend	Gets a value indicating whether the device supports source blending.
	SupportsDepthBufferTest	Gets a value indicating whether the device supports depth buffer comparisons.
	SupportsFog	Gets a value indicating whether the device supports fog.
	SupportsTextureMapping	Gets a value indicating whether the device supports texture mapping.

Public Methods

	Name	Description
	Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.LineCaps instances are equal.
	GetHashCode	Gets the hash code for this object.
	GetType	(Inherited from Object .)
	Op_Equality	Determines whether two GraphicsDeviceCapabilities.LineCaps instances are equal.
	Op_Inequality	Determines whether two GraphicsDeviceCapabilities.LineCaps instances are unequal.

GraphicsDeviceCapabilities.LineCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.LineCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    LineCaps left,  
    LineCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.LineCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.LineCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.LineCaps.op_Inequality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.LineCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    LineCaps left,  
    LineCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.LineCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.LineCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.LineCaps.ToString Method

Retrieves a string representation of this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override string ToString ()
```

Return Value

String representation of this object.

GraphicsDeviceCapabilities.LineCaps Properties

Public Properties

	Name	Description
	SupportsAlphaCompare	Gets a value indicating whether the device supports alpha-test comparisons.
	SupportsAntiAlias	Gets a value indicating whether the device supports antialiased lines.
	SupportsBlend	Gets a value indicating whether the device supports source blending.
	SupportsDepthBufferTest	Gets a value indicating whether the device supports depth buffer comparisons.
	SupportsFog	Gets a value indicating whether the device supports fog.
	SupportsTextureMapping	Gets a value indicating whether the device supports texture mapping.

GraphicsDeviceCapabilities.LineCaps.SupportsAlphaCompare Property

Gets a value indicating whether the device supports alpha-test comparisons.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsAlphaCompare { get; }
```

Property Value

true if the device supports alpha-test comparisons; **false** otherwise.

GraphicsDeviceCapabilities.LineCaps.SupportsAntiAlias Property

Gets a value indicating whether the device supports antialiased lines.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsAntiAlias { get; }
```

Property Value

true if the device supports antialiased lines; **false** otherwise.

GraphicsDeviceCapabilities.PixelShaderCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.PixelShaderCaps type.

Public Fields

Name	Description
 MaxDynamicFlowControlDepth	Specifies the maximum level of nesting of dynamic flow control instructions (break - vs, break_comp - vs, breakp - vs, if_comp - vs, if_comp - vs, if_pred - vs).
 MaxNumberInstructionSlots	Specifies the maximum number of instruction slots supported.
 MaxNumberTemps	Specifies the maximum number of temporary registers supported.
 MaxStaticFlowControlDepth	Specifies the depth of nesting of the loop - vs/rep - vs and call - vs/callnz bool - vs instructions
 MinDynamicFlowControlDepth	Specifies the minimum level of nesting of dynamic flow control instructions (break - vs, break_comp - vs, breakp - vs, if_comp - vs, if_comp - vs, if_pred - vs).
 MinNumberInstructionSlots	Specifies the minimum number of instruction slots supported.
 MinNumberTemps	Specifies the minimum number of temporary registers supported.
 MinStaticFlowControlDepth	Specifies the minimum depth of nesting of the loop - vs/rep - vs and call - vs/callnz bool - vs instructions.

Public Properties

Name	Description
 DynamicFlowControlDepth	Gets a value specifying the dynamic flow control depth.
 NumberInstructionSlots	Gets a value specifying the number of instruction slots supported.
 NumberTemps	Gets a value specifying the number of temporary registers supported.
 StaticFlowControlDepth	Gets a value specifying the depth of nesting of the loop - vs/rep - vs and call - vs/callnz bool - vs instructions.
 SupportsArbitrarySwizzle	Gets a value indicating whether arbitrary swizzling is supported.
 SupportsGradientInstructions	Gets a value indicating whether gradient instructions are supported.
 SupportsNoDependentReadLimit	Gets a value indicating whether there is a limit on the number of dependent reads per instruction.
 SupportsNoTextureInstructionLimit	Gets a value indicating whether there is a limit on the number of texture instructions.
 SupportsPredication	Gets a value indicating whether instruction predication is supported.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.PixelShaderCaps instances are equal.
 GetHashCode	Gets the hash code for this object.
 GetType	(Inherited from Object .)
 Op_Equality	Determines whether two GraphicsDeviceCapabilities.PixelShaderCaps instances are equal.
 Op_Inequality	Determines whether two GraphicsDeviceCapabilities.PixelShaderCaps instances are unequal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

GraphicsDeviceCapabilities.PixelShaderCaps.Equals Method (Object)

Determines whether two [GraphicsDeviceCapabilities.PixelShaderCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [GraphicsDeviceCapabilities.PixelShaderCaps](#) object to compare this instance to.

Return Value

true if the instances are equal; **false** otherwise.

GraphicsDeviceCapabilities.PixelShaderCaps.op_Equality

Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.PixelShaderCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    PixelShaderCaps left,  
    PixelShaderCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.PixelShaderCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.PixelShaderCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.PixelShaderCaps.op_Inequality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.PixelShaderCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    PixelShaderCaps left,  
    PixelShaderCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.PixelShaderCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.PixelShaderCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.
