	SupportsNoDependentReadLimit	Gets a value indicating whether there is a limit on the number of dependent reads per instruction.
	SupportsNoTextureInstructionLimit	Gets a value indicating whether there is a limit on the number of texture instructions.
	SupportsPredication	Gets a value indicating whether instruction predication is supported.

GraphicsDeviceCapabilities.PixelShaderCaps.DynamicFlowControlDepth Property

Gets a value specifying the dynamic flow control depth.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int DynamicFlowControlDepth { get; }
```

Property Value

The dynamic flow control depth. Must be 0 or 24.

Gets a value specifying the number of instruction slots supported.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int NumberInstructionSlots { get; }
```

Property Value

The number of instruction slots supported.

GraphicsDeviceCapabilities.PrimitiveCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.PrimitiveCaps type.

Public Properties

Name	Description
 HasFogVertexClamped	Gets a value indicating whether the device clamps fog blend factor per vertex.
 IsNullReference	Gets a value indicating whether the device is a null reference device that does not render.
 SupportsBlendOperation	Gets a value indicating whether the device supports blending operations other than BlendFunction.Add .
 SupportsClipTransformedVertices	Gets a value indicating whether the device clips post-transformed vertex primitives.
 SupportsColorWrite	Gets a value indicating whether the device supports per-channel writes for the render-target color buffer through the ColorWriteChannels state.
 SupportsCullClockwiseFace	Gets a value indicating whether the driver supports clockwise triangle culling through the CullMode state.
 SupportsCullCounterClockwiseFace	Gets a value indicating whether the driver supports counterclockwise triangle culling through the CullMode state.
 SupportsCullNone	Gets a value indicating whether the driver does not perform triangle culling.
 SupportsFogAndSpecularAlpha	Gets a value indicating whether the driver supports separate fog and specular alpha.
 SupportsIndependentWriteMasks	Gets a value indicating whether the device supports independent write masks for multiple element textures or multiple render targets.
 SupportsMaskZ	Gets a value indicating whether the device can enable and disable modification of the depth buffer on pixel operations.
 SupportsMultipleRenderTargetIndependentBitDepths	Gets a value indicating whether the device supports different bit depths for multiple render targets.
 SupportsMultipleRenderTargetPostPixelShaderBlending	Gets a value indicating whether the device supports post-pixel shader operations for multiple render targets.
 SupportsSeparateAlphaBlend	Gets a value indicating whether the device supports separate blend settings for the alpha channel.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.PrimitiveCaps instances are equal.
 GetHashCode	Gets the hash code for this object.
 GetType	(Inherited from Object .)
  Op_Equality	Determines whether two GraphicsDeviceCapabilities.PrimitiveCaps instances are equal.
  Op_Inequality	Determines whether two GraphicsDeviceCapabilities.PrimitiveCaps instances are unequal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

GraphicsDeviceCapabilities.PrimitiveCaps.Equals Method (Object)

Determines whether two [GraphicsDeviceCapabilities.PrimitiveCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [GraphicsDeviceCapabilities.PrimitiveCaps](#) object to compare this instance to.

Return Value

true if the instances are equal; **false** otherwise.

GraphicsDeviceCapabilities.PrimitiveCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.PrimitiveCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    PrimitiveCaps left,  
    PrimitiveCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.PrimitiveCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.PrimitiveCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.PrimitiveCaps.op_Inequality

Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.PrimitiveCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    PrimitiveCaps left,  
    PrimitiveCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.PrimitiveCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.PrimitiveCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

Gets a value indicating whether the driver supports clockwise triangle culling through the [CullMode](#) state.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsCullClockwiseFace { get; }
```

Property Value

true if the driver supports clockwise triangle culling; **false** otherwise.

Remarks

This applies only to triangle primitives.

GraphicsDeviceCapabilities.PrimitiveCaps.SupportsFogAndSpecularAlpha Property

Gets a value indicating whether the driver supports separate fog and specular alpha.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsFogAndSpecularAlpha { get; }
```

Property Value

true if the driver supports separate fog and specular alpha; **false** otherwise.

Remarks

Many devices use the specular alpha channel to store the fog factor.

GraphicsDeviceCapabilities.RasterCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.RasterCaps type.

Public Properties

Name	Description
 SupportsAnisotropy	Gets a value indicating whether the device supports anisotropic filtering.
 SupportsColorPerspective	Gets a value indicating whether the device iterates colors perspective correctly.
 SupportsDepthBias	Gets a value indicating whether the device supports legacy depth bias.
 SupportsDepthBufferLessHsr	Gets a value indicating whether the device can perform hidden-surface removal (HSR) without requiring the application to sort polygons and without requiring the allocation of a depth buffer.
 SupportsDepthBufferTest	Gets a value indicating whether the device can perform depth-test operations.
 SupportsDepthFog	Gets a value indicating whether the device supports depth-based fog.
 SupportsFogRange	Gets a value indicating whether the device supports range-based fog.
 SupportsFogTable	Gets a value indicating whether the device calculates the fog value by referring to a lookup table containing fog values that are indexed to the depth of a given pixel.
 SupportsFogVertex	Gets a value indicating whether the device calculates the fog value during the lighting operation and interpolates the fog value during rasterization.
 SupportsMipMapLevelOfDetailBias	Gets a value indicating whether the device supports level-of-detail bias adjustments.
 SupportsMultisampleToggle	Gets a value indicating whether the device supports toggling multisampling on and off.
 SupportsScissorTest	Gets a value indicating whether the device supports scissor test.
 SupportsSlopeScaleDepthBias	Gets a value indicating whether the device performs true slope-scale based depth bias.
 SupportsWFog	Gets a value indicating whether the device supports w-based fog.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.RasterCaps instances are equal.
 GetHashCode	Gets the hash code for this object.
 GetType	(Inherited from Object .)
 Op_Equality	Determines whether two GraphicsDeviceCapabilities.RasterCaps instances are equal.
 Op_Inequality	Determines whether two GraphicsDeviceCapabilities.RasterCaps instances are unequal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

GraphicsDeviceCapabilities.RasterCaps.Equals Method (Object)

Determines whether two [GraphicsDeviceCapabilities.RasterCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [GraphicsDeviceCapabilities.RasterCaps](#) object to compare this instance to.

Return Value

true if the instances are equal; **false** otherwise.

GraphicsDeviceCapabilities.RasterCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.RasterCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    RasterCaps left,  
    RasterCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.RasterCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.RasterCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.RasterCaps.op_Inequality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.RasterCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    RasterCaps left,  
    RasterCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.RasterCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.RasterCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.RasterCaps.ToString Method

Retrieves a string representation of this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override string ToString ()
```

Return Value

String representation of this object.

GraphicsDeviceCapabilities.RasterCaps Properties

Public Properties

	Name	Description
	SupportsAnisotropy	Gets a value indicating whether the device supports anisotropic filtering.
	SupportsColorPerspective	Gets a value indicating whether the device iterates colors perspective correctly.
	SupportsDepthBias	Gets a value indicating whether the device supports legacy depth bias.
	SupportsDepthBufferLessHsr	Gets a value indicating whether the device can perform hidden-surface removal (HSR) without requiring the application to sort polygons and without requiring the allocation of a depth buffer.
	SupportsDepthBufferTest	Gets a value indicating whether the device can perform depth-test operations.
	SupportsDepthFog	Gets a value indicating whether the device supports depth-based fog.
	SupportsFogRange	Gets a value indicating whether the device supports range-based fog.
	SupportsFogTable	Gets a value indicating whether the device calculates the fog value by referring to a lookup table containing fog values that are indexed to the depth of a given pixel.
	SupportsFogVertex	Gets a value indicating whether the device calculates the fog value during the lighting operation and interpolates the fog value during rasterization.
	SupportsMipMapLevelOfDetailBias	Gets a value indicating whether the device supports level-of-detail bias adjustments.
	SupportsMultisampleToggle	Gets a value indicating whether the device supports toggling multisampling on and off.
	SupportsScissorTest	Gets a value indicating whether the device supports scissor test.
	SupportsSlopeScaleDepthBias	Gets a value indicating whether the device performs true slope-scale based depth bias.
	SupportsWFog	Gets a value indicating whether the device supports w-based fog.

GraphicsDeviceCapabilities.RasterCaps.SupportsAnisotropy Property

Gets a value indicating whether the device supports anisotropic filtering.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsAnisotropy { get; }
```

Property Value

true if the device supports anisotropic filtering; **false** otherwise.

GraphicsDeviceCapabilities.RasterCaps.SupportsColorPerspective Property

Gets a value indicating whether the device iterates colors perspective correctly.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsColorPerspective { get; }
```

Property Value

true if the device iterates colors perspective correctly; **false** otherwise.

GraphicsDeviceCapabilities.RasterCaps.SupportsDepthBias Property

Gets a value indicating whether the device supports legacy depth bias.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsDepthBias { get; }
```

Property Value

true if the device supports legacy depth bias; **false** otherwise.

GraphicsDeviceCapabilities.RasterCaps.SupportsDepthBufferLessHsr Property

Gets a value indicating whether the device can perform hidden-surface removal (HSR) without requiring the application to sort polygons and without requiring the allocation of a depth buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsDepthBufferLessHsr { get; }
```

Property Value

true if the device can perform hidden-surface removal (HSR) without requiring the application to sort polygons and without requiring the allocation of a depth buffer; **false** otherwise.

Remarks

This leaves more video memory for textures. The method used to perform HSR is hardware-dependent and is transparent to the application.

Z-bufferless HSR is performed if no depth-buffer surface is associated with the rendering-target surface and the depth-buffer comparison test is enabled (that is, when the state value associated with the [DepthBufferEnable](#) is true).

GraphicsDeviceCapabilities.RasterCaps.SupportsDepthBufferTest Property

Gets a value indicating whether the device can perform depth-test operations.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsDepthBufferTest { get; }
```

Property Value

true if the device can perform depth-test operations; **false** otherwise.

Remarks

This effectively renders a primitive and indicates whether any depth pixels have been rendered.

GraphicsDeviceCapabilities.RasterCaps.SupportsFogRange Property

Gets a value indicating whether the device supports range-based fog.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsFogRange { get; }
```

Property Value

true if the device supports range-based fog; **false** otherwise.

Remarks

In range-based fog, the distance of an object from the viewer is used to compute fog effects, not the depth of the object (that is, the z-coordinate) in the scene.

GraphicsDeviceCapabilities.RasterCaps.SupportsFogTable Property

Gets a value indicating whether the device calculates the fog value by referring to a lookup table containing fog values that are indexed to the depth of a given pixel.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsFogTable { get; }
```

Property Value

true if the device calculates the fog value by referring to a lookup table; **false** otherwise.

GraphicsDeviceCapabilities.RasterCaps.SupportsMipMapLevelOfDetailBias Property

Gets a value indicating whether the device supports level-of-detail bias adjustments.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsMipMapLevelOfDetailBias { get; }
```

Property Value

true if the device supports level-of-detail bias adjustments; **false** otherwise.

Remarks

These bias adjustments enable an application to make a mipmap appear crisper or less sharp than it normally would.

GraphicsDeviceCapabilities.RasterCaps.SupportsSlopeScaleDepthBias Property

Gets a value indicating whether the device performs true slope-scale based depth bias.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsSlopeScaleDepthBias { get; }
```

Property Value

true if the device performs true slope-scale based depth bias; **false** otherwise.

Remarks

This is in contrast to the legacy-style depth bias.

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.RasterCaps.SupportsWFog Property

Gets a value indicating whether the device supports w-based fog.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsWFog { get; }
```

Property Value

true if the device supports w-based fog; **false** otherwise.

Remarks

W-based fog is used when a perspective projection matrix is specified, but affine projections still use z-based fog. The system considers a projection matrix that contains a nonzero value in the [3][4] element to be a perspective projection matrix.

The following tables list the members exposed by the GraphicsDeviceCapabilities.ShadingCaps type.

Public Properties

Name	Description
 SupportsAlphaGouraudBlend	Gets a value indicating whether the device can support an alpha component for Gouraud-blended transparency.
 SupportsColorGouraudRgb	Gets a value indicating whether the device can support colored Gouraud shading.
 SupportsFogGouraud	Gets a value indicating whether the device can support fog in the Gouraud shading mode.
 SupportsSpecularGouraudRgb	Gets a value indicating whether the device supports Gouraud shading of specular highlights.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.ShadingCaps instances are equal.
 GetHashCode	Gets the hash code for this object.
 GetType	(Inherited from Object .)
 S op_Equality	Determines whether two GraphicsDeviceCapabilities.ShadingCaps instances are equal.
 S op_Inequality	Determines whether two GraphicsDeviceCapabilities.ShadingCaps instances are unequal.

Gets a value indicating whether the device can support an alpha component for Gouraud-blended transparency.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsAlphaGouraudBlend { get; }
```

Property Value

true if can support an alpha component for Gouraud-blended transparency; **false** otherwise.

Remarks

In this mode, the alpha color component of a primitive is provided at vertices and interpolated across a face along with the other color components.

GraphicsDeviceCapabilities.StencilCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.StencilCaps type.

Public Properties

Name	Description
 SupportsDecrement	Gets a value indicating whether the device supports decrementing the stencil-buffer entry, wrapping to the maximum value if the new value is less than zero.
 SupportsDecrementSaturation	Gets a value indicating whether the device supports decrementing the stencil-buffer entry, clamping to zero.
 SupportsIncrement	Gets a value indicating whether the device supports incrementing the stencil-buffer entry, wrapping to zero if the new value exceeds the maximum value.
 SupportsIncrementSaturation	Gets a value indicating whether the device supports incrementing the stencil-buffer entry, clamping to the maximum value.
 SupportsInvert	Gets a value indicating whether the device supports inverting the bits in the stencil-buffer entry.
 SupportsKeep	Gets a value indicating whether the device does not update the entry in the stencil buffer.
 SupportsReplace	Gets a value indicating whether the device supports replacing the stencil-buffer entry with a reference value.
 SupportsTwoSided	Gets a value indicating whether the device supports two-sided stencil.
 SupportsZero	Gets a value indicating whether the device supports setting the stencil-buffer entry to 0.

Public Methods

GraphicsDeviceCapabilities.StencilCaps.ToString Method

Retrieves a string representation of this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override string ToString ()
```

Return Value

String representation of this object.

GraphicsDeviceCapabilities.StencilCaps Properties

Public Properties

	Name	Description
	SupportsDecrement	Gets a value indicating whether the device supports decrementing the stencil-buffer entry, wrapping to the maximum value if the new value is less than zero.
	SupportsDecrementSaturation	Gets a value indicating whether the device supports decrementing the stencil-buffer entry, clamping to zero.
	SupportsIncrement	Gets a value indicating whether the device supports incrementing the stencil-buffer entry, wrapping to zero if the new value exceeds the maximum value.
	SupportsIncrementSaturation	Gets a value indicating whether the device supports incrementing the stencil-buffer entry, clamping to the maximum value.
	SupportsInvert	Gets a value indicating whether the device supports inverting the bits in the stencil-buffer entry.
	SupportsKeep	Gets a value indicating whether the device does not update the entry in the stencil buffer.
	SupportsReplace	Gets a value indicating whether the device supports replacing the stencil-buffer entry with a reference value.
	SupportsTwoSided	Gets a value indicating whether the device supports two-sided stencil.
	SupportsZero	Gets a value indicating whether the device supports setting the stencil-buffer entry to 0.

GraphicsDeviceCapabilities.StencilCaps.SupportsDecrement Property

Gets a value indicating whether the device supports decrementing the stencil-buffer entry, wrapping to the maximum value if the new value is less than zero.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsDecrement { get; }
```

Property Value

true if the device supports decrementing the stencil-buffer entry; **false** otherwise.

GraphicsDeviceCapabilities.TextureCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.TextureCaps type.

Public Properties

Name	Description
 RequiresCubeMapPower2	Gets a value indicating whether the device requires that cube texture maps have dimensions specified as powers of two.
 RequiresPower2	Gets a value indicating whether the device only supports textures that are powers of two.
 RequiresSquareOnly	Gets a value indicating whether the device requires all textures to be square.
 RequiresVolumeMapPower2	Gets a value indicating whether the device requires that volume texture maps have dimensions specified as powers of two.
 SupportsAlpha	Gets a value indicating whether the device supports alpha in texture pixels.
 SupportsCubeMap	Gets a value indicating whether the device supports cube textures
 SupportsMipCubeMap	Gets a value indicating whether the device supports mipmapped cube textures.
 SupportsMipMap	Gets a value indicating whether the device supports mipmapped textures.
 SupportsMipVolumeMap	Gets a value indicating whether the device supports mipmapped volume textures.
 SupportsNonPower2Conditional	Gets a value indicating whether the device supports the use of 2D textures with dimensions that are not powers of two, under certain conditions.
 SupportsNoProjectedBumpEnvironment	Gets a value indicating whether the device does not support a projected bump-environment look up operation in programmable and fixed-function shaders.
 SupportsPerspective	Gets a value indicating whether the device supports perspective correction texturing
 SupportsProjected	Gets a value indicating whether the device supports per pixel projective divide.
 SupportsTextureRepeatNotScaledBySize	Gets a value indicating whether the device does not scale texture indices by the texture size prior to interpolation.
 SupportsVolumeMap	Gets a value indicating whether the device supports volume textures.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.TextureCaps instances are equal.

GraphicsDeviceCapabilities.TextureCaps.Equals Method (Object)

Determines whether two [GraphicsDeviceCapabilities.TextureCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [GraphicsDeviceCapabilities.TextureCaps](#) object to compare this instance to.

Return Value

true if the instances are equal; **false** otherwise.

GraphicsDeviceCapabilities.TextureCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.TextureCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    TextureCaps left,  
    TextureCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.TextureCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.TextureCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.TextureCaps.op_Inequality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.TextureCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    TextureCaps left,  
    TextureCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.TextureCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.TextureCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.TextureCaps.RequiresCubeMapPower2 Property

Gets a value indicating whether the device requires that cube texture maps have dimensions specified as powers of two.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool RequiresCubeMapPower2 { get; }
```

Property Value

true if the device requires that cube texture maps have dimensions specified as powers of two; **false** otherwise.

See Also

Reference

[GraphicsDeviceCapabilities.TextureCaps Structure](#)

GraphicsDeviceCapabilities.TextureCaps.RequiresPower2 Property

Gets a value indicating whether the device only supports textures that are powers of two.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool RequiresPower2 { get; }
```

Property Value

true if the device only supports textures that are powers of two; **false** otherwise.

Remarks

The effect of [RequiresPower2](#) also depends on the value of [SupportsNonPower2Conditional](#):

RequiresPower2 value	SupportsNonPower2Conditional value	Result
false	false	Unconditional support for 2D textures with dimensions that are not powers of 2.
true	false	All textures must have widths and heights specified as powers of 2. This requirement does not apply to either cube textures or volume textures.
true	true	The device conditionally supports the use of 2D textures with dimensions that are not powers of 2. Mipmaps and wrapping are not supported. For more information, see SupportsNonPower2Conditional .

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.TextureCaps.SupportsNonPower2Conditional Property

Gets a value indicating whether the device supports the use of 2D textures with dimensions that are not powers of two, under certain conditions.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsNonPower2Conditional { get; }
```

Property Value

true if the device supports the use of 2D textures with dimensions that are not powers of two, under certain conditions; **false** otherwise.

Remarks

The device can use a texture with dimensions that are not a power of two, as long as these conditions are met:

- The texture-addressing mode for the texture stage is set to [TextureAddressMode.Clamp](#).
- Texture wrapping for the texture stage is disabled ([Wrap1](#), and [Wrap15](#) is set to [TextureWrapCoordinates.Zero](#)).
- Mipmapping is not in use (use magnification filter only).
- Texture formats must not be [SurfaceFormat.Dxt1](#) through [SurfaceFormat.Dxt5](#).

If this flag is not set, and [RequiresPower2](#) also is not set, then unconditional support is provided for 2D textures with dimensions that are not powers of two.

A texture that is not a power of two cannot be set at a stage that will be read based on a shader computation (such as the **bem** - ps and **texm3x3** - ps instructions in pixel shaders versions 1_0 to 1_3). For example, these textures can be used to store bumps that will be fed into texture reads, but not the environment maps that are used in **texbem** - ps, **texbem1** - ps, and **texm3x3spec** - ps. This means that a texture with dimensions that are not powers of two cannot be addressed or sampled using texture coordinates computed within the shader. This type of operation is known as a dependent read. It cannot be performed on these types of textures.

[GraphicsDeviceCapabilities.TextureCaps Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.TextureCaps.SupportsProjectedProperty

Gets a value indicating whether the device supports per pixel projective divide.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsProjected { get; }
```

Property Value

true if the device supports supports per pixel projective divide; **false** otherwise.

Remarks

When applied, the device divides transformed texture coordinates by the last texture coordinate. If this capability is present, the projective divide occurs per pixel. If this capability is not present, but the projective divide needs to occur anyway, it is performed on a per-vertex basis by the Direct3D runtime.

GraphicsDeviceCapabilities.VertexFormatCaps.Equals Method (Object)

Determines whether two [GraphicsDeviceCapabilities.VertexFormatCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [GraphicsDeviceCapabilities.VertexFormatCaps](#) object to compare this instance to.

Return Value

true if the instances are equal; **false** otherwise.

GraphicsDeviceCapabilities.VertexFormatCaps.op_Equality Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.VertexFormatCaps](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    VertexFormatCaps left,  
    VertexFormatCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.VertexFormatCaps](#) on the left side of the equal sign.

right

[GraphicsDeviceCapabilities.VertexFormatCaps](#) on the right side of the equal sign.

Return Value

true if *left* is equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.VertexFormatCaps.op_Inequality

Method

Note

This method is available only when developing for Windows.

Determines whether two [GraphicsDeviceCapabilities.VertexFormatCaps](#) instances are unequal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    VertexFormatCaps left,  
    VertexFormatCaps right  
)
```

Parameters

left

[GraphicsDeviceCapabilities.VertexFormatCaps](#) on the left side of the inequality operator.

right

[GraphicsDeviceCapabilities.VertexFormatCaps](#) on the right side of the inequality operator.

Return Value

true if *left* is not equal to *right*; **false** otherwise.

GraphicsDeviceCapabilities.VertexFormatCaps Properties

Public Properties

	Name	Description
	NumberSimultaneousTextureCoordinates	Gets the total number of texture coordinate sets that the device can simultaneously use for multiple texture blending.
	SupportsDoNotStripElements	Gets a value indicating whether vertex elements should not be stripped.
	SupportsPointSize	Gets a value indicating whether point size comes from point size data in the vertex declaration.

GraphicsDeviceCapabilities.VertexFormatCaps.NumberSimultaneousTextureCoordinates Property

Gets the total number of texture coordinate sets that the device can simultaneously use for multiple texture blending.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public short NumberSimultaneousTextureCoordinates { get; }
```

Property Value

The total number of texture coordinate sets that the device can simultaneously use for multiple texture blending. (You can use up to eight texture coordinate sets for any vertex, but the device can blend using only the specified number of texture coordinate sets.)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.VertexFormatCaps.SupportsDoNotStripElements Property

Gets a value indicating whether vertex elements should not be stripped.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsDoNotStripElements { get; }
```

Property Value

true if vertex elements should not be stripped; otherwise false.

Remarks

If the vertex format contains elements that are not used with the current render states, there is no need to regenerate the vertices. If this property is false, stripping extraneous elements from the vertex format provides better performance.

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsDeviceCapabilities.VertexFormatCaps.SupportsPointSize Property

Gets a value indicating whether point size comes from point size data in the vertex declaration.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SupportsPointSize { get; }
```

Property Value

true if point size comes from point size data in the vertex declaration; otherwise false.

Remarks

If this property is false, point size is determined by [PointSize](#). If an application provides point size in both the render state and the vertex declaration, the vertex data overrides the render-state data.

GraphicsDeviceCapabilities.VertexShaderCaps Members

The following tables list the members exposed by the GraphicsDeviceCapabilities.VertexShaderCaps type.

Public Fields

Name	Description
 MaxDynamicFlowControlDepth	Specifies the maximum level of nesting of dynamic flow control instructions (break - vs, break_comp - vs, breakp - vs, if_comp - vs, if_comp - vs, if_pred - vs).
 MaxNumberTemps	Specifies the maximum number of temporary registers supported.
 MaxStaticFlowControlDepth	Specifies the maximum depth of nesting of the loop - vs/rep - vs and call - vs/callnz bool - vs instructions.
 MinDynamicFlowControlDepth	Specifies the minimum level of nesting of dynamic flow control instructions (break - vs, break_comp - vs, breakp - vs, if_comp - vs, if_comp - vs, if_pred - vs).
 MinNumberTemps	Specifies the minimum number of temporary registers supported.
 MinStaticFlowControlDepth	Specifies the minimum depth of nesting of the loop - vs/rep - vs and call - vs/callnz bool - vs instructions.

Public Properties

Name	Description
 DynamicFlowControlDepth	Gets a value specifying the depth of the dynamic flow control instruction nesting.
 NumberTemps	Gets a value specifying the number of temporary registers supported.
 StaticFlowControlDepth	Gets a value specifying the depth of nesting of the loop - vs/rep - vs and call - vs/callnz bool - vs instructions.
 SupportsPredication	Gets a value indicating whether instruction predication is supported.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether two GraphicsDeviceCapabilities.VertexShaderCaps instances are equal.
 GetType	(Inherited from Object .)
 op_Equality	Determines whether two GraphicsDeviceCapabilities.VertexShaderCaps instances are equal.
 op_Inequality	Determines whether two GraphicsDeviceCapabilities.VertexShaderCaps instances are unequal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

C#

```
public int DynamicFlowControlDepth { get; }
```

Property Value

The depth of the dynamic flow control instruction nesting; either 0 or 24.

GraphicsDeviceCapabilities.VertexShaderCaps.StaticFlowControlDepth Property

Gets a value specifying the depth of nesting of the **loop - vs/rep - vs** and **call - vs/callnz bool - vs** instructions.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int StaticFlowControlDepth { get; }
```

Property Value

The depth of nesting of the **loop - vs/rep - vs** and **call - vs/callnz bool - vs** instructions.

GraphicsDeviceCreationParameters Members

The following tables list the members exposed by the GraphicsDeviceCreationParameters type.

Public Constructors

	Name	Description
	GraphicsDeviceCreationParameters	Initializes a new instance of the GraphicsDeviceCreationParameters class.

Public Properties

	Name	Description
	Adapter	Gets the graphics adapter.
	DeviceType	Gets a information describing the amount of emulated functionality for the device.
	FocusWindowHandle	Gets a pointer to the window to which focus belongs for the current device.

Public Methods

	Name	Description
	Equals	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	ToString	Retrieves a string representation of this object.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

GraphicsDeviceCreationParameters Constructor

Initializes a new instance of the [GraphicsDeviceCreationParameters](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GraphicsDeviceCreationParameters (  
    GraphicsAdapter graphicsAdapter,  
    DeviceType deviceType,  
    IntPtr windowHandle  
)
```

Parameters

graphicsAdapter

The display adapter.

deviceType

The emulated functionality for this device.

windowHandle

Window handle to which focus belongs for this Direct3D device.

GraphicsResource Members

The following tables list the members exposed by the GraphicsResource type.

Public Properties

Name	Description
 GraphicsDevice	Gets the GraphicsDevice associated with this GraphicsResource .
 IsDisposed	Gets a value that indicates whether the object is disposed.
 Name	Gets the name of the resource.
 Priority	Gets or sets the resource-management priority for this resource.
 ResourceType	Gets the type of this resource.
 Tag	Gets the resource tags for this resource.

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_Disposing	Raises the Disposing event when called from within a derived class.

Public Events

Name	Description
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

See Also

Reference

[GraphicsResource Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

GraphicsResource Methods

Public Methods

	Name	Description
	Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)

[GraphicsResource Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

GraphicsResource.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
GraphicsResource.Dispose ()	Immediately releases the unmanaged resources used by this object.
GraphicsResource.Dispose (Boolean)	Immediately releases the unmanaged resources used by this object.

See Also

Reference

[GraphicsResource Class](#)

[GraphicsResource Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

GraphicsResource.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call [Dispose](#) when you are finished using the [GraphicsResource](#). The [Dispose](#) method leaves the [GraphicsResource](#) in an unusable state. After calling [Dispose](#), you must release all references to the [GraphicsResource](#) so the garbage collector can reclaim the memory that the [GraphicsResource](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [GraphicsResource](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [GraphicsResource](#) object's [Finalize](#) method.

See Also

Reference

[GraphicsResource Class](#)

[GraphicsResource Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsResource.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[[MarshalAsAttribute\(U1\)](#)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [GraphicsResource](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

See Also

Reference

[GraphicsResource Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GraphicsResource.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

GraphicsResource.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the Disposing event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

ImageFileFormat Enumeration

Note

This enumeration is available only when developing for Windows.

Defines supported image file formats that may be used for textures.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum ImageFileFormat
```

Members

Member name	Description
Bmp	Microsoft Windows bitmap file format.
Dds	DirectDrawSurface file format.
Dib	Microsoft Windows bitmap file format.
Hdr	High dynamic-range file format.
Jpg	Joint Photographic Experts Group (JPEG) compressed file format.
Pfm	Portable float map file format.
Png	Portable Network Graphics file format.
Ppm	Portable pixmap file format.
Tga	Truevision Targa image file format.

IndexBuffer Class

Describes the rendering order of the vertices in a vertex buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class IndexBuffer : GraphicsResource
```

Example

The vertex stream and index data of the graphics device must be set before any call to [DrawIndexedPrimitives](#). The following example sets the index data and associates a user-created vertex buffer of type **VertexPositionNormalTexture** with vertex stream 0 (zero) of the graphics device.

C#

```
graphics.GraphicsDevice.Vertices[0].SetSource(  
    vertexBuffer, 0,  
    VertexPositionNormalTexture.SizeInBytes);  
  
graphics.GraphicsDevice.Indices = lineListIndexBuffer;
```

IndexBuffer Members

The following tables list the members exposed by the IndexBuffer type.

Public Constructors

Name	Description
 IndexBuffer	Overloaded. Initializes a new instance of this class.

Public Properties

Name	Description
 BufferUsage	Gets the state of the related BufferUsage enumeration.
 GraphicsDevice	(Inherited from GraphicsResource .)
 IndexElementSize	Gets or sets a value indicating the size of this index element.
 IsDisposed	(Inherited from GraphicsResource .)
 Name	(Inherited from GraphicsResource .)
 Priority	(Inherited from GraphicsResource .)
 ResourceType	(Inherited from GraphicsResource .)
 SizeInBytes	Gets the size, in bytes, of this IndexBuffer .
 Tag	(Inherited from GraphicsResource .)

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetData	Overloaded. Copies the index buffer into an array.
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 SetData	Overloaded. Copies array data to the index buffer.
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 MemberwiseClone	(Inherited from Object .)
 raise_Disposing	(Inherited from GraphicsResource .)

Public Events

Name	Description
 Disposing	(Inherited from GraphicsResource .)

IndexBuffer Constructor (GraphicsDevice, Int32, BufferUsage, IndexElementSize)

Initializes a new instance of the [IndexBuffer](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IndexBuffer (
    GraphicsDevice graphicsDevice,
    int sizeInBytes,
    BufferUsage usage,
    IndexElementSize elementSize
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) object to associate with the index buffer.

sizeInBytes

The size, in bytes, of the index buffer.

usage

A set of options identifying the behaviors of this index buffer resource.

elementSize

The size, in bits, of an index element.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentOutOfRangeException	One of the following conditions is true: <ul style="list-style-type: none"> <i>elementSize</i> is an invalid value. <i>elementSize</i> must be either IndexElementSize.SixteenBits or IndexElementSize.ThirtyTwoBits. <i>sizeInBytes</i> is not a valid value. <i>sizeInBytes</i> must be greater than zero, and a multiple of <i>elementSize</i>.
InvalidOperationException	Unable to create this IndexBuffer resource on the graphics device.

IndexBuffer Constructor (GraphicsDevice, Type, Int32, BufferUsage)

Initializes a new instance of the [IndexBuffer](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IndexBuffer (
    GraphicsDevice graphicsDevice,
    Type indexType,
    int elementCount,
    BufferUsage usage
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) object to associate with the index buffer.

indexType

The type to use for index values.

elementCount

The number of values in the buffer.

usage

A set of options identifying the behaviors of this index buffer resource.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentOutOfRangeException	The <i>elementCount</i> parameter is invalid. Index buffers can only be created for indices which are sixteen or thirty-two bits in length.
InvalidOperationException	Unable to create this IndexBuffer resource on the graphics device.

IndexBuffer.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
IndexBuffer.Dispose (Boolean)	Immediately releases the unmanaged resources used by this object.
IndexBuffer.Dispose ()	(Inherited from GraphicsResource .)

Remarks

Call [Dispose](#) when you are finished using the [IndexBuffer](#). The [Dispose](#) method leaves the [IndexBuffer](#) in an unusable state. After calling [Dispose](#), you must release all references to the [IndexBuffer](#) so the garbage collector can reclaim the memory that the [IndexBuffer](#) was occupying.

 Note
Always call Dispose before you release your last reference to the IndexBuffer . Otherwise, the resources it is using will not be freed until the garbage collector calls the IndexBuffer object's Finalize method.

[IndexBuffer Class](#)

[IndexBuffer Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

IndexBuffer.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\]](#) **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the **Finalize** method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. **Finalize** invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [IndexBuffer](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

IndexBuffer.GetData Generic Method (Int32, T[], Int32, Int32)

Copies the index buffer into an array.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GetData<T> (
    int offsetInBytes,
    T[] data,
    int startIndex,
    int elementCount
) where T : ValueType
```

Type Parameters

T

The type of elements in the array.

Parameters

offsetInBytes

The number of bytes into the index buffer where copying will start.

data

The array to receive index buffer data.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

Exceptions

Exception type	Condition
ArgumentNullException	<i>data</i> is null .
InvalidOperationException	The array specified in the <i>data</i> parameter is not the correct size for the amount of data requested.
NotSupportedException	This IndexBuffer was created with a usage type of BufferUsage.WriteOnly . Calling GetData on a resource that was created with BufferUsage.WriteOnly is not supported.

IndexBuffer.GetData Generic Method (T[])

Copies the index buffer into an array.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GetData<T> (
    T[] data
) where T : ValueType
```

Type Parameters

T

The type of elements in the array.

Parameters

data

The array to receive index buffer data.

Exceptions

Exception type	Condition
ArgumentNullException	<i>data</i> is null .
InvalidOperationException	The array specified in the <i>data</i> parameter is not the correct size for the amount of data requested.
NotSupportedException	This IndexBuffer was created with a usage type of BufferUsage.WriteOnly . Calling GetData on a resource that was created with BufferUsage.WriteOnly is not supported.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

Syntax

C#

```
public void SetData<T> (  
    T[] data  
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

data

The array of data to copy.

Remarks

⚠Caution

Here is a tip for rendering objects within the [Draw](#) method of an Xbox 360 game. Do not use **SetData** when writing data to vertex buffers, index buffers, and textures. This method may lead to graphics corruption or crashes. To avoid this potential issue, use [DrawUserPrimitives](#) or [DynamicIndexBuffer](#) as the preferred alternative to **SetData** for dynamic vertex generation.

This is because, in cases where the size of the back buffer and depth stencil buffer exceed the size of the Xbox 360 10 MB of embedded memory (EDRAM), [predicated tiling](#) is utilized on this platform to compensate for the additional memory requirements. Predicated tiling is a process by which scene rendering is performed multiple times on subsections of the final render target dimensions.

When predicated tiling has been triggered, the drawing commands contained in the [Draw](#) function are not submitted until [Present](#) is called. (Note that [Draw](#) implicitly calls [Present](#) at the end of this method.) In this case, these resources are not available for modification until the GPU is finished with presenting the entire frame.

An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

[Model Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Model.CopyAbsoluteBoneTransformsTo Method

Copies a transform of each bone in a model relative to all parent bones of the bone into a given array.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void CopyAbsoluteBoneTransformsTo (
    Matrix[] destinationBoneTransforms
)
```

Parameters

destinationBoneTransforms

The array to receive bone transforms.

Exceptions

Exception type	Condition
ArgumentNullException	<i>destinationBoneTransforms</i> is null .
ArgumentOutOfRangeException	<i>destinationBoneTransforms</i> is not the same size as Bones

Remarks

In an absolute transform, each bone is transformed according to the position of all parent bones.

This is the same as iterating the [Bones](#) collection and applying the transformation matrix of every parent of a [ModelBone](#) to the [Transform](#) property of each [ModelBone](#) and copying the results into an array that can be indexed into by the bone index.

An array of transformation matrices for the meshes of any model can be obtained by calling [CopyAbsoluteBoneTransformsTo](#) or [CopyBoneTransformsTo](#). The resulting array contains the transforms that describe how each [ModelMesh](#) is located relative to one another in the [Model](#). The transformation matrix that should be applied to each [ModelMesh](#) can be obtained using the index of the **CopyAbsoluteBoneTransformsTo** to retrieve a transformation matrix from this collection.

For a demonstration of how to use the transforms for the parent bones of a model mesh to set the position of the mesh parts, please see [How To: Render a Model](#).

ModelBone Class

Represents bone data for a model.

Namespace: Microsoft.Xna.Framework.Graphics

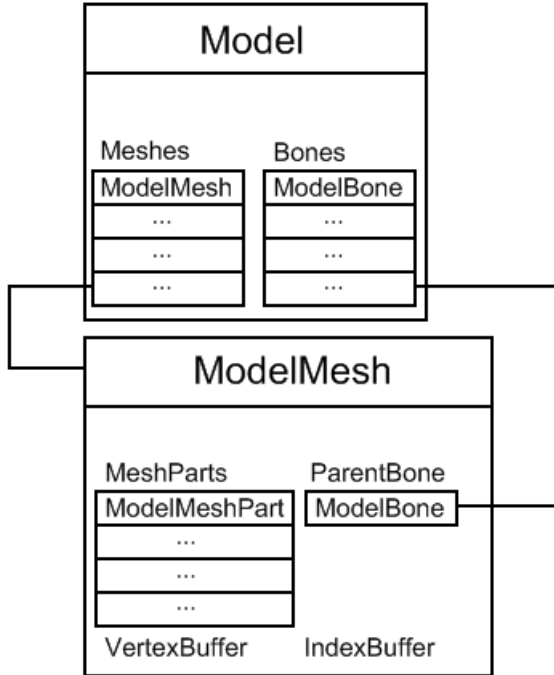

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class ModelBone
```

Remarks

In the XNA Framework, the [Model](#) class represents the whole model. The [Model](#) contains a [ModelMesh](#) for each separate mesh in the model. Each [ModelMesh](#) contains a [ParentBone](#), which controls the mesh's position and orientation relative to the model. The [Model](#) has a [Root](#) bone, which determines the model's position and orientation. Every [ModelBone](#) can have one parent and many children. The [Root](#) bone on the [Model](#) object is the ultimate parent. Its children are bones on [ModelMesh](#) objects—objects which might have other [ModelMesh](#) bones as their children, and so on. In any given family of bones, rotating the parent bone also rotates the children, and their children, and so on.

Every bone has a transformation matrix (called [Transform](#)) that defines its position and rotation relative to the position of the parent bone. This rotation and translation applies to all the vertices in the [ModelMesh](#) (for example, all the vertices that connect to that bone). To animate a bone, you multiply the default bone transform by a new matrix. When you draw the [ModelMesh](#), you then base your world matrix on the bone's transform.

The easiest way to incorporate transformed bones into drawing is to use the [CopyAbsoluteBoneTransformsTo](#) method. This method takes the bone transforms, which are relative to each other, and iterates over them to make them relative to the [Root](#) bone of the [Model](#). Then it returns a copy of these transforms. When you draw each [ModelMesh](#), you can use the absolute bone transform as the first part of your world matrix. This way you won't have to worry about parent bones and their relationships.

C#

```
public int Index { get; }
```

Property Value

The index of this bone in the [Bones](#) collection.

See Also

Reference

[ModelBone Class](#)

[ModelBone Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

ModelBone.Name Property

Gets the name of this bone.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Name { get; }
```

Property Value

The name of this bone.

See Also

Reference

[ModelBone Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

ModelBone.Parent Property

Gets the parent of this bone.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ModelBone Parent { get; }
```

Property Value

The parent of this bone.

See Also

Reference

ModelBone.Transform Property

Gets or sets the matrix used to transform this bone relative to its parent bone.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Matrix Transform { get; set; }
```

Property Value

The matrix used to transform this bone relative only to its parent bone.

Remarks

⚠Caution

Please note that the transform described by **Transform** does not describe the cumulative relationship of each mesh relative to *all* of its parent meshes in a [Model](#), just the immediate parent of the mesh. For this information, please see [CopyAbsoluteBoneTransformsTo](#).

For a demonstration of how to use the transforms for the parent bones of a model mesh to set the position of the mesh parts, please see [How To: Render a Model](#).

ModelBoneCollection.TryGetValue Method

Finds a bone with a given name if it exists in the collection.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool TryGetValue (  
    string boneName,  
    out ModelBone value  
)
```

Parameters

boneName

The name of the bone to find.

value

[[OutAttribute](#)] The bone named **boneName**, if found.

Return Value

true if the named bone is found, otherwise **false**.

Exceptions

Exception type	Condition
ArgumentNullException	<i>boneName</i> is null .

ModelBoneCollection.Enumerator Members

The following tables list the members exposed by the ModelBoneCollection.Enumerator type.

Public Properties

	Name	Description
	Current	Gets the current element in the ModelBoneCollection .

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
	GetType	(Inherited from Object .)
	MoveNext	Advances the enumerator to the next element of the ModelBoneCollection .
	ReferenceEquals	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	System.Collections.IEnumerator.Current	Gets the current element in the ModelBoneCollection as a Object .
	System.Collections.IEnumerator.Reset	Sets the enumerator to its initial position, which is before the first element in the ModelBoneCollection .

See Also

Reference

ModelBoneCollection.Enumerator Methods

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
	GetType	(Inherited from Object .)
	MoveNext	Advances the enumerator to the next element of the ModelBoneCollection .
	ReferenceEquals	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	System.Collections.IEnumerator.Current	Gets the current element in the ModelBoneCollection as a Object .
	System.Collections.IEnumerator.Reset	Sets the enumerator to its initial position, which is before the first element in the ModelBoneCollection .

See Also

Reference

[ModelBoneCollection.Enumerator Structure](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

ModelBoneCollection.Enumerator.Dispose Method

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[ModelBoneCollection.Enumerator Structure](#)

[ModelBoneCollection.Enumerator Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

ModelBoneCollection.Enumerator.MoveNext Method

Advances the enumerator to the next element of the [ModelBoneCollection](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool MoveNext ()
```

Return Value

true if the enumerator was successfully advanced to the next element; **false** if the enumerator has passed the end of the collection.

Exceptions

Exception type	Condition
InvalidOperationException	The collection was modified after the enumerator was created.

Remarks

After an enumerator is created or after a call to [System.Collections.IEnumerator.Reset](#), an enumerator is positioned before the first element of the collection, and the first call to **MoveNext** moves the enumerator over the first element of the collection.

After the end of the collection is passed, subsequent calls to **MoveNext** return **false** until [System.Collections.IEnumerator.Reset](#) is called.

An enumerator remains valid as long as the collection remains unchanged. If changes, such as adding, modifying, or deleting elements are made to the collection, the enumerator is irrecoverably invalidated and the next call to **MoveNext** or [System.Collections.IEnumerator.Reset](#) throws an [InvalidOperationException](#).

See Also

Reference

[ModelBoneCollection.Enumerator Structure](#)

[ModelBoneCollection.Enumerator Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

System.Collections.IEnumerator.Reset Method

Sets the enumerator to its initial position, which is before the first element in the [ModelBoneCollection](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private void System.Collections.IEnumerator.Reset ()
```

Exceptions

Exception type	Condition
InvalidOperationException	The collection was modified after the enumerator was created.

Remarks

An enumerator remains valid as long as the collection remains unchanged. If changes, such as adding, modifying, or deleting elements are made to the collection, the enumerator is irrecoverably invalidated and the next call to [MoveNext](#) or the **System.Collections.IEnumerator.Reset** throws an [InvalidOperationException](#).

Note

Notes to Implementers: All calls to **System.Collections.IEnumerator.Reset** must result in the same state for the enumerator. The preferred implementation is to move the enumerator to the beginning of the collection, before the first element. This invalidates the enumerator if the collection has been modified since the enumerator was created, which is consistent with [MoveNext](#) and [Current](#).

ModelMesh Members

The following tables list the members exposed by the ModelMesh type.

Public Properties

Name	Description
 BoundingSphere	Gets the BoundingSphere that contains this mesh.
 Effects	Gets a collection of effects associated with this mesh.
 IndexBuffer	Gets the index buffer for this mesh.
 MeshParts	Gets the ModelMeshPart objects that make up this mesh. Each part of a mesh is composed of a set of primitives that share the same material.
 Name	Gets the name of this mesh.
 ParentBone	Gets the parent bone for this mesh. The parent bone of a mesh contains a transformation matrix that describes how the mesh is located relative to any parent meshes in a model.
 Tag	Gets or sets an object identifying this mesh.
 VertexBuffer	Gets the vertex buffer used to render this mesh.

Public Methods

Name	Description
 Draw	Overloaded. Draws all the ModelMeshPart objects in this mesh, using their current Effect settings.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

[ModelMesh Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

ModelMesh.Effects Property

Gets a collection of effects associated with this mesh.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ModelEffectCollection Effects { get; }
```

Property Value

A collection of effects associated with this mesh.

Remarks

[ModelMesh.Effects](#) is a shortcut for iterating over the [MeshParts](#) property of the [ModelMesh](#) and looking up the [ModelMeshPart.Effect](#) property of each [ModelMeshPart](#).

[ModelMesh.Effects](#) is a collection of all the [Effect](#) properties of the for the [MeshParts](#) of this [ModelMesh](#). Each [ModelMeshPart](#) has a single [Effect](#) which is a reference to one of the [Effects](#) of the parent [ModelMesh](#) property. By updating all the effects of the [ModelMesh](#) all of the effects of each [ModelMeshPart](#) are updated as well.

[ModelMesh Class](#)

[ModelMesh Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

ModelMesh.IndexBuffer Property

Gets the index buffer for this mesh.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IndexBuffer IndexBuffer { get; }
```

Property Value

The index buffer for this mesh.

See Also

Reference

[ModelMesh Class](#)

[ModelMesh Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

ModelMesh.MeshParts Property

Gets the [ModelMeshPart](#) objects that make up this mesh. Each part of a mesh is composed of a set of primitives that share the same material.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ModelMeshPartCollection MeshParts { get; }
```

Property Value

The [ModelMeshPart](#) objects that make up this mesh.

Remarks

It is not necessary to use this class directly. In advanced rendering scenarios, it is possible to draw using **MeshParts** properties in combination with the vertex and index buffers on [ModelMesh](#). However, in most cases, [ModelMesh.Draw](#) will be sufficient.

Platforms Xbox 360, Windows XP SP2, Windows Vista

ModelMesh.Name Property

Gets the name of this mesh.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Name { get; }
```

Property Value

The name of this mesh.

See Also

Reference

[ModelMesh Class](#)

[ModelMesh Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

ModelMesh.ParentBone Property

Gets the parent bone for this mesh. The parent bone of a mesh contains a transformation matrix that describes how the mesh is located relative to any parent meshes in a model.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ModelBone ParentBone { get; }
```

Property Value

The parent bone for this mesh.

Remarks

An array of transformation matrices for the meshes of any model can be obtained by calling [CopyAbsoluteBoneTransformsTo](#) or [CopyBoneTransformsTo](#). The resulting array contains the transforms that describe how each [ModelMesh](#) is located relative to one another in the [Model](#). The transformation matrix that should be applied to each [ModelMesh](#) can be obtained using the index of the **ParentBone** to retrieve a transformation matrix from this collection.

For a demonstration of how to use the transforms for the parent bones of a model mesh to set the position of the mesh parts, please see [How To: Render a Model](#).

ModelMesh.Tag Property

Gets or sets an object identifying this mesh.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Object Tag { get; set; }
```

Property Value

An object identifying this mesh.

ModelMesh.VertexBuffer Property

Gets the vertex buffer used to render this mesh.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public VertexBuffer VertexBuffer { get; }
```

Property Value

The vertex buffer used to render this mesh.

ModelMeshCollection.TryGetValue Method

Finds a mesh with a given name if it exists in the collection.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool TryGetValue (  
    string meshName,  
    out ModelMesh value  
)
```

Parameters

meshName

The name of the mesh to find.

value

[[OutAttribute](#)] The mesh named **meshName**, if found.

Return Value

true if the named mesh is found; **false** otherwise.

Exceptions

Exception type	Condition
ArgumentNullException	<i>meshName</i> is null .

ModelMeshCollection.Enumerator Members

The following tables list the members exposed by the ModelMeshCollection.Enumerator type.

Public Properties

	Name	Description
	Current	Gets the current element in the ModelMeshCollection .

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
	GetType	(Inherited from Object .)
	MoveNext	Advances the enumerator to the next element of the ModelMeshCollection .
	ReferenceEquals	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	System.Collections.IEnumerator.Current	Gets the current element in the ModelMeshCollection as a Object .
	System.Collections.IEnumerator.Reset	Sets the enumerator to its initial position, which is before the first element in the ModelMeshCollection .

See Also

Reference

ModelMeshCollection.Enumerator Methods

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
	GetType	(Inherited from Object .)
	MoveNext	Advances the enumerator to the next element of the ModelMeshCollection .
	ReferenceEquals	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	System.Collections.IEnumerator.Current	Gets the current element in the ModelMeshCollection as a Object .
	System.Collections.IEnumerator.Reset	Sets the enumerator to its initial position, which is before the first element in the ModelMeshCollection .

See Also

Reference

[ModelMeshCollection.Enumerator Structure](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

ModelMeshCollection.Enumerator.Dispose Method

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[ModelMeshCollection.Enumerator Structure](#)

[ModelMeshCollection.Enumerator Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

ModelMeshCollection.Enumerator.MoveNext Method

Advances the enumerator to the next element of the [ModelMeshCollection](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool MoveNext ()
```

Return Value

true if the enumerator was successfully advanced to the next element; **false** if the enumerator has passed the end of the collection.

Exceptions

Exception type	Condition
InvalidOperationException	The collection was modified after the enumerator was created.

Remarks

After an enumerator is created or after a call to [System.Collections.IEnumerator.Reset](#), an enumerator is positioned before the first element of the collection, and the first call to **MoveNext** moves the enumerator over the first element of the collection.

After the end of the collection is passed, subsequent calls to **MoveNext** return false until [System.Collections.IEnumerator.Reset](#) is called.

An enumerator remains valid as long as the collection remains unchanged. If changes, such as adding, modifying, or deleting elements are made to the collection, the enumerator is irrecoverably invalidated and the next call to **MoveNext** or [System.Collections.IEnumerator.Reset](#) throws an [InvalidOperationException](#).

See Also

Reference

[ModelMeshCollection.Enumerator Structure](#)

[ModelMeshCollection.Enumerator Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

System.Collections.IEnumerator.Reset Method

Sets the enumerator to its initial position, which is before the first element in the [ModelMeshCollection](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private void System.Collections.IEnumerator.Reset ()
```

Exceptions

Exception type	Condition
InvalidOperationException	The collection was modified after the enumerator was created.

Remarks

An enumerator remains valid as long as the collection remains unchanged. If changes, such as adding, modifying, or deleting elements are made to the collection, the enumerator is irrecoverably invalidated and the next call to [MoveNext](#) or the **System.Collections.IEnumerator.Reset** throws an [InvalidOperationException](#).

Note

Notes to Implementers: All calls to **System.Collections.IEnumerator.Reset** must result in the same state for the enumerator. The preferred implementation is to move the enumerator to the beginning of the collection, before the first element. This invalidates the enumerator if the collection has been modified since the enumerator was created, which is consistent with [MoveNext](#) and [Current](#).

ModelMeshPart Class

Represents a batch of geometry information to submit to the graphics device during rendering. Each **ModelMeshPart** is a subdivision of a [ModelMesh](#) object. The [ModelMesh](#) class is split into multiple **ModelMeshPart** objects, typically based on material information.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class ModelMeshPart
```

Remarks

It is not necessary to use this class directly. In advanced rendering scenarios, it is possible to draw using **ModelMeshPart** properties in combination with the vertex and index buffers on [ModelMesh](#). However, in most cases, [ModelMesh.Draw](#) will be sufficient.

ModelMeshPart Members

The following tables list the members exposed by the ModelMeshPart type.

Public Properties

Name	Description
 BaseVertex	Gets the offset to add to each vertex index in the index buffer.
 Effect	Gets or sets the material Effect for this mesh part.
 NumVertices	Gets the number of vertices used during a draw call.
 PrimitiveCount	Gets the number of primitives to render.
 StartIndex	Gets the location in the index array at which to start reading vertices.
 StreamOffset	Gets the offset in bytes from the beginning of the VertexBuffer .
 Tag	Gets or sets an object identifying this model mesh part.
 VertexDeclaration	Gets the vertex declaration for this model mesh part.
 VertexStride	Gets the size, in bytes, of the elements in this vertex stream.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Reference

[ModelMeshPart Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

ModelMeshPart.BaseVertex Property

Gets the offset to add to each vertex index in the index buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int BaseVertex { get; }
```

Property Value

Offset to add to each vertex index in the index buffer.

See Also

Reference

ModelMeshPart.Effect Property

Gets or sets the material [Effect](#) for this mesh part.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Effect Effect { get; set; }
```

Property Value

The material effect for this mesh part.

Remarks

[ModelMesh.Effects](#) is a shortcut for iterating over the [MeshParts](#) property of the [ModelMesh](#) and looking up the [ModelMeshPart.Effect](#) property of each [ModelMeshPart](#).

[ModelMesh.Effects](#) is a collection of all the [Effect](#) properties of the for the [MeshParts](#) of this [ModelMesh](#). Each [ModelMeshPart](#) has a single [Effect](#) which is a reference to one of the [Effects](#) of the parent [ModelMesh](#) property. By updating all the effects of the [ModelMesh](#) all of the effects of each [ModelMeshPart](#) are updated as well.

Example

The **Effect** property can be used to assign a custom [Effect](#) to a model loaded with [BasicEffect](#).

C#

```
public static void RemapModel(Model model, Effect effect)
{
    foreach (ModelMesh mesh in model.Meshes)
    {
        foreach (ModelMeshPart part in mesh.MeshParts)
        {
            part.Effect = effect;
        }
    }
}
```

ModelMeshPartCollection.Enumerator Members

The following tables list the members exposed by the ModelMeshPartCollection.Enumerator type.

Public Properties

	Name	Description
	Current	Gets the current element in the ModelMeshPartCollection .

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
	GetType	(Inherited from Object .)
	MoveNext	Advances the enumerator to the next element of the ModelMeshPartCollection .
	ReferenceEquals	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	System.Collections.IEnumerator.Current	Gets the current element in the ModelMeshPartCollection as a Object .
	System.Collections.IEnumerator.Reset	Sets the enumerator to its initial position, which is before the first element in the ModelMeshPartCollection .

Reference

[ModelMeshPartCollection.Enumerator Structure](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

ModelMeshPartCollection.Enumerator.Dispose Method

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[ModelMeshPartCollection.Enumerator Structure](#)

[ModelMeshPartCollection.Enumerator Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

ModelMeshPartCollection.Enumerator.MoveNext Method

Advances the enumerator to the next element of the [ModelMeshPartCollection](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool MoveNext ()
```

Return Value

true if the enumerator was successfully advanced to the next element; **false** if the enumerator has passed the end of the collection.

Exceptions

Exception type	Condition
InvalidOperationException	The collection was modified after the enumerator was created.

Remarks

After an enumerator is created or after a call to [System.Collections.IEnumerator.Reset](#), an enumerator is positioned before the first element of the collection, and the first call to **MoveNext** moves the enumerator over the first element of the collection.

After the end of the collection is passed, subsequent calls to **MoveNext** return false until [System.Collections.IEnumerator.Reset](#) is called.

An enumerator remains valid as long as the collection remains unchanged. If changes, such as adding, modifying, or deleting elements are made to the collection, the enumerator is irrecoverably invalidated and the next call to **MoveNext** or [System.Collections.IEnumerator.Reset](#) throws an [InvalidOperationException](#).

Platforms Xbox 360, Windows XP SP2, Windows Vista

System.Collections.IEnumerator.Reset Method

Sets the enumerator to its initial position, which is before the first element in the [ModelMeshPartCollection](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private void System.Collections.IEnumerator.Reset ()
```

Exceptions

Exception type	Condition
InvalidOperationException	The collection was modified after the enumerator was created.

Remarks

An enumerator remains valid as long as the collection remains unchanged. If changes, such as adding, modifying, or deleting elements are made to the collection, the enumerator is irrecoverably invalidated and the next call to [MoveNext](#) or the **System.Collections.IEnumerator.Reset** throws an [InvalidOperationException](#).

Note

Notes to Implementers: All calls to **System.Collections.IEnumerator.Reset** must result in the same state for the enumerator. The preferred implementation is to move the enumerator to the beginning of the collection, before the first element. This invalidates the enumerator if the collection has been modified since the enumerator was created, which is consistent with [MoveNext](#) and [Current](#).

MultiSampleType Enumeration

Defines the levels of full-scene multisampling that the game machine can apply.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum MultiSampleType
```

Members

Member name	Description
SixteenSamples	Enables 16 levels of full-scene multisampling.
FifteenSamples	Enables 15 levels of full-scene multisampling.
FourteenSamples	Enables 14 levels of full-scene multisampling.
ThirteenSamples	Enables 13 levels of full-scene multisampling.
TwelveSamples	Enables 12 levels of full-scene multisampling.
ElevenSamples	Enables 11 levels of full-scene multisampling.
TenSamples	Enables 10 levels of full-scene multisampling.
NineSamples	Enables 9 levels of full-scene multisampling.
EightSamples	Enables 8 levels of full-scene multisampling.
SevenSamples	Enables 7 levels of full-scene multisampling.
SixSamples	Enables 6 levels of full-scene multisampling.
FiveSamples	Enables 5 levels of full-scene multisampling.
FourSamples	Enables 4 levels of full-scene multisampling.
ThreeSamples	Enables 3 levels of full-scene multisampling.
TwoSamples	Enables 2 levels of full-scene multisampling.
NonMaskable	Enables the multisample quality value. For a quality of 1, the video card determines the best multisampling mode.
None	Specifies no full-scene multisampling, and enables swap effects other than SwapEffect.Discard .

Remarks

When multisampling is enabled, all subsamples of a pixel are updated in one pass. However, when subsamples are used for other effects that involve multiple rendering passes, the application can specify that only some of them be affected by a given rendering pass. This latter approach enables simulation of motion blur, depth-of-field focus effects, reflection blur, and other effects.

In addition to enabling full-scene multisampling when a [Reset](#) occurs, there are render states that turn various multisampling aspects on and off at fine-grained levels. For more information, see [RenderState](#).

Multisampling is valid only on a swap chain that is created or reset with [SwapEffect.Discard](#).

The multisampling antialiasing value can be set with the parameters or sub-parameters in the following methods.

Module	Parameters	Sub-parameters
CheckDeviceMultiSampleType	<i>multiSampleType, qualityLevels</i>	None
GraphicsDevice	<i>presentationParameters</i>	MultiSampleType , MultiSampleQuality
Reset	<i>presentationParameters</i>	MultiSampleType , MultiSampleQuality

Example

Use the [PreparingDeviceSettings](#) event to set **MultiSampleType** after calling [CheckDeviceMultiSampleType](#):

C#

```
void graphics_PreparingDeviceSettings(object sender,
    PreparingDeviceSettingsEventArgs e)
{
    // Xbox 360 and most PCs support FourSamples/0
```

```

        // (4x) and TwoSamples/0 (2x) antialiasing.
        PresentationParameters pp =
            e.GraphicsDeviceInformation.PresentationParameters;
    #if XBOX
        pp.MultiSampleQuality = 0;
        pp.MultiSampleType = MultiSampleType.FourSamples;
        return;
    #else
        int quality = 0;
        GraphicsAdapter adapter = e.GraphicsDeviceInformation.Adapter;
        SurfaceFormat format = adapter.CurrentDisplayMode.Format;
        // Check for 4xAA
        if (adapter.CheckDeviceMultiSampleType(DeviceType.Hardware, format,
            false, MultiSampleType.FourSamples, out quality))
        {
            // even if a greater quality is returned, we only want quality 0
            pp.MultiSampleQuality = 0;
            pp.MultiSampleType =
                MultiSampleType.FourSamples;
        }
        // Check for 2xAA
        else if (adapter.CheckDeviceMultiSampleType(DeviceType.Hardware,
            format, false, MultiSampleType.TwoSamples, out quality))
        {
            // even if a greater quality is returned, we only want quality 0
            pp.MultiSampleQuality = 0;
            pp.MultiSampleType =
                MultiSampleType.TwoSamples;
        }
        return;
    #endif
}

```

OcclusionQuery Class

Used to perform an occlusion query against the latest drawn objects.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class OcclusionQuery : IDisposable
```

Remarks

An occlusion query is a technique that determines how many pixels were actually drawn during a set of draw calls. This is useful for certain rendering techniques and rendering optimizations.

An example of using this query follows:

```
OcclusionQuery query = new OcclusionQuery(device);

query.Begin();
// Drawing simple objects, bounding areas, etc.
query.End();

// Do additional work here to provide enough time for the GPU to complete query execution.

// Draw additional models
if (query.IsComplete == true && query.PixelCount > 0)
{
    // A non-zero pixel count means some of the low res model is visible
    // so let's draw the real version of it
}
```

The number of non-occluded pixels (indicated by [PixelCount](#)) can differ based on the platform.

For Xbox 360 games, [PixelCount](#) represents the number of pixels modified by drawing. This includes [GraphicsDevice.Clear](#) calls and any drawing associated with sprite batches.

For Windows games, [PixelCount](#) represents the number of pixels that passed the depth and stencil tests. This does not include sprite batch drawing (because the depth test is turned off) or calls to [GraphicsDevice.Clear](#).

To achieve consistent results across all platforms, use occlusion queries only when the depth buffer is enabled. In addition, avoid calling [Clear](#) or changing the assigned render target inside an occlusion query begin/end block.

OcclusionQuery Members

The following tables list the members exposed by the OcclusionQuery type.

Public Constructors

Name	Description
 OcclusionQuery	Initializes a new instance of OcclusionQuery with the specified device.

Public Properties

Name	Description
 GraphicsDevice	Gets the graphics device being queried.
 IsComplete	Gets a value that indicates if the occlusion query has completed.
 IsDisposed	Gets a value that indicates whether the object is disposed.
 IsSupported	Specifies if occlusion queries are supported on the related graphics device.
 Name	Gets the name of this occlusion query
 PixelCount	Gets the number of visible pixels.
 Tag	Gets the resource tag for this occlusion query.

Public Methods

Name	Description
 Begin	Begins application of the query.
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 End	Ends the application of the query.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_Disposing	Raises the Disposing event when called from within a derived class.

Public Events

Name	Description
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

OcclusionQuery.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the [Disposing](#) event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

OcclusionQuery Properties

Public Properties

	Name	Description
	GraphicsDevice	Gets the graphics device being queried.
	IsComplete	Gets a value that indicates if the occlusion query has completed.
	IsDisposed	Gets a value that indicates whether the object is disposed.
	IsSupported	Specifies if occlusion queries are supported on the related graphics device.
	Name	Gets the name of this occlusion query
	PixelCount	Gets the number of visible pixels.
	Tag	Gets the resource tag for this occlusion query.

See Also

Reference

[OcclusionQuery Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

OcclusionQuery.GraphicsDevice Property

Gets the graphics device being queried.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GraphicsDevice GraphicsDevice { get; }
```

Property Value

The related graphics device queried the occlusion query.

See Also

Reference

[OcclusionQuery Class](#)

[OcclusionQuery Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

OcclusionQuery.IsComplete Property

Gets a value that indicates if the occlusion query has completed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsComplete { get; }
```

Property Value

true if the query completed; otherwise **false**.

Remarks

If predicated tiling has been triggered for an Xbox 360 game, calls to **IsComplete** from within the tiling bracket always fail. Access this data by switching to a different render target or end the frame. This condition does not apply to games targeting the Windows platform.

See Also

Reference

[OcclusionQuery Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

OcclusionQuery.IsDisposed Property

Gets a value that indicates whether the object is disposed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsDisposed { get; }
```

Property Value

true if the object is disposed; otherwise **false**.

See Also

Reference

[OcclusionQuery Class](#)

[OcclusionQuery Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

OcclusionQuery.IsSupported Property

Specifies if occlusion queries are supported on the related graphics device.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsSupported { get; }
```

Property Value

true if occlusion queries are supported; **false** otherwise.

Occlusion queries are always supported on the Xbox 360 platform. Occlusion queries on the Windows platform are dependent upon the abilities of the installed video card.

OcclusionQuery.Name Property

Gets the name of this occlusion query

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Name { get; set; }
```

Property Value

Name of the query.

See Also

Reference

[OcclusionQuery Class](#)

[OcclusionQuery Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

OcclusionQuery.PixelCount Property

Gets the number of visible pixels.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int PixelCount { get; }
```

Property Value

Number of visible pixels. Zero indicates full occlusion, which means the pixels are not visible from the current camera position.

Exceptions

Exception type	Condition
InvalidOperationException	The query data is not yet available. Use the IsComplete property to determine if the data is available before attempting to retrieve it.

Remarks

The number of non-occluded pixels (indicated by [PixelCount](#)) can differ based on the platform.

For Xbox 360 games, [PixelCount](#) represents the number of pixels modified by drawing. This includes [GraphicsDevice.Clear](#) calls and any drawing associated with sprite batches.

For Windows games, [PixelCount](#) represents the number of pixels that passed the depth and stencil tests. This does not include sprite batch drawing (because the depth test is turned off) or calls to [GraphicsDevice.Clear](#).

To achieve consistent results across all platforms, use occlusion queries only when the depth buffer is enabled. In addition, avoid calling [Clear](#) or changing the assigned render target inside an occlusion query begin/end block.

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

OutOfVideoMemoryException Constructor (String)

Initializes a new instance of this class with a specified error message.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public OutOfVideoMemoryException (  
    string message  
)
```

Parameters

message

A message that describes the error.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

The following table shows the initial property values for an instance of [OutOfVideoMemoryException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

OutOfVideoMemoryException Constructor (String, Exception)

Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public OutOfVideoMemoryException (  
    string message,  
    Exception inner  
)
```

Parameters

message

A message that describes the error.

inner

The exception that is the cause of the current exception. If the *inner* parameter is not a null reference, the current exception is raised in a catch block that handles the inner exception.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

An exception that is thrown as a direct result of a previous exception should include a reference to the previous exception in the [InnerException](#) property. The [InnerException](#) property returns the same value that is passed into the constructor, or a null reference if the [InnerException](#) property does not supply the inner exception value to the constructor.

The following table shows the initial property values for an instance of [OutOfVideoMemoryException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

PixelShader Class

Encapsulates the functionality of a pixel shader.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class PixelShader : IDisposable
```

See Also

Reference

[PixelShader Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

PixelShader Members

The following tables list the members exposed by the PixelShader type.

Public Constructors

Name	Description
 PixelShader	Initializes a new instance of the PixelShader class.

Public Properties

Name	Description
 GraphicsDevice	Gets the GraphicsDevice associated with this PixelShader .
 IsDisposed	Gets a value that indicates whether the object is disposed.
 Name	Returns the name of the pixel shader.
 Tag	Gets the resource tags.

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetShaderCode	Gets an array of bytes containing the shader code.
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_Disposing	Raises the Disposing event when called from within a derived class.

Public Events

Name	Description
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

[Microsoft.Xna.Framework.Graphics Namespace](#)

PixelShader Constructor

Initializes a new instance of the [PixelShader](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public PixelShader (  
    GraphicsDevice graphicsDevice,  
    byte[] shaderCode  
)
```

Parameters

graphicsDevice

Device to create the pixel shader.

shaderCode

The compiled byte code. A pixel shader function token array, specifying the blending operations.

Exceptions

Exception type	Condition
ArgumentException	The array specified in <i>shaderCode</i> must have a length that is a multiple of four.
ArgumentNullException	<i>graphicsDevice</i> or <i>shaderCode</i> is null .
InvalidOperationException	Unable to create this PixelShader resource on the graphics device.

PixelShader.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
PixelShader.Dispose ()	Immediately releases the unmanaged resources used by this object.
PixelShader.Dispose (Boolean)	Immediately releases the unmanaged resources used by this object.

See Also

Reference

[PixelShader Class](#)

[PixelShader Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

PixelShader.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call [Dispose](#) when you are finished using the [PixelShader](#). The [Dispose](#) method leaves the [PixelShader](#) in an unusable state. After calling [Dispose](#), you must release all references to the [PixelShader](#) so the garbage collector can reclaim the memory that the [PixelShader](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [PixelShader](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [PixelShader](#) object's [Finalize](#) method.

See Also

Reference

[PixelShader Class](#)

[PixelShader Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

PixelShader.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[[MarshalAsAttribute\(U1\)](#)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [PixelShader](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

See Also

Reference

[PixelShader Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

PixelShader.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

PixelShader.GetShaderCode Method

Gets an array of bytes containing the shader code.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public byte[] GetShaderCode ()
```

Return Value

The shader code.

PixelShader.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the Disposing event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

PresentationParameters Members

The following tables list the members exposed by the PresentationParameters type.

Public Constructors

Name	Description
 PresentationParameters	Initializes a new instance of this class.

Public Fields

Name	Description
 DefaultPresentRate	The default presentation rate.

Public Properties

Name	Description
 AutoDepthStencilFormat	Gets or sets a value specifying the format of the depth-stencil surface that the device will automatically create.
 BackBufferCount	Gets or sets a value specifying how many back buffers to create.
 BackBufferFormat	Gets or sets the format of the back buffer.
 BackBufferHeight	Gets or sets a value indicating the height of the new swap chain's back buffer.
 BackBufferWidth	Gets or sets a value indicating the width of the new swap chain's back buffer.
 DeviceWindowHandle	Gets or sets the handle to the device window.
 EnableAutoDepthStencil	Gets or sets a value indicating whether Direct3D will manage depth buffers for the application.
 FullScreenRefreshRateInHz	Gets or sets a value indicating the rate at which the display adapter will refresh the screen.
 IsFullScreen	Gets or sets a value indicating whether the application is in full screen mode.
 MultiSampleQuality	Gets or sets a value indicating the multisample quality level.
 MultiSampleType	Gets or sets the multisample type.
 PresentationInterval	Gets or sets the maximum rate at which the swap chain's back buffers can be presented to the front buffer.
 PresentOptions	Gets or sets miscellaneous presentation flags.
 RenderTargetUsage	Gets or sets render target usage flags.
 SwapEffect	Gets or sets the swap effect.

Public Methods

Name	Description
 Clear	Resets all of the PresentationParameters values.
 Clone	Creates a copy of this PresentationParameters object.
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
 GetHashCode	Gets the hash code for this instance.
 GetType	(Inherited from Object .)
 Sop_Equality	Compares two objects to determine whether they are the same.
 Sop_Inequality	Compares two objects to determine whether they are different.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

PresentationParameters.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[[MarshalAsAttribute\(U1\)](#)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the **Finalize** method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. **Finalize** invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [PresentationParameters](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

Reference

[PresentationParameters Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

PresentationParameters.AutoDepthStencilFormat Property

Gets or sets a value specifying the format of the depth-stencil surface that the device will automatically create.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public DepthFormat AutoDepthStencilFormat { get; set; }
```

Property Value

The format of the depth-stencil surface that the device will automatically create.

Remarks

This member is ignored unless [EnableAutoDepthStencil](#) is **true**.

⚠ Caution

In cases where the size of the back buffer and depth stencil buffer exceed the size of the Xbox 360 10 MB of embedded memory (EDRAM), [predicated tiling](#) is used on this platform to compensate for the additional memory requirements. Predicated tiling is a process by which scene rendering is performed multiple times on subsections of the final render target dimensions. Using a depth-stencil surface directly affects the size of the back buffer and depth-stencil buffer and may trigger predicated tiling.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

PresentationParameters.BackBufferCount Property

Gets or sets a value specifying how many back buffers to create.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int BackBufferCount { get; set; }
```

Property Value

The number of back buffers to create. Can be 0, 1, 2, or 3. 0 is considered 1.

Remarks

When an instance of this class is returned from a method (for example, the [GraphicsDevice](#) constructor), **BackBufferCount** is set to the number of back buffers that can be created. For that reason, an application can call the method twice and expect the second call to successfully create back buffers.

[SwapEffect.Copy](#) requires exactly one back buffer.

See Also

PresentationParameters.BackBufferFormat Property

Gets or sets the format of the back buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SurfaceFormat BackBufferFormat { get; set; }
```

Property Value

The format of the back buffer.

Remarks

For windowed applications, the back-buffer format no longer needs to match the display-mode format because color conversion can now be done by the hardware (if the hardware supports color conversion). The set of possible back-buffer formats is constrained, but the runtime will allow any valid back-buffer format to be presented to any desktop format. (There is the additional requirement that the device be operable in the desktop mode; devices typically do not operate in 8-bits-per-pixel modes.)

Full screen applications cannot do color conversion.

⚠ Caution

In cases where the size of the back buffer and depth stencil buffer exceed the size of the Xbox 360 10 MB of embedded memory (EDRAM), [predicated tiling](#) is utilized on this platform to compensate for the additional memory requirements. Predicated tiling is a process by which scene rendering is performed multiple times on subsections of the final render target dimensions. The format of the back buffer chosen with the **BackBufferFormat** property directly affects the size of the back buffer and may trigger predicated tiling.

PresentationParameters.BackBufferHeight Property

Gets or sets a value indicating the height of the new swap chain's back buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int BackBufferHeight { get; set; }
```

Property Value

The height of the back buffer, in pixels.

Remarks

If [IsFullScreen](#) is **true**, [BackBufferHeight](#) and [BackBufferWidth](#) must equal the width and height of one of the enumerated display modes found through [SupportedDisplayModes](#). If [IsFullScreen](#) is **false** and either of these values is zero, the corresponding dimension of the client area of the [DeviceWindowHandle](#) (or the focus window, if [DeviceWindowHandle](#) is [Zero](#)) is taken.

PresentationParameters.BackBufferWidth Property

Gets or sets a value indicating the width of the new swap chain's back buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int BackBufferWidth { get; set; }
```

Property Value

The width of the back buffer, in pixels.

Remarks

If [IsFullScreen](#) is **true**, [BackBufferHeight](#) and [BackBufferWidth](#) must equal the width and height of one of the enumerated display modes found through [SupportedDisplayModes](#). If [IsFullScreen](#) is **false** and either of these values is zero, the corresponding dimension of the client area of the [DeviceWindowHandle](#) (or the focus window, if [DeviceWindowHandle](#) is [Zero](#)) is taken.

PresentationParameters.DeviceWindowHandle Property

Gets or sets the handle to the device window.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IntPtr DeviceWindowHandle { get; set; }
```

Property Value

The handle to the device window.

Remarks

The device window determines the location and size of the back buffer on screen. This is used by Direct3D when the back buffer contents are copied to the front buffer during [Present](#).

For a full screen application, this is a handle to the top window (which is the focus window). For applications that use multiple full screen devices (such as a multimonitor system), exactly one device can use the focus window as the device window. All other devices must have unique device windows.

For a windowed-mode application, this handle will be the default target window for [Present](#). If this handle is [Zero](#), the focus window will be taken.

Note that the runtime does not attempt to reflect user changes in window size. The back buffer is not implicitly reset when this window is reset. However, the [Present](#) method does automatically track window position changes.

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

PresentationParameters.EnableAutoDepthStencil Property

Gets or sets a value indicating whether Direct3D will manage depth buffers for the application.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool EnableAutoDepthStencil { get; set; }
```

Property Value

true if Direct3D will manage depth buffers for the application; **false** otherwise.

Remarks

If [EnableAutoDepthStencil](#) is **true**, the device will create a depth-stencil buffer when it is created. The depth-stencil buffer will be automatically set as the render target of the device. When the device is reset, the depth-stencil buffer will be automatically destroyed and recreated in the new size.

If [EnableAutoDepthStencil](#) is **true**, then [AutoDepthStencilFormat](#) must be a valid depth-stencil format.

PresentationParameters.FullScreenRefreshRateInHz Property

Gets or sets a value indicating the rate at which the display adapter will refresh the screen.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int FullScreenRefreshRateInHz { get; set; }
```

Property Value

The refresh rate in hertz, or 0 in windowed mode.

Remarks

For full screen mode, the refresh rate must be one of the refresh rates found in [SupportedDisplayModes](#).

PresentationParameters.MultiSampleQuality Property

Gets or sets a value indicating the multisample quality level.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MultiSampleQuality { get; set; }
```

Property Value

The multisample quality level. The valid range is from 0 to one less than the value returned by [CheckDeviceMultiSampleType](#).

Remarks

Paired values of render targets or of depth-stencil surfaces and [MultiSampleType](#) must match.

Example

Use the [PreparingDeviceSettings](#) event to set **MultiSampleQuality** after calling [CheckDeviceMultiSampleType](#):

C#

```
void graphics_PreparingDeviceSettings(object sender,
    PreparingDeviceSettingsEventArgs e)
{
    // Xbox 360 and most PCs support FourSamples/0
    // (4x) and TwoSamples/0 (2x) antialiasing.
    PresentationParameters pp =
        e.GraphicsDeviceInformation.PresentationParameters;

    #if XBOX
        pp.MultiSampleQuality = 0;
        pp.MultiSampleType = MultiSampleType.FourSamples;
        return;
    #else
        int quality = 0;
        GraphicsAdapter adapter = e.GraphicsDeviceInformation.Adapter;
        SurfaceFormat format = adapter.CurrentDisplayMode.Format;
        // Check for 4xAA
        if (adapter.CheckDeviceMultiSampleType(DeviceType.Hardware, format,
            false, MultiSampleType.FourSamples, out quality))
        {
            // even if a greater quality is returned, we only want quality 0
            pp.MultiSampleQuality = 0;
            pp.MultiSampleType =
                MultiSampleType.FourSamples;
        }
        // Check for 2xAA
        else if (adapter.CheckDeviceMultiSampleType(DeviceType.Hardware,
            format, false, MultiSampleType.TwoSamples, out quality))
        {
            // even if a greater quality is returned, we only want quality 0
            pp.MultiSampleQuality = 0;
            pp.MultiSampleType =
                MultiSampleType.TwoSamples;
        }
        return;
    #endif
}
```

PresentationParameters.MultiSampleType Property

Gets or sets the multisample type.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public MultiSampleType MultiSampleType { get; set; }
```

Property Value

The multisample type. Must be [MultiSampleType.None](#) unless [SwapEffect](#) has been set to [SwapEffect.Discard](#). Multisampling is supported only if [SwapEffect](#) is [SwapEffect.Discard](#).

Remarks

⚠Caution

In cases where the size of the back buffer and depth stencil buffer exceed the size of the Xbox 360 10 MB of embedded memory (EDRAM), the platform uses [predicated tiling](#) to compensate for the additional memory requirements. Predicated tiling renders scenes performed multiple times on subsections of the final render target dimensions. The multisampling chosen with the **MultiSampleType** property directly affects the size of the back buffer and may trigger predicated tiling.

Example

Use the [PreparingDeviceSettings](#) event to set **MultiSampleType** after calling [CheckDeviceMultiSampleType](#):

C#

```
void graphics_PreparingDeviceSettings(object sender,
    PreparingDeviceSettingsEventArgs e)
{
    // Xbox 360 and most PCs support FourSamples/0
    // (4x) and TwoSamples/0 (2x) antialiasing.
    PresentationParameters pp =
        e.GraphicsDeviceInformation.PresentationParameters;
#if XBOX
    pp.MultiSampleQuality = 0;
    pp.MultiSampleType = MultiSampleType.FourSamples;
    return;
#else
    int quality = 0;
    GraphicsAdapter adapter = e.GraphicsDeviceInformation.Adapter;
    SurfaceFormat format = adapter.CurrentDisplayMode.Format;
    // Check for 4xAA
    if (adapter.CheckDeviceMultiSampleType(DeviceType.Hardware, format,
        false, MultiSampleType.FourSamples, out quality))
    {
        // even if a greater quality is returned, we only want quality 0
        pp.MultiSampleQuality = 0;
        pp.MultiSampleType =
            MultiSampleType.FourSamples;
    }
    // Check for 2xAA
    else if (adapter.CheckDeviceMultiSampleType(DeviceType.Hardware,
        format, false, MultiSampleType.TwoSamples, out quality))
    {
        // even if a greater quality is returned, we only want quality 0
        pp.MultiSampleQuality = 0;
        pp.MultiSampleType =
            MultiSampleType.TwoSamples;
    }
    return;
#endif
}
```

PresentationParameters.SwapEffect Property

Gets or sets the swap effect.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SwapEffect SwapEffect { get; set; }
```

Property Value

The swap effect to use.

Remarks

The runtime will guarantee the implied semantics concerning buffer swap behavior. Therefore, if [IsFullScreen](#) is **false** and [SwapEffect](#) is set to [SwapEffect.Flip](#), the runtime will create one extra back buffer and copy whichever becomes the front buffer at presentation time.

[SwapEffect.Copy](#) requires that [BackBufferCount](#) be set to 1.

[SwapEffect.Discard](#) will be enforced in the debug runtime by filling any buffer with noise after it is presented.

PresentInterval Enumeration

Defines flags that describe the relationship between the adapter refresh rate and the rate at which [Present](#) operations are completed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum PresentInterval
```

Members

Member name	Description
Default	Equivalent to setting One .
One	The driver waits for the vertical retrace period (the runtime will beam trace to prevent tearing). Present operations are not affected more frequently than the screen refresh rate; the runtime completes one Present operation per adapter refresh period, at most. This option is always available for both windowed and full-screen swap chains.
Two	The driver waits for the vertical retrace period. Present operations are not affected more frequently than every second screen refresh. Check the PresentInterval property to determine whether the driver supports this option.
Three	The driver waits for the vertical retrace period. Present operations are not affected more frequently than every third screen refresh. Check the PresentInterval property to determine whether the driver supports this option.
Four	The driver waits for the vertical retrace period. Present operations are not affected more frequently than every fourth screen refresh. Check the PresentInterval property to determine whether the driver supports this option.
Immediate	The runtime updates the window client area immediately, and might do so more than once during the adapter refresh period. Present operations might be affected immediately. This option is always available for both windowed and full-screen swap chains.

PresentOptions Enumeration

Defines flags that control the behavior of the back buffer and depth buffer.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[FlagsAttribute]
public enum PresentOptions
```

Members

Member name	Description
DeviceClip	Clips a windowed Present blit into the window client area, within the monitor screen area of the video adapter that created the Microsoft Direct3D device. This flag works only on Microsoft Windows 2000 and Windows XP.
DiscardDepthStencil	<p>Enables depth-buffer discarding if set when the device or swap chain is created. When this flag is set, the contents of the depth stencil buffer are invalid after either Present or DepthStencilBuffer is called.</p> <p>Discarding depth-buffer data can increase performance and is dependent on the driver. The debug runtime enforces discarding by clearing the depth-buffer to some constant value after calling either Present or DepthStencilBuffer with a different depth surface.</p> <p>Discarding depth-buffer data is illegal for all lockable formats, DepthFormat.Depth16Lockable, and DepthFormat.Depth32Lockable. Using the GraphicsDevice constructor to specify a lockable format and depth-buffer discarding will result in failure.</p>
None	Use no presentation flags.
Video	Informs the driver that the back buffers contain video data.

PrimitiveType Enumeration

Defines how data in a vertex stream is interpreted during a draw call.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum PrimitiveType
```

Members

Member name	Description
LineList	Renders the vertices as a list of isolated straight line segments; the count may be any positive integer.
LineStrip	Renders the vertices as a single polyline; the count may be any positive integer.
PointList	Renders the vertices as a collection of isolated points. This value is unsupported for indexed primitives.
TriangleFan	Renders the vertices as a triangle fan.
TriangleList	Renders the specified vertices as a sequence of isolated triangles. Each group of three vertices defines a separate triangle. Back-face culling is affected by the current winding-order render state.
TriangleStrip	Renders the vertices as a triangle strip. The back-face culling flag is flipped automatically on even-numbered triangles.

Remarks Using triangle strips or triangle fans is often more efficient than using triangle lists because fewer vertices are duplicated.

QueryUsages Enumeration

Defines options for querying device resource formats.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[FlagsAttribute]
public enum QueryUsages
```

Members

Member name	Description
Filter	Query the resource format to see if it supports texture filter types other than TextureFilter.Point (which is always supported).
None	No option specified.
PostPixelShaderBlending	Query the resource to verify support for post pixel shader blending support, including alpha test, pixel fog, render-target blending, color write enable, and dithering.
SrgbRead	Query the resource to verify if a texture supports gamma correction during a read operation.
SrgbWrite	Query the resource to verify if a texture supports gamma correction during a write operation.
VertexTexture	Query the resource to verify support for vertex shader texture sampling.
WrapAndMip	Query the resource to verify support for texture wrapping and mipmapping.

RasterStatus.InVerticalBlank Property

Gets the status of the vertical blank period.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool InVerticalBlank { get; }
```

Property Value

true if the raster is in the vertical blank period; **false** otherwise.

See Also

Reference

[RasterStatus Structure](#)

[RasterStatus Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

RasterStatus.ScanLine Property

Gets a value that roughly corresponds to the current scan line painted by the raster.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int ScanLine { get; }
```

Property Value

Integer that roughly corresponds to the current scan line to set or retrieve.

Remarks

If [InVerticalBlank](#) is **false**, this property's value is an integer that roughly corresponds to the current scan line painted by the raster. Scan lines are numbered in the same way as Microsoft Direct3D surface coordinates: 0 is the top of the primary surface, extending to the value (height of the surface - 1) at the bottom of the display.

If [InVerticalBlank](#) is **true**, this value is set to 0 and can be ignored.

RenderState Members

The following tables list the members exposed by the RenderState type.

Public Properties

Name	Description
 AlphaBlendEnable	Gets or sets a value to enable alpha-blended transparency. The default value is false.
 AlphaBlendOperation	Gets or sets the arithmetic operation applied to separate alpha blending. The default is BlendFunction.Add .
 AlphaDestinationBlend	Gets or sets the separate alpha channel blending factor. This factor represents a destination value by which to multiply the alpha channel only. The default is Blend.One .
 AlphaFunction	Gets or sets the comparison function for the alpha test. The default is CompareFunction.Always .
 AlphaSourceBlend	Gets or sets the separate alpha channel blending factor. This factor represents a value by which to multiply the alpha channel only. The default is Blend.One .
 AlphaTestEnable	Gets or sets a render state that enables a per-pixel alpha test. The default value is false.
 BlendFactor	Gets or sets the color used for a constant-blend factor during alpha blending. The default is Color.White .
 BlendFunction	Gets or sets a value to select the arithmetic operation to apply to the source and destination pixel components when AlphaBlendEnable is set to true. The default is BlendFunction.Add .
 ColorWriteChannels	Gets or sets a value that enables a per-channel write for the render target color buffer. The default value is ColorWriteChannels.None .
 ColorWriteChannels1	Gets or sets a value that enables a per-channel write for the render target color buffer. The default value is ColorWriteChannels.None .
 ColorWriteChannels2	Gets or sets a value that enables a per-channel write for the render target color buffer. The default value is ColorWriteChannels.None .
 ColorWriteChannels3	Gets or sets a value that enables a per-channel write for the render target color buffer. The default value is ColorWriteChannels.None .
 CounterClockwiseStencilDepthBufferFail	Gets or sets the stencil operation to perform if the stencil test passes and the depth-buffer test fails for a counterclockwise triangle. The default is StencilOperation.Keep .
 CounterClockwiseStencilFail	Gets or sets the stencil operation to perform if the stencil test fails for a counterclockwise triangle. The default is StencilOperation.Keep .
 CounterClockwiseStencilFunction	Gets or sets the comparison function to use for counterclockwise stencil tests. The default is CompareFunction.Always .
 CounterClockwiseStencilPass	Gets or sets the stencil operation to perform if the stencil and z-tests pass for a counterclockwise triangle. The default is StencilOperation.Keep .
 CullMode	Specifies how back-facing triangles are culled, if at all. The default value is CullMode.CounterClockwise .
 DepthBias	Sets or retrieves the depth bias for polygons. The default value is 0.
 DepthBufferEnable	Enables or disables depth buffering. The default is true.
 DepthBufferFunction	Gets or sets the comparison function for the depth-buffer test. The default is CompareFunction.LessEqual .
 DepthBufferWriteEnable	Enables or disables writing to the depth buffer. The default is true.
 DestinationBlend	Gets or sets the color blending factor. This factor represents a value by which to multiply the destination pixel color before adding it to the source pixel to produce a color that is a blend of the two. The default is Blend.Zero .
 FillMode	Represents the fill mode. The default is FillMode.Solid .
 FogColor	Gets or sets the fog color. The default value is Color.TransparentBlack .
 FogDensity	Gets or sets the fog density for pixel or vertex fog used in exponential fog modes. The default value is 1.0f.
 FogEnable	Enables or disables fog blending. The default is false.
FogEnd	Gets or sets the depth at which pixel or vertex fog effects end for linear fog mode. The default value is 1.0f.
FogStart	Gets or sets the depth at which pixel or vertex fog effects begin for linear fog mode. The default value is 0.0f.
FogTableMode	Gets or sets the fog formula to use for pixel fog. The default is None .
FogVertexMode	Gets or sets the fog formula to use for vertex fog. The default is FogMode.None .

 MultiSampleAntiAlias	Enables or disables multisample antialiasing. The default is true.
 MultiSampleMask	Gets or sets a bitmask controlling modification of the samples in a multisample render target. The default is 0xffffffff.
 PointSize	Gets or sets the size to use for point size computation in cases where point size is not specified for each vertex. The default value is the value a driver returns. If a driver returns 0 or 1, the default value is 64, which allows software point size emulation.
 PointSizeMax	Gets or sets the maximum size of point primitives. The default is 64.0f.
 PointSizeMin	Gets or sets the minimum size of point primitives. The default is 1.0f.
 PointSpriteEnable	Enables or disables full texture mapping on each point. The default is false.
 RangeFogEnable	Gets or sets enabling of range-based vertex fog. The default value is false.
 ReferenceAlpha	Specifies a reference alpha value against which pixels are tested when alpha testing is enabled. The default value is 0.
 ReferenceStencil	Specifies a reference value to use for the stencil test. The default is 0.
 ScissorTestEnable	Enables or disables scissor testing. The default is false.
 SeparateAlphaBlendEnabled	Enables or disables the separate blend mode for the alpha channel. The default is false.
 SlopeScaleDepthBias	Gets or sets a value used to determine how much bias can be applied to coplanar primitives to reduce flinmering z-fighting. The default is 0.
 SourceBlend	Gets or sets the color blending factor. This factor represents a value by which to multiply the source pixel color before adding it to the destination pixel to produce a color that is a blend of the two. The default is Blend.One .
 StencilDepthBufferFail	Gets or sets the stencil operation to perform if the stencil test passes and the depth-test fails. The default is StencilOperation.Keep .
 StencilEnable	Gets or sets stencil enabling. The default is false.
 StencilFail	Gets or sets the stencil operation to perform if the stencil test fails. The default is StencilOperation.Keep .
 StencilFunction	Gets or sets the comparison function for the stencil test. The default is CompareFunction.Always .
 StencilMask	Gets or sets the mask applied to the reference value and each stencil buffer entry to determine the significant bits for the stencil test. The default mask is Int32.MaxValue.
 StencilPass	Gets or sets the stencil operation to perform if the stencil test passes. The default is StencilOperation.Keep .
 StencilWriteMask	Gets or sets the write mask applied to values written into the stencil buffer. The default mask is Int32.MaxValue.
 TwoSidedStencilMode	Enables or disables two-sided stenciling. The default is false.
 Wrap0	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap1	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap10	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap11	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap12	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap13	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap14	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap15	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap2	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap3	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).

 Wrap4	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap5	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap6	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap7	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap8	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap9	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).

RenderState Properties

Public Properties

Name	Description
 AlphaBlendEnable	Gets or sets a value to enable alpha-blended transparency. The default value is false.
 AlphaBlendOperation	Gets or sets the arithmetic operation applied to separate alpha blending. The default is BlendFunction.Add .
 AlphaDestinationBlend	Gets or sets the separate alpha channel blending factor. This factor represents a destination value by which to multiply the alpha channel only. The default is Blend.One .
 AlphaFunction	Gets or sets the comparison function for the alpha test. The default is CompareFunction.Always .
 AlphaSourceBlend	Gets or sets the separate alpha channel blending factor. This factor represents a value by which to multiply the alpha channel only. The default is Blend.One .
 AlphaTestEnable	Gets or sets a render state that enables a per-pixel alpha test. The default value is false.
 BlendFactor	Gets or sets the color used for a constant-blend factor during alpha blending. The default is Color.White .
 BlendFunction	Gets or sets a value to select the arithmetic operation to apply to the source and destination pixel components when AlphaBlendEnable is set to true. The default is BlendFunction.Add .
 ColorWriteChannels	Gets or sets a value that enables a per-channel write for the render target color buffer. The default value is ColorWriteChannels.None .
 ColorWriteChannels1	Gets or sets a value that enables a per-channel write for the render target color buffer. The default value is ColorWriteChannels.None .
 ColorWriteChannels2	Gets or sets a value that enables a per-channel write for the render target color buffer. The default value is ColorWriteChannels.None .
 ColorWriteChannels3	Gets or sets a value that enables a per-channel write for the render target color buffer. The default value is ColorWriteChannels.None .
 CounterClockwiseStencilDepthBufferFail	Gets or sets the stencil operation to perform if the stencil test passes and the depth-buffer test fails for a counterclockwise triangle. The default is StencilOperation.Keep .
 CounterClockwiseStencilFail	Gets or sets the stencil operation to perform if the stencil test fails for a counterclockwise triangle. The default is StencilOperation.Keep .
 CounterClockwiseStencilFunction	Gets or sets the comparison function to use for counterclockwise stencil tests. The default is CompareFunction.Always .
 CounterClockwiseStencilPass	Gets or sets the stencil operation to perform if the stencil and z-tests pass for a counterclockwise triangle. The default is StencilOperation.Keep .
 CullMode	Specifies how back-facing triangles are culled, if at all. The default value is CullMode.CounterClockwise .
 DepthBias	Sets or retrieves the depth bias for polygons. The default value is 0.
 DepthBufferEnable	Enables or disables depth buffering. The default is true.
 DepthBufferFunction	Gets or sets the comparison function for the depth-buffer test. The default is CompareFunction.LessEqual .
 DepthBufferWriteEnable	Enables or disables writing to the depth buffer. The default is true.
 DestinationBlend	Gets or sets the color blending factor. This factor represents a value by which to multiply the destination pixel color before adding it to the source pixel to produce a color that is a blend of the two. The default is Blend.Zero .
 FillMode	Represents the fill mode. The default is FillMode.Solid .
 FogColor	Gets or sets the fog color. The default value is Color.TransparentBlack .
 FogDensity	Gets or sets the fog density for pixel or vertex fog used in exponential fog modes. The default value is 1.0f.
 FogEnable	Enables or disables fog blending. The default is false.
 FogEnd	Gets or sets the depth at which pixel or vertex fog effects end for linear fog mode. The default value is 1.0f.
FogStart	Gets or sets the depth at which pixel or vertex fog effects begin for linear fog mode. The default value is 0.0f.
FogTableMode	Gets or sets the fog formula to use for pixel fog. The default is None .
FogVertexMode	Gets or sets the fog formula to use for vertex fog. The default is FogMode.None .
MultiSampleAntiAlias	Enables or disables multisample antialiasing. The default is true.

 MultiSampleMask	Gets or sets a bitmask controlling modification of the samples in a multisample render target. The default is <code>0xffffffff</code> .
 PointSize	Gets or sets the size to use for point size computation in cases where point size is not specified for each vertex. The default value is the value a driver returns. If a driver returns 0 or 1, the default value is 64, which allows software point size emulation.
 PointSizeMax	Gets or sets the maximum size of point primitives. The default is 64.0f.
 PointSizeMin	Gets or sets the minimum size of point primitives. The default is 1.0f.
 PointSpriteEnable	Enables or disables full texture mapping on each point. The default is false.
 RangeFogEnable	Gets or sets enabling of range-based vertex fog. The default value is false.
 ReferenceAlpha	Specifies a reference alpha value against which pixels are tested when alpha testing is enabled. The default value is 0.
 ReferenceStencil	Specifies a reference value to use for the stencil test. The default is 0.
 ScissorTestEnable	Enables or disables scissor testing. The default is false.
 SeparateAlphaBlendEnabled	Enables or disables the separate blend mode for the alpha channel. The default is false.
 SlopeScaleDepthBias	Gets or sets a value used to determine how much bias can be applied to coplanar primitives to reduce flickering z-fighting. The default is 0.
 SourceBlend	Gets or sets the color blending factor. This factor represents a value by which to multiply the source pixel color before adding it to the destination pixel to produce a color that is a blend of the two. The default is <code>Blend.One</code> .
 StencilDepthBufferFail	Gets or sets the stencil operation to perform if the stencil test passes and the depth-test fails. The default is <code>StencilOperation.Keep</code> .
 StencilEnable	Gets or sets stencil enabling. The default is false.
 StencilFail	Gets or sets the stencil operation to perform if the stencil test fails. The default is <code>StencilOperation.Keep</code> .
 StencilFunction	Gets or sets the comparison function for the stencil test. The default is <code>CompareFunction.Always</code> .
 StencilMask	Gets or sets the mask applied to the reference value and each stencil buffer entry to determine the significant bits for the stencil test. The default mask is <code>Int32.MaxValue</code> .
 StencilPass	Gets or sets the stencil operation to perform if the stencil test passes. The default is <code>StencilOperation.Keep</code> .
 StencilWriteMask	Gets or sets the write mask applied to values written into the stencil buffer. The default mask is <code>Int32.MaxValue</code> .
 TwoSidedStencilMode	Enables or disables two-sided stenciling. The default is false.
 Wrap0	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).
 Wrap1	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).
 Wrap10	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).
 Wrap11	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).
 Wrap12	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).
 Wrap13	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).
 Wrap14	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).
 Wrap15	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).
 Wrap2	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).
 Wrap3	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).
 Wrap4	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is <code>TextureWrapCoordinates.Zero</code> (wrapping disabled in all directions).

 Wrap5	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap6	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap7	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap8	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).
 Wrap9	Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is TextureWrapCoordinates.Zero (wrapping disabled in all directions).

RenderState.AlphaBlendEnable Property

Gets or sets a value to enable alpha-blended transparency. The default value is **false**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool AlphaBlendEnable { get; set; }
```

Property Value

true if alpha-blended transparency is enabled; **false** otherwise.

Remarks

The alpha value of a color controls its transparency. Enabling alpha blending with [AlphaBlendEnable](#) allows colors, materials, and textures on a surface to be blended with transparency onto another surface.

Alpha blending is determined by the [SourceBlend](#) and [DestinationBlend](#) properties. With the default [BlendFunction](#), the source pixel times the [SourceBlend](#) is added to the destination pixel (the pixel on the back buffer) times the [DestinationBlend](#) to produce a color that is a blend of the two pixel colors. The [BlendFunction](#) determines the operation used on the outcome of the source blend and destination blend components.

Example

The following short code snippet sets the render state to use additive alpha blending prior to a draw call.

C#

```
graphics.GraphicsDevice.RenderState.AlphaBlendEnable = true;
graphics.GraphicsDevice.RenderState.SourceBlend = Blend.One;
graphics.GraphicsDevice.RenderState.DestinationBlend = Blend.One;
graphics.GraphicsDevice.RenderState.BlendFunction = BlendFunction.Add;

// TODO: Place the drawing calls that should be alpha blended here.
```

RenderState.AlphaBlendOperation Property

Gets or sets the arithmetic operation applied to separate alpha blending. The default is [BlendFunction.Add](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public BlendFunction AlphaBlendOperation { get; set; }
```

Property Value

A value from the [BlendFunction](#) enumeration.

Remarks

This value is ignored unless [SeparateAlphaBlendEnabled](#) is **true**.

⚠ Caution

This value is used for blending the alpha channel only, not for alpha blending of the entire pixel. For setting the blending mode for alpha blending operation, see [BlendFunction](#).

RenderState.AlphaDestinationBlend Property

Gets or sets the separate alpha channel blending factor. This factor represents a destination value by which to multiply the alpha channel only. The default is [Blend.One](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Blend AlphaDestinationBlend { get; set; }
```

Property Value

A value from the [Blend](#) enumeration. **BothSourceAlpha** and **BothInverseSourceAlpha** are not supported on Xbox 360.

Remarks

This value is ignored unless [SeparateAlphaBlendEnabled](#) is **true**.

⚠ Caution

This value is used for blending the alpha channel only, not for alpha blending of the entire pixel. For setting the blending mode for alpha blending of the destination color, see [DestinationBlend](#).

RenderState.AlphaFunction Property

Gets or sets the comparison function for the alpha test. The default is [CompareFunction.Always](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public CompareFunction AlphaFunction { get; set; }
```

Property Value

A member of the [CompareFunction](#) enumeration that represents the comparison function to set or get.

See Also

RenderState.AlphaSourceBlend Property

Gets or sets the separate alpha channel blending factor. This factor represents a value by which to multiply the alpha channel only. The default is [Blend.One](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Blend AlphaSourceBlend { get; set; }
```

Property Value

A value from the [Blend](#) enumeration.

Remarks

⚠Caution

This value is used for blending the alpha channel only, not for alpha blending of the entire pixel. For setting the blending mode for alpha blending of the source color, see [SourceBlend](#).

This value is ignored unless [SeparateAlphaBlendEnabled](#) is **true**.

RenderState.AlphaTestEnable Property

Gets or sets a render state that enables a per-pixel alpha test. The default value is **false**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool AlphaTestEnable { get; set; }
```

Property Value

true if per-pixel alpha blending is enabled; **false** otherwise.

Remarks

If the test passes, the pixel is processed by the frame buffer. Otherwise, all frame-buffer processing is skipped for the pixel. The test is done by comparing the incoming alpha value with the reference alpha value, using the comparison function provided by [AlphaFunction](#). The reference alpha value is determined by the value set for [ReferenceAlpha](#).

RenderState.BlendFactor Property

Gets or sets the color used for a constant-blend factor during alpha blending. The default is [Color.White](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Color BlendFactor { get; set; }
```

Property Value

The color used for a constant-blend factor during alpha blending.

Remarks

Blend factoring during alpha blending is available if [SupportsBlendFactor](#) or [SupportsBlendFactor](#) is **true**.

RenderState.BlendFunction Property

Gets or sets a value to select the arithmetic operation to apply to the source and destination pixel components when [AlphaBlendEnable](#) is set to **true**. The default is [BlendFunction.Add](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public BlendFunction BlendFunction { get; set; }
```

Property Value

The blending operation to set or get.

Remarks

The alpha value of a color controls its transparency. Enabling alpha blending with [AlphaBlendEnable](#) allows colors, materials, and textures on a surface to be blended with transparency onto another surface.

Alpha blending is determined by the [SourceBlend](#) and [DestinationBlend](#) properties. With the default [BlendFunction](#), the source pixel times the [SourceBlend](#) is added to the destination pixel (the pixel on the back buffer) times the [DestinationBlend](#) to produce a color that is a blend of the two pixel colors. The [BlendFunction](#) determines the operation used on the outcome of the source blend and destination blend components.

Example

The following short code snippet sets the render state to use additive alpha blending prior to a draw call.

C#

```
graphics.GraphicsDevice.RenderState.AlphaBlendEnable = true;
graphics.GraphicsDevice.RenderState.SourceBlend = Blend.One;
graphics.GraphicsDevice.RenderState.DestinationBlend = Blend.One;

RenderState.ColorWriteChannels Property

Gets or sets a value that enables a per-channel write for the render target color buffer. The default value is [ColorWriteChannels.None](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ColorWriteChannels ColorWriteChannels { get; set; }
```

Property Value

Value of the [ColorWriteChannels](#) enumeration that specifies the color channel to set or get.

Remarks

Color writing is available if [SupportsColorWrite](#) is **true**.

[CounterClockwiseStencilDepthBufferFail](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

RenderState.CullMode Property

Specifies how back-facing triangles are culled, if at all. The default value is [CullMode.CounterClockwise](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public CullMode CullMode { get; set; }
```

Property Value

The culling mode to set or get.

Remarks

When drawing sprites, [SpriteBatch.Begin](#) does not save your current render state, and will change certain render state properties that may make 3D objects render incorrectly. This includes setting **CullMode** to [CullMode.CullCounterClockwiseFace](#). You can choose to either reset the render state yourself after the call to [SpriteBatch.End](#), or call [SpriteBatch.Begin](#) and pass in [SaveStateMode.SaveState](#), which will restore the render state after sprites are drawn.

RenderState.DepthBias Property

Sets or retrieves the depth bias for polygons. The default value is 0.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float DepthBias { get; set; }
```

Property Value

Depth bias for polygons.

Remarks

This property specifies a value in the range of 0 through 16 (inclusive). This value is used to make polygons that are physically coplanar appear separate.

Polygons with a high z-bias value appear in front of polygons with a lower value, without requiring sorting for drawing order. For example, polygons with a value of 1 appear in front of polygons with a value of 0.

RenderState.DepthBufferEnable Property

Enables or disables depth buffering. The default is **true**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool DepthBufferEnable { get; set; }
```

Property Value

true if depth buffering is enabled; **false** otherwise.

See Also

Reference

[RenderState Class](#)

[RenderState Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

RenderState.DepthBufferFunction Property

Gets or sets the comparison function for the depth-buffer test. The default is [CompareFunction.LessEqual](#)

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public CompareFunction DepthBufferFunction { get; set; }
```

Property Value

Value of a [CompareFunction](#) that represents the comparison function to set or get.

Remarks

The depth value of the pixel is compared to the depth-buffer value. If the depth value of the pixel passes the comparison function, the pixel is written.

See Also

Reference

[RenderState Class](#)

[RenderState Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

RenderState.DepthBufferWriteEnable Property

Enables or disables writing to the depth buffer. The default is **true**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool DepthBufferWriteEnable { get; set; }
```

Property Value

true if writing to the depth buffer is enabled; **false** otherwise.

Remarks

This property enables an application to prevent the system from updating the depth buffer with new depth values.

If **false**, depth comparisons are still made according to the render state [DepthBufferFunction](#), assuming that depth buffering is taking place, but depth values are not written to the buffer.

See Also

Reference

Platforms Xbox 360, Windows XP SP2, Windows Vista

RenderState.DestinationBlend Property

Gets or sets the color blending factor. This factor represents a value by which to multiply the destination pixel color before adding it to the source pixel to produce a color that is a blend of the two. The default is [Blend.Zero](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Blend DestinationBlend { get; set; }
```

Property Value

A [Blend](#) factor to set or get for the destination pixel.

Remarks

The alpha value of a color controls its transparency. Enabling alpha blending with [AlphaBlendEnable](#) allows colors, materials, and textures on a surface to be blended with transparency onto another surface.

Alpha blending is determined by the [SourceBlend](#) and [DestinationBlend](#) properties. With the default [BlendFunction](#), the source pixel times the [SourceBlend](#) is added to the destination pixel (the pixel on the back buffer) times the [DestinationBlend](#) to produce a color that is a blend of the two pixel colors. The [BlendFunction](#) determines the operation used on the outcome of the source blend and destination blend components.

Example

The following short code snippet sets the render state to use additive alpha blending prior to a draw call.

C#

```
graphics.GraphicsDevice.RenderState.AlphaBlendEnable = true;  
graphics.GraphicsDevice.RenderState.SourceBlend = Blend.One;  
graphics.GraphicsDevice.RenderState.DestinationBlend = Blend.One;  
graphics.GraphicsDevice.RenderState.BlendFunction = BlendFunction.Add;  
  
// TODO: Place the drawing calls that should be alpha blended here.
```

RenderState.FogColor Property

Note

This property is available only when developing for Windows.

Gets or sets the fog color. The default value is [Color.TransparentBlack](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Color FogColor { get; set; }
```

Property Value

A color that specifies the fog color to set or get.

RenderState.FogDensity Property

Note

This property is available only when developing for Windows.

Gets or sets the fog density for pixel or vertex fog used in exponential fog modes. The default value is 1.0f.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float FogDensity { get; set; }
```

Property Value

Value that represents the fog density to set or get.

Remarks

Valid fog density values range from 0.0 through 1.0.

RenderState.FogEnd Property

Note

This property is available only when developing for Windows.

Gets or sets the depth at which pixel or vertex fog effects end for linear fog mode. The default value is 1.0f.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float FogEnd { get; set; }
```

Property Value

Value that represents the ending depth to set or get.

Remarks

Depth is specified in world space for vertex fog, and in either device space [0.0, 1.0] or world space for pixel fog. For pixel fog, these values are in device space when the system uses z for fog calculations, or in world space when the system uses eye-relative fog (w-fog).

Note

This property is available only when developing for Windows.

Gets or sets the depth at which pixel or vertex fog effects begin for linear fog mode. The default value is 0.0f.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float FogStart { get; set; }
```

Property Value

Value that represents the beginning depth to set or get.

Remarks

Depth is specified in world space for vertex fog, and in either device space [0.0, 1.0] or world space for pixel fog. For pixel fog, these values are in device space when the system uses z for fog calculations, or in world space when the system uses eye-relative fog (w-fog).

RenderState.MultiSampleAntiAlias Property

Enables or disables multisample antialiasing. The default is **true**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool MultiSampleAntiAlias { get; set; }
```

Property Value

true to enable multisample antialiasing; **false** otherwise.

Remarks

When multisample antialiasing is enabled, the multiple samples are computed so that full-scene antialiasing is performed by sampling at different sample positions for each multiple sample. When disabled, the multiple samples are all written with the same sample value, sampled at the pixel center, which allows non-antialiased rendering to a multisample buffer. This render state has no effect when rendering to a single sample buffer.

See Also

Reference

[RenderState Class](#)

[RenderState Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

RenderState.MultiSampleMask Property

Gets or sets a bitmask controlling modification of the samples in a multisample render target. The default is 0xffffffff.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MultiSampleMask { get; set; }
```

Property Value

A bitmask value controlling write enables for the samples. Each bit in this mask, starting at the least-significant bit, controls modification of one of the samples in a multisample render target. Thus, for an 8-sample render target, the low byte contains the eight write enables for each of the eight samples. This render state has no effect when rendering to a single sample buffer.

Remarks

This render state enables use of a multisample buffer as an accumulation buffer, doing multipass rendering of geometry where each pass updates a subset of samples.

Given n multisamples and k enabled samples, the resulting intensity of the rendered image should be k/n . Each component RGB of every pixel is factored by k/n .

RenderState.PointSize Property

Gets or sets the size to use for point size computation in cases where point size is not specified for each vertex. The default value is the value a driver returns. If a driver returns 0 or 1, the default value is 64, which allows software point size emulation.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float PointSize { get; set; }
```

Property Value

This value is in world space units.

RenderState.PointSizeMax Property

Gets or sets the maximum size of point primitives. The default is 64.0f.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float PointSizeMax { get; set; }
```

Property Value

The maximum size of point primitives. Must be less than or equal to [Capabilities.MaxPointSize](#) and greater than or equal to [PointSizeMin](#).

See Also

Reference

[RenderState Class](#)

[RenderState Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

RenderState.PointSizeMin Property

Gets or sets the minimum size of point primitives. The default is 1.0f.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float PointSizeMin { get; set; }
```

Property Value

The minimum size of point primitives.

Remarks

Point primitives are clamped to this size during rendering. Setting this to values smaller than 1.0 results in points dropping out when the point does not cover a pixel center and antialiasing is disabled or, when antialiasing is enabled, being rendered with reduced intensity.

RenderState.PointSpriteEnable Property

Enables or disables full texture mapping on each point. The default is **false**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool PointSpriteEnable { get; set; }
```

Property Value

true to set texture coordinates of point primitives so that full textures are mapped on each point; **false** otherwise. When **false**, the vertex texture coordinates are used for the entire point.

See Also

RenderState.RangeFogEnable Property

Note

This property is available only when developing for Windows.

Gets or sets enabling of range-based vertex fog. The default value is **false**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool RangeFogEnable { get; set; }
```

Property Value

true if range-based vertex fog is enabled; **false** otherwise. If **false**, depth-based fog is used.

Remarks

In range-based fog, the distance of an object from the viewer is used to compute fog effects, not the depth of the object in the scene. In range-based fog, all fog methods work as usual, except that they use range instead of depth in the computations.

Range is the correct factor to use for fog computations, but depth is commonly used instead because range is time-consuming to compute and depth is generally already available. Using depth to calculate fog has the undesirable effect of having the fogginess of peripheral objects change as the viewer's eye moves - in this case, the depth changes and the range remains constant.

Because no hardware currently supports per-pixel range-based fog, range correction is offered only for vertex fog.

RenderState.ReferenceAlpha Property

Specifies a reference alpha value against which pixels are tested when alpha testing is enabled. The default value is 0.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int ReferenceAlpha { get; set; }
```

Property Value

Integer that specifies the reference alpha value to set or get. This is an 8-bit value placed in the low 8 bits of the DWORD render-state value. Values can range from 0x00000000 through 0x000000FF.

See Also

RenderState.ReferenceStencil Property

Specifies a reference value to use for the stencil test. The default is 0.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int ReferenceStencil { get; set; }
```

Property Value

Integer that specifies the stencil test value to set or get.

Remarks

The reference value is compared, by the comparison function specified by the [StencilFunction](#) property, to the stencil buffer entry of a pixel. This can be illustrated by a simple equation:

$$\text{ReferenceStencil} \text{ StencilFunction} (\textit{stencil buffer entry})$$

This comparison applies only to the bits in the reference value and stencil buffer entry that are set in the stencil mask by this property. If the comparison is true, the stencil test passes and the pass operation (specified by the [StencilPass](#) property) is performed.

RenderState.ScissorTestEnable Property

Enables or disables scissor testing. The default is **false**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool ScissorTestEnable { get; set; }
```

Property Value

true to enable scissor testing; **false** otherwise.

Remarks

With scissor testing enabled, the graphics device will only draw onto parts of the screen that fall within the specified [ScissorRectangle](#).

See Also

Reference

RenderState.SeparateAlphaBlendEnabled Property

Enables or disables the separate blend mode for the alpha channel. The default is **false**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool SeparateAlphaBlendEnabled { get; set; }
```

Property Value

true to enable the separate blend mode for the alpha channel; **false** otherwise.

Remarks

When set to **false**, the render-target blending factors and operations applied to alpha are forced to be the same as those defined for color. This mode is effectively hard-wired to **false** on implementations that don't set [SupportsSeparateAlphaBlend](#) to **true**.

The [AlphaSourceBlend](#) and [AlphaDestinationBlend](#) render states determine the type of separate alpha blending.

RenderState.SlopeScaleDepthBias Property

Gets or sets a value used to determine how much bias can be applied to coplanar primitives to reduce flimmering z-fighting. The default is 0.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float SlopeScaleDepthBias { get; set; }
```

Property Value

Value that specifies the slope scale bias to apply.

Remarks

Polygons that are coplanar in your 3D space can be made to appear as if they are not coplanar by adding a z-bias to each one. An application can help ensure that coplanar polygons are rendered properly by adding a bias to the z-values that the system uses when rendering sets of coplanar polygons.

The following formula shows how to calculate the bias to be applied to coplanar primitives.

$$\textit{bias} = (m \times \textbf{SlopeScaleDepthBias}) + \textbf{DepthBias}$$

Where m is the maximum depth slope of the triangle being rendered, defined as:

$$m = \textbf{max}(\textbf{abs}(\textit{delta z} / \textit{delta x}), \textbf{abs}(\textit{delta z} / \textit{delta y}))$$

RenderState.SourceBlend Property

Gets or sets the color blending factor. This factor represents a value by which to multiply the source pixel color before adding it to the destination pixel to produce a color that is a blend of the two. The default is [Blend.One](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Blend SourceBlend { get; set; }
```

Property Value

A [Blend](#) factor to set or get for the source pixel.

Remarks

The alpha value of a color controls its transparency. Enabling alpha blending with [AlphaBlendEnable](#) allows colors, materials, and textures on a surface to be blended with transparency onto another surface.

Alpha blending is determined by the [SourceBlend](#) and [DestinationBlend](#) properties. With the default [BlendFunction](#), the source pixel times the [SourceBlend](#) is added to the destination pixel (the pixel on the back buffer) times the [DestinationBlend](#) to produce a color that is a blend of the two pixel colors. The [BlendFunction](#) determines the operation used on the outcome of the source blend and destination blend components.

Example

The following short code snippet sets the render state to use additive alpha blending prior to a draw call.

C#

```
graphics.GraphicsDevice.RenderState.AlphaBlendEnable = true;
graphics.GraphicsDevice.RenderState.SourceBlend = Blend.One;
graphics.GraphicsDevice.RenderState.DestinationBlend = Blend.One;
graphics.GraphicsDevice.RenderState.BlendFunction = BlendFunction.Add;

// TODO: Place the drawing calls that should be alpha blended here.
```

RenderState.StencilFunction Property

Gets or sets the comparison function for the stencil test. The default is [CompareFunction.Always](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public CompareFunction StencilFunction { get; set; }
```

Property Value

Value of a [CompareFunction](#) that represents the comparison function to set or get.

Remarks

The comparison function is used to compare the reference value (stored in the [ReferenceStencil](#) property) to the stencil buffer entry of a pixel. This can be illustrated by a simple equation:

```
ReferenceStencil StencilFunction (stencil buffer entry)
```

This comparison applies only to the bits in the reference value and stencil buffer entry that are set in the stencil mask by this property. If the comparison is true, the stencil test passes and the pass operation (specified by the [StencilPass](#) property) is performed.

Gets or sets the stencil operation to perform if the stencil test passes. The default is [StencilOperation.Keep](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public StencilOperation StencilPass { get; set; }
```

Property Value

The stencil operation to perform.

See Also

Concepts

RenderState.StencilWriteMask Property

Gets or sets the write mask applied to values written into the stencil buffer. The default mask is [Int32.MaxValue](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int StencilWriteMask { get; set; }
```

Property Value

Value that represents the write mask to set or get.

Platforms Xbox 360, Windows XP SP2, Windows Vista

RenderState.TwoSidedStencilMode Property

Enables or disables two-sided stenciling. The default is **false**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool TwoSidedStencilMode { get; set; }
```

Property Value

true to enable two-sided stenciling; **false** otherwise.

Remarks

The application should set [CullMode](#) to [CullMode.None](#) to enable two-sided stencil mode. If the triangle winding order is clockwise, the [StencilFunction](#) will be used. If the winding order is counterclockwise, the [CounterClockwiseStencilFunction](#) will be used.

RenderState.Wrap0 Property

Gets or sets the texture-wrapping behavior for multiple sets of texture coordinates. The default value for this render state is [TextureWrapCoordinates.Zero](#) (wrapping disabled in all directions).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TextureWrapCoordinates Wrap0 { get; set; }
```

Property Value

Combination of values from [TextureWrapCoordinates](#) to set or get.

Remarks

Valid values for this render state can be **Zero**, **One**, or both. These cause the system to wrap in the direction of the first, second, third, and fourth dimensions, sometimes referred to as the s, t, r, and q directions, for a given texture.

RenderTarget Class

Represents a resource that will be written to at the end of a render pass. This is the base class for [RenderTarget2D](#) and [RenderTargetCube](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public abstract class RenderTarget : IDisposable
```

Remarks

After a render pass the render target contains the color information of a rendered image.

Render targets represent a linear area of display memory and usually reside in the display memory of the display card. Because of this, **RenderTarget** objects must be recreated when the device is reset.

To use a **RenderTarget**, you must:

1. Create the **RenderTarget**.

C#

```
shadowRenderTarget = GfxComponent.CreateRenderTarget(GraphicsDevice,
    1, SurfaceFormat.Single);
```

C#

```
public static RenderTarget2D CreateRenderTarget(GraphicsDevice device,
    int numberLevels, SurfaceFormat surface)
{
    MultiSampleType type =
        device.PresentationParameters.MultiSampleType;

    // If the card can't use the surface format
    if (!GraphicsAdapter.DefaultAdapter.CheckDeviceFormat(
        DeviceType.Hardware,
        GraphicsAdapter.DefaultAdapter.CurrentDisplayMode.Format,
        TextureUsage.None,
        QueryUsages.None,
        ResourceType.RenderTarget,
        surface))
    {
        // Fall back to current display format
        surface = device.DisplayMode.Format;
    }
    // Or it can't accept that surface format
    // with the current AA settings
    else if (!GraphicsAdapter.DefaultAdapter.CheckDeviceMultiSampleType(
        DeviceType.Hardware, surface,
        device.PresentationParameters.IsFullScreen, type))
    {
        // Fall back to no antialiasing
        type = MultiSampleType.None;
    }

    int width, height;

    // See if we can use our buffer size as our texture
```

```
        CheckTextureSize(device.PresentationParameters.BackBufferWidth,
            device.PresentationParameters.BackBufferHeight,
            out width, out height);

        // Create our render target
        return new RenderTarget2D(device,
            width, height, numberLevels, surface,
            type, 0);
    }
```

2. Set the **RenderTarget**.

C#

```
GraphicsDevice.SetRenderTarget(0, shadowRenderTarget);
```

3. Draw into the **RenderTarget**.

C#

```
// Render the shadow map
GraphicsDevice.Clear(Color.Black);
DrawScene(MyEffect.shadowMap);
```

4. Reset the original **RenderTarget** **null** as the default render target - i.e. the back buffer.

C#

```
// Set render target back to the back buffer
GraphicsDevice.SetRenderTarget(0, null);
```

5. Call [GetTexture](#) to retrieve the contents of the **RenderTarget**.

C#

```
// Return the shadow map as a texture
return shadowRenderTarget.GetTexture();
```

RenderTarget Members

The following tables list the members exposed by the RenderTarget type.

Public Properties

Name	Description
 Format	Gets the format of the render target.
 GraphicsDevice	Gets the graphics device associated with this render target resource.
 Height	Gets the height, in pixels, of this render target.
 IsContentLost	Gets the current state of the content on a device.
 IsDisposed	Gets a value that indicates whether the object is disposed.
 MultiSampleQuality	Gets the number of quality stops available for a given multisample type.
 MultiSampleType	Gets the levels of full-scene multisampling that the device can apply.
 Name	Gets the name of this render-target resource.
 RenderTargetUsage	Gets or sets render target usage flags.
 Tag	Gets the resource tags for this render target.
 Width	Gets the width, in pixels, of this render target.

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_ContentLost	Occurs when content is about to be lost on a GraphicsDevice .
 raise_Disposing	Raises the Disposing event when called from within a derived class.

Public Events

Name	Description
 ContentLost	Occurs when resources are lost (for example, when the current device is lost).
 Disposing	Occurs when RenderTarget.Dispose Method is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

See Also

Reference

[RenderTarget Class](#)

Reference

[RenderTarget Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

RenderTarget.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
RenderTarget.Dispose ()	Immediately releases the unmanaged resources used by this object.
RenderTarget.Dispose (Boolean)	Releases the unmanaged resources used by the RenderTarget and optionally releases the managed resources.

See Also

Reference

[RenderTarget Class](#)

[RenderTarget Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

RenderTarget.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[RenderTarget Class](#)

[RenderTarget Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

RenderTarget.Dispose Method (Boolean)

Releases the unmanaged resources used by the [RenderTarget](#) and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\] true](#) to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [RenderTarget](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

RenderTarget.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

RenderTarget.raise_ContentLost Method

Note

This method is available only when developing for Windows.

Occurs when content is about to be lost on a [GraphicsDevice](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void raise_ContentLost (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

The source of this event.

value1

The event arguments that are associated with the action that raised the event.

RenderTarget.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the [Disposing](#) event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

RenderTarget.Height Property

Gets the height, in pixels, of this render target.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Height { get; }
```

Property Value

The height, in pixels, of this render target.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

RenderTarget.IsContentLost Property

Gets the current state of the content on a device.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsContentLost { get; }
```

Property Value

true if content was lost due to device lost or similar event; otherwise **false**.

RenderTarget.IsDisposed Property

Gets a value that indicates whether the object is disposed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsDisposed { get; }
```

Property Value

true if the object is disposed; **false** otherwise.

RenderTarget Events

Public Events

	Name	Description
	Content Lost	Occurs when resources are lost (for example, when the current device is lost).
	Disposing	Occurs when RenderTarget.Dispose Method is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

See Also

Reference

[RenderTarget Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

RenderTarget.ContentLost Event

Occurs when resources are lost (for example, when the current device is lost).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public virtual event EventHandler ContentLost
```

Remarks

When **ContentLost** fires, [IsContentLost](#) is set to **true**. This property resets when the content is restored through a call to a [SetData](#) method or the rendering of a render target.

See Also

Reference

[RenderTarget Class](#)

[RenderTarget Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

RenderTarget.Disposing Event

Occurs when [RenderTarget.Dispose Method](#) is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public event EventHandler Disposing
```

Remarks [IsDisposed](#) indicates whether that object has been disposed.

Example

To add an event handler that listens for the **Disposing** event, use the following C# code.

```
obj.Disposing += new System.EventHandler( this.OnDisposing );
```

RenderTarget2D Class

Represents a 2D texture resource that will be written to at the end of a render pass.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class RenderTarget2D : RenderTarget
```

Remarks

After a render pass the render target contains the color information of a rendered image.

Render targets represent a linear area of display memory and usually reside in the display memory of the display card. Because of this, **RenderTarget2D** objects must be recreated when the device is reset.

To use a **RenderTarget2D**, you must:

1. Create the **RenderTarget2D**.

C#

```
shadowRenderTarget = GfxComponent.CreateRenderTarget(GraphicsDevice,
    1, SurfaceFormat.Single);
```

C#

```
public static RenderTarget2D CreateRenderTarget(GraphicsDevice device,
    int numberLevels, SurfaceFormat surface)
{
    MultiSampleType type =
        device.PresentationParameters.MultiSampleType;

    // If the card can't use the surface format
    if (!GraphicsAdapter.DefaultAdapter.CheckDeviceFormat(
        DeviceType.Hardware,
        GraphicsAdapter.DefaultAdapter.CurrentDisplayMode.Format,
        TextureUsage.None,
        QueryUsages.None,
        ResourceType.RenderTarget,
        surface))
    {
        // Fall back to current display format
        surface = device.DisplayMode.Format;
    }
    // Or it can't accept that surface format
    // with the current AA settings
    else if (!GraphicsAdapter.DefaultAdapter.CheckDeviceMultiSampleType(
        DeviceType.Hardware, surface,
        device.PresentationParameters.IsFullScreen, type))
    {
        // Fall back to no antialiasing
        type = MultiSampleType.None;
    }

    int width, height;

    // See if we can use our buffer size as our texture
    CheckTextureSize(device.PresentationParameters.BackBufferWidth,
```

```
        device.PresentationParameters.BackBufferHeight,
        out width, out height);

    // Create our render target
    return new RenderTarget2D(device,
        width, height, numberLevels, surface,
        type, 0);
}
```

2. Set the **RenderTarget2D**.

C#

```
GraphicsDevice.SetRenderTarget(0, shadowRenderTarget);
```

3. Draw into the **RenderTarget2D**.

C#

```
// Render the shadow map
GraphicsDevice.Clear(Color.Black);
DrawScene(MyEffect.shadowMap);
```

4. Reset the original **RenderTarget2D** **null** as the default render target - i.e. the back buffer.

C#

```
// Set render target back to the back buffer
GraphicsDevice.SetRenderTarget(0, null);
```

5. Call [GetTexture](#) to retrieve the contents of the **RenderTarget2D**.

C#

```
// Return the shadow map as a texture
return shadowRenderTarget.GetTexture();
```

Overload List

Name	Description
RenderTarget2D (GraphicsDevice, Int32, Int32, Int32, SurfaceFormat)	Initializes a new instance of this class.
RenderTarget2D (GraphicsDevice, Int32, Int32, Int32, SurfaceFormat, MultiSampleType, Int32)	Initializes a new instance of this class.
RenderTarget2D (GraphicsDevice, Int32, Int32, Int32, SurfaceFormat, MultiSampleType, Int32, RenderTargetUsage)	Initializes a new instance of RenderTarget2D with the specified values.
RenderTarget2D (GraphicsDevice, Int32, Int32, Int32, SurfaceFormat, RenderTargetUsage)	Initializes a new instance of RenderTarget2D with the specified values.

Remarks

After a render pass the render target contains the color information of a rendered image.

Render targets represent a linear area of display memory and usually reside in the display memory of the display card. Because of this, **RenderTarget2D** objects must be recreated when the device is reset.

To use a **RenderTarget2D**, you must:

1. Create the **RenderTarget2D**.

C#

```
shadowRenderTarget = GfxComponent.CreateRenderTarget(GraphicsDevice,
    1, SurfaceFormat.Single);
```

C#

```
public static RenderTarget2D CreateRenderTarget(GraphicsDevice device,
    int numberLevels, SurfaceFormat surface)
{
    MultiSampleType type =
        device.PresentationParameters.MultiSampleType;

    // If the card can't use the surface format
    if (!GraphicsAdapter.DefaultAdapter.CheckDeviceFormat(
        DeviceType.Hardware,
        GraphicsAdapter.DefaultAdapter.CurrentDisplayMode.Format,
        TextureUsage.None,
        QueryUsages.None,
        ResourceType.RenderTarget,
        surface))
    {
        // Fall back to current display format
        surface = device.DisplayMode.Format;
    }
    // Or it can't accept that surface format
    // with the current AA settings
    else if (!GraphicsAdapter.DefaultAdapter.CheckDeviceMultiSampleType(
        DeviceType.Hardware, surface,
        device.PresentationParameters.IsFullScreen, type))
    {
        // Fall back to no antialiasing
        type = MultiSampleType.None;
    }

    int width, height;

    // See if we can use our buffer size as our texture
```

```
        CheckTextureSize(device.PresentationParameters.BackBufferWidth,
            device.PresentationParameters.BackBufferHeight,
            out width, out height);

        // Create our render target
        return new RenderTarget2D(device,
            width, height, numberLevels, surface,
            type, 0);
    }
```

2. Set the **RenderTarget2D**.

C#

```
GraphicsDevice.SetRenderTarget(0, shadowRenderTarget);
```

3. Draw into the **RenderTarget2D**.

C#

```
// Render the shadow map
GraphicsDevice.Clear(Color.Black);
DrawScene(MyEffect.shadowMap);
```

4. Reset the original **RenderTarget2D** **null** as the default render target - i.e. the back buffer.

C#

```
// Set render target back to the back buffer
GraphicsDevice.SetRenderTarget(0, null);
```

5. Call [GetTexture](#) to retrieve the contents of the **RenderTarget2D**.

C#

```
// Return the shadow map as a texture
return shadowRenderTarget.GetTexture();
```

RenderTarget2D Constructor (GraphicsDevice, Int32, Int32, Int32, SurfaceFormat)

Initializes a new instance of this class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public RenderTarget2D (
    GraphicsDevice graphicsDevice,
    int width,
    int height,
    int numberLevels,
    SurfaceFormat format
)
```

Parameters

graphicsDevice

The graphics device to associate with this render target resource.

width

Width, in pixels, of the render target. You can use **graphicsDevice.PresentationParameters.BackBufferWidth** to get the current screen width.

height

Height, in pixels, of the render target. You can use **graphicsDevice.PresentationParameters.BackBufferHeight** to get the current screen height.

numberLevels

The number of downsampled surfaces to create when preprocessing the texture. These smaller versions of the texture, known as mip levels, are used when the texture is minified to fit a smaller area than the original texture size. The chain of downsampled surfaces associated with a texture is sometimes called a mipmap chain.

If this is zero, all texture sublevels down to 1×1 pixels will be generated for hardware that supports mipmapped textures.

format

Surface format of the render target. Use [CheckDeviceFormat](#) to determine if a particular surface format is usable in a render target.

Exceptions

Exception type	Condition
ArgumentException	One of the following conditions is true: <ul style="list-style-type: none"> <i>width</i> is larger than MaxTextureWidth. <i>height</i> is larger than MaxTextureHeight. The graphics device does not support creating a render target of type <i>format</i>. CheckDeviceFormat may be used to verify if a surface format is supported. <i>format</i> is SurfaceFormat.Unknown. Textures cannot be created using SurfaceFormat.Unknown. <i>numberLevels</i> is greater than 32. Textures have a maximum of 32 levels.
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentOutOfRangeException	<i>width</i> or <i>height</i> is less than or equal to zero. <i>width</i> and <i>height</i> must be greater than zero.
InvalidOperationException	Unable to create this RenderTarget2D resource on the graphics device.

Remarks

After a render pass the render target contains the color information of a rendered image.

Render targets represent a linear area of display memory and usually reside in the display memory of the display card.

Because of this, **RenderTarget2D** objects must be recreated when the device is reset.

To use a **RenderTarget2D**, you must:

1. Create the **RenderTarget2D**.

C#

```
shadowRenderTarget = GfxComponent.CreateRenderTarget(GraphicsDevice,
    1, SurfaceFormat.Single);
```

C#

```
public static RenderTarget2D CreateRenderTarget(GraphicsDevice device,
    int numberLevels, SurfaceFormat surface)
{
    MultiSampleType type =
        device.PresentationParameters.MultiSampleType;

    // If the card can't use the surface format
    if (!GraphicsAdapter.DefaultAdapter.CheckDeviceFormat(
        DeviceType.Hardware,
        GraphicsAdapter.DefaultAdapter.CurrentDisplayMode.Format,
        TextureUsage.None,
        QueryUsages.None,
        ResourceType.RenderTarget,
        surface))
    {
        // Fall back to current display format
        surface = device.DisplayMode.Format;
    }
    // Or it can't accept that surface format
    // with the current AA settings
    else if (!GraphicsAdapter.DefaultAdapter.CheckDeviceMultiSampleType(
        DeviceType.Hardware, surface,
        device.PresentationParameters.IsFullScreen, type))
    {
        // Fall back to no antialiasing
        type = MultiSampleType.None;
    }

    int width, height;

    // See if we can use our buffer size as our texture
    CheckTextureSize(device.PresentationParameters.BackBufferWidth,
        device.PresentationParameters.BackBufferHeight,
        out width, out height);

    // Create our render target
    return new RenderTarget2D(device,
        width, height, numberLevels, surface,
        type, 0);
}
```

2. Set the **RenderTarget2D**.

C#

```
GraphicsDevice.SetRenderTarget(0, shadowRenderTarget);
```

3. Draw into the **RenderTarget2D**.

C#

```
// Render the shadow map
GraphicsDevice.Clear(Color.Black);
DrawScene(MyEffect.shadowMap);
```

4. Reset the original **RenderTarget2D**. **null** as the default render target - i.e. the back buffer.

C#

```
// Set render target back to the back buffer
GraphicsDevice.SetRenderTarget(0, null);
```

5. Call [GetTexture](#) to retrieve the contents of the **RenderTarget2D**.

C#

```
// Return the shadow map as a texture
return shadowRenderTarget.GetTexture();
```

To use a **RenderTarget2D**, you must:

1. Create the **RenderTarget2D**.

C#

```
shadowRenderTarget = GfxComponent.CreateRenderTarget(GraphicsDevice,
    1, SurfaceFormat.Single);
```

C#

```
public static RenderTarget2D CreateRenderTarget(GraphicsDevice device,
    int numberLevels, SurfaceFormat surface)
{
    MultiSampleType type =
        device.PresentationParameters.MultiSampleType;

    // If the card can't use the surface format
    if (!GraphicsAdapter.DefaultAdapter.CheckDeviceFormat(
        DeviceType.Hardware,
        GraphicsAdapter.DefaultAdapter.CurrentDisplayMode.Format,
        TextureUsage.None,
        QueryUsages.None,
        ResourceType.RenderTarget,
        surface))
    {
        // Fall back to current display format
        surface = device.DisplayMode.Format;
    }
    // Or it can't accept that surface format
    // with the current AA settings
    else if (!GraphicsAdapter.DefaultAdapter.CheckDeviceMultiSampleType(
        DeviceType.Hardware, surface,
        device.PresentationParameters.IsFullScreen, type))
    {
        // Fall back to no antialiasing
        type = MultiSampleType.None;
    }

    int width, height;

    // See if we can use our buffer size as our texture
    CheckTextureSize(device.PresentationParameters.BackBufferWidth,
        device.PresentationParameters.BackBufferHeight,
        out width, out height);

    // Create our render target
    return new RenderTarget2D(device,
        width, height, numberLevels, surface,
        type, 0);
}
```

```
}
```

2. Set the **RenderTarget2D**.

C#

```
GraphicsDevice.SetRenderTarget(0, shadowRenderTarget);
```

3. Draw into the **RenderTarget2D**.

C#

```
// Render the shadow map  
GraphicsDevice.Clear(Color.Black);  
DrawScene(MyEffect.shadowMap);
```

4. Reset the original **RenderTarget2D** **null** as the default render target - i.e. the back buffer.

C#

```
// Set render target back to the back buffer  
GraphicsDevice.SetRenderTarget(0, null);
```

5. Call [GetTexture](#) to retrieve the contents of the **RenderTarget2D**.

C#

```
// Return the shadow map as a texture  
return shadowRenderTarget.GetTexture();
```

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

RenderTarget2D Constructor (GraphicsDevice, Int32, Int32, Int32, SurfaceFormat, RenderTargetUsage)

Initializes a new instance of **RenderTarget2D** with the specified values.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public RenderTarget2D (  
    GraphicsDevice graphicsDevice,  
    int width,  
    int height,  
    int numberLevels,  
    SurfaceFormat format,  
    RenderTargetUsage usage  
)
```

Parameters

graphicsDevice

The graphics device to associate with this render target resource.

width

Width, in pixels, of the render target. You can use **graphicsDevice.PresentationParameters.BackBufferWidth** to get the current screen width.

height

Height, in pixels, of the render target. You can use **graphicsDevice.PresentationParameters.BackBufferHeight** to get the current screen height.

numberLevels

The number of downsampled surfaces to create when preprocessing the texture. These smaller versions of the texture, known as mipmap levels, are used when the texture is minified to fit a smaller area than the original texture size. The chain of downsampled surfaces associated with a texture is sometimes called a mipmap chain.

If this is zero, all texture sublevels down to 1×1 pixels will be generated for hardware that supports mipmapped textures.

format

Surface format of the render target. Use [CheckDeviceFormat](#) to determine if a particular surface format is usable in a render target.

usage

Options identifying the behaviors of this render target resource.

RenderTarget2D.GetTexture Method

Gets the 2D texture associated with this render target.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Texture2D GetTexture ()
```

Return Value

The 2D texture associated with this render target.

Exceptions

Exception type	Condition
InvalidOperationException	A render target must be resolved (for example, setting the index to null or a different index) before calling GetTexture .

Example

C#

```
// Create a new render target to receive the drawn data.
renderTarget = new RenderTarget2D(
    graphics.GraphicsDevice,
    // In this case, we are creating
    // a render target to match half of a split screen:
    leftViewPort.Width,
    leftViewPort.Height,
    // Number of levels in the render target:
    1,
    // Use the same surface format as the back buffer.
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);

// Set the render target on the device.
graphics.GraphicsDevice.SetRenderTarget(0, renderTarget);

// TODO: Add your code to draw to the render target here.
// For example, this could be a call to Mesh.Draw,
// a SpriteBatch Begin-End sequence, or a call to
// DrawIndexedPrimitives, as you would have called them
// in the Draw method of your application.

// Set the device render target back to the back buffer.
graphics.GraphicsDevice.SetRenderTarget(0, null);

// Call GetTexture to retrieve the render target data and save it to a texture.
capturedTexture = renderTarget.GetTexture();
```

RenderTargetCube Class

Represents a cubic texture resource that will be written to at the end of a render pass.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class RenderTargetCube : RenderTarget
```

Remarks

After a render pass the render target contains the color information of a rendered image.

Render targets represent a linear area of display memory and usually reside in the display memory of the display card. Because of this, **RenderTargetCube** objects must be recreated when the device is reset.

To use a **RenderTargetCube**, you must:

1. Create the **RenderTargetCube**.

C#

```
shadowRenderTarget = GfxComponent.CreateRenderTarget(GraphicsDevice,
    1, SurfaceFormat.Single);
```

C#

```
public static RenderTarget2D CreateRenderTarget(GraphicsDevice device,
    int numberLevels, SurfaceFormat surface)
{
    MultiSampleType type =
        device.PresentationParameters.MultiSampleType;

    // If the card can't use the surface format
    if (!GraphicsAdapter.DefaultAdapter.CheckDeviceFormat(
        DeviceType.Hardware,
        GraphicsAdapter.DefaultAdapter.CurrentDisplayMode.Format,
        TextureUsage.None,
        QueryUsages.None,
        ResourceType.RenderTarget,
        surface))
    {
        // Fall back to current display format
        surface = device.DisplayMode.Format;
    }
    // Or it can't accept that surface format
    // with the current AA settings
    else if (!GraphicsAdapter.DefaultAdapter.CheckDeviceMultiSampleType(
        DeviceType.Hardware, surface,
        device.PresentationParameters.IsFullScreen, type))
    {
        // Fall back to no antialiasing
        type = MultiSampleType.None;
    }

    int width, height;

    // See if we can use our buffer size as our texture
    CheckTextureSize(device.PresentationParameters.BackBufferWidth,
```

```
        device.PresentationParameters.BackBufferHeight,
        out width, out height);

    // Create our render target
    return new RenderTarget2D(device,
        width, height, numberLevels, surface,
        type, 0);
}
```

2. Set the **RenderTargetCube**.

C#

```
GraphicsDevice.SetRenderTarget(0, shadowRenderTarget);
```

3. Draw into the **RenderTargetCube**.

C#

```
// Render the shadow map
GraphicsDevice.Clear(Color.Black);
DrawScene(MyEffect.shadowMap);
```

4. Reset the original **RenderTargetCube** **null** as the default render target - i.e. the back buffer.

C#

```
// Set render target back to the back buffer
GraphicsDevice.SetRenderTarget(0, null);
```

5. Call [GetTexture](#) to retrieve the contents of the **RenderTargetCube**.

C#

```
// Return the shadow map as a texture
return shadowRenderTarget.GetTexture();
```

RenderTargetCube Constructor (GraphicsDevice, Int32, Int32, SurfaceFormat)

Initializes a new instance of this class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public RenderTargetCube (
    GraphicsDevice graphicsDevice,
    int size,
    int numberLevels,
    SurfaceFormat format
)
```

Parameters

graphicsDevice

The graphics device to associate with this render target resource.

size

The width and height of this cube texture resource, in pixels.

numberLevels

The number of downsampled surfaces to create when preprocessing the texture. These smaller versions of the texture, known as mip levels, are used when the texture is minified to fit a smaller area than the original texture size. The chain of downsampled surfaces associated with a texture is sometimes called a mipmap chain.

If this is zero, all texture sublevels down to 1×1 pixels will be generated for hardware that supports mipmapped textures.

format

Surface format of the render target.

Exceptions

Exception type	Condition
ArgumentException	One of the following conditions is true: <ul style="list-style-type: none"> The graphics device does not support creating a render target of type <i>format</i>. <i>size</i> is larger than MaxTextureWidth or MaxTextureHeight. <i>format</i> is SurfaceFormat.Unknown. Textures cannot be created using SurfaceFormat.Unknown. <i>numberLevels</i> is greater than 32. Textures have a maximum of 32 levels.
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentOutOfRangeException	<i>size</i> is less than or equal to zero. <i>size</i> must be greater than zero.
InvalidOperationException	Unable to create this RenderTargetCube resource on the graphics device.

Remarks

After a render pass the render target contains the color information of a rendered image.

```
GraphicsDevice.SetRenderTarget(0, shadowRenderTarget);
```

3. Draw into the **RenderTargetCube**.

C#

```
// Render the shadow map
GraphicsDevice.Clear(Color.Black);
DrawScene(MyEffect.shadowMap);
```

4. Reset the original **RenderTargetCube**. **null** as the default render target - i.e. the back buffer.

C#

```
// Set render target back to the back buffer
GraphicsDevice.SetRenderTarget(0, null);
```

5. Call [GetTexture](#) to retrieve the contents of the **RenderTargetCube**.

C#

```
// Return the shadow map as a texture
return shadowRenderTarget.GetTexture();
```

RenderTargetCube.GetTexture Method

Gets a copy of the cube texture associated with this render target.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TextureCube GetTexture ()
```

Return Value

A copy of the cube texture associated with this render target.

Exceptions

Exception type	Condition
InvalidOperationException	A render target must be resolved (e.g. setting the index to null or a different index) before calling GetTexture .

Example

C#

```
// Create a new render target to receive the drawn data.
renderTarget = new RenderTarget2D(
    graphics.GraphicsDevice,
    // In this case, we are creating
    // a render target to match half of a split screen:
    leftViewPort.Width,
    leftViewPort.Height,
    // Number of levels in the render target:
    1,
    // Use the same surface format as the back buffer.
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);

// Set the render target on the device.
graphics.GraphicsDevice.SetRenderTarget(0, renderTarget);

// TODO: Add your code to draw to the render target here.
// For example, this could be a call to Mesh.Draw,
// a SpriteBatch Begin-End sequence, or a call to
// DrawIndexedPrimitives, as you would have called them
// in the Draw method of your application.

// Set the device render target back to the back buffer.
graphics.GraphicsDevice.SetRenderTarget(0, null);

// Call GetTexture to retrieve the render target data and save it to a texture.
capturedTexture = renderTarget.GetTexture();
```

RenderTargetUsage Enumeration

Determines how render target data is used once a new render target is set.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum RenderTargetUsage
```

Members

Member name	Description
DiscardContents	Always clears the render target data.
PlatformContents	Either clears or keeps the data, depending on the current platform. On Xbox 360, the render target will discard contents. On PC, the render target will discard if multisampling is enabled, and preserve the contents if not.
PreserveContents	Always keeps the render target data.

Reference

[ResolveTexture2D Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

ResolveTexture2D Constructor

Initializes an empty instance of **ResolveTexture2D**.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ResolveTexture2D (
    GraphicsDevice graphicsDevice,
    int width,
    int height,
    int numberLevels,
    SurfaceFormat format
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) used to display the texture.

width

The width of the texture, in pixels. This value must be a power of two if the [RequiresPower2](#) property of *graphicsDevice* is **true**. If this value is 0, *width* is set to 1.

height

The height of the texture, in pixels. This value must be a power of two if the [RequiresPower2](#) property of *graphicsDevice* is **true**. If this value is 0, *height* is set to 1.

numberLevels

The number of downsampled surfaces to create when preprocessing the texture. These smaller versions of the texture, known as mip levels, are used when the texture is minified to fit a smaller area than the original texture size. The chain of downsampled surfaces associated with a texture is sometimes called a mipmap chain.

If *numberLevels* is zero, all texture sublevels down to 1×1 pixels will be generated for hardware that supports mipmapped textures. Use [LevelCount](#) to see the number of levels generated.

format

A [SurfaceFormat](#) value specifying the requested pixel format for the texture. The returned texture may be of a different format if the device does not support the requested format. Applications should check the format of the returned texture to ensure that it matches the requested format.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentException	<p>One of the following conditions is true:</p> <ul style="list-style-type: none"> <i>width</i> is larger than MaxTextureWidth. <i>height</i> is larger than MaxTextureHeight. <i>numberLevels</i> is greater than 32. Textures have a maximum of 32 levels. <i>format</i> is SurfaceFormat.Unknown. Textures cannot be created using SurfaceFormat.Unknown. <p>The parameters specified are not compatible:</p> <ul style="list-style-type: none"> <i>format</i> and <i>numberLevels</i> are incompatible. Multi-element textures of type SurfaceFormat.Multi2Bgra32 cannot be mipmapped, set <i>numberLevels</i> to 1. The <i>format</i> requested is not supported by the graphics device. The device does not support creating a texture of the given format with the given TextureUsage.
ArgumentOutOfRangeException	<i>width</i> or <i>height</i> is less than or equal to zero; <i>width</i> and <i>height</i> must be greater than zero.

OutOfVideoMemoryException	Unable to create this resource on the graphics device.

ResolveTexture2D.raise_ContentLost Method

Note

This method is available only when developing for Windows.

Occurs after content is lost from a graphics device failure, allowing an application to re-create all resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void raise_ContentLost (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

The source of this event.

value1

The event arguments that are associated with the action that raised the event.

Platforms Xbox 360, Windows XP SP2, Windows Vista

SamplerState.MipMapLevelOfDetailBias Property

Gets or sets the mipmap level of detail (LOD) bias. The default value is 0.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float MipMapLevelOfDetailBias { get; set; }
```

Property Value

The mipmap bias to set or get.

SamplerStateCollection.Item Property

Gets a specific [SamplerState](#) object using an index value.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SamplerState this [
    int index
] { get; }
```

Property Value

The [SamplerState](#) object at the requested index.

Exceptions

Exception type	Condition
InvalidOperationException	The index for this vertex stream is invalid.

SaveStateMode Enumeration

Defines options for saving the graphics device state before and after an effect technique is applied.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum SaveStateMode
```

Members

Member name	Description
None	No device state is saved when calling Begin or restored when calling End .
SaveState	Save all device state when calling Begin and restore device state when calling End .

SetDataOptions Enumeration

Describes whether existing buffer data will be overwritten or discarded during a **SetData** operation.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[FlagsAttribute]
public enum SetDataOptions
```

Members

Member name	Description
Discard	<p>The SetData operation will discard all existing buffer data.</p> <p>The operation will overwrite (with a write-only operation) every location within the locked surface. This is a valid option when using dynamic textures, dynamic vertex buffers, and dynamic index buffers. You may not use this option to update a portion of a surface.</p> <p>For vertex and index buffers, the SetData operation will discard the entire buffer. A pointer to a new memory area is returned so that the direct memory access (DMA) and rendering from the previous area do not stall.</p> <p>For textures, the SetData operation will overwrite (with a write-only operation) every location within the region being locked.</p>
None	Portions of existing data in the buffer may be overwritten during this operation.
NoOverwrite	The SetData operation will not overwrite existing data in the vertex and index buffers. Specifying this option allows the driver to return immediately from a SetData operation and continue rendering.

Remarks

Note

Discard is not valid on Xbox 360, but dynamic geometry may be rendered on the Xbox 360 by using [DrawUserPrimitives](#).

ShaderCompiler.AssembleFromFile Method (Stream, CompilerMacro[], CompilerIncludeHandler, CompilerOptions, TargetPlatform)

Note

This method is available only when developing for Windows.

Compiles a shader from a stream containing shader assembly code (ASM).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static CompiledShader AssembleFromFile (
    Stream shaderSourceCode,
    CompilerMacro[] preprocessorDefines,
    CompilerIncludeHandler includeHandler,
    CompilerOptions options,
    TargetPlatform platform
)
```

Parameters

shaderSourceCode

Stream that contains the shader data.

preprocessorDefines

Describes preprocessor definitions used by an effect object.

includeHandler

User-implemented interface to provide callbacks for **#include** directives during shader compilation.

options

Compilation optimization options.

platform

Target platform for the compilation.

Return Value

The compiled shader.

Exceptions

Exception type	Condition
ArgumentNullException	<i>shaderSourceCode</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>shaderSourceCode</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>shaderSourceCode</i> does not contain enough data to support this call.

ShaderCompiler.AssembleFromFile Method (Stream, Int32, CompilerMacro[], CompilerIncludeHandler, CompilerOptions, TargetPlatform)

Note

This method is available only when developing for Windows.

Compiles a shader from a stream containing shader assembly code (ASM), specifying the number of bytes in the stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static CompiledShader AssembleFromFile (
    Stream shaderSourceCode,
    int numberBytes,
    CompilerMacro[] preprocessorDefines,
    CompilerIncludeHandler includeHandler,
    CompilerOptions options,
    TargetPlatform platform
)
```

Parameters

shaderSourceCode

Stream that contains the shader data.

numberBytes

The number of bytes in *shaderSourceCode*.

preprocessorDefines

Describes preprocessor definitions used by an effect object.

includeHandler

User-implemented interface to provide callbacks for **#include** directives during shader compilation.

options

Compilation optimization options.

platform

Target platform for the compilation.

Return Value

The compiled shader.

Exceptions

Exception type	Condition
ArgumentNullException	<i>shaderSourceCode</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>shaderSourceCode</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>shaderSourceCode</i> does not contain enough data to support this call.

ShaderCompiler.AssembleFromFile Method (String, CompilerMacro[], CompilerIncludeHandler, CompilerOptions, TargetPlatform)

Note

This method is available only when developing for Windows.

Compiles a shader from a file containing shader assembly code (ASM).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static CompiledShader AssembleFromFile (
    string shaderFileName,
    CompilerMacro[] preprocessorDefines,
    CompilerIncludeHandler includeHandler,
    CompilerOptions options,
    TargetPlatform platform
)
```

Parameters

shaderFileName

Name of the file containing the compiled shader data.

preprocessorDefines

Describes preprocessor definitions used by an effect object.

includeHandler

User-implemented interface to provide callbacks for **#include** directives during shader compilation.

options

Compilation optimization options.

platform

Target platform for the compilation.

Return Value

The compiled shader.

Exceptions

Exception type	Condition
ArgumentException	<i>shaderFileName</i> is a zero-length string, contains only white space, or contains one or more invalid characters as defined by InvalidPathChars .
ArgumentNullException	<i>shaderFileName</i> is null .
PathTooLongException	The specified path, file name, or both exceed the system-defined maximum length. For example, on Windows-based platforms, paths must be less than 248 characters, and file names must be less than 260 characters.
DirectoryNotFoundException	The specified path is invalid (for example, it is on an unmapped drive).
UnauthorizedAccessException	The <i>shaderFileName</i> parameter specifies a directory, or the caller does not have the required permission to access the file specified by <i>filename</i> .
FileNotFoundException	The file specified in <i>shaderFileName</i> was not found.
NotSupportedException	<i>shaderFileName</i> is in an invalid format.

ShaderCompiler.CompileFromFile Method (Stream, CompilerMacro[], CompilerIncludeHandler, CompilerOptions, String, ShaderProfile, TargetPlatform)

Note

This method is available only when developing for Windows.

Compiles a shader from a stream containing the shader source code.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static CompiledShader CompileFromFile (
    Stream shaderSourceCode,
    CompilerMacro[] preprocessorDefines,
    CompilerIncludeHandler includeHandler,
    CompilerOptions options,
    string functionName,
    ShaderProfile profile,
    TargetPlatform platform
)
```

Parameters

shaderSourceCode

Stream that contains the shader source code.

preprocessorDefines

Describes preprocessor definitions used by an effect object.

includeHandler

User-implemented interface to provide callbacks for **#include** directives during shader compilation.

options

Compilation optimization options.

functionName

The function to be compiled.

profile

A shader profile that determines the shader instruction set.

platform

The target platform for compilation.

Return Value

The compiled shader.

Exceptions

Exception type	Condition
ArgumentNullException	<i>shaderSourceCode</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>shaderSourceCode</i> is not readable. Streams passed into this method must be readable.

ShaderCompiler.Disassemble Method

Note

This method is available only when developing for Windows.

Disassembles a shader.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static string Disassemble (  
    byte[] shaderCode,  
    bool enableColorCode,  
    string comments  
)
```

Parameters

shaderCode

The shader byte code to disassemble.

enableColorCode

[[MarshalAsAttribute](#)(U1)] Specifies whether to enable color coding to make the disassembly easier to read.

comments

A comment string to include at the top of the shader.

Return Value

The disassembled shader.

ShaderConstant.SetValue Method (GraphicsDevice, Matrix[])

Sets the value of a [ShaderConstant](#) to an array of [Matrix](#) objects.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetValue (  
    GraphicsDevice graphicsDevice,  
    Matrix[] value  
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) associated with the [ShaderConstant](#).

value

Value to assign to the [ShaderConstant](#).

ShaderConstantTable Members

The following tables list the members exposed by the ShaderConstantTable type.

Public Constructors

Name	Description
 ShaderConstantTable	Initializes a new instance of the ShaderConstantTable class.

Public Properties

Name	Description
 Constants	Gets a collection of the constants in the ShaderConstantTable .
 Creator	Gets the name of the constant table creator.
 IsDisposed	Gets a value that indicates whether the object is disposed.
 Version	Gets the shader version.

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 SetDefaults	Sets the constants in the ShaderConstantTable to their default values. The default values are declared in the variable declarations in the shader.
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_Disposing	Raises the Disposing event when called from within a derived class.

Public Events

Name	Description
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime (CLR).

See Also

Reference

[ShaderConstantTable Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

ShaderConstantTable Constructor

Initializes a new instance of the [ShaderConstantTable](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ShaderConstantTable (  
    byte[] code  
)
```

Parameters

code

The shader byte code.

Exceptions

Exception type	Condition
ArgumentException	The array <i>code</i> must have a length that is a multiple of four.
ArgumentNullException	<i>code</i> is null .
InvalidOperationException	Unable to create the ShaderConstantTable .

[ShaderConstantTable Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

ShaderConstantTable.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
ShaderConstantTable.Dispose ()	Immediately releases the unmanaged resources used by this object.
ShaderConstantTable.Dispose (Boolean)	Releases the unmanaged resources used by the ShaderConstantTable and optionally releases the managed resources.

See Also

Reference

[ShaderConstantTable Class](#)

[ShaderConstantTable Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

ShaderConstantTable.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[ShaderConstantTable Class](#)

[ShaderConstantTable Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

ShaderConstantTable.Dispose Method (Boolean)

Releases the unmanaged resources used by the [ShaderConstantTable](#) and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\] true](#) to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [ShaderConstantTable](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

ShaderConstantTable.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the [Disposing](#) event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

ShaderConstantTable.IsDisposed Property

Gets a value that indicates whether the object is disposed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsDisposed { get; }
```

Property Value

true if the object is disposed; **false** otherwise.

Platforms Xbox 360, Windows XP SP2, Windows Vista

ShaderProfile Enumeration

Defines vertex and pixel shader versions.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum ShaderProfile
```

Members

Member name	Description
PS_1_1	Pixel shader version ps_1_1.
PS_1_2	Pixel shader version ps_1_2.
PS_1_3	Pixel shader version ps_1_3.
PS_1_4	Pixel shader version ps_1_4.
PS_2_0	Pixel shader version ps_2_0.
PS_2_A	Pixel shader version ps_2_a.
PS_2_B	Pixel shader version ps_2_b.
PS_2_SW	Pixel software shader version ps_2_sw.
PS_3_0	Pixel shader version ps_3_0.
Unknown	Unknown pixel shader version.
VS_1_1	Vertex shader version v_1_1.
VS_2_0	Vertex shader version v_2_0.
VS_2_A	Vertex shader version v_2_a.
VS_2_SW	Vertex software shader version v_2_sw.
VS_3_0	Vertex shader version vs_3_0.
XPS_3_0	Xbox microcode assembly pixel shader version xps_3_0. Microcode assembly language supports a superset of the ps_3_0 and vs_3_0 specifications defined by Direct3D 9.0 for Windows. It does not support earlier Direct3D vertex and pixel shader specifications.
XVS_3_0	Xbox microcode assembly vertex shader version xvs_3_0. Microcode assembly language supports a superset of the ps_3_0 and vs_3_0 specifications defined by Direct3D 9.0 for Windows. It does not support earlier Direct3D vertex and pixel shader specifications.

Remarks

These pixel shader versions identify the assembly-level shader model compilation target the HLSL compiler should use to express the final shader code. When shader compilation is completed at runtime, an application might query the using [MaxVertexShaderProfile](#) or [MaxPixelShaderProfile](#) to select a compilation target to match the capabilities of the graphics device.

ShaderRegisterSet Enumeration

Defines the data type of a shader register.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum ShaderRegisterSet
```

Members

Member name	Description
Boolean	Boolean value.
Float4	4D floating-point number.
Int4	4D integer number.
Sampler	The register contains 4D sampler data.

Platforms Xbox 360, Windows XP SP2, Windows Vista

ShaderSemantic Structure

Note

This structure is available only when developing for Windows.

Semantics map a parameter to vertex or pixel shader registers. They can also be optional descriptive strings attached to non-register parameters.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[SerializableAttribute]  
public struct ShaderSemantic
```

RemarksSemantics are required for vertex and pixel shader, input and output registers.

SpriteBatch Members

The following tables list the members exposed by the SpriteBatch type.

Public Constructors

Name	Description
 SpriteBatch	Initializes a new instance of the class, which enables a group of sprites to be drawn using the same settings.

Public Properties

Name	Description
 GraphicsDevice	Gets the graphics device associated with this SpriteBatch .
 IsDisposed	Gets a value that indicates whether the object is disposed.
 Name	Gets or sets the name of this sprite batch.
 Tag	Gets or sets an object that uniquely identifies this sprite batch.

Public Methods

Name	Description
 Begin	Overloaded. Prepares the graphics device for drawing sprites.
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Draw	Overloaded. Adds a sprite to the batch of sprites to be rendered.
 DrawString	Overloaded. Adds a sprite string to the batch of sprites to be rendered.
 End	Flushes the sprite batch and restores the device state to how it was before Begin was called.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Public Events

Name	Description
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

SpriteBatch.Begin Method

Prepares the graphics device for drawing sprites.

Unexpected behavior can result when rendering sprites and 3D objects on the same graphics device. For more information, see [Render States and the Graphics Device](#).

Overload List

Name	Description
SpriteBatch.Begin ()	Prepares the graphics device for drawing sprites.
SpriteBatch.Begin (SpriteBlendMode)	Prepares the graphics device for drawing sprites with specified blending options.
SpriteBatch.Begin (SpriteBlendMode, SpriteSortMode, SaveStateMode)	Prepares the graphics device for drawing sprites with specified blending, sorting, and render state options.
SpriteBatch.Begin (SpriteBlendMode, SpriteSortMode, SaveStateMode, Matrix)	Prepares the graphics device for drawing sprites with specified blending, sorting, and render state options, and a global transform matrix.

[SpriteBatch Class](#)

[SpriteBatch Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

SpriteBatch.Begin Method ()

Prepares the graphics device for drawing sprites.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Begin ()
```

Exceptions

Exception type	Condition
InvalidOperationException	Begin has been called before calling End after the last call to Begin . Begin cannot be called again until End has been successfully called.

Remarks

This method must be called before any calls to [Draw](#). When all the sprites have been drawn, call [End](#).

Begin sets the following render states:

- [CullMode](#)
- [DepthBufferEnable](#)
- [AlphaBlendEnable](#)
- [AlphaTestEnable](#)
- [AlphaBlendOperation](#)
- [SourceBlend](#)
- [DestinationBlend](#)
- [SeparateAlphaBlendEnabled](#)
- [AlphaFunction](#)
- [ReferenceAlpha](#)

Begin sets the following sampler states:

- [AddressU](#)
- [AddressV](#)
- [MagFilter](#)
- [MinFilter](#)
- [MipFilter](#)
- [MipMapLevelOfDetailBias](#)
- [MaxMipLevel](#)

This version of **Begin** sets [SpriteBlendMode](#) to **AlphaBlend**, [SpriteSortMode](#) to **Deferred**, and [SaveStateMode](#) to **None**. When [SaveStateMode](#) is set to **None**, the caller must reset the render and sampler states if they are used elsewhere.

SpriteBatch.Begin Method (SpriteBlendMode)

Prepares the graphics device for drawing sprites with specified blending options.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Begin (
    SpriteBlendMode blendMode
)
```

Parameters

blendMode

Blending options to use when rendering.

Exceptions

Exception type	Condition
InvalidOperationException	Begin has been called before calling End after the last call to Begin . Begin cannot be called again until End has been successfully called.

Remarks

This method must be called before any calls to [Draw](#). When all the sprites have been drawn, call [End](#).

Begin sets the following render states:

- [CullMode](#)
- [DepthBufferEnable](#)
- [AlphaBlendEnable](#)
- [AlphaTestEnable](#)
- [AlphaBlendOperation](#)
- [SourceBlend](#)
- [DestinationBlend](#)
- [SeparateAlphaBlendEnabled](#)
- [AlphaFunction](#)
- [ReferenceAlpha](#)

Begin sets the following sampler states:

- [AddressU](#)
- [AddressV](#)
- [MagFilter](#)
- [MinFilter](#)
- [MipFilter](#)
- [MipMapLevelOfDetailBias](#)
- [MaxMipLevel](#)

This version of **Begin** sets [SpriteSortMode](#) to **Deferred**, and [SaveStateMode](#) to **None**. When [SaveStateMode](#) is set to **None**, the caller must reset the render and sampler states if they are used elsewhere.

SpriteBatch.Begin Method (SpriteBlendMode, SpriteSortMode, SaveStateMode)

Prepares the graphics device for drawing sprites with specified blending, sorting, and render state options.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Begin (
    SpriteBlendMode blendMode,
    SpriteSortMode sortMode,
    SaveStateMode stateMode
)
```

Parameters

blendMode

Blending options to use when rendering.

sortMode

Sorting options to use when rendering.

stateMode

Rendering state options.

Exceptions

Exception type	Condition
InvalidOperationException	Begin has been called before calling End after the last call to Begin . Begin cannot be called again until End has been successfully called.

Remarks

This method must be called before any calls to [Draw](#). When all the sprites have been drawn, call [End](#).

Begin sets the following render states:

- [CullMode](#)
- [DepthBufferEnable](#)
- [AlphaBlendEnable](#)
- [AlphaTestEnable](#)
- [AlphaBlendOperation](#)
- [SourceBlend](#)
- [DestinationBlend](#)
- [SeparateAlphaBlendEnabled](#)
- [AlphaFunction](#)
- [ReferenceAlpha](#)

Begin sets the following sampler states:

- [AddressU](#)
- [AddressV](#)
- [MagFilter](#)
- [MinFilter](#)
- [MipFilter](#)
- [MipMapLevelOfDetailBias](#)
- [MaxMipLevel](#)

If **Begin** is called with [SaveStateMode](#) set to **None**, the caller must reset these states must be reset if they are used elsewhere. Calling **Begin** with [SaveStateMode](#) set to **SaveState** will reset these values properly, but performance may be adversely affected.

[SpriteBatch Class](#)

[SpriteBatch Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SpriteBatch.Begin Method (SpriteBlendMode, SpriteSortMode, SaveStateMode, Matrix)

Prepares the graphics device for drawing sprites with specified blending, sorting, and render state options, and a global transform matrix.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Begin (  
    SpriteBlendMode blendMode,  
    SpriteSortMode sortMode,  
    SaveStateMode stateMode,  
    Matrix transformMatrix  
)
```

Parameters

blendMode

Blending options to use when rendering.

sortMode

Sorting options to use when rendering.

stateMode

Rendering state options.

transformMatrix

A matrix to apply to position, rotation, scale, and depth data passed to [Draw](#).

Remarks

This method must be called before any calls to [Draw](#). When all the sprites have been drawn, call [End](#).

Begin sets the following render states.

- [CullMode](#)
- [DepthBufferEnable](#)
- [AlphaBlendEnable](#)
- [AlphaTestEnable](#)
- [AlphaBlendOperation](#)
- [SourceBlend](#)
- [DestinationBlend](#)
- [SeparateAlphaBlendEnabled](#)
- [AlphaFunction](#)
- [ReferenceAlpha](#)

Begin sets the following sampler states.

- [AddressU](#)
- [AddressV](#)
- [MagFilter](#)
- [MinFilter](#)
- [MipFilter](#)
- [MipMapLevelOfDetailBias](#)
- [MaxMipLevel](#)

If **Begin** is called with [SaveStateMode](#) set to **None**, then these states must be reset by the caller if they are used elsewhere. Calling **Begin** with [SaveStateMode](#) set to **SaveState** will reset these values properly, but may adversely affect performance.

Use **transformMatrix** to apply the same transformation to all sprites drawn by this [SpriteBatch](#). This matrix can be any combination of translation, scaling, or rotation operations. This matrix is applied to the position, rotation, scale, and depth

values provided to [Draw](#).

SpriteBatch.Draw Method (Texture2D, Rectangle, Color)

Adds a sprite to the batch of sprites to be rendered, specifying the texture, destination rectangle, and color tint.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Draw (  
    Texture2D texture,  
    Rectangle destinationRectangle,  
    Color color  
)
```

Parameters

texture

The sprite texture.

destinationRectangle

A rectangle specifying, in screen coordinates, where the sprite will be drawn. If this rectangle is not the same size as *sourceRectangle*, the sprite is scaled to fit.

color

The color channel modulation to use. Use [Color.White](#) for full color with no tinting.

Exceptions

Exception type	Condition
ArgumentNullException	<i>texture</i> is null .
InvalidOperationException	Draw was called, but Begin has not yet been called. Begin must be called successfully before Draw can be called.

Remarks

Before any calls to [Draw](#), you must call [Begin](#). Once all calls to [Draw](#) are complete, call [End](#).

Adds a sprite to the batch of sprites to be rendered, specifying the texture, destination and source rectangles, and color tint.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Draw (
    Texture2D texture,
    Rectangle destinationRectangle,
    Nullable<Rectangle> sourceRectangle,
    Color color
)
```

Parameters

texture

The sprite texture.

destinationRectangle

A rectangle specifying, in screen coordinates, where the sprite will be drawn. If this rectangle is not the same size as *sourceRectangle* the sprite will be scaled to fit.

sourceRectangle

A rectangle specifying, in texels, which section of the rectangle to draw. Use **null** to draw the entire texture.

color

The color channel modulation to use. Use [Color.White](#) for full color with no tinting.

Exceptions

Exception type	Condition
ArgumentNullException	<i>texture</i> is null .
InvalidOperationException	Draw was called, but Begin has not yet been called. Begin must be called successfully before Draw can be called.

Remarks

SpriteBatch.Draw Method (Texture2D, Rectangle, Nullable<Rectangle>, Color, Single, Vector2, SpriteEffects, Single)

Adds a sprite to the batch of sprites to be rendered, specifying the texture, destination, and source rectangles, color tint, rotation, origin, effects, and sort depth.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Draw (
    Texture2D texture,
    Rectangle destinationRectangle,
    Nullable<Rectangle> sourceRectangle,
    Color color,
    float rotation,
    Vector2 origin,
    SpriteEffects effects,
    float layerDepth
)
```

Parameters

texture

The sprite texture.

destinationRectangle

A rectangle specifying, in screen coordinates, where the sprite will be drawn. If this rectangle is not the same size as *sourceRectangle*, the sprite is scaled to fit.

sourceRectangle

A rectangle specifying, in texels, which section of the rectangle to draw. Use **null** to draw the entire texture.

color

The color channel modulation to use. Use [Color.White](#) for full color with no tinting.

rotation

The angle, in radians, to rotate the sprite around the origin.

origin

The origin of the sprite. Specify (0,0) for the upper-left corner.

effects

Rotations to apply prior to rendering.

layerDepth

The sorting depth of the sprite, between 0 (front) and 1 (back).

You must specify either [SpriteSortMode.FrontToBack](#) or [SpriteSortMode.BackToFront](#) for this parameter to affect sprite drawing.

Exceptions

Exception type	Condition
ArgumentNullException	<i>texture</i> is null .
InvalidOperationException	Draw was called, but Begin has not yet been called. Begin must be called successfully before you can call Draw .

Remarks

Before making any calls to [Draw](#), you must call [Begin](#). Once all calls to [Draw](#) are complete, call [End](#).

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SpriteBatch.Draw Method (Texture2D, Vector2, Color)

Adds a sprite to the batch of sprites to be rendered, specifying the texture, screen position, and color tint.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Draw (  
    Texture2D texture,  
    Vector2 position,  
    Color color  
)
```

Parameters

texture

The sprite texture.

position

The location, in screen coordinates, where the sprite will be drawn.

color

The color channel modulation to use. Use [Color.White](#) for full color with no tinting.

Exceptions

Exception type	Condition
ArgumentNullException	<i>texture</i> is null .
InvalidOperationException	Draw was called, but Begin has not yet been called. Begin must be called successfully before Draw can be called.

Remarks

Before any calls to [Draw](#), you must call [Begin](#). Once all calls to [Draw](#) are complete, call [End](#).

SpriteBatch.Draw Method (Texture2D, Vector2, Nullable<Rectangle>, Color)

Adds a sprite to the batch of sprites to be rendered, specifying the texture, screen position, source rectangle, and color tint.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Draw (  
    Texture2D texture,  
    Vector2 position,  
    Nullable<Rectangle> sourceRectangle,  
    Color color  
)
```

Parameters

texture

The sprite texture.

position

The location, in screen coordinates, where the sprite will be drawn.

sourceRectangle

A rectangle specifying, in texels, which section of the rectangle to draw. Use **null** to draw the entire texture.

color

The color channel modulation to use. Use [Color.White](#) for full color with no tinting.

Exceptions

Exception type	Condition
ArgumentNullException	<i>texture</i> is null .
InvalidOperationException	Draw was called, but Begin has not yet been called. Begin must be called successfully before Draw can be called.

Remarks

Before any calls to [Draw](#), you must call [Begin](#). Once all calls to [Draw](#) are complete, call [End](#).

SpriteBatch.Draw Method (Texture2D, Vector2, Nullable<Rectangle>, Color, Single, Vector2, Single, SpriteEffects, Single)

Adds a sprite to the batch of sprites to be rendered, specifying the texture, screen position, optional source rectangle, color tint, rotation, origin, scale, effects, and sort depth.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Draw (
    Texture2D texture,
    Vector2 position,
    Nullable<Rectangle> sourceRectangle,
    Color color,
    float rotation,
    Vector2 origin,
    float scale,
    SpriteEffects effects,
    float layerDepth
)
```

Parameters

texture

The sprite texture.

position

The location, in screen coordinates, where the sprite will be drawn.

sourceRectangle

A rectangle specifying, in texels, which section of the rectangle to draw. Use **null** to draw the entire texture.

color

The color channel modulation to use. Use [Color.White](#) for full color with no tinting.

rotation

The angle, in radians, to rotate the sprite around the origin.

origin

The origin of the sprite. Specify (0,0) for the upper-left corner.

scale

Uniform multiple by which to scale the sprite width and height.

effects

Rotations to apply prior to rendering.

layerDepth

The sorting depth of the sprite, between 0 (front) and 1 (back).

You must specify either [SpriteSortMode.FrontToBack](#) or [SpriteSortMode.BackToFront](#) for this parameter to affect sprite drawing.

Exceptions

Exception type	Condition
ArgumentNullException	<i>texture</i> is null .
InvalidOperationException	Draw was called, but Begin has not yet been called. Begin must be called successfully before you can call Draw .

Remarks

Before making any calls to [Draw](#), you must call [Begin](#). Once all calls to [Draw](#) are complete, call [End](#).

SpriteBatch.Draw Method (Texture2D, Vector2, Nullable<Rectangle>, Color, Single, Vector2, Vector2, SpriteEffects, Single)

Adds a sprite to the batch of sprites to be rendered, specifying the texture, screen position, source rectangle, color tint, rotation, origin, scale, effects, and sort depth.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Draw (
    Texture2D texture,
    Vector2 position,
    Nullable<Rectangle> sourceRectangle,
    Color color,
    float rotation,
    Vector2 origin,
    Vector2 scale,
    SpriteEffects effects,
    float layerDepth
)
```

Parameters

texture

The sprite texture.

position

The location, in screen coordinates, where the sprite will be drawn.

sourceRectangle

A rectangle specifying, in texels, which section of the rectangle to draw. Use **null** to draw the entire texture.

color

The color channel modulation to use. Use [Color.White](#) for full color with no tinting.

rotation

The angle, in radians, to rotate the sprite around the origin.

origin

The origin of the sprite. Specify (0,0) for the upper-left corner.

scale

Vector containing separate scalar multiples for the x- and y-axes of the sprite.

effects

Rotations to apply before rendering.

layerDepth

The sorting depth of the sprite, between 0 (front) and 1 (back).

You must specify either [SpriteSortMode.FrontToBack](#) or [SpriteSortMode.BackToFront](#) for this parameter to affect sprite drawing.

Exceptions

Exception type	Condition
ArgumentNullException	<i>texture</i> is null .
InvalidOperationException	Draw was called, but Begin has not yet been called. Begin must be called successfully before you can call Draw .

Remarks

Before making any calls to [Draw](#), you must call [Begin](#). Once all calls to [Draw](#) are complete, call [End](#).

SpriteBatch.DrawString Method

Adds a sprite string to the batch of sprites to be rendered.

Overload List

Name	Description
SpriteBatch.DrawString (SpriteFont, String, Vector2, Color)	Adds a sprite string to the batch of sprites to be rendered, specifying the font, output text, screen position, and color tint.
SpriteBatch.DrawString (SpriteFont, String, Vector2, Color, Single, Vector2, Single, SpriteEffects, Single)	Adds a sprite string to the batch of sprites to be rendered, specifying the font, output text, screen position, color tint, rotation, origin, scale, and effects.
SpriteBatch.DrawString (SpriteFont, String, Vector2, Color, Single, Vector2, Vector2, SpriteEffects, Single)	Adds a sprite string to the batch of sprites to be rendered, specifying the font, output text, screen position, color tint, rotation, origin, scale, effects, and depth.
SpriteBatch.DrawString (SpriteFont, StringBuilder, Vector2, Color)	Adds a mutable sprite string to the batch of sprites to be rendered, specifying the font, output text, screen position, and color tint.
SpriteBatch.DrawString (SpriteFont, StringBuilder, Vector2, Color, Single, Vector2, Single, SpriteEffects, Single)	Adds a mutable sprite string to the batch of sprites to be rendered, specifying the font, output text, screen position, color tint, rotation, origin, scale, and effects.
SpriteBatch.DrawString (SpriteFont, StringBuilder, Vector2, Color, Single, Vector2, Vector2, SpriteEffects, Single)	Adds a mutable sprite string to the batch of sprites to be rendered, specifying the font, output text, screen position, color tint, rotation, origin, scale, effects, and depth.

SpriteBatch.DrawString Method (SpriteFont, String, Vector2, Color)

Adds a sprite string to the batch of sprites to be rendered, specifying the font, output text, screen position, and color tint.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void DrawString (
    SpriteFont spriteFont,
    string text,
    Vector2 position,
    Color color
)
```

Parameters

spriteFont

The sprite font.

text

The string to draw.

position

The location, in screen coordinates, where the text will be drawn.

color

The desired color of the text.

Exceptions

Exception type	Condition
ArgumentException	There is a character in <i>text</i> that was not imported by the SpriteFont . You must include all the characters in the character regions in the sprite font file. For more information, see How To: Extend the Font Description Processor to Support Additional Characters .
ArgumentNullException	<i>spriteFont</i> or <i>text</i> is null .
InvalidOperationException	DrawString was called, but Begin has not yet been called. Begin must be called successfully before DrawString can be called.

Remarks

[SpriteFont](#) objects are loaded from the Content Manager. See the [SpriteFont](#) class for more information.

Before any calls to [DrawString](#), you must call [Begin](#). Once all calls to [DrawString](#) are complete, call [End](#).

Use a newline character (\n) to draw more than one line of text.

SpriteBatch.DrawString Method (SpriteFont, String, Vector2, Color, Single, Vector2, Single, SpriteEffects, Single)

Adds a sprite string to the batch of sprites to be rendered, specifying the font, output text, screen position, color tint, rotation, origin, scale, and effects.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void DrawString (
    SpriteFont spriteFont,
    string text,
    Vector2 position,
    Color color,
    float rotation,
    Vector2 origin,
    float scale,
    SpriteEffects effects,
    float layerDepth
)
```

Parameters

spriteFont

The sprite font.

text

The string to draw.

position

The location, in screen coordinates, where the text will be drawn.

color

The desired color of the text.

rotation

The angle, in radians, to rotate the text around the origin.

origin

The origin of the string. Specify (0,0) for the upper-left corner.

scale

Uniform multiple by which to scale the sprite width and height.

effects

Rotations to apply prior to rendering.

layerDepth

The sorting depth of the sprite, between 0 (front) and 1 (back).

Exceptions

Exception type	Condition
ArgumentException	There is a character in <i>text</i> that was not imported by the SpriteFont . You must include all the characters in the character regions in the sprite font file. For more information, see How To: Extend the Font Description Processor to Support Additional Characters .
ArgumentNullException	<i>spriteFont</i> or <i>text</i> is null .
InvalidOperationException	DrawString was called, but Begin has not yet been called. Begin must be called successfully before DrawString can be called.

Remarks

[SpriteFont](#) objects are loaded from the Content Manager. See the [SpriteFont](#) class for more information.

Before any calls to [DrawString](#), you must call [Begin](#). Once all calls to [DrawString](#) are complete, call [End](#).

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SpriteFont Class

Represents a font texture.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class SpriteFont
```

Remarks

To load a [SpriteFont](#), click **Sprite Font** on the **Add New Item** menu. This adds an XML file to your project describing how to build a texture map for your font. At build time, XNA Game Studio creates a texture with the image of the characters of the font you specify, with the specified font point size.

At run time, load the font using [ContentManager.Load](#), and pass it to [SpriteBatch.DrawString](#) when drawing text.

Note

As with most types of software, font files are licensed rather than sold. Font licenses vary from vendor to vendor, but most don't allow redistribution of the fonts, and that includes redistribution of reproductions such as bitmaps containing the rasterized character set. This is even true of many of the licenses covering fonts that Microsoft supplies with applications and Windows. Be careful, therefore, to ensure that you have the required license rights to redistribute any font you include as a bitmap containing the rasterized character set in your game!

For an example of rendering a sprite font inside your game, see [How To: Draw Text](#).

SpriteFont Members

The following tables list the members exposed by the SpriteFont type.

Public Properties

	Name	Description
	Characters	Gets a collection of all the characters that are included in the font.
	DefaultCharacter	Gets or sets the default character for the font.
	LineSpacing	The line spacing, in pixels, of this font.
	Spacing	Gets or sets the spacing of the font characters.

Public Methods

	Name	Description
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	MeasureString	Overloaded. Returns the height and width of a given string.
	ReferenceEquals	(Inherited from Object .)
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

SpriteFont.MeasureString Method

Returns the height and width of a given string.

Overload List

Name	Description
SpriteFont.MeasureString (String)	Returns the height and width of a given string as a Vector2 .
SpriteFont.MeasureString (StringBuilder)	Returns the height and width of a mutable string as a Vector2 .

See Also

Reference

[SpriteFont Class](#)

SpriteFont.MeasureString Method (String)

Returns the height and width of a given string as a [Vector2](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector2 MeasureString (  
    string text  
)
```

Parameters

text

The string to measure.

Return Value

The height and width, in pixels, of *text*, when it is rendered.

Exceptions

Exception type	Condition
ArgumentNullException	<i>text</i> cannot be null .
ArgumentException	There is a character in <i>text</i> that was not imported by the SpriteFont . You must include all the characters in the character regions in the sprite font file. For more information see How To: Extend the Font Description Processor to Support Additional Characters .

See Also

Reference

SpriteFont.MeasureString Method (StringBuilder)

Returns the height and width of a mutable string as a [Vector2](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector2 MeasureString (
    StringBuilder text
)
```

Parameters

text

The mutable (read/write) string to measure.

Return Value

The height and width, in pixels, of *text*, when it is rendered.

Exceptions

Exception type	Condition
ArgumentNullException	<i>text</i> cannot be null .
ArgumentOutOfRangeException	There is a character in <i>text</i> that was not imported by the SpriteFont . You must include all the characters in the character regions in the sprite font file. For more information, see How To: Extend the Font Description Processor to Support Additional Characters .

Remarks

By accepting a [StringBuilder](#) argument in place of a [String](#) argument, this form supports measurement of dynamically formatted text.

SpriteFont Properties

Public Properties

	Name	Description
	Characters	Gets a collection of all the characters that are included in the font.
	DefaultCharacter	Gets or sets the default character for the font.
	LineSpacing	The line spacing, in pixels, of this font.
	Spacing	Gets or sets the spacing of the font characters.

See Also

Reference

[SpriteFont Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

SpriteFont.Characters Property

Gets a collection of all the characters that are included in the font.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ReadOnlyCollection<char> Characters { get; }
```

Property Value

The collection of all characters included in this font.

See Also

Reference

[SpriteFont Class](#)

[SpriteFont Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SpriteFont.DefaultCharacter Property

Gets or sets the default character for the font.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Nullable<char> DefaultCharacter { get; set; }
```

Property Value

The default character for this font.

Remarks

If set to anything other than null, this character will be automatically substituted any time an attempt is made to draw or measure characters that are not in the font.

If set to null, missing characters will produce an exception.

SpriteFont.LineSpacing Property

The line spacing, in pixels, of this font.

The line spacing is the vertical distance between the base lines of two consecutive lines of text. Thus, it includes the blank space between lines as well as the height of the characters.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int LineSpacing { get; set; }
```

Property Value

The height of one line, in pixels.

See Also

SpriteFont.Spacing Property

Gets or sets the spacing of the font characters.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float Spacing { get; set; }
```

Property Value

The spacing, in pixels, of the font characters.

SpriteSortMode Enumeration

Defines sprite sort-rendering options.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum SpriteSortMode
```

Members

Member name	Description
BackToFront	Same as Deferred mode, except sprites are sorted by depth in back-to-front order prior to drawing. This procedure is recommended when drawing transparent sprites of varying depths.
Deferred	Sprites are not drawn until End is called. End will apply graphics device settings and draw all the sprites in one batch, in the same order calls to Draw were received. This mode allows Draw calls to two or more instances of SpriteBatch without introducing conflicting graphics device settings. SpriteBatch defaults to Deferred mode.
FrontToBack	Same as Deferred mode, except sprites are sorted by depth in front-to-back order prior to drawing. This procedure is recommended when drawing opaque sprites of varying depths.
Immediate	Begin will apply new graphics device settings, and sprites will be drawn within each Draw call. In Immediate mode there can only be one active SpriteBatch instance without introducing conflicting device settings. Immediate mode is faster than Deferred mode.
Texture	Same as Deferred mode, except sprites are sorted by texture prior to drawing. This can improve performance when drawing non-overlapping sprites of uniform depth.

StateBlock Members

The following tables list the members exposed by the StateBlock type.

Public Constructors

Name	Description
 StateBlock	Initializes a new instance of the StateBlock class.

Public Properties

Name	Description
 GraphicsDevice	Gets the GraphicsDevice associated with this StateBlock .
 IsContentLost	Gets the current state of the content on a device.
 IsDisposed	Gets a value that indicates whether the object is disposed.
 Name	Gets or sets the name of the StateBlock .
 Tag	Gets or sets the resource manager tag for the StateBlock .

Public Methods

Name	Description
 Apply	Applies the state block to the current GraphicsDevice .
 Capture	Captures the current value of states that are included in a state block.
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_ContentLost	Occurs when content is about to be lost due to a device reset.
 raise_Disposing	Raises the Disposing event when called from within a derived class.

Public Events

Name	Description
 ContentLost	Occurs when resources are lost (for example, when the current device is lost).
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime (CLR).

StateBlock Constructor

Initializes a new instance of the [StateBlock](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public StateBlock (  
    GraphicsDevice graphicsDevice  
)
```

Parameters

graphicsDevice

The device to associate with the state block.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .
InvalidOperationException	Unable to create this StateBlock resource on the graphics device.

Remarks

StateBlock objects must be recreated when the device is reset.

StateBlock.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
StateBlock.Dispose ()	Immediately releases the unmanaged resources used by this object.
StateBlock.Dispose (Boolean)	Immediately releases the unmanaged resources used by this object.

See Also

Reference

[StateBlock Class](#)

[StateBlock Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

StateBlock.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call [Dispose](#) when you are finished using the [StateBlock](#). The [Dispose](#) method leaves the [StateBlock](#) in an unusable state. After calling [Dispose](#), you must release all references to the [StateBlock](#) so the garbage collector can reclaim the memory that the [StateBlock](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [StateBlock](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [StateBlock](#) object's [Finalize](#) method.

See Also

Reference

[StateBlock Class](#)

[StateBlock Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

StateBlock.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\]](#) **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [StateBlock](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

See Also

Reference

[StateBlock Class](#)

[StateBlock Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

StateBlock.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

StateBlock.raise_ContentLost Method

Note

This method is available only when developing for Windows.

Occurs when content is about to be lost due to a device reset.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void raise_ContentLost (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

The source of this event.

value1

The event arguments that are associated with the action that raised the event.

StateBlock.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the [Disposing](#) event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

StencilOperation Enumeration

Defines stencil buffer operations.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum StencilOperation
```

Members

Member name	Description
Decrement	Decrements the stencil-buffer entry, wrapping to the maximum value if the new value is less than 0.
DecrementSaturation	Decrements the stencil-buffer entry, clamping to 0.
Increment	Increments the stencil-buffer entry, wrapping to 0 if the new value exceeds the maximum value.
IncrementSaturation	Increments the stencil-buffer entry, clamping to the maximum value.
Invert	Inverts the bits in the stencil-buffer entry.
Keep	Does not update the stencil-buffer entry. This is the default value.
Replace	Replaces the stencil-buffer entry with a reference value.
Zero	Sets the stencil-buffer entry to 0.

Remarks Stencil-buffer entries are integer values that range from 0 to $2n - 1$, where n is the bit depth of the stencil buffer.

SurfaceFormat Enumeration

Defines various types of surface formats.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum SurfaceFormat
```

Members

Member name	Description
Alpha8	(Unsigned format) 8-bit alpha only.
Bgr233	(Unsigned format) 8-bit BGR texture format using 2 bits for blue, 3 bits for green, and 3 bits for red.
Bgr24	(Unsigned format) 24-bit BGR pixel format with 8 bits per channel.
Bgr32	(Unsigned format) 32-bit BGR pixel format, where 8 bits are reserved for each color.
Bgr444	(Unsigned format) 16-bit BGR pixel format where 4 bits are reserved for each color.
Bgr555	(Unsigned format) 16-bit BGR pixel format where 5 bits are reserved for each color.
Bgr565	(Unsigned format) 16-bit BGR pixel format with 5 bits for blue, 6 bits for green, and 5 bits for red.
Bgra1010102	(Unsigned format) 32-bit pixel format using 10 bits each for blue, green, and red; and 2 bits for alpha.
Bgra2338	(Unsigned format) 16-bit BGRA format using 2 bits for blue, 3 bits each for red and green; and 8 bits for alpha.
Bgra4444	(Unsigned format) 16-bit BGRA pixel format with 4 bits for each channel.
Bgra5551	(Unsigned format) 16-bit BGRA pixel format where 5 bits are reserved for each color and 1 bit is reserved for alpha.
Color	(Unsigned format) 32-bit ARGB pixel format with alpha, using 8 bits per channel.

Depth15Stencil1	(Buffer format) 16-bit depth-buffer bit depth where 15 bits are reserved for the depth channel and 1 bit is reserved for the stencil channel.
Depth16	(Buffer format) 16-bit depth-buffer bit depth.
Depth24	(Buffer format) 32-bit depth-buffer bit depth using 24 bits for the depth channel.
Depth24Stencil4	(Buffer format) 32-bit depth-buffer bit depth using 24 bits for the depth channel and 4 bits for the stencil channel.
Depth24Stencil8	(Buffer format) 32-bit depth-buffer bit depth using 24 bits for the depth channel and 8 bits for the stencil channel.
Depth24Stencil8Single	(Buffer format) A non-lockable format that contains 24 bits of depth (in a 24-bit floating-point format – 20e4) and 8 bits of stencil.
Depth32	(Buffer format) 32-bit depth-buffer bit depth.
Dxt1	DXT1 compression texture format. The runtime will not allow an application to create a surface using a DXTn format unless the surface dimensions are multiples of 4. This applies to offscreen-plain surfaces, render targets, 2D textures, cube textures, and volume textures.
Dxt2	DXT2 compression texture format. The runtime will not allow an application to create a surface using a DXTn format unless the surface dimensions are multiples of 4. This applies to offscreen-plain surfaces, render targets, 2D textures, cube textures, and volume textures.
Dxt3	DXT3 compression texture format. The runtime will not allow an application to create a surface using a DXTn format unless the surface dimensions are multiples of 4. This applies to offscreen-plain surfaces, render targets, 2D textures, cube textures, and volume textures.
Dxt4	DXT4 compression texture format. The runtime will not allow an application to create a surface using a DXTn format unless the surface dimensions are multiples of 4. This applies to offscreen-plain surfaces, render targets, 2D textures, cube textures, and volume textures.
Dxt5	DXT5 compression texture format. The runtime will not allow an application to create a surface using a DXTn format unless the surface dimensions are multiples of 4. This applies to offscreen-plain surfaces, render targets, 2D textures, cube textures, and volume textures.

HalfSingle	(Floating-point format) 16-bit float format using 16 bits for the red channel.
HalfVector2	(Floating-point format) 32-bit float format using 16 bits for the red channel and 16 bits for the green channel.
HalfVector4	(Floating-point format) 64-bit float format using 16 bits for each channel (alpha, blue, green, red).
Luminance16	(Unsigned format) 16-bit luminance only.
Luminance8	(Unsigned format) 8-bit luminance only.
LuminanceAlpha16	(Unsigned format) 16-bit using 8 bits each for alpha and luminance.
LuminanceAlpha8	(Unsigned format) 8-bit using 4 bits each for alpha and luminance.
Multi2Bgra32	MultiElement texture (not compressed)
NormalizedAlpha1010102	(Mixed format) 32-bit bump-map format using 2 bits for alpha and 10 bits each for w, v, and u.
NormalizedByte2	(Signed format) 16-bit bump-map format using 8 bits each for u and v data.

Normalized DBYTE2C omputed	(Signed format) 16-bit normal compression format. The texture sampler computes the C channel from: $C = \sqrt{1 - U^2 - V^2}$.
Normalized DBYTE4	(Signed format) 32-bit bump-map format using 8 bits for each channel.
Normalized dLuminance16	(Mixed format) 16-bit bump-map format with luminance using 6 bits for luminance, and 5 bits each for v and u.
Normalized dLuminance32	(Mixed format) 32-bit bump-map format with luminance using 8 bits for each channel.
Normalized dShort2	(Signed format) 32-bit bump-map format using 16 bits for each channel.
Normalized dShort4	(Signed format) 64-bit bump-map format using 16 bits for each component.
Palette8	(Unsigned format) 8-bit color indexed.
PaletteAlpha16	(Unsigned format) 8-bit color indexed with 8 bits of alpha.

Rg32	(Unsigned format) 32-bit pixel format using 16 bits each for red and green.
Rgb32	(Unsigned format) 32-bit RGB pixel format, where 8 bits are reserved for each color.
Rgba1010102	(Unsigned format) 32-bit RGBA pixel format using 10 bits for each color and 2 bits for alpha.
Rgba32	(Unsigned format) 32-bit RGBA pixel format with alpha, using 8 bits per channel.
Rgba64	(Unsigned format) 64-bit RGBA pixel format using 16 bits for each component.
Single	(IEEE format) 32-bit float format using 32 bits for the red channel.
Unknown	Surface format is unknown.
Vector2	(IEEE format) 64-bit float format using 32 bits for the red channel and 32 bits for the green channel.
Vector4	(IEEE format) 128-bit float format using 32 bits for each channel (alpha, blue, green, red).
VideoRGB	A 16-bit packed RGB format analogous to VideoYuYv (U0Y0, V0Y1, U2Y2, and so on). It requires a pixel pair to properly represent the color value. The first pixel in the pair contains 8 bits of green (in the low 8 bits) and 8 bits of red (in the high 8 bits). The second pixel contains 8 bits of green (in the low 8 bits) and 8 bits of blue (in the high 8 bits). Together, the two pixels share the red and blue components, while each has a unique green component (R0G0, B0G1, R2G2, and so on). The texture sampler does not normalize the colors when looking up into a pixel shader; they remain in the range of 0.0f to 255.0f. This is true for all programmable pixel shader models. For the fixed-function pixel shader, the hardware should normalize to the 0.f to 1.f range and essentially treat it as the VideoYyVy texture. Hardware that exposes this format must have PixelShader1xMaxValue set to a value capable of handling that range.
VideoRGB	A 16-bit packed RGB format analogous to VideoUyVy (Y0U0, Y1V0, Y2U2, and so on). It requires a pixel pair to properly represent the color value. The first pixel in the pair contains 8 bits of green (in the high 8 bits) and 8 bits of red (in the low 8 bits). The second pixel contains 8 bits of green (in the high 8 bits) and 8 bits of blue (in the low 8 bits). Together, the two pixels share the red and blue components, while each has a unique green component (G0R0, G1B0, G2R2, and so on). The texture sampler does not normalize the colors when looking up into a pixel shader; they remain in the range of 0.0f to 255.0f. This is true for all programmable pixel shader models. For the fixed-function pixel shader, the hardware should normalize to the 0.f to 1.f range and essentially treat it as the VideoYyVy texture. Hardware that exposes this format must have PixelShader1xMaxValue set to a value capable of handling that range.
VideoUYVY	YUY2 format (PC98 compliance)
VideoUYVY	VideoYuYv format (PC98 compliance)

Remarks

In the XNA Framework, all two-dimensional (2D) images are represented by a range of memory called a surface. Within a surface, each element holds a color value representing a small section of the image, called a pixel. An image's detail level is defined by both the number of pixels needed to represent the image, and the number of bits needed for the image's color

spectrum. For example, an image that is 800 pixels wide by 600 pixels high with 32 bits of color for each pixel (written as 800×600×32) is more detailed than an image that is 640 pixels wide by 480 pixels tall with 16 bits of color for each pixel (written as 640×480×16). Likewise, the more detailed image requires a larger surface to store the data. For an 800×600×32 image, the surface's array dimensions are 800×600, and each element holds a 32-bit value to represent its color.

All formats are listed from left to right, most-significant bit to least-significant bit. For example, ARGB formats are ordered from the most-significant bit channel A (alpha), to the least-significant bit channel B (blue). When traversing surface data, the data is stored in memory from least-significant bit to most-significant bit, which means that the channel order in memory is from least-significant bit (blue) to most-significant bit (alpha).

The default value for formats that contain undefined channels (Rg32, Alpha8, and so on) is 1. The only exception is the Alpha8 format, which is initialized to 000 for the three color channels.

The order of the bits is from the most-significant byte first, so LuminanceAlpha16 indicates that the high byte of this 2-byte format is alpha. Depth16 indicates a 16-bit integer value and an application-lockable surface.

Floating-point formats are also known as s10e5 formats. IEEE formats are also known as s23e8 formats. Data in mixed formats can contain a combination of unsigned data and signed data. Data in a signed format can be both positive and negative. Signed formats use combinations of (U), (V), (W), and (Q) data. Data in an unsigned format must be positive. Unsigned formats use combinations of (R)ed, (G)reen, (B)lue, (A)lpha, (L)uminance, and (P)alette data. Palette data is also referred to as "color-indexed" data because the data is used to index a color palette.

Back-Buffer or Display Formats

The following formats are the only valid formats for a back buffer or a display.

Format	Back Buffer	Display
Bgra1010102	x	x (full-screen mode only)
Color	x	
Bgr32	x	x
Bgra5551	x	
Bgr555	x	x
Bgr565	x	x

Depth-stencil Buffer Formats

Depth-stencil buffers each have unique formats. All depth-stencil formats except **Depth16Lockable** indicate no particular bit ordering per pixel, and the driver is allowed to consume more than the indicated number of bits-per-depth channel (but not stencil channel).

⚠Caution
If the back buffer size has changed and the depth stencil must have the corresponding size, recreate the depth stencil when the device is reset.

DXT Compressed Texture Formats

The runtime will not allow an application to create a surface using a DXTn format unless the surface dimensions are multiples of 4. This applies to offscreen-plain surfaces, render targets, 2D textures, cube textures, and volume textures.

Direct3D Equivalents

A mapping of each Direct3D 9 surface format name to the **SurfaceFormat** equivalent is listed in the following table.

	Direct3D Surface Format	SurfaceFormat equivalent
Floating Point		
Float32	D3DFMT_R32F	Single
	D3DFMT_G32R32F	Vector2
	D3DFMT_A32B32G32R32F	Vector4
Float16	D3DFMT_R16F	HalfSingle
	D3DFMT_G16R16F	HalfVector2
	D3DFMT_A16B16G16R16F	HalfVector4
Unsigned Normalized		
64 bpp	D3DFMT_A16B16G16R16	Rgba64
32 bpp	D3DFMT_A8R8G8B8	Color
	D3DFMT_X8R8G8B8	Bgr32
	D3DFMT_A8B8G8R8	Rgba32

	D3DFMT_X8B8G8R8	Rgb32
	D3DFMT_A2R10G10B10	Bgra1010102
	D3DFMT_A2B10G10R10	Rgba1010102
	D3DFMT_G16R16	Rg32
24 bpp	D3DFMT_R8G8B8	Bgr24
16 bpp	D3DFMT_R5G6B5	Bgr565
	D3DFMT_A1R5G5B5	Bgra5551
	D3DFMT_X1R5G5B5	Bgr555
	D3DFMT_A4R4G4B4	Bgra4444
	D3DFMT_X4R4G4B4	Bgr444

SwapEffect Enumeration

Defines how the device front buffer and back buffer are to be swapped when [Present](#) is called.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum SwapEffect
```

Members

Member name	Description
Copy	<p>This swap effect can be specified only for a swap chain that comprises a single back buffer.</p> <p>Whether the swap chain is windowed or full-screen, the runtime guarantees the semantics implied by a copy-based Present operation; specifically, that the operation leaves the content of the back buffer unchanged, instead of replacing it with the content of the front buffer as a flip-based Present operation would.</p> <p>For a windowed swap chain, a Present operation causes the back buffer content to be copied immediately to the client area of the target window. No attempt is made to synchronize the copy with the vertical retrace period of the display adapter, so tearing effects may be observed.</p> <p>For a full-screen swap chain, the runtime uses a combination of flip and copy operations, which are supported by hidden back buffers if necessary, to accomplish the Present operation. Accordingly, the presentation is synchronized with the display adapter's vertical retrace and its rate is constrained by the chosen presentation interval. A swap chain specified with the PresentationInterval.Immediate flag is the only exception. (For more information, see PresentationInterval.) In this case, a Present operation copies the back buffer content directly to the front buffer without waiting for the vertical retrace.</p>
Default	<p>The default swap effect is Discard.</p>
Discard	<p>When a swap chain is created with a swap effect of Flip or Copy, the runtime guarantees that a Present operation will not affect the content of any of the back buffers. However, meeting this guarantee can involve substantial video memory or processing overheads, especially when implementing flip semantics for a windowed swap chain or copy semantics for a full-screen swap chain.</p> <p>An application can use the Discard swap effect to avoid these overheads and to enable the display driver to choose the most efficient presentation technique for the swap chain.</p> <p>Discard is also the only swap effect that can be used when specifying a value other than None for MultiSampleType. Like a swap chain that uses Flip, a swap chain that uses Discard might include more than one back buffer.</p> <p>The swap chain is essentially a queue where 0 always indexes the back buffer that will be displayed by the next Present operation and from which buffers are discarded once they have been displayed. An application that uses this swap effect should update an entire back buffer before invoking a Present operation that displays it.</p> <p>The debug version of the runtime overwrites the contents of discarded back buffers with random data, to enable developers to verify that their applications are updating the entire back buffer surface correctly.</p> <p>For a full-screen swap chain, the presentation rate is determined by the value assigned to PresentationInterval when the device or swap chain is created. Unless this value is PresentationInterval.Immediate, the presentation is synchronized with the vertical sync of the monitor. For a windowed swap chain, the presentation is implemented by means of copy operations, and always occurs immediately.</p>

Flip	<p>The swap chain might include multiple back buffers and is essentially a circular queue that includes the front buffer. Within this queue, the back buffers are always numbered sequentially from 0 to $(n - 1)$, where n is the number of back buffers, so that 0 denotes the least recently presented buffer.</p> <p>When Present is invoked, the queue is rotated so that the front buffer becomes the back buffer $(n - 1)$, while the back buffer 0 becomes the new front buffer.</p> <p>For a full-screen swap chain, the presentation rate is determined by the value assigned to the PresentationInterval when the device or swap chain is created. Unless this value is PresentInterval.Immediate, the presentation is synchronized with the vertical sync of the monitor.</p> <p>For a windowed swap chain, the flipping is implemented by means of copy operations, and the presentation always occurs immediately.</p>
-------------	---

Remarks

The state of the back buffer after a call to [Present](#) is well-defined by each of these swap effects, and whether the Microsoft Direct3D device was created with a full-screen swap chain or a windowed swap chain has no effect on this state. In particular, the **Flip** swap effect operates the same whether windowed or full-screen, and the Direct3D runtime guarantees this by creating extra buffers. As a result, it is recommended that applications use **Discard** whenever possible to avoid any performance penalties, because the current swap effect is always the most efficient in terms of memory consumption and performance.

Full-screen destination alpha will not work with applications that use **Flip** or **Discard**. This means that the **DestinationBlend** render state will not work as expected because, from the driver's point of view, full-screen swap chains with these swap effects do not have an explicit pixel format. The driver infers that it should take on the display format, which does not have an alpha channel. To work around this, use **Copy** and check [SupportsAlphaFullScreenFlipOrDiscard](#), which indicates whether the driver can perform alpha blending when **Flip** or **Discard** is used.

Texture Members

The following tables list the members exposed by the Texture type.

Public Properties

	Name	Description
	GraphicsDevice	(Inherited from GraphicsResource .)
	IsDisposed	(Inherited from GraphicsResource .)
	LevelCount	Gets the number of texture levels in a multilevel texture.
	LevelOfDetail	Gets or sets the highest level-of-detail mipmap stored for a managed texture.
	Name	(Inherited from GraphicsResource .)
	Priority	(Inherited from GraphicsResource .)
	ResourceType	(Inherited from GraphicsResource .)
	Tag	(Inherited from GraphicsResource .)

Public Methods

	Name	Description
	Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
 S	FromFile	Overloaded. Creates a texture resource from a file.
	GenerateMipMaps	Request generation of mipmap sublevels for a render target texture.
 S	GetCreationParameters	Overloaded. Loads texture creation parameters from a file.
	GetHashCode	(Inherited from Object .)
 S	GetTextureInformation	Overloaded. Retrieves information about a given image file.
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	Save	Saves a texture to a file.
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	MemberwiseClone	(Inherited from Object .)
	raise_Disposing	(Inherited from GraphicsResource .)

Public Events

	Name	Description
	Disposing	(Inherited from GraphicsResource .)

Texture.Dispose Method (Boolean)

Releases the unmanaged resources used by this object and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Dispose (  
    bool  
)
```

Parameters

[[MarshalAsAttribute\(U1\)](#)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [Texture](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

Texture.FromFile Method

Creates a texture resource from a file.

Overload List

Name	Description
Texture.FromFile (GraphicsDevice, Stream)	Creates a texture resource from a stream.
Texture.FromFile (GraphicsDevice, Stream, Int32)	Creates a texture resource from a stream, specifying the number of bytes in the stream.
Texture.FromFile (GraphicsDevice, Stream, Int32, TextureCreationParameters)	Loads a Texture from a file.
Texture.FromFile (GraphicsDevice, Stream, TextureCreationParameters)	Loads a Texture from a file.
Texture.FromFile (GraphicsDevice, String)	Creates a texture resource from a file.
Texture.FromFile (GraphicsDevice, String, Int32, Int32, Int32)	Creates a texture resource from a file, specifying the width, height, and depth of the texture in pixels.
Texture.FromFile (GraphicsDevice, String, TextureCreationParameters)	Creates a texture resource from a file, specifying the parameters to be used in creation of the texture.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Texture.FromFile Method (GraphicsDevice, Stream)

Note

This method is available only when developing for Windows.

Creates a texture resource from a stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture FromFile (  
    GraphicsDevice graphicsDevice,  
    Stream textureStream  
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

textureStream

Stream that contains the texture data.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Creates a texture resource from a stream, specifying the number of bytes in the stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture FromFile (
    GraphicsDevice graphicsDevice,
    Stream textureStream,
    int numberBytes
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

textureStream

Stream that contains the texture data.

numberBytes

The number of bytes in *textureStream*.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Note

This method is available only when developing for Windows.

Loads a [Texture](#) from a file.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture FromFile (
    GraphicsDevice graphicsDevice,
    Stream textureStream,
    int numberBytes,
    TextureCreationParameters creationParameters
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) to associate the texture with.

textureStream

The stream to load the texture from.

numberBytes

The number of bytes in the stream.

creationParameters

Parameters to use when creating the [Texture](#).

Return Value

The created [Texture](#).

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Texture.FromFile Method (GraphicsDevice, String)

Note

This method is available only when developing for Windows.

Creates a texture resource from a file.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture FromFile (
    GraphicsDevice graphicsDevice,
    string filename
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

filename

The name of the file containing the texture.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentException	<i>filename</i> is a zero-length string, contains only white space, or contains one or more invalid characters as defined by InvalidPathChars .
ArgumentNullException	<i>filename</i> is null .
PathTooLongException	The specified path, file name, or both exceed the system-defined maximum length. For example, on Windows-based platforms, paths must be less than 248 characters, and file names must be less than 260 characters.
DirectoryNotFoundException	The specified path is invalid (for example, it is on an unmapped drive).
UnauthorizedAccessException	The <i>filename</i> parameter specifies a directory, or the caller does not have the required permission to access the file specified by <i>filename</i> .
FileNotFoundException	The file specified in <i>filename</i> was not found.
NotSupportedException	<i>filename</i> is in an invalid format.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Texture.FromFile Method (GraphicsDevice, String, TextureCreationParameters)

Note

This method is available only when developing for Windows.

Creates a texture resource from a file, specifying the parameters to be used in creation of the texture.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture FromFile (
    GraphicsDevice graphicsDevice,
    string filename,
    TextureCreationParameters creationParameters
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

filename

The name of the file containing the texture.

creationParameters

The parameters to use when creating this texture.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentException	<i>filename</i> is a zero-length string, contains only white space, or contains one or more invalid characters as defined by InvalidPathChars .
ArgumentNullException	<i>filename</i> is null .
PathTooLongException	The specified path, file name, or both exceed the system-defined maximum length. For example, on Windows-based platforms, paths must be less than 248 characters, and file names must be less than 260 characters.
DirectoryNotFoundException	The specified path is invalid (for example, it is on an unmapped drive).
UnauthorizedAccessException	The <i>filename</i> parameter specifies a directory, or the caller does not have the required permission to access the file specified by <i>filename</i> .
FileNotFoundException	The file specified in <i>filename</i> was not found.
NotSupportedException	<i>filename</i> is in an invalid format.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Texture.GenerateMipMaps Method

Request generation of mipmap sublevels for a render target texture.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GenerateMipMaps (
    TextureFilter filterType
)
```

Parameters

filterType

Determines how the texture will be filtered for each mipmap level.

Exceptions

Exception type	Condition
NotSupportedException	GenerateMipMaps is not supported on Xbox 360.

Remarks

This method is valid only if [TextureUsage.AutoGenerateMipMap](#) is set when calling the constructor for a render target texture. Setting this flag indicates that mip levels should be generated, but not when they should be generated. For this case, **GenerateMipMaps** hints to the driver that it should generate sublevels if it has not done so already.

Only the top texture level is accessible to the application, and as a result [LevelCount](#) will not be changed after a call to **GenerateMipMaps**. The texture sublevels are not accessible since the driver creates them only when needed.

Example

In this example, a new [Texture2D](#) is created for use as a render target, the data is initialized with a call to [ResolveBackBuffer](#), and the generation of mipmaps for the resolved render target is requested.

C#

```
ResolveTexture2D renderTargetTexture;
renderTargetTexture = new ResolveTexture2D(
    graphics.GraphicsDevice,
    graphics.GraphicsDevice.PresentationParameters.BackBufferWidth,
    graphics.GraphicsDevice.PresentationParameters.BackBufferHeight,
    1,
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);

graphics.GraphicsDevice.ResolveBackBuffer(renderTargetTexture);
renderTargetTexture.GenerateMipMaps( TextureFilter.Linear );
```

Texture.GetCreationParameters Method (GraphicsDevice, Stream)

Note

This method is available only when developing for Windows.

Loads texture creation parameters from a stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static TextureCreationParameters GetCreationParameters (  
    GraphicsDevice graphicsDevice,  
    Stream textureStream  
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) to associate with the texture creation parameters.

textureStream

Stream containing the texture creation data.

Return Value

The texture creation parameters.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Texture.Save Method

Note

This method is available only when developing for Windows.

Saves a texture to a file.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Save (  
    string filename,  
    ImageFileFormat format  
)
```

Parameters

filename

The file name of the destination image.

format

The file format to use when saving. This function supports saving to all [ImageFileFormat](#) formats except Portable Pixmap (.ppm) and Targa/Truevision Graphics Adapter (.tga).

Remarks

This function handles conversion to and from compressed texture formats.

If the volume is nondynamic and located in video memory, **Save** will fail because this function cannot lock nondynamic volumes located in video memory.

Reference

[Texture Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Texture.LevelCount Property

Gets the number of texture levels in a multilevel texture.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int LevelCount { get; }
```

Property Value

The number of texture levels in the multilevel texture.

See Also

Reference

[Texture Class](#)

[Texture Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Texture.LevelOfDetail Property

Gets or sets the highest level-of-detail mipmap stored for a managed texture.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int LevelOfDetail { get; set; }
```

Property Value

The highest level-of-detail mipmap stored for a managed texture. The default value is 0, causing loading of all mipmapped textures.

Remarks

For example, a 512×512 texture has the following dimensions for each mipmap level: level 0 is 512×512, level 1 is 256×256, level 2 is 128×128, level 3 is 64×64, and so on.

For this example, a value of 3 indicates that the driver only loads mipmaps of size 64×64 and smaller into video memory.

This member is ignored for games targeting the Xbox 360 platform because copying of texture data from system memory to video memory is not permitted.

Texture2D Class

Represents a 2D grid of texels.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class Texture2D : Texture
```

Remarks

A texel represents the smallest unit of a texture that can be read from or written to by the GPU. A texel is composed of 1 to 4 components. Specifically, a texel may be any one of the available texture formats represented in the [SurfaceFormat](#) enumeration.

A [Texture2D](#) resource contains a 2D grid of texels. Each texel is addressable by a u, v vector. Since it is a texture resource, it may contain mipmap levels. Figure 1 shows a fully populated 2D texture resource.

Figure 1. Texture2D Resource Architecture

This texture resource contains a single 3×5 texture with three mipmap levels.

Texture2D Members

The following tables list the members exposed by the Texture2D type.

Public Constructors

Name	Description
 Texture2D	Overloaded. Creates an uninitialized Texture2D resource of the specified dimensions. To initialize a Texture2D from an existing file, see the static method ContentManager.Load or Texture2D.FromFile .

Public Properties

Name	Description
 Format	Gets the pixel format of this texture resource.
 GraphicsDevice	(Inherited from GraphicsResource .)
 Height	Gets the height of this texture resource, in pixels.
 IsDisposed	(Inherited from GraphicsResource .)
 LevelCount	(Inherited from Texture .)
 LevelOfDetail	(Inherited from Texture .)
 Name	(Inherited from GraphicsResource .)
 Priority	(Inherited from GraphicsResource .)
 ResourceType	(Inherited from GraphicsResource .)
 Tag	(Inherited from GraphicsResource .)
 TextureUsage	Gets the state of the related TextureUsage enumeration.
 Width	Gets the width of this texture resource, in pixels.

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
  FromFile	Overloaded. Creates a texture resource from a file.
 GenerateMipMaps	(Inherited from Texture .)
 GetCreationParameters	(Inherited from Texture .)
 GetData	Overloaded. Copies texture data into an array.
 GetHashCode	(Inherited from Object .)
 GetTextureInformation	(Inherited from Texture .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 Save	(Inherited from Texture .)
 SetData	Overloaded. Copies array data to the texture.
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_Disposing	(Inherited from GraphicsResource .)

Public Events

Name	Description
 Disposing	(Inherited from GraphicsResource .)

Creates an uninitialized [Texture2D](#) resource of the specified dimensions. To initialize a [Texture2D](#) from an existing file, see the static method [ContentManager.Load](#) or [Texture2D.FromFile](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Texture2D (
    GraphicsDevice graphicsDevice,
    int width,
    int height
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) used to display the texture.

width

The width of the texture, in pixels. This value must be a power of two if the [RequiresPower2](#) property of *graphicsDevice* is **true**. If this value is 0, a value of 1 is used.

height

The height of the texture, in pixels. This value must be a power of two if the [RequiresPower2](#) property of *graphicsDevice* is **true**. If this value is 0, a value of 1 is used.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentException	<p>One of the following conditions is true:</p> <ul style="list-style-type: none"> <i>width</i> is larger than MaxTextureWidth. <i>height</i> is larger than MaxTextureHeight. <i>numberLevels</i> is greater than 32. Textures have a maximum of 32 levels. <i>usage</i> is not a valid value. Texture resource can be created only with the following TextureUsage options: TextureUsage.AutoGenerateMipMap, TextureUsage.Tiled, and TextureUsage.Linear. <i>format</i> is SurfaceFormat.Unknown. Textures cannot be created using SurfaceFormat.Unknown. <p>The parameters specified are not compatible:</p> <ul style="list-style-type: none"> <i>format</i> and <i>numberLevels</i> are incompatible. Multi-element textures of type SurfaceFormat.Multi2Bgra32 cannot be mipmapped, so you need to set <i>numberLevels</i> to 1. <i>usage</i> and <i>numberLevels</i> are incompatible. Textures specifying the usage TextureUsage.AutoGenerateMipMap must set <i>numberLevels</i> to either 0 or 1. The <i>format</i> and <i>usage</i> requested are not supported by the graphics device. The device does not support creating a texture of the given format with the given TextureUsage.
ArgumentOutOfRangeException	<i>width</i> or <i>height</i> is less than or equal to zero; <i>width</i> and <i>height</i> must be greater than zero.
OutOfVideoMemoryException	Unable to create this resource on the graphics device.

Remarks

A texel represents the smallest unit of a texture that can be read from or written to by the GPU. A texel is composed of 1 to 4 components. Specifically, a texel may be any one of the available texture formats represented in the [SurfaceFormat](#) enumeration.

A [Texture2D](#) resource contains a 2D grid of texels. Each texel is addressable by a u, v vector. Since it is a texture resource, it may contain mipmap levels. Figure 1 shows a fully populated 2D texture resource.

Figure 1. Texture2D Resource Architecture

This texture resource contains a single 3×5 texture with three mipmap levels.

Example

In this example, a new [Texture2D](#) is created for use as a render target, the data is initialized with a call to [ResolveBackBuffer](#), and the generation of mipmaps for the resolved render target is requested.

C#

```
ResolveTexture2D renderTargetTexture;  
renderTargetTexture = new ResolveTexture2D(  
    graphics.GraphicsDevice,  
    graphics.GraphicsDevice.PresentationParameters.BackBufferWidth,  
    graphics.GraphicsDevice.PresentationParameters.BackBufferHeight,  
    1,  
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);  
  
graphics.GraphicsDevice.ResolveBackBuffer(renderTargetTexture);  
renderTargetTexture.GenerateMipMaps( TextureFilter.Linear );
```

[Texture2D Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Texture2D Constructor (GraphicsDevice, Int32, Int32, Int32, TextureUsage, SurfaceFormat)

Creates an uninitialized [Texture2D](#) resource of the specified dimensions. To initialize a [Texture2D](#) from an existing file, see the static method [ContentManager.Load](#) or [Texture2D.FromFile](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Texture2D (
    GraphicsDevice graphicsDevice,
    int width,
    int height,
    int numberLevels,
    TextureUsage usage,
    SurfaceFormat format
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) used to display the texture.

width

The width of the texture, in pixels. This value must be a power of two if the [RequiresPower2](#) property of *graphicsDevice* is **true**. If this value is 0, a value of 1 is used.

height

The height of the texture, in pixels. This value must be a power of two if the [RequiresPower2](#) property of *graphicsDevice* is **true**. If this value is 0, a value of 1 is used.

numberLevels

The number of levels in the texture. These smaller versions of the texture, known as mipmap levels, are used when the texture is minified to fit a smaller area than the original texture size. The chain of downsampled surfaces associated with a texture is sometimes called a mipmap chain.

If *numberLevels* is zero, all texture sublevels down to 1×1 pixels will be generated for hardware that supports mipmapped textures. Use [LevelCount](#) to see the number of levels generated.

usage

Options identifying the behaviors of this texture resource.

format

A [SurfaceFormat](#) value specifying the requested pixel format for the texture. The returned texture may be of a different format if the device does not support the requested format. Applications should check the format of the returned texture to ensure that it matches the requested format.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .

ArgumentException	<p>One of the following conditions is true:</p> <ul style="list-style-type: none"> • <i>width</i> is larger than MaxTextureWidth. • <i>height</i> is larger than MaxTextureHeight. • <i>numberLevels</i> is greater than 32. Textures have a maximum of 32 levels. • <i>usage</i> is not a valid value. Texture resource can be created only with the following TextureUsage options: TextureUsage.AutoGenerateMipMap, TextureUsage.Tiled, and TextureUsage.Linear. • <i>format</i> is SurfaceFormat.Unknown. Textures cannot be created using SurfaceFormat.Unknown. <p>The parameters specified are not compatible:</p> <ul style="list-style-type: none"> • <i>format</i> and <i>numberLevels</i> are incompatible. Multi-element textures of type SurfaceFormat.Multi2Bgra32 cannot be mipmapped, so you need to set <i>numberLevels</i> to 1. • <i>usage</i> and <i>numberLevels</i> are incompatible. Textures specifying the usage TextureUsage.AutoGenerateMipMap must set <i>numberLevels</i> to either 0 or 1. • The <i>format</i> and <i>usage</i> requested are not supported by the graphics device. The device does not support creating a texture of the given format with the given TextureUsage.
ArgumentOutOfRangeException	<i>width</i> or <i>height</i> is less than or equal to zero; <i>width</i> and <i>height</i> must be greater than zero.
OutOfVideoMemoryException	Unable to create this resource on the graphics device.

Remarks

A texel represents the smallest unit of a texture that can be read from or written to by the GPU. A texel is composed of 1 to 4 components. Specifically, a texel may be any one of the available texture formats represented in the [SurfaceFormat](#) enumeration.

A [Texture2D](#) resource contains a 2D grid of texels. Each texel is addressable by a u, v vector. Since it is a texture resource, it may contain mipmap levels. Figure 1 shows a fully populated 2D texture resource.

Figure 1. Texture2D Resource Architecture

This texture resource contains a single 3×5 texture with three mipmap levels.

Example

In this example, a new [Texture2D](#) is created for use as a render target, the data is initialized with a call to [ResolveBackBuffer](#), and the generation of mipmaps for the resolved render target is requested.

C#

```
ResolveTexture2D renderTargetTexture;
renderTargetTexture = new ResolveTexture2D(
    graphics.GraphicsDevice,
    graphics.GraphicsDevice.PresentationParameters.BackBufferWidth,
    graphics.GraphicsDevice.PresentationParameters.BackBufferHeight,
    1,
    graphics.GraphicsDevice.PresentationParameters.BackBufferFormat);

graphics.GraphicsDevice.ResolveBackBuffer(renderTargetTexture);
renderTargetTexture.GenerateMipMaps( TextureFilter.Linear );
```

Texture2D.Dispose Method (Boolean)

Releases the unmanaged resources used by the [Texture2D](#) and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Dispose (  
    bool  
)
```

Parameters

[[MarshalAsAttribute](#)(U1)] **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [Texture2D](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

Texture2D.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

Texture2D.FromFile Method

Creates a texture resource from a file.

Overload List

Name	Description
Texture2D.FromFile (GraphicsDevice, Stream)	Creates a texture resource from a stream.
Texture2D.FromFile (GraphicsDevice, Stream, Int32)	Creates a texture resource from a stream, specifying the number of bytes in the stream.
Texture2D.FromFile (GraphicsDevice, Stream, Int32, TextureCreationParameters)	Creates a texture resource from a stream, specifying the number of bytes in the stream and the texture creation parameters to use.
Texture2D.FromFile (GraphicsDevice, Stream, TextureCreationParameters)	Creates a texture resource from a stream, specifying the parameters to be used in creation of the texture.
Texture2D.FromFile (GraphicsDevice, String)	Creates a texture resource from a file.
Texture2D.FromFile (GraphicsDevice, String, Int32, Int32)	Creates a texture resource from a file, specifying the width and height of the texture in pixels.
Texture2D.FromFile (GraphicsDevice, String, TextureCreationParameters)	Creates a texture resource from a file, specifying the parameters to be used in creation of the texture.
Texture2D.FromFile (GraphicsDevice, String, Int32, Int32, Int32)	(Inherited from Texture .)

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Texture2D.FromFile Method (GraphicsDevice, Stream)

Note

This method is available only when developing for Windows.

Creates a texture resource from a stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture2D FromFile (  
    GraphicsDevice graphicsDevice,  
    Stream textureStream  
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

textureStream

Stream containing the texture data.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Texture2D.FromFile Method (GraphicsDevice, Stream, Int32)

Note

This method is available only when developing for Windows.

Creates a texture resource from a stream, specifying the number of bytes in the stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture2D FromFile (
    GraphicsDevice graphicsDevice,
    Stream textureStream,
    int numberBytes
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

textureStream

Stream containing the texture data.

numberBytes

The number of bytes in *textureStream*.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Note

This method is available only when developing for Windows.

Creates a texture resource from a stream, specifying the number of bytes in the stream and the texture creation parameters to use.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture2D FromFile (
    GraphicsDevice graphicsDevice,
    Stream textureStream,
    int numberBytes,
    TextureCreationParameters creationParameters
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

textureStream

Stream containing the volume texture data.

numberBytes

The number of bytes in *textureStream*.

creationParameters

The parameters to use when creating this texture.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Remarks

Note

This method is available only when developing for Windows.

Creates a texture resource from a file.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture2D FromFile (
    GraphicsDevice graphicsDevice,
    string filename
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

filename

The name of the file containing the texture.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentException	<i>filename</i> is a zero-length string, contains only white space, or contains one or more invalid characters as defined by InvalidPathChars .
ArgumentNullException	<i>filename</i> is null .
PathTooLongException	The specified path, file name, or both exceed the system-defined maximum length. For example, on Windows-based platforms, paths must be less than 248 characters, and file names must be less than 260 characters.
DirectoryNotFoundException	The specified path is invalid (for example, it is on an unmapped drive).
UnauthorizedAccessException	The <i>filename</i> parameter specifies a directory, or the caller does not have the required permission to access the file specified by <i>filename</i> .
FileNotFoundException	The file specified in <i>filename</i> was not found.
NotSupportedException	<i>filename</i> is in an invalid format.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Reference

[Texture2D Class](#)

[Texture2D Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Texture2D.GetData Generic Method (Int32, Nullable<Rectangle>, T[], Int32, Int32)

Copies texture data into an array.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GetData<T> (
    int level,
    Nullable<Rectangle> rect,
    T[] data,
    int startIndex,
    int elementCount
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array. This is usually a [Microsoft.Xna.Framework.Graphics.PackedVector](#) type which matches the [Format](#) of the texture, but it can be any fundamental type that matches the bit size of the surface format.

Parameters

level

The mipmap level to copy from.

rect

The section of the texture to copy. **null** indicates the data will be copied from the entire texture.

data

The array to receive texture data.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

Exceptions

Exception type	Condition
ArgumentNullException	<i>data</i> must be of sufficient length to receive the data.
InvalidOperationException	The vertex stride is larger than the vertex buffer, or the vertex stride is too small for the type of data requested.

Example

In this example, the color of the pixel beneath the mouse is retrieved from the back buffer.

C#

```
if (Mouse.GetState().LeftButton == ButtonState.Pressed &&
    // If the left button is pressed
    Mouse.GetState().X > 0 && Mouse.GetState().Y > 0 &&
    // and we are inside the game window
    (Mouse.GetState().X <
     GraphicsDevice.PresentationParameters.BackBufferWidth) &&
    (Mouse.GetState().Y <
     GraphicsDevice.PresentationParameters.BackBufferHeight))
{
    backBufferData = new ResolveTexture2D(
        GraphicsDevice,
        GraphicsDevice.PresentationParameters.BackBufferWidth,
        GraphicsDevice.PresentationParameters.BackBufferHeight,
        1,
        GraphicsDevice.PresentationParameters.BackBufferFormat);
}
```

```
Rectangle sourceRectangle =  
    new Rectangle(Mouse.GetState().X, Mouse.GetState().Y, 1, 1);  
  
Color[] retrievedColor = new Color[1];  
  
GraphicsDevice.ResolveBackBuffer(backBufferData);  
  
backBufferData.GetData<Color>(0,  
    sourceRectangle,  
    retrievedColor,  
    0,  
    1);  
}
```

Texture2D.GetData Generic Method (T[])

Copies texture data into an array.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GetData<T> (
    T[] data
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array. This is usually a [Microsoft.Xna.Framework.Graphics.PackedVector](#) type that matches the [Format](#) of the texture, but it can be any fundamental type that matches the bit size of the surface format.

Parameters

data

The array to receive texture data.

Exceptions

Exception type	Condition
ArgumentNullException	<i>data</i> must be of sufficient length to receive the data.
InvalidOperationException	The vertex stride is larger than the vertex buffer, or the vertex stride is too small for the type of data requested.

Example

In this example, the color of the pixel beneath the mouse is retrieved from the back buffer.

C#

```
if (Mouse.GetState().LeftButton == ButtonState.Pressed &&
    // If the left button is pressed
    Mouse.GetState().X > 0 && Mouse.GetState().Y > 0 &&
    // and we are inside the game window
    (Mouse.GetState().X <
    GraphicsDevice.PresentationParameters.BackBufferWidth) &&
    (Mouse.GetState().Y <
    GraphicsDevice.PresentationParameters.BackBufferHeight))
{
    backBufferData = new ResolveTexture2D(
        GraphicsDevice,
        GraphicsDevice.PresentationParameters.BackBufferWidth,
        GraphicsDevice.PresentationParameters.BackBufferHeight,
        1,
        GraphicsDevice.PresentationParameters.BackBufferFormat);

    Rectangle sourceRectangle =
        new Rectangle(Mouse.GetState().X, Mouse.GetState().Y, 1, 1);

    Color[] retrievedColor = new Color[1];

    GraphicsDevice.ResolveBackBuffer(backBufferData);

    backBufferData.GetData<Color>(
        0,
        sourceRectangle,
        retrievedColor,
        0,
        1);
}
```

Texture2D.GetData Generic Method (T[], Int32, Int32)

Copies texture data into an array.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GetData<T> (
    T[] data,
    int startIndex,
    int elementCount
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array. This is usually a [Microsoft.Xna.Framework.Graphics.PackedVector](#) type that matches the [Format](#) of the texture, but it can be any fundamental type that matches the bit size of the surface format.

Parameters

data

The array to receive texture data.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

Exceptions

Exception type	Condition
ArgumentNullException	<i>data</i> must be of sufficient length to receive the data.
InvalidOperationException	The vertex stride is larger than the vertex buffer, or the vertex stride is too small for the type of data requested.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

Example

In this example, the color of the pixel beneath the mouse is retrieved from the back buffer.

C#

```
if (Mouse.GetState().LeftButton == ButtonState.Pressed &&
    // If the left button is pressed
    Mouse.GetState().X > 0 && Mouse.GetState().Y > 0 &&
    // and we are inside the game window
    (Mouse.GetState().X <
    GraphicsDevice.PresentationParameters.BackBufferWidth) &&
    (Mouse.GetState().Y <
    GraphicsDevice.PresentationParameters.BackBufferHeight))
{
    backBufferData = new ResolveTexture2D(
        GraphicsDevice,
        GraphicsDevice.PresentationParameters.BackBufferWidth,
        GraphicsDevice.PresentationParameters.BackBufferHeight,
        1,
        GraphicsDevice.PresentationParameters.BackBufferFormat);

    Rectangle sourceRectangle =
        new Rectangle(Mouse.GetState().X, Mouse.GetState().Y, 1, 1);

    Color[] retrievedColor = new Color[1];

    GraphicsDevice.ResolveBackBuffer(backBufferData);
```

```
backBufferData.GetData<Color>(
    0,
    sourceRectangle,
    retrievedColor,
    0,
    1);
}
```

[Texture2D Class](#)

[Texture2D Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Texture2D.SetData Generic Method (Int32, Nullable<Rectangle>, T[], Int32, Int32, SetDataOptions)

Copies array data to the texture.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (
    int level,
    Nullable<Rectangle> rect,
    T[] data,
    int startIndex,
    int elementCount,
    SetDataOptions options
) where T : ValueType
```

Type Parameters

T

The type of data to set.

Parameters

level

The mipmap level where the data will be placed.

rect

The section of the texture where the data will be placed. **null** indicates the data will be copied over the entire texture.

data

The array of data to copy. If *rect* is null, the number of elements in the array must be equal to the size of the texture, which is **Width** × **Height**; otherwise, the number of elements in the array should equal the size of the rectangle specified.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

options

Option that specifies whether existing data in the buffer will be kept after this operation.

Exceptions

Exception type	Condition
InvalidOperationException	The size of the data passed in is too large or too small for this resource.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

⚠ Caution

Here is a tip for rendering objects within the [Draw](#) method of an Xbox 360 game. Do not use **SetData** when writing data to vertex buffers, index buffers, and textures. This method may lead to graphics corruption or crashes.

This is because, in cases where the size of the back buffer and depth-stencil buffer exceed the size of the Xbox 360 10 MB of embedded memory (EDRAM), [predicated tiling](#) is utilized on this platform to compensate for the additional memory requirements. Predicated tiling is a process by which scene rendering is performed multiple times on subsections of the final render target dimensions.

When predicated tiling has been triggered, the drawing commands contained in the [Draw](#) function are not submitted until [Present](#) is called. (Note that [Draw](#) implicitly calls [Present](#) at the end of this method.) In this case, these resources are not available for modification until the GPU is finished with presenting the entire frame.

Example

This example demonstrates the use of the *rect* argument to set a single pixel in a texture.

C#

```
texture2D.SetData<Color>(
    0,
    new Rectangle(randomX, randomY, 1, 1),
    new Color[] { Color.White },
    0,
    1,
    SetDataOptions.None
);
```

Texture2D.SetData Generic Method (T[])

Copies array data to the texture at mipmap level 0.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (
    T[] data
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

data

The array of data to copy. The number of elements in the array must be equal to the size of the texture, which is [Width](#) × [Height](#).

Exceptions

Exception type	Condition
InvalidOperationException	The size of the data passed in is too large or too small for this resource.

Remarks

⚠Caution

Here is a tip for rendering objects within the [Draw](#) method of an Xbox 360 game. Do not use **SetData** when writing data to vertex buffers, index buffers, and textures. This method may lead to graphics corruption or crashes.

This is because, in cases where the size of the back buffer and depth-stencil buffer exceed the size of the Xbox 360 10 MB of embedded memory (EDRAM), [predicated tiling](#) is utilized on this platform to compensate for the additional memory requirements. Predicated tiling is a process by which scene rendering is performed multiple times on subsections of the final render target dimensions.

When predicated tiling has been triggered, the drawing commands contained in the [Draw](#) function are not submitted until [Present](#) is called. (Note that [Draw](#) implicitly calls [Present](#) at the end of this method.) In this case, these resources are not available for modification until the GPU is finished with presenting the entire frame.

An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

Texture2D.SetData Generic Method (T[], Int32, Int32, SetDataOptions)

Copies array data to the texture at mipmap level 0.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (
    T[] data,
    int startIndex,
    int elementCount,
    SetDataOptions options
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array. Generally the type for this array will allow for elements in the same size as specified for the [Format](#) property of the texture.

Parameters

data

The array of data to copy.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy. This must be equal to the size of the texture, which is [Width](#) × [Height](#).

options

Option that specifies whether existing data in the buffer will be kept after this operation.

Exceptions

Exception type	Condition
InvalidOperationException	The size of the data passed in is too large or too small for this resource.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

⚠ Caution

Here is a tip for rendering objects within the [Draw](#) method of an Xbox 360 game. Do not use **SetData** when writing data to vertex buffers, index buffers, and textures. This method may lead to graphics corruption or crashes.

Texture2D Properties

Public Properties

	Name	Description
	Format	Gets the pixel format of this texture resource.
	GraphicsDevice	(Inherited from GraphicsResource .)
	Height	Gets the height of this texture resource, in pixels.
	IsDisposed	(Inherited from GraphicsResource .)
	LevelCount	(Inherited from Texture .)
	LevelOfDetail	(Inherited from Texture .)
	Name	(Inherited from GraphicsResource .)
	Priority	(Inherited from GraphicsResource .)
	ResourceType	(Inherited from GraphicsResource .)
	Tag	(Inherited from GraphicsResource .)
	TextureUsage	Gets the state of the related TextureUsage enumeration.
	Width	Gets the width of this texture resource, in pixels.

Texture2D.Format Property

Gets the pixel format of this texture resource.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SurfaceFormat Format { get; }
```

Property Value

The pixel format of this texture resource.

Texture2D.Height Property

Gets the height of this texture resource, in pixels.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Height { get; }
```

Property Value

The height of this texture resource, in pixels.

Texture2D.TextureUsage Property

Gets the state of the related [TextureUsage](#) enumeration.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TextureUsage TextureUsage { get; }
```

Property Value

Indicates how the application uses the texture.

Texture3D Class

Represents a 3D volume of texels.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class Texture3D : Texture
```

Remarks

A texel represents the smallest unit of a texture that can be read from or written to by the GPU. A texel is composed of 1 to 4 components. Specifically, a texel may be any one of the available texture formats represented in the [SurfaceFormat](#) enumeration.

A **Texture3D** resource (also known as a volume texture) contains a 3D volume of texels. Since it is a texture resource, it may contain mipmap levels. Figure 1 shows a fully populated **Texture3D** resource.

Figure 1. Texture3D Resource Architecture

When a **Texture3D** mipmap slice is bound as a render target output (by creating a [RenderTargetCube](#)), the **Texture3D** behaves identically to an array of [Texture2D](#) objects with n array slices, where n is the depth (third dimension) of the **Texture3D**.

Texture3D Members

The following tables list the members exposed by the Texture3D type.

Public Constructors

	Name	Description
	Texture3D	Creates an uninitialized volume texture resource of the given dimensions, specifying the memory management mode for the resource. To initialize a Texture3D from an existing file, see the static method ContentManager.Load or FromFile .

Public Properties

	Name	Description
	Depth	Gets the depth of this volume texture resource, in pixels.
	Format	Gets the pixel format for this texture resource.
	GraphicsDevice	(Inherited from GraphicsResource .)
	Height	Gets the height of this texture resource, in pixels.
	IsDisposed	(Inherited from GraphicsResource .)
	LevelCount	(Inherited from Texture .)
	LevelOfDetail	(Inherited from Texture .)
	Name	(Inherited from GraphicsResource .)
	Priority	(Inherited from GraphicsResource .)
	ResourceType	(Inherited from GraphicsResource .)
	Tag	(Inherited from GraphicsResource .)
	TextureUsage	Gets the state of the related TextureUsage enumeration.
	Width	Gets the width of this texture resource, in pixels.

Public Methods

	Name	Description
	Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
	 FromFile	Overloaded. Creates a volume texture resource from a file.
	GenerateMipMaps	(Inherited from Texture .)
	GetCreationParameters	(Inherited from Texture .)
	GetData	Overloaded. Gets a copy of the texture data.
	GetHashCode	(Inherited from Object .)
	GetTextureInformation	(Inherited from Texture .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	Save	(Inherited from Texture .)
	SetData	Overloaded. Copies array data to the texture.
	ToString	Retrieves a string representation of this object.

Protected Methods

	Name	Description
	Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
	MemberwiseClone	(Inherited from Object .)
	raise_Disposing	(Inherited from GraphicsResource .)

Public Events

	Name	Description
	Disposing	(Inherited from GraphicsResource .)

Reference

[Texture3D Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Texture3D Constructor

Creates an uninitialized volume texture resource of the given dimensions, specifying the memory management mode for the resource. To initialize a [Texture3D](#) from an existing file, see the static method [ContentManager.Load](#) or [FromFile](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Texture3D (
    GraphicsDevice graphicsDevice,
    int width,
    int height,
    int depth,
    int numberLevels,
    TextureUsage usage,
    SurfaceFormat format
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) that will display the volume texture.

width

The width, in pixels, of the top-level of the volume texture. This value must be a power of two if the [RequiresPower2](#) property of *graphicsDevice* is **true**. The pixel dimensions of subsequent levels will be the truncated value of half of the previous level's pixel dimension (independently). Each dimension clamps at a size of 1 pixel. Thus, if the division by two results in 0 (zero), 1 will be taken instead. The maximum dimension that a driver supports (for *width*, *height*, and *depth*) can be found in [MaxVolumeExtent](#).

height

The height, in pixels, of the top-level of the volume texture. This value must be a power of two if the [RequiresPower2](#) property of *graphicsDevice* is **true**. The pixel dimensions of subsequent levels will be the truncated value of half of the previous level's pixel dimension (independently). Each dimension clamps at a size of 1 pixel. Thus, if the division by two results in 0 (zero), 1 will be taken instead. The maximum dimension that a driver supports (for *width*, *height*, and *depth*) can be found in [MaxVolumeExtent](#).

depth

The depth, in pixels, of the top-level of the volume texture. This value must be a power of two if the [RequiresVolumeMapPower2](#) property of *graphicsDevice* is **true**. The pixel dimensions of subsequent levels will be the truncated value of half of the previous level's pixel dimension (independently). Each dimension clamps at a size of 1 pixel. Thus, if the division by two results in 0 (zero), 1 will be taken instead. The maximum dimension that a driver supports (for *width*, *height*, and *depth*) can be found in [MaxVolumeExtent](#).

numberLevels

The number of downsampled surfaces to create when preprocessing the texture. These smaller versions of the texture, known as mipmap levels, are used when the texture is minified to fit a smaller area than the original texture size. The chain of downsampled surfaces associated with a texture is sometimes called a mipmap chain.

If *numberLevels* is zero, all texture sublevels down to 1×1 pixels will be generated for hardware that supports mipmapped textures. Use [LevelCount](#) to see the number of levels generated.

usage

Options identifying the behaviors of this texture resource.

format

The format of all levels in the volume texture resource.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentOutOfRangeException	<i>width</i> , <i>height</i> , or <i>depth</i> is less than or equal to zero. <i>width</i> , <i>height</i> and <i>depth</i> must be greater than zero.

ArgumentException	<p>One of the following conditions is true:</p> <ul style="list-style-type: none"> • <i>numberLevels</i> is too large for a texture cube of this size. • <i>numberLevels</i> is greater than 32. Textures have a maximum of 32 levels. • <i>format</i> is SurfaceFormat.Unknown. Textures cannot be created using SurfaceFormat.Unknown. • <i>usage</i> is not a valid value. Texture resources can only be created with the following TextureUsage options: TextureUsage.AutoGenerateMipMap, TextureUsage.Tiled, and TextureUsage.Linear. • The combination of <i>width</i>, <i>height</i>, and <i>depth</i> requested results in a resource that is too large. • <i>format</i> and <i>numberLevels</i> are incompatible. Multi-element textures of type SurfaceFormat.Multi2Bgra32 cannot be mipmapped, set <i>numberLevels</i> to 1. • The graphics device does not support the requested <i>format</i> and <i>usage</i>. The device does not support creating a texture of the given format with the given TextureUsage.
OutOfVideoMemoryException	Unable to create this resource on the graphics device.

Remarks

A texel represents the smallest unit of a texture that can be read from or written to by the GPU. A texel is composed of 1 to 4 components. Specifically, a texel may be any one of the available texture formats represented in the [SurfaceFormat](#) enumeration.

A **Texture3D** resource (also known as a volume texture) contains a 3D volume of texels. Since it is a texture resource, it may contain mipmap levels. Figure 1 shows a fully populated **Texture3D** resource.

Figure 1. Texture3D Resource Architecture

When a **Texture3D** mipmap slice is bound as a render target output (by creating a [RenderTargetCube](#)), the **Texture3D** behaves identically to an array of [Texture2D](#) objects with *n* array slices, where *n* is the depth (third dimension) of the **Texture3D**.

Texture3D.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
Texture3D.Dispose (Boolean)	Releases the unmanaged resources used by the Texture3D and optionally releases the managed resources.
Texture3D.Dispose ()	(Inherited from GraphicsResource .)

See Also

Reference

[Texture3D Class](#)

[Texture3D Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Texture3D.Dispose Method (Boolean)

Releases the unmanaged resources used by the [Texture3D](#) and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\]](#) **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [Texture3D](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

Texture3D.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

Texture3D.FromFile Method

Creates a volume texture resource from a file.

Overload List

Name	Description
Texture3D.FromFile (GraphicsDevice, Stream)	Creates a volume texture resource from a stream.
Texture3D.FromFile (GraphicsDevice, Stream, Int32)	Creates a volume texture resource from a stream, specifying the number of bytes in the stream.
Texture3D.FromFile (GraphicsDevice, Stream, Int32, TextureCreationParameters)	Creates a volume texture resource from a stream, specifying the number of bytes in the stream and the texture creation parameters to use.
Texture3D.FromFile (GraphicsDevice, Stream, TextureCreationParameters)	Creates a volume texture resource from a stream, specifying the parameters to use for the texture creation.
Texture3D.FromFile (GraphicsDevice, String)	Creates a volume texture resource from a file.
Texture3D.FromFile (GraphicsDevice, String, Int32, Int32, Int32)	Creates a volume texture resource from a file, specifying the width, height, and depth in pixels.
Texture3D.FromFile (GraphicsDevice, String, TextureCreationParameters)	Creates a volume texture resource from a file, specifying the parameters to be used in creation of the texture.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Texture3D.FromFile Method (GraphicsDevice, Stream)

Note

This method is available only when developing for Windows.

Creates a volume texture resource from a stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture3D FromFile (  
    GraphicsDevice graphicsDevice,  
    Stream textureStream  
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

textureStream

Stream containing the volume texture data.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Note

This method is available only when developing for Windows.

Creates a volume texture resource from a stream, specifying the number of bytes in the stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture3D FromFile (  
    GraphicsDevice graphicsDevice,  
    Stream textureStream,  
    int numberBytes  
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

textureStream

Stream containing the texture data.

numberBytes

The number of bytes in *textureStream*.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Texture3D.FromFile Method (GraphicsDevice, String)

Note

This method is available only when developing for Windows.

Creates a volume texture resource from a file.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static Texture3D FromFile (
    GraphicsDevice graphicsDevice,
    string filename
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

filename

The name of the file containing the texture.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentException	<i>filename</i> is a zero-length string, contains only white space, or contains one or more invalid characters as defined by InvalidPathChars .
ArgumentNullException	<i>filename</i> is null .
PathTooLongException	The specified path, file name, or both exceed the system-defined maximum length. For example, on Windows-based platforms, paths must be less than 248 characters, and file names must be less than 260 characters.
DirectoryNotFoundException	The specified path is invalid (for example, it is on an unmapped drive).
UnauthorizedAccessException	The <i>filename</i> parameter specifies a directory, or the caller does not have the required permission to access the file specified by <i>filename</i> .
FileNotFoundException	The file specified in <i>filename</i> was not found.
NotSupportedException	<i>filename</i> is in an invalid format.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Texture3D.GetData Generic Method (Int32, Int32, Int32, Int32, Int32, Int32, Int32, T[], Int32, Int32)

Gets a copy of the texture data, specifying the level and dimensions of the volume texture to copy.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GetData<T> (  
    int level,  
    int left,  
    int top,  
    int right,  
    int bottom,  
    int front,  
    int back,  
    T[] data,  
    int startIndex,  
    int elementCount  
) where T : ValueType
```

Type Parameters

T

Type of value to return.

Parameters

level

The mipmap level where the data will be placed.

left

Position of the left side of the box on the x-axis.

top

Position of the top of the box on the y-axis.

right

Position of the right side of the box on the x-axis.

bottom

Position of the bottom of the box on the y-axis.

front

Position of the front of the box on the z-axis.

back

Position of the back of the box on the z-axis.

data

An array to fill with data.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

Platforms Xbox 360, Windows XP SP2, Windows Vista

Texture3D.GetData Generic Method (T[], Int32, Int32)

Gets a copy of the texture data, specifying the starting index and number of elements to copy.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GetData<T> (  
    T[] data,  
    int startIndex,  
    int elementCount  
) where T : ValueType
```

Type Parameters

T

Type of value to return.

Parameters

data

An array to fill with data.

startIndex

Index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

Texture3D.SetData Method

Copies array data to the texture.

Overload List

Name	Description
Texture3D.SetData (Int32, Int32, Int32, Int32, Int32, Int32, Int32, T[], Int32, Int32, SetDataOptions)	Copies array data to the texture, specifying the dimensions of the volume and the mipmap level where the data is to be placed.
Texture3D.SetData (T[])	Copies array data to the texture at mipmap level 0.
Texture3D.SetData (T[], Int32, Int32, SetDataOptions)	Copies array data to the texture at mipmap level 0, specifying the starting index and number of elements to copy.

Exceptions

Exception type	Condition
InvalidOperationException	The size of the data passed in is too large or too small for this resource.

Texture3D.SetData Generic Method (Int32, Int32, Int32, Int32, Int32, Int32, Int32, T[], Int32, Int32, SetDataOptions)

Copies array data to the texture, specifying the dimensions of the volume and the mipmap level where the data is to be placed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (
    int level,
    int left,
    int top,
    int right,
    int bottom,
    int front,
    int back,
    T[] data,
    int startIndex,
    int elementCount,
    SetDataOptions options
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

level

The mipmap level where the data will be placed.

left

Position of the left side of the box on the x-axis.

top

Position of the top of the box on the y-axis.

right

Position of the right side of the box on the x-axis.

bottom

Position of the bottom of the box on the y-axis.

front

Position of the front of the box on the z-axis.

back

Position of the back of the box on the z-axis.

data

The array of data to copy. The number of elements in the array should be equal to the size of the box where the data will be placed.

startIndex

The index of the element in the array at which to start copying.

elementCount

The number of elements to copy.

options

Option specifying whether existing data in the buffer will be kept after this operation.

Exceptions

Exception type	Condition
ArgumentException	<i>data</i> is null .
InvalidOperationException	The size of the data passed in is too large or too small for this resource.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

⚠ Caution

Here is a tip for rendering objects within the [Draw](#) method of an Xbox 360 game. Do not use **SetData** when writing data to vertex buffers, index buffers, and textures. This method may lead to graphics corruption or crashes.

This is because, in cases where the size of the back buffer and depth-stencil buffer exceed the size of the Xbox 360 10 MB of embedded memory (EDRAM), [predicated tiling](#) is utilized on this platform to compensate for the additional memory requirements. Predicated tiling is a process by which scene rendering is performed multiple times on subsections of the final render target dimensions.

When predicated tiling has been triggered, the drawing commands contained in the [Draw](#) function are not submitted until [Present](#) is called. (Note that [Draw](#) implicitly calls [Present](#) at the end of this method.) In this case, these resources are not available for modification until the GPU is finished with presenting the entire frame.

Texture3D.SetData Generic Method (T[])

Copies array data to the texture at mipmap level 0.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (
    T[] data
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

data

The array of data to copy. The number of elements in the array must be equal to the size of the texture, which is **Width** × **Height** × **Depth**.

Exceptions

Exception type	Condition
ArgumentException	<i>data</i> is null .
InvalidOperationException	The size of the data passed in is too large or too small for this resource.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

⚠ Caution

Here is a tip for rendering objects within the [Draw](#) method of an Xbox 360 game. Do not use **SetData** when writing data to vertex buffers, index buffers, and textures. This method may lead to graphics corruption or crashes.

TextureAddressMode Enumeration

Defines constants that describe supported texture-addressing modes.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum TextureAddressMode
```

Members

Member name	Description
Border	Texture coordinates outside the range [0.0, 1.0] are set to the border color.
Clamp	Texture coordinates outside the range [0.0, 1.0] are set to the texture color at 0.0 or 1.0, respectively.
Mirror	Similar to Wrap , except that the texture is flipped at every integer junction. For u values between 0 and 1, for example, the texture is addressed normally; between 1 and 2, the texture is flipped (mirrored); between 2 and 3, the texture is normal again, and so on.
MirrorOnce	Similar to Mirror and Clamp . Takes the absolute value of the texture coordinate (thus, mirroring around 0), and then clamps to the maximum value. The most common usage is for volume textures, where support for the full MirrorOnce texture-addressing mode is not necessary, but the data is symmetrical around the one axis.
Wrap	Tile the texture at every integer junction. For example, for u values between 0 and 3, the texture is repeated three times; no mirroring is performed.

TextureCreationParameters Members

The following tables list the members exposed by the TextureCreationParameters type.

Public Constructors

	Name	Description
	TextureCreationParameters	Creates a new instance of TextureCreationParameters .

Public Properties

	Name	Description
	ColorKey	Gets or sets the color value to replace with transparent black.
	Default	Gets the default texture creation parameters.
	Depth	Gets or sets the depth to create the Texture with.
	Filter	Gets or sets a set of options controlling how the image is filtered.
	Format	Gets or sets the format of the texture to be created.
	Height	Gets or sets the height to create a Texture with.
	MipFilter	Gets or sets a set of options controlling how mipmaps are filtered.
	MipLevels	Gets or sets the number of mip levels to create a Texture with.
	TextureUsage	Gets the state of the related TextureUsage enumeration.
	Width	Gets or sets the width to create a Texture with.

Public Methods

	Name	Description
	Equals	Overloaded. Determines whether two instances of TextureCreationParameters are equal.
	GetHashCode	Gets the hash code for this instance.
	GetType	(Inherited from Object .)
	op_Equality	Determines whether two instances of TextureCreationParameters are equal.
	op_Inequality	Determines whether two instances of TextureCreationParameters are not equal.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a String that represents the current TextureCreationParameters .

Protected Methods

TextureCreationParameters Constructor

Note

This constructor is available only when developing for Windows.

Creates a new instance of [TextureCreationParameters](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TextureCreationParameters (
    int width,
    int height,
    int depth,
    int mipLevels,
    SurfaceFormat format,
    TextureUsage textureUsage,
    Color colorKey,
    FilterOptions filter,
    FilterOptions mipFilter
)
```

Parameters

width

Width of the texture.

height

Height of the texture.

depth

Depth of the texture.

mipLevels

Number of mip levels in the texture.

format

The format of the texture.

textureUsage

A set of options identifying the behaviors of this texture resource.

colorKey

The color key of the texture.

filter

A set of options controlling how the image is filtered.

mipFilter

A set of options controlling how mipmaps are filtered.

Note

This method is available only when developing for Windows.

Determines whether the specified [Object](#) is equal to the [TextureCreationParameters](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [Object](#) to compare with the current [TextureCreationParameters](#).

Return Value

true if the specified [Object](#) is equal to the current [TextureCreationParameters](#); **false** otherwise.

This property is available only when developing for Windows.

Gets or sets a set of options controlling how mipmaps are filtered.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public FilterOptions MipFilter { get; set; }
```

Property Value

A set of options controlling how mipmaps are filtered.

TextureCube Class

Represents a set of six 2D textures, one for each face of a cube.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class TextureCube : Texture
```

Remarks

A texel represents the smallest unit of a texture that can be read from or written to by the GPU. A texel is composed of 1 to 4 components. Specifically, a texel may be any one of the available texture formats represented in the [SurfaceFormat](#) enumeration.

A cube texture is a collection of six textures, one for each face of the cube. All faces must be present in the cube texture. Also, a cube map surface must be the same pixel size in all three dimensions (x, y, and z). Figure 1 shows a fully populated texture cube.

TextureCube Members

The following tables list the members exposed by the TextureCube type.

Public Constructors

Name	Description
 TextureCube	Creates an uninitialized TextureCube resource of the specified dimensions. To initialize a Texture2D from an existing file, see the static method ContentManager.Load or FromFile .

Public Properties

Name	Description
 Format	Gets the pixel format for this texture resource.
 GraphicsDevice	(Inherited from GraphicsResource .)
 IsDisposed	(Inherited from GraphicsResource .)
 LevelCount	(Inherited from Texture .)
 LevelOfDetail	(Inherited from Texture .)
 Name	(Inherited from GraphicsResource .)
 Priority	(Inherited from GraphicsResource .)
 ResourceType	(Inherited from GraphicsResource .)
 Size	Gets the width and height of this texture resource, in pixels.
 Tag	(Inherited from GraphicsResource .)
 TextureUsage	Gets the state of the related TextureUsage enumeration.

Public Methods

Name	Description
 Dispose	Overloaded. Releases the resources used by the TextureCube class.
 Equals	(Inherited from Object .)
  FromFile	Overloaded. Creates a cube texture resource from a file.
 GenerateMipMaps	(Inherited from Texture .)
 GetCreationParameters	(Inherited from Texture .)
 GetData	Overloaded. Returns a copy of the texture data.
 GetHashCode	(Inherited from Object .)
 GetTextureInformation	(Inherited from Texture .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 Save	(Inherited from Texture .)
 SetData	Overloaded. Copies array data to the texture.
 ToString	Returns a String that represents the current TextureCube .

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_Disposing	(Inherited from GraphicsResource .)

Public Events

Name	Description
 Disposing	(Inherited from GraphicsResource .)

Reference

[TextureCube Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

TextureCube Constructor

Creates an uninitialized [TextureCube](#) resource of the specified dimensions. To initialize a [Texture2D](#) from an existing file, see the static method [ContentManager.Load](#) or [FromFile](#).

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TextureCube (
    GraphicsDevice graphicsDevice,
    int size,
    int numberLevels,
    TextureUsage usage,
    SurfaceFormat format
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) that will display the cube texture.

size

The size of the edges of all the top-level faces of the cube texture. The pixel dimensions of subsequent levels of each face will be the truncated value of half of the previous level's pixel dimension (independently). Each dimension clamps at a size of 1 pixel. Thus, if the division by 2 results in 0 (zero), 1 will be taken instead.

numberLevels

The number of downsampled surfaces to create for each face of the cube texture when preprocessing the texture. These smaller versions of the texture, known as mip levels, are used when the texture is minified to fit a smaller area than the original texture size. The chain of downsampled surfaces associated with a texture is sometimes called a mipmap chain.

If *numberLevels* is zero, all cube texture sublevels down to 1×1 pixels will be generated for each face for hardware that supports mipmapped cube textures. Use [LevelCount](#) to see the number of levels generated.

usage

A set of options identifying the behaviors of this resource.

format

The format of all levels in the cube texture.

Exceptions

Exception type	Condition
ArgumentException	<p>One of the following conditions is true:</p> <ul style="list-style-type: none"> The <i>size</i> requested would result in a resource too large for the graphics device. <i>numberLevels</i> is too large. It is either greater than 32, or if less than 32 it would result in a cube texture that is too large for this graphics device. Textures have a maximum of 32 levels. <i>usage</i> is not a valid value. Texture resources can only be created with the following TextureUsage options: TextureUsage.AutoGenerateMipMap, TextureUsage.Tiled, and TextureUsage.Linear. <i>format</i> is SurfaceFormat.Unknown. Textures cannot be created using SurfaceFormat.Unknown. <p>The parameters specified are not compatible:</p> <ul style="list-style-type: none"> <i>format</i> and <i>numberLevels</i> are incompatible. Multi-element textures of type SurfaceFormat.Multi2Bgra32 cannot be mipmapped, set <i>numberLevels</i> to 1. <i>usage</i> and <i>numberLevels</i> are incompatible. Textures specifying the usage TextureUsage.AutoGenerateMipMap must set <i>numberLevels</i> to either 0 or 1.
ArgumentNullException	<i>graphicsDevice</i> is null .
ArgumentOutOfRangeException	<i>size</i> is less than or equal to zero. <i>size</i> must be greater than or equal to zero.

Remarks

A mipmap (texture) is a collection of successively downsampled (mipmapped) surfaces. An application can discover support for automatic generation of mipmaps in a particular format by calling [CheckDeviceFormat](#) with [TextureUsage.AutoGenerateMipMap](#).

A texel represents the smallest unit of a texture that can be read from or written to by the GPU. A texel is composed of 1 to 4 components. Specifically, a texel may be any one of the available texture formats represented in the [SurfaceFormat](#) enumeration.

A cube texture is a collection of six textures, one for each face of the cube. All faces must be present in the cube texture. Also, a cube map surface must be the same pixel size in all three dimensions (x, y, and z). Figure 1 shows a fully populated texture cube.

[Microsoft.Xna.Framework.Graphics Namespace](#)

TextureCube.Dispose Method (Boolean)

Releases the unmanaged resources used by the [TextureCube](#) and optionally releases the managed resources.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\]](#) **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [TextureCube](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

TextureCube.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

TextureCube.FromFile Method

Creates a cube texture resource from a file.

Overload List

Name	Description
TextureCube.FromFile (GraphicsDevice, Stream)	Creates a cube texture resource from a stream.
TextureCube.FromFile (GraphicsDevice, Stream, Int32)	Creates a texture resource from a stream, specifying the number of bytes in the stream.
TextureCube.FromFile (GraphicsDevice, Stream, Int32, TextureCreationParameters)	Creates a texture resource from a stream, specifying the number of bytes in the stream and the texture creation parameters to use.
TextureCube.FromFile (GraphicsDevice, Stream, TextureCreationParameters)	Creates a texture resource from a stream, specifying the parameters to be used in creation of the texture.
TextureCube.FromFile (GraphicsDevice, String)	Creates a cube texture resource from a file.
TextureCube.FromFile (GraphicsDevice, String, Int32)	Creates a cube texture resource from a file, specifying the width and height of the texture in pixels.
TextureCube.FromFile (GraphicsDevice, String, TextureCreationParameters)	Creates a texture resource from a file, specifying the parameters to be used in creation of the texture.
TextureCube.FromFile (GraphicsDevice, String, Int32, Int32, Int32)	(Inherited from Texture .)

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

TextureCube.FromFile Method (GraphicsDevice, Stream)

Note

This method is available only when developing for Windows.

Creates a cube texture resource from a stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static TextureCube FromFile (  
    GraphicsDevice graphicsDevice,  
    Stream textureStream  
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

textureStream

Stream containing the texture data.

Return Value

The cube texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

Note

This method is available only when developing for Windows.

Creates a texture resource from a stream, specifying the number of bytes in the stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static TextureCube FromFile (  
    GraphicsDevice graphicsDevice,  
    Stream textureStream,  
    int numberBytes  
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

textureStream

Stream containing the texture data.

numberBytes

The number of bytes in *textureStream*.

Return Value

The texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

TextureCube.FromFile Method (GraphicsDevice, Stream, Int32, TextureCreationParameters)

Note

This method is available only when developing for Windows.

Creates a texture resource from a stream, specifying the number of bytes in the stream and the texture creation parameters to use.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static TextureCube FromFile (
    GraphicsDevice graphicsDevice,
    Stream textureStream,
    int numberBytes,
    TextureCreationParameters creationParameters
)
```

Parameters

graphicsDevice

The graphics device to use to create the texture resource.

textureStream

Stream containing the volume texture data.

numberBytes

The number of bytes in *textureStream*.

creationParameters

The parameters to use when creating this texture.

Return Value

The volume texture resource that has been created on the specified graphics device.

Exceptions

Exception type	Condition
ArgumentNullException	<i>textureStream</i> is null . The stream passed into this method cannot be null.
NotSupportedException	<i>textureStream</i> is not readable. Streams passed into this method must be readable.
EndOfStreamException	<i>textureStream</i> does not contain enough data to support this call.

Remarks

The supported texture image file formats are described by the [ImageFileFormat](#) enumeration.

TextureCube.GetData Generic Method (CubeMapFace, Int32, Nullable<Rectangle>, T[], Int32, Int32)

Returns a copy of the texture data, specifying the start index, starting offset, number of elements, region to copy, and level where the data is to be placed.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GetData<T> (
    CubeMapFace faceType,
    int level,
    Nullable<Rectangle> rect,
    T[] data,
    int startIndex,
    int elementCount
) where T : ValueType
```

Type Parameters

T

The type of data in the texture buffer.

Parameters

faceType

The cube map face type.

level

The mipmap level where the data will be placed.

rect

The section of the texture where the data will be placed. **null** indicates the data will be copied over the entire texture.

data

The array into which to copy the data.

startIndex

Index in the array at which to begin the copy.

elementCount

Number of elements in the array.

Exceptions

Exception type	Condition
ArgumentNullException	<i>data</i> must be of sufficient length to receive the data.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

TextureCube.SetData Generic Method (CubeMapFace, Int32, Nullable<Rectangle>, T[], Int32, Int32, SetDataOptions)

Copies array data to the texture, specifying a start offset, mipmap level, and subregion to copy.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (
    CubeMapFace faceType,
    int level,
    Nullable<Rectangle> rect,
    T[] data,
    int startIndex,
    int elementCount,
    SetDataOptions options
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

faceType

The cube map face type.

level

The mipmap level where the data will be placed.

rect

The section of the texture where the data will be placed. **null** indicates the data will be copied over the entire texture.

data

The array of data to copy.

startIndex

Start offset in the array.

elementCount

Number of elements in the array. The number of elements to copy must be equal to the size of the texture.

options

Option specifying if existing data in the buffer will be kept after this operation.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

⚠ Caution

Here is a tip for rendering objects within the [Draw](#) method of an Xbox 360 game. Do not use **SetData** when writing data to vertex buffers, index buffers, and textures. This method may lead to graphics corruption or crashes.

This is because, in cases where the size of the back buffer and depth-stencil buffer exceed the size of the Xbox 360 10 MB of embedded memory (EDRAM), [predicated tiling](#) is utilized on this platform to compensate for the additional memory requirements. Predicated tiling is a process by which scene rendering is performed multiple times on subsections of the final render target dimensions.

When predicated tiling has been triggered, the drawing commands contained in the [Draw](#) function are not submitted until [Present](#) is called. (Note that [Draw](#) implicitly calls [Present](#) at the end of this method.) In this case, these resources are not available for modification until the GPU is finished with presenting the entire frame.

TextureCube.SetData Generic Method (CubeMapFace, T[])

Copies array data to the texture at mipmap level 0.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (  
    CubeMapFace faceType,  
    T[] data  
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

faceType

The cube map face type.

data

The array of data to copy. The number of elements in the array must be equal to the size of the texture.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

⚠Caution

Here is a tip for rendering objects within the [Draw](#) method of an Xbox 360 game. Do not use **SetData** when writing data to vertex buffers, index buffers, and textures. This method may lead to graphics corruption or crashes.

TextureCube.SetData Generic Method (CubeMapFace, T[], Int32, Int32, SetDataOptions)

Copies array data to the texture at mipmap level 0, specifying a start offset.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (
    CubeMapFace faceType,
    T[] data,
    int startIndex,
    int elementCount,
    SetDataOptions options
) where T : ValueType
```

Type Parameters

T

The type of the elements in the array.

Parameters

faceType

The cube map face type.

data

The array of data to copy.

startIndex

Start offset in the array.

elementCount

Number of elements in the array. This must be equal to the size of the texture.

options

Option specifying if existing data in the buffer will be kept after this operation.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

⚠ Caution

TextureFilter Enumeration

Defines how a texture will be filtered as it is minified for each mipmap level.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum TextureFilter
```

Members

Member name	Description
Anisotropic	Anisotropic texture filtering used as a texture magnification or minification filter. This type of filtering compensates for distortion caused by the difference in angle between the texture polygon and the plane of the screen.
GaussianQuad	A 4-sample Gaussian filter used as a texture magnification or minification filter.
Linear	Bilinear interpolation filtering used as a texture magnification or minification filter. A weighted average of a 2×2 area of texels surrounding the desired pixel is used. The texture filter used between mipmap levels is trilinear mipmap interpolation, in which the rasterizer performs linear interpolation on pixel color, using the texels of the two nearest mipmap textures.
None	Mipmapping disabled. The rasterizer uses the magnification filter instead.
Point	Point filtering used as a texture magnification or minification filter. The texel with coordinates nearest to the desired pixel value is used. The texture filter used between mipmap levels is based on the nearest point; that is, the rasterizer uses the color from the texel of the nearest mipmap texture.
PyramidalQuad	A 4-sample tent filter used as a texture magnification or minification filter.

Remarks

To determine whether a format supports texture filter types other than **Point** (which is always supported), call [CheckDeviceFormat](#).

Not all valid filtering modes for a device apply to volume maps. In general, **Point** and **Linear** magnification filters are supported for volume maps. If [SupportsMipVolumeMap](#) is **true** (the texture capabilities can be found in [TextureCapabilities](#)), the **Point** mipmap filter and the **Point** and **Linear** minification filters are supported for volume maps. The device might or might not support the **Linear** mipmap filter for volume maps. Devices that support anisotropic filtering for 2D maps do not necessarily support it for volume maps. However, applications that enable anisotropic filtering, even if they do not support it, receive the best available filtering (probably linear).

Initializes a new instance of the [TextureInformation](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TextureInformation (  
    int width,  
    int height,  
    int depth,  
    int mipLevels,  
    SurfaceFormat format  
)
```

Parameters

width

Width of the texture, in pixels.

height

Height of the texture, in pixels.

depth

Depth of the texture, in pixels.

mipLevels

Number of mip levels in original image.

format

Describes the data in the original image.

Determines whether two instances of [TextureInformation](#) are equal.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    TextureInformation left,  
    TextureInformation right  
)
```

Parameters

left

The object to the left of the equality operator.

right

The object to the right of the equality operator.

Return Value

true if *left* is equal to *right*; **false** otherwise.

Specifies special usage of the texture data.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[FlagsAttribute]
public enum TextureUsage
```

Members

Member name	Description
AutoGenerateMipMap	The resource automatically generates mipmaps. Automatic generation of mipmaps is not supported for volume textures and depth stencil surfaces/textures.
Linear	(Xbox 360 only) Linear texture memory format. Linear formats are arranged in memory using a left-to-right and top-to-bottom layout (with pixels contiguous in memory for each row, and rows contiguous except for possible alignment padding). Use this format when doing dynamic CPU updates to textures where: <ul style="list-style-type: none"> You do not want the overhead of translating tile addresses using the CPU. Textures are not often referenced during the frame. Less efficient GPU performance is not a problem. <p>This flag is valid only for texture creation on Xbox 360. It is ignored if used elsewhere. On Xbox, most formats are created as Tiled if it is applicable.</p>
None	None.
Tiled	(Xbox 360 only) Tiled texture memory format. Tiled formats are arranged using a memory layout designed to maximize the cache coherency of texture fetches and balance the access workload of the memory controllers. The exact pixel arrangement of tiled formats varies based on the bit depth of the format; however, pixels that are close to one another spatially are located close to one another in memory. For example, two pixels adjacent to one another in a vertical column would be separated in memory by an entire row of pixels for a linear format, but could be separated by only a few bytes for a tiled format. <p>The tiled texture format is usually more efficient than the linear texture format.</p> <p>This flag is valid only when used for texture creation on Xbox 360, and will be ignored if used elsewhere. On Xbox, most formats are created as Tiled if it is applicable.</p>

TextureWrapCoordinates Enumeration

Defines supported wrap coordinates.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[FlagsAttribute]
public enum TextureWrapCoordinates
```

Members

Member name	Description
None	No texture wrap coordinates specified.
Zero	U texture wrapping (wrapping in the direction of the first dimension).
One	V texture wrapping (wrapping in the direction of the second dimension).
Two	W texture wrapping (wrapping in the direction of the third dimension).
Three	Texture wrapping in the direction of the fourth dimension.

RemarksThis enumeration is used by the [Wrap0](#) property and the [Wrap1](#) through [Wrap15](#) properties.

VertexBuffer Class

Represents a list of 3D vertices to be streamed to the graphics device.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class VertexBuffer : GraphicsResource
```

Example

The vertex stream of the graphics device must be set before any call to [DrawPrimitives](#). The following example associates a user created vertex buffer of type **VertexPositionNormalTexture** with vertex stream 0 (zero) of the graphics device.

C#

```
graphics.GraphicsDevice.Vertices[0].SetSource(  
    vertexBuffer, 0,  
    VertexPositionNormalTexture.SizeInBytes);
```

VertexBuffer.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
VertexBuffer.Dispose (Boolean)	Immediately releases the unmanaged resources used by this object.
VertexBuffer.Dispose ()	(Inherited from GraphicsResource .)

Remarks

Call [Dispose](#) when you are finished using the [VertexBuffer](#). The [Dispose](#) method leaves the [VertexBuffer](#) in an unusable state. After calling [Dispose](#), you must release all references to the [VertexBuffer](#) so the garbage collector can reclaim the memory that the [VertexBuffer](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [VertexBuffer](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [VertexBuffer](#) object's **Finalize** method.

VertexBuffer.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\]](#) **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the **Finalize** method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. **Finalize** invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [VertexBuffer](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

VertexBuffer.GetData Method

Returns a copy of the vertex buffer data.

Overload List

Name	Description
VertexBuffer.GetData (Int32, T[], Int32, Int32, Int32)	Gets a copy of the vertex buffer data, specifying the start index, starting offset, number of elements, and size of the vertex buffer elements.
VertexBuffer.GetData (T[])	Gets a copy of the vertex buffer data.
VertexBuffer.GetData (T[], Int32, Int32)	Gets a copy of the vertex buffer data, specifying the start index and number of elements in the vertex buffer.

VertexBuffer.GetData Generic Method (Int32, T[], Int32, Int32, Int32)

Gets a copy of the vertex buffer data, specifying the start index, starting offset, number of elements, and size of the vertex buffer elements.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GetData<T> (
    int offsetInBytes,
    T[] data,
    int startIndex,
    int elementCount,
    int vertexStride
) where T : ValueType
```

Type Parameters

T

The type of data in the vertex buffer.

Parameters

offsetInBytes

Starting offset.

data

The array into which to copy the vertex buffer data.

startIndex

Index of the element in the array at which to start copying.

elementCount

Number of elements in the array.

vertexStride

Size, in bytes, of an element in the vertex buffer.

Exceptions

Exception type	Condition
ArgumentNullException	<i>data</i> is null . <i>data</i> must be of sufficient length to receive the data.
ArgumentOutOfRangeException	One of the following conditions is true: <ul style="list-style-type: none"> The vertex stride is larger than the vertex buffer. The vertex stride is too small for the type of data requested.
InvalidOperationException	The array is not the correct size for the amount of data requested.
NotSupportedException	This VertexBuffer was created with a usage type of BufferUsage.WriteOnly . Calling GetData on a resource that was created with BufferUsage.WriteOnly is not supported.

VertexBuffer.GetData Generic Method (T[])

Gets a copy of the vertex buffer data.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void GetData<T> (
    T[] data
) where T : ValueType
```

Type Parameters

T

The type of data in the vertex buffer.

Parameters

data

The array into which to copy the vertex buffer data.

Exceptions

Exception type	Condition
ArgumentNullException	<i>data</i> is null . <i>data</i> must be of sufficient length to receive the data.
ArgumentOutOfRangeException	One of the following conditions is true: <ul style="list-style-type: none"> The vertex stride is larger than the vertex buffer. The vertex stride is too small for the type of data requested.
InvalidOperationException	The array is not the correct size for the amount of data requested.
NotSupportedException	This VertexBuffer was created with a usage type of BufferUsage.WriteOnly . Calling GetData on a resource that was created with BufferUsage.WriteOnly is not supported.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

VertexBuffer.SetData Generic Method (T[])

Sets the vertex buffer data.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetData<T> (
    T[] data
) where T : ValueType
```

Type Parameters

T

The type of data in the vertex buffer.

Parameters

data

The array from which to copy the vertex buffer data.

Exceptions

Exception type	Condition
ArgumentNullException	<i>data</i> is null .
ArgumentOutOfRangeException	One of the following conditions is true: <ul style="list-style-type: none"> The vertex stride is larger than the vertex buffer. The vertex stride is too small for the type of data requested.
InvalidOperationException	The array is not the correct size for the amount of data requested.

Remarks An [InvalidOperationException](#) is thrown if an attempt is made to modify (for example, calls to the **SetData** method) a resource that is currently set on a graphics device.

⚠ Caution

Here is a tip for rendering objects within the [Draw](#) method of an Xbox 360 game. Do not use **SetData** when writing data to vertex buffers, index buffers, and textures. This method may lead to graphics corruption or crashes. To avoid this potential issue, use [DrawUserPrimitives](#), [DrawUserIndexedPrimitives](#), or [DynamicVertexBuffer](#) as the preferred alternative to [VertexBuffer.SetData](#) for dynamic vertex generation.

This is because, in cases where the size of the back buffer and depth stencil buffer exceed the size of the Xbox 360 10 MB of embedded memory (EDRAM), [predicated tiling](#) is utilized on this platform to compensate for the additional memory requirements. Predicated tiling is a process by which scene rendering is performed multiple times on subsections of the final render target dimensions.

When predicated tiling has been triggered, the drawing commands contained in the [Draw](#) function are not submitted until [Present](#) is called. (Note that [Draw](#) implicitly calls [Present](#) at the end of this method.) In this case, these resources are not available for modification until the GPU is finished with presenting the entire frame.

Example

This example demonstrates how to create a vertex buffer to hold a list of vertices and set the data for the vertex buffer to the array of vertices.

C#

```
vertexBuffer = new VertexBuffer(graphics.GraphicsDevice,
    VertexPositionNormalTexture.SizeInBytes * (pointList.Length),
    BufferUsage.None);

// Set the vertex buffer data to the array of vertices.
vertexBuffer.SetData<VertexPositionNormalTexture>(pointList);
```

Prior to drawing the vertices, set the source of the vertex stream for the graphics device by setting the desired vertex stream

from [GraphicsDevice.Vertices](#). Here, we use vertex stream zero, so **GraphicsDevice.Vertices[0]** is set to the vertex buffer created in step (1).

C#

```
graphics.GraphicsDevice.Vertices[0].SetSource(  
    vertexBuffer, 0,  
    VertexPositionNormalTexture.SizeInBytes);
```

VertexDeclaration Members

The following tables list the members exposed by the VertexDeclaration type.

Public Constructors

Name	Description
 VertexDeclaration	Initializes a new instance of the VertexDeclaration class.

Public Properties

Name	Description
 GraphicsDevice	Gets the GraphicsDevice associated with this vertex declaration.
 IsDisposed	Gets a value that indicates whether the object is disposed.
 Name	Returns the name of this vertex declaration.
 Tag	Returns the resource tags for this vertex declaration.

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 GetVertexElements	Gets the vertex shader declaration.
 GetVertexStrideSize	Overloaded. Gets the size of a vertex from the vertex declaration.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_Disposing	Raises the Disposing event when called from within a derived class.

Public Events

Name	Description
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

Initializes a new instance of the [VertexDeclaration](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public VertexDeclaration (  
    GraphicsDevice graphicsDevice,  
    VertexElement[] elements  
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) associated with the vertex elements.

elements

An array of vertex elements.

Exceptions

Exception type	Condition
ArgumentNullException	<i>graphicsDevice</i> or <i>elements</i> is null .
ArgumentOutOfRangeException	<i>elements</i> does not contain any elements, or is too large for the graphics device.
InvalidOperationException	Unable to create this VertexDeclaration resource on the graphics device.

Remarks

VertexDeclaration objects must be recreated when the device is reset.

VertexDeclaration.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\]](#) **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [VertexDeclaration](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

VertexDeclaration.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

VertexElement Structure

Defines input vertex data to the pipeline.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[SerializableAttribute]  
public struct VertexElement
```

Platforms Xbox 360, Windows XP SP2, Windows Vista

VertexElement Members

The following tables list the members exposed by the VertexElement type.

Public Constructors

Name	Description
 VertexElement	Initializes a new instance of the VertexElement class.

Public Properties

Name	Description
 Offset	Retrieves or sets the offset (if any) from the beginning of the stream to the beginning of the vertex data.
 Stream	Retrieves or sets the stream number (or index) to use.
 UsageIndex	Modifies the usage data to allow the user to specify multiple usage types.
 VertexElementFormat	Gets or sets the format of this vertex element.
 VertexElementMethod	Gets or sets a value indicating which vertex data to calculate during tessellation.
 VertexElementUsage	Gets or sets a value describing how the vertex element is to be used.

Public Methods

Name	Description
 Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
 GetHashCode	Gets the hash code for this instance.
 GetType	(Inherited from Object .)
  Op_Equality	Compares two objects to determine whether they are the same.
  Op_Inequality	Compares two objects to determine whether they are different.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

VertexElement Constructor

Initializes a new instance of the [VertexElement](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public VertexElement (
    short stream,
    short offset,
    VertexElementFormat elementFormat,
    VertexElementMethod elementMethod,
    VertexElementUsage elementUsage,
    byte usageIndex
)
```

Parameters

stream

Stream number (or index) to use.

offset

Offset (if any) from the beginning of the stream to the beginning of the vertex data.

elementFormat

One of several predefined types that define the vertex data size.

elementMethod

The tessellator processing method. These methods determine how the tessellator interprets/operates on the vertex data.

elementUsage

The intended use of the vertex data.

usageIndex

Modifies the usage data to allow the user to specify multiple usage types.

Remarks Vertex data is defined using an array of [VertexElement](#) structures.

VertexElement.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The [Object](#) to compare with the current [VertexElement](#).

Return Value

true if the objects are the same; **false** otherwise.

VertexElement.GetHashCode Method

Gets the hash code for this instance.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override int GetHashCode ()
```

Return Value

Hash code for this object.

VertexElement.op_Equality Method

Compares two objects to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    VertexElement left,  
    VertexElement right  
)
```

Parameters

left

Object to the left of the equality operator.

right

Object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

VertexElement.op_Inequality Method

Compares two objects to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    VertexElement left,  
    VertexElement right  
)
```

Parameters

left

Object to the left of the inequality operator.

right

Object to the right of the inequality operator.

Return Value

true if the objects are different; **false** otherwise.

VertexElement.Offset Property

Retrieves or sets the offset (if any) from the beginning of the stream to the beginning of the vertex data.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public short Offset { get; set; }
```

Property Value

Offset, in bytes, to the start of the vertex data.

See Also

Reference

VertexElement.UsageIndex Property

Modifies the usage data to allow the user to specify multiple usage types.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public byte UsageIndex { get; set; }
```

Property Value

Byte that represents the usage index.

RemarksThe **UsageIndex** property is used in conjunction with [VertexElementUsage](#) to specify the semantic of a vertex element.

VertexElementFormat Enumeration

Defines vertex element formats.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum VertexElementFormat
```

Members

Member name	Description
Single	Single-component, 32-bit floating-point, expanded to <i>(float, 0, 0, 1)</i> .
Vector2	Two-component, 32-bit floating-point, expanded to <i>(float, Float32 value, 0, 1)</i> .
Vector3	Three-component, 32-bit floating point, expanded to <i>(float, float, float, 1)</i> .
Vector4	Four-component, 32-bit floating point, expanded to <i>(float, float, float, float)</i> .
HalfVector2	Two-component, 16-bit floating point expanded to <i>(value, value, value, value)</i> . This type is valid for vertex shader version 2.0 or higher.
HalfVector4	Four-component, 16-bit floating-point expanded to <i>(value, value, value, value)</i> . This type is valid for vertex shade r version 2.0 or higher.
Rgba64	Normalized, four-component, unsigned short, expanded to <i>(first byte/65535.0, second byte/65535.0, third byte/65535.0, fourth byte/65535.0)</i> . This type is valid for vertex shader version 2.0 or higher.
Color	Four-component, packed, unsigned byte, mapped to 0 to 1 range. Input is in Int32 format (ARGB) expanded to (R, G, B, A).
Rgba32	Four-component byte with each byte normalized by dividing the component with 255.0f. This type is valid for vertex shader version 2.0 or higher.
Rg32	Normalized, two-component, unsigned short, expanded to <i>(first byte/65535.0, second byte/65535.0, 0, 1)</i> . This type is valid for vertex shader version 2.0 or higher.
NormalizedShort2	Normalized, two-component, signed short, expanded to <i>(first short/32767.0, second short/32767.0, 0, 1)</i> . This type is valid for vertex shader version 2.0 or higher.
NormalizedShort4	Normalized, four-component, signed short, expanded to <i>(first short/32767.0, second short/32767.0, third short/32767.0, fourth short/32767.0)</i> . This type is valid for vertex shader version 2.0 or higher.
Normalized101010	Three-component, signed, 10 10 10 format normalized and expanded to <i>(v[0]/511.0, v[1]/511.0, v[2]/511.0, 1)</i> .
Short2	Two-component, signed short expanded to <i>(value, value, 0, 1)</i> .
Short4	Four-component, signed short expanded to <i>(value, value, value, value)</i> .
Byte4	Four-component, unsigned byte.
UInt101010	Three-component, unsigned, 10 10 10 format expanded to <i>(value, value, value, 1)</i> .
Unused	Type field in the declaration is unused. This is designed for use with VertexElementMethod.UV and VertexElementMethod.LookUpPresampled .

Remarks

Vertex data is declared with an array of [VertexElement](#) structures. Each element in the array contains a vertex declaration method. These values can be passed into the constructor or to the [VertexElementMethod](#) property.

A mapping of each Direct3D 9 format name to the **VertexElementFormat** equivalent is listed in the following table.

	Direct3D 9 Vertex Format	VertexElementFormat equivalent
Floating Point		
Float32	D3DDECLTYPE_FLOAT1	Single
	D3DDECLTYPE_FLOAT2	Vector2
	D3DDECLTYPE_FLOAT3	Vector3
	D3DDECLTYPE_FLOAT4	Vector4
Float16	D3DDECLTYPE_FLOAT16_2	HalfVector2
	D3DDECLTYPE_FLOAT16_4	HalfVector4

Unsigned Normalized		
64 bpp	D3DDECLTYPE_USHORT4N	Rgba64
32 bpp	D3DDECLTYPE_D3DCOLOR	Color
	D3DDECLTYPE_UBYTE4N	Rgba32
	D3DDECLTYPE_USHORT2N	Rg32
Signed Normalized		
	D3DDECLTYPE_SHORT2N	NormalizedShort2
	D3DDECLTYPE_SHORT4N	NormalizedShort4
	D3DDECLTYPE_DEC3N	Normalized101010
Signed Integer		
	D3DDECLTYPE_SHORT2	Short2
	D3DDECLTYPE_SHORT4	Short4
Unsigned Integer		
	D3DDECLTYPE_UBYTE4	Byte4
	D3DDECLTYPE_UDEC3	UInt101010

VertexElementMethod Enumeration

Defines the tessellator processing method for a vertex element.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum VertexElementMethod
```

Members

Member name	Description
Default	Default value. The tessellator copies the vertex data (or the spline data if it is operating on a patch) without performing additional calculations on it. The input and output types can be any value. When the tessellator is used, this element is interpolated; otherwise, vertex data is copied into the input register.
Lookup	Looks up a displacement map. The input type can be VertexElementFormat.Vector2 , VertexElementFormat.Vector3 , or VertexElementFormat.Vector4 . Only the .x and .y components are used for the texture map lookup. The output type is always VertexElementFormat.Single . The device must support displacement mapping. This constant is supported only by the programmable pipeline on N-patch data, if N-patches are enabled.
LookupPresampled	Looks up a presampled displacement map. The input type must be set to VertexElementFormat.Unused , and the stream index and stream offset must be set to 0. The output type for this operation is always VertexElementFormat.Single . The device must support displacement mapping. This constant is supported only by the programmable pipeline on N-patch data, if N-patches are enabled.
UV	Copies out the u and v values at a point on the rectangle or triangle patch. This results in a 2D float. The input type must be set to VertexElementFormat.Unused ; the output type is always VertexElementFormat.Vector2 . The input stream and offset also are unused, but must be set to 0.

Remarks

The [VertexElement](#) structure uses **VertexElementMethod** values to determine which vertex data to calculate during tessellation. These values can be passed into the constructor or to the [VertexElementMethod](#) property. Mesh data should use the default value. Patches can use any of the other implemented types.

Vertex data is declared with an array of [VertexElement](#) structures. Each element in the array contains a vertex declaration method.

In addition to using **Default**, a normal mesh can use **Lookup** and **LookupPresampled** when N-patches are enabled.

VertexElementUsage Enumeration

Defines usage for vertex elements.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum VertexElementUsage
```

Members

Member name	Description
Binormal	Vertex binormal data.
BlendIndices	Blending indices data. (BlendIndices with UsageIndex = 0) specifies matrix indices for fixed-function vertex processing using indexed paletted skinning.
BlendWeight	Blending weight data. (BlendWeight with UsageIndex = 0) specifies the blend weights in fixed-function vertex processing.
Color	Vertex data contains diffuse or specular color. (Color with UsageIndex = 0) specifies the diffuse color in the fixed-function vertex shader and in pixel shaders prior to ps_3_0. (Color with UsageIndex = 1) specifies the specular color in the fixed-function vertex shader and in pixel shaders prior to ps_3_0.
Depth	Vertex data contains depth data.
Fog	Vertex data contains fog data. (Fog with UsageIndex = 0) specifies a fog blend value to use after pixel shading is finished. This flag applies to pixel shaders prior to version ps_3_0.
Normal	Vertex normal data. (Normal with UsageIndex = 0) specifies vertex normals for fixed-function vertex processing and the N-patch tessellator. (Normal with UsageIndex = 1) specifies vertex normals for fixed-function vertex processing for skinning.
PointSize	Point size data. (PointSize with UsageIndex = 0) specifies the point-size attribute used by the setup engine of the rasterizer to expand a point into a quad for the point-sprite functionality.
Position	Position data. (Position with UsageIndex = 0) specifies the nontransformed position in fixed-function vertex processing and the N-patch tessellator. (Position with UsageIndex = 1) specifies the nontransformed position in the fixed-function vertex shader for skinning.
Sampler	Vertex data contains sampler data. (Sampler with UsageIndex = 0) specifies the displacement value to look up. This flag can be used only with VertexElementMethod.LookUpPresampled or VertexElementMethod.LookUp .
Tangent	Vertex tangent data.
TessellateFactor	Single, positive floating-point value. (TessellateFactor with UsageIndex = 0) specifies a tessellation factor used in the tessellation unit to control the rate of tessellation.
TextureCoordinate	Texture coordinate data. (TextureCoordinate , <i>n</i>) specifies texture coordinates in fixed-function vertex processing and in pixel shaders prior to ps_3_0. These coordinates can be used to pass user-defined data.

Remarks Vertex data is declared with an array of [VertexElement](#) structures. Each element in the array contains a usage type.

VertexPositionColorTexture Structure

Describes a custom vertex format structure that contains position, color, and one set of texture coordinates.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[SerializableAttribute]  
public struct VertexPositionColorTexture
```

VertexPositionColorTexture Members

The following tables list the members exposed by the VertexPositionColorTexture type.

Public Constructors

	Name	Description
	VertexPositionColorTexture	Initializes a new instance of the VertexPositionColorTexture class.

Public Fields

	Name	Description
	Color	The vertex color.
	Position	The vertex position.
	TextureCoordinate	The texture coordinates.
	 VertexElements	An array of three vertex elements describing the position, texture coordinate, and color of this vertex.

Public Properties

	Name	Description
	 SizeInBytes	Gets the size of the VertexPositionColorTexture class.

Public Methods

	Name	Description
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code for this instance.
	GetType	(Inherited from Object .)
	 op_Equality	Compares two objects to determine whether they are the same.
	 op_Inequality	Compares two objects to determine whether they are different.
	ReferenceEquals	(Inherited from Object .)
	ToString	Retrieves a string representation of this object.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Platforms Xbox 360, Windows XP SP2, Windows Vista

VertexShader Members

The following tables list the members exposed by the VertexShader type.

Public Constructors

Name	Description
 VertexShader	Initializes a new instance of the VertexShader class.

Public Properties

Name	Description
 GraphicsDevice	Gets the GraphicsDevice associated with this VertexShader .
 IsDisposed	Gets a value that indicates whether the object is disposed.
 Name	Gets the name of this vertex shader.
 Tag	Gets the resource tags for this vertex shader.

Public Methods

Name	Description
 Dispose	Overloaded. Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetShaderCode	Gets the shader byte code.
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)
 raise_Disposing	Raises the Disposing event when called from within a derived class.

Public Events

Name	Description
 Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

Reference

[VertexShader Class](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

VertexShader Constructor

Initializes a new instance of the [VertexShader](#) class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public VertexShader (  
    GraphicsDevice graphicsDevice,  
    byte[] shaderCode  
)
```

Parameters

graphicsDevice

The [GraphicsDevice](#) to associate with this [VertexShader](#).

shaderCode

The compiled byte code. An array of tokens that represents the vertex shader, including embedded debug and symbol table information.

Exceptions

Exception type	Condition
ArgumentException	<i>shaderCode</i> must have a length that is a multiple of four.
ArgumentNullException	<i>graphicsDevice</i> or <i>shaderCode</i> is null .
InvalidOperationException	Unable to create this VertexShader resource on the graphics device.

VertexShader.Dispose Method

Immediately releases the unmanaged resources used by this object.

Overload List

Name	Description
VertexShader.Dispose ()	Immediately releases the unmanaged resources used by this object.
VertexShader.Dispose (Boolean)	Immediately releases the unmanaged resources used by this object.

See Also

Reference

[VertexShader Class](#)

[VertexShader Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

VertexShader.Dispose Method ()

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call [Dispose](#) when you are finished using the [VertexShader](#). The [Dispose](#) method leaves the [VertexShader](#) in an unusable state. After calling [Dispose](#), you must release all references to the [VertexShader](#) so the garbage collector can reclaim the memory that the [VertexShader](#) was occupying.

Note

Always call [Dispose](#) before you release your last reference to the [VertexShader](#). Otherwise, the resources it is using will not be freed until the garbage collector calls the [VertexShader](#) object's [Finalize](#) method.

See Also

Reference

[VertexShader Class](#)

[VertexShader Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

VertexShader.Dispose Method (Boolean)

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected virtual void Dispose (  
    bool  
)
```

Parameters

[\[MarshalAsAttribute\(U1\)\]](#) **true** to release both managed and unmanaged resources; **false** to release only unmanaged resources.

Remarks

This method is called by the public [Dispose](#) method and the [Finalize](#) method. [Dispose](#) invokes the protected [Dispose\(Boolean\)](#) method with the *disposing* parameter set to **true**. [Finalize](#) invokes [Dispose\(Boolean\)](#) with *disposing* set to **false**.

When the *disposing* parameter is **true**, this method releases all resources held by any managed objects that this [VertexShader](#) references. This method invokes the [Dispose](#) method of each referenced object.

Note

Notes to Inheritors

[Dispose](#) can be called multiple times by other objects. When overriding [Dispose\(Boolean\)](#), be careful not to reference objects disposed of in an earlier call to [Dispose](#).

[VertexShader Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

VertexShader.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method; an object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

VertexShader.GetShaderCode Method

Gets the shader byte code.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public byte[] GetShaderCode ()
```

Return Value

The shader byte code.

VertexShader.raise_Disposing Method

Note

This method is available only when developing for Windows.

Raises the Disposing event when called from within a derived class.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected void raise_Disposing (  
    Object value0,  
    EventArgs value1  
)
```

Parameters

value0

Invoking object reference; should be this object.

value1

Arguments to pass to the event handler.

VertexStream.SetSource Method

Sets the source of the vertex stream.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void SetSource (  
    VertexBuffer vb,  
    int offsetInBytes,  
    int vertexStride  
)
```

Parameters

vb

The vertex buffer source.

offsetInBytes

The starting offset.

vertexStride

The size, in bytes, of the elements in the vertex buffer.

Exceptions

Exception type	Condition
InvalidOperationException	The requested vertex stream is invalid.
ObjectDisposedException	SetSource was called after the GraphicsDevice was disposed.

Viewport.Project Method

Projects a 3D vector from object space into screen space.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 Project (  
    Vector3 source,  
    Matrix projection,  
    Matrix view,  
    Matrix world  
)
```

Parameters

source

The vector to project.

projection

The projection matrix.

view

The view matrix.

world

The world matrix.

Return Value

The vector in screen space.

Viewport.Unproject Method

Converts a screen space point into a corresponding point in world space.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 Unproject (  
    Vector3 source,  
    Matrix projection,  
    Matrix view,  
    Matrix world  
)
```

Parameters

source

The vector to project.

projection

The projection matrix.

view

The view matrix.

world

The world matrix.

Return Value

The vector in object space.

Remarks

A common use for **Unproject** is determining if the current cursor location intersects with an object in 3D world space. First, calculate two [Vector3](#) values that differ only by their Z value. For instance, assume that the cursor location is currently (100, 100). Therefore, the first vector (located at the near clip plane) becomes (100, 100, 0) and the second (located at the far clip plane) becomes (100, 100, 1).

Call **Unproject** for each point, and store the result. For example, `minPointSource` stores the result of "unprojecting" (100,100,0), and `maxPointSource` stores the result of "unprojecting" (100, 100, 1). Determine the direction vector by subtracting `maxPointSource` from `minPointSource`.

Finally, normalize the direction vector, and create a [Ray](#) with `minPointSource` and the now-normalized direction vector. You can now use this ray in a simple intersect test case (for example, [Intersects](#)) with the model.

For more usage examples of **Unproject**, see the following:

- [How To: Detect Whether a User Clicked a 3D Object](#)
- Picking sample (found at <http://creators.xna.com>)
- Picking with Triangle Accuracy sample (also found at <http://creators.xna.com>)

Viewport Properties

Public Properties

	Name	Description
	AspectRatio	Gets the aspect ratio used by the viewport
	Height	Gets or sets the height dimension of the viewport on the render-target surface, in pixels.
	MaxDepth	Gets or sets the maximum depth of the clip volume.
	MinDepth	Gets or sets the minimum depth of the clip volume.
	TitleSafeArea	Returns the title safe area of the current viewport.
	Width	Gets or sets the width dimension of the viewport on the render-target surface, in pixels.
	X	Gets or sets the pixel coordinate of the upper-left corner of the viewport on the render-target surface.
	Y	Gets or sets the pixel coordinate of the upper-left corner of the viewport on the render-target surface.

See Also

Reference

[Viewport Structure](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Viewport.AspectRatio Property

Gets the aspect ratio used by the viewport

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float AspectRatio { get; }
```

Property Value

The aspect ratio of the viewport.

See Also

Reference

[Viewport Structure](#)

[Viewport Members](#)

[Microsoft.Xna.Framework.Graphics Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Viewport.Height Property

Gets or sets the height dimension of the viewport on the render-target surface, in pixels.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Height { get; set; }
```

Property Value

The height, in pixels, of the viewport to set or get.

RemarksUnless rendering is being done only to a subset of the surface, this member should be set to the height dimension of the render target surface.

Viewport.MaxDepth Property

Gets or sets the maximum depth of the clip volume.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float MaxDepth { get; set; }
```

Property Value

The maximum depth of the clipping volume.

Remarks **MaxDepth**, together with [MinDepth](#), specifies the range of depth values into which a scene is rendered. Most applications set this value to 1.0. Clipping is performed after the projection matrix is applied.

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float MinDepth { get; set; }
```

Property Value

The minimum depth of the clipping volume.

Remarks **MinDepth**, together with [MaxDepth](#), specifies the range of depth values into which a scene is rendered. Most applications set this value to 0.0. Clipping is performed after the projection matrix is applied.

Viewport.TitleSafeArea Property

Returns the title safe area of the current viewport.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Rectangle TitleSafeArea { get; }
```

Property Value

The title safe area.

Remarks

On television sets, text should not be displayed at the outer edges of the screen because it may not be visible to the user. The title safe area is the part of the screen where text should be displayed.

This property does not compare the current location of the viewport with the title safe area of the entire display—it reduces the title safe area of the viewport uniformly.

Viewport.Width Property

Gets or sets the width dimension of the viewport on the render-target surface, in pixels.

Namespace: Microsoft.Xna.Framework.Graphics

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Width { get; set; }
```

Property Value

The width, in pixels, of the viewport to set or get.

RemarksUnless rendering is being done only to a subset of the surface, this member should be set to the width dimension of the render-target surface.

Microsoft.Xna.Framework.Graphics.PackedVector Namespace

Represents data types with components that are not multiples of 8 bits.

Interfaces

Name	Description
 IPackedVector	Converts packed vector types to and from Vector4 values.
 IPackedVector	Interface that converts packed vector types to and from Vector4 values, allowing multiple encodings to be manipulated in a generic way.

Structures

Name	Description
 Alpha8	Packed vector type containing a single 8 bit normalized W value in the range of 0 to 1.
 Bgr565	Packed vector type containing unsigned normalized values ranging from 0 to 1. The x and z components use 5 bits, and the y component uses 6 bits.
 Bgra5551	Packed vector type containing unsigned normalized values, ranging from 0 to 1, using 5 bits each for x, y, and z, and 1 bit for w.
 Byte4	Packed vector type containing four 8-bit unsigned integer values, ranging from 0 to 255.
 HalfSingle	Packed vector type containing a single 16 bit floating point value.
 HalfVector2	Packed vector type containing two 16-bit floating-point values.
 HalfVector4	Packed vector type containing four 16-bit floating-point values.
 Normalized101010	Packed vector type containing signed normalized values, ranging from -1 to 1, using 10 bits each for x, y, and z, and 2 bits for w.
 NormalizedByte2	Packed vector type containing two 8-bit signed normalized values, ranging from -1 to 1.
 NormalizedByte4	Packed vector type containing four 8-bit signed normalized values, ranging from -1 to 1.
 NormalizedShort2	Packed vector type containing two 16-bit signed normalized values, ranging from -1 to 1.
 NormalizedShort4	Packed vector type containing four 16-bit signed normalized values, ranging from -1 to 1.
 Rg32	Packed vector type containing two 16-bit unsigned normalized values, ranging from 0 to 1.
 Rgba1010102	Packed vector type containing unsigned normalized values, ranging from 0 to 1, using 10 bits each for x, y, and z, and 2 bits for w.
 Rgba32	Packed vector type containing four 8-bit unsigned normalized values, ranging from 0 to 1.
 Rgba64	Packed vector type containing four 16-bit unsigned normalized values, ranging from 0 to 1.
 Short2	Packed vector type containing two 16-bit signed integer values.
 Short4	Packed vector type containing four 16-bit signed integer values.
 UInt101010	Packed vector type containing unsigned integer values, using 10 bits each for x, y, and z (ranging from 0 to 1023), and 2 bits for w (ranging from 0 to 3).

Alpha8 Structure

Packed vector type containing a single 8 bit normalized W value in the range of 0 to 1.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public struct Alpha8 : IPackedVector<byte>, IEquatable<Alpha8>
```

See Also

[Microsoft.Xna.Framework.Graphics.PackedVector Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Alpha8 Members

The following tables list the members exposed by the Alpha8 type.

Public Constructors

Name	Description
 Alpha8	Initializes a new instance of the Alpha8 structure.

Public Properties

Name	Description
 PackedValue	Directly gets or sets the packed representation of the value.

Public Methods

Name	Description
 Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
 GetHashCode	Gets the hash code for the current instance.
 GetType	(Inherited from Object .)
 Op_Equality	Compares the current instance of a class to another instance to determine whether they are the same.
 Op_Inequality	Compares the current instance of a class to another instance to determine whether they are different.
 ReferenceEquals	(Inherited from Object .)
 ToAlpha	Expands the packed representation to a System.Single .
 ToString	Returns a string representation of the current instance.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

Name	Description
 Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4	Sets the packed representation from a Vector4 .
 Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.ToVector4	Expands the packed representation into a Vector4 .

Alpha8.Equals Method (Alpha8)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    Alpha8 other  
)
```

Parameters

other

The object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Alpha8.op_Equality Method

Compares the current instance of a class to another instance to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Alpha8 a,  
    Alpha8 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

Alpha8.op_Inequality Method

Compares the current instance of a class to another instance to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    Alpha8 a,  
    Alpha8 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are different; **false** otherwise.

Bgra5551 Members

The following tables list the members exposed by the Bgra5551 type.

Public Constructors

	Name	Description
	Bgra5551	Overloaded. Initializes a new instance of the Bgra5551 class.

Public Properties

	Name	Description
	PackedValue	Directly gets or sets the packed representation of the value.

Public Methods

	Name	Description
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code for the current instance.
	GetType	(Inherited from Object .)
	Sop_Equality	Compares the current instance of a class to another instance to determine whether they are the same.
	Sop_Inequality	Compares the current instance of a class to another instance to determine whether they are different.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a string representation of the current instance.
	ToVector4	Expands the packed representation into a Vector4 .

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4	Sets the packed representation from a Vector4 .

Bgra5551 Constructor (Single, Single, Single, Single)

Initializes a new instance of the [Bgra5551](#) class.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Bgra5551 (  
    float x,  
    float y,  
    float z,  
    float w  
)
```

Parameters

- x*
Initial value for the x component.
- y*
Initial value for the y component.
- z*
Initial value for the z component.
- w*
Initial value for the w component.

Bgra5551.Equals Method (Bgra5551)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    Bgra5551 other  
)
```

Parameters

other

The object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Bgra5551.op_Equality Method

Compares the current instance of a class to another instance to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Bgra5551 a,  
    Bgra5551 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

Compares the current instance of a class to another instance to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    Bgra5551 a,  
    Bgra5551 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are different; **false** otherwise.

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private void Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4 (
    Vector4 vector
)
```

Parameters

vector

The vector to create the packed representation from.

Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.ToVector4 Method

Expands the packed representation into a [Vector4](#).

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private Vector4 Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.ToVector4 ()
```

Return Value

The expanded vector.

HalfSingle.op_Equality Method

Compares the current instance of a class to another instance to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    HalfSingle a,  
    HalfSingle b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

HalfVector2 Members

The following tables list the members exposed by the HalfVector2 type.

Public Constructors

Name	Description
 HalfVector2	Overloaded. Initializes a new instance of the HalfVector2 class.

Public Properties

Name	Description
 PackedValue	Directly gets or sets the packed representation of the value.

Public Methods

Name	Description
 Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
 GetHashCode	Gets the hash code for the current instance.
 GetType	(Inherited from Object .)
 Op_Equality	Compares the current instance of a class to another instance to determine whether they are the same.
 Op_Inequality	Compares the current instance of a class to another instance to determine whether they are different.
 ReferenceEquals	(Inherited from Object .)
 ToString	Returns a string representation of the current instance.
 ToVector2	Expands the HalfVector2 to a Vector2 .

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

Name	Description
 Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4	Sets the packed representation from a Vector4 .
 Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.ToVector4	Expands the packed representation into a Vector4 .

HalfVector2.Equals Method (HalfVector2)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    HalfVector2 other  
)
```

Parameters

other

The object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

IPackedVector Interface

Interface that converts packed vector types to and from [Vector4](#) values, allowing multiple encodings to be manipulated in a generic way.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public interface IPackedVector
```

IPackedVector.PackFromVector4 Method

Sets the packed representation from a [Vector4](#).

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void PackFromVector4 (  
    Vector4 vector  
)
```

Parameters

vector

The vector to create the packed representation from.

Normalized101010 Structure

Packed vector type containing signed normalized values, ranging from -1 to 1 , using 10 bits each for x, y, and z, and 2 bits for w.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public struct Normalized101010 : IPackedVector<uint>, IEquatable<Normalized101010>
```

See Also

Normalized101010 Members

The following tables list the members exposed by the Normalized101010 type.

Public Constructors

Name	Description
 Normalized101010	Overloaded. Initializes a new instance of the Normalized101010 class.

Public Properties

Name	Description
 PackedValue	Directly gets or sets the packed representation of the value.

Public Methods

Name	Description
 Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
 GetHashCode	Gets the hash code for the current instance.
 GetType	(Inherited from Object .)
 Op_Equality	Compares the current instance of a class to another instance to determine whether they are the same.
 Op_Inequality	Compares the current instance of a class to another instance to determine whether they are different.
 ReferenceEquals	(Inherited from Object .)
 ToString	Returns a string representation of the current instance.
 ToVector3	Expands the packed representation into a Vector3 .

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

Name	Description
 Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4	Sets the packed representation from a Vector4 .
 Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.ToVector4	Expands the packed representation into a Vector4 .

Normalized101010 Constructor (Single, Single, Single)

Initializes a new instance of the [Normalized101010](#) class.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Normalized101010 (  
    float x,  
    float y,  
    float z  
)
```

Parameters

x
Initial value for the x component.

y
Initial value for the y component.

z
Initial value for the z component.

Normalized101010.Equals Method (Normalized101010)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    Normalized101010 other  
)
```

Parameters

other

The object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Normalized101010.op_Equality Method

Compares the current instance of a class to another instance to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Normalized101010 a,  
    Normalized101010 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

Compares the current instance of a class to another instance to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    Normalized101010 a,  
    Normalized101010 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are different; **false** otherwise.

[Microsoft.Xna.Framework.Graphics.PackedVector Namespace](#)

NormalizedByte4 Constructor (Single, Single, Single, Single)

Initializes a new instance of the [NormalizedByte4](#) class.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public NormalizedByte4 (  
    float x,  
    float y,  
    float z,  
    float w  
)
```

Parameters

x

Initial value for the x component.

y

Initial value for the y component.

z

Initial value for the z component.

w

Initial value for the w component.

NormalizedByte4 Constructor (Vector4)

Initializes a new instance of the [NormalizedByte4](#) structure.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public NormalizedByte4 (  
    Vector4 vector  
)
```

Parameters

vector

A vector containing the initial values for the components of the [NormalizedByte4](#) structure.

NormalizedByte4 Methods

Public Methods

	Name	Description
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code for the current instance.
	GetType	(Inherited from Object .)
	op_Equality	Compares the current instance of a class to another instance to determine whether they are the same.
	op_Inequality	Compares the current instance of a class to another instance to determine whether they are different.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a string representation of the current instance.
	ToVector4	Expands the packed representation into a Vector4 .

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4	Sets the packed representation from a Vector4 .

NormalizedByte4.Equals Method (NormalizedByte4)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    NormalizedByte4 other  
)
```

Parameters

other

The object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

NormalizedByte4.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

NormalizedByte4.GetHashCode Method

Gets the hash code for the current instance.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override int GetHashCode ()
```

Return Value

Hash code for the instance.

Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4 Method

Sets the packed representation from a [Vector4](#).

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private void Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4 (
    Vector4 vector
)
```

Parameters

vector

The vector to create the packed representation from.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

NormalizedByte4.op_Equality Method

Compares the current instance of a class to another instance to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    NormalizedByte4 a,  
    NormalizedByte4 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

NormalizedByte4.op_Inequality Method

Compares the current instance of a class to another instance to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    NormalizedByte4 a,  
    NormalizedByte4 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are different; **false** otherwise.

Syntax

C#

```
private void Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4 (
    Vector4 vector
)
```

Parameters

vector

The vector to create the packed representation from.

NormalizedShort4.op_Equality Method

Compares the current instance of a class to another instance to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    NormalizedShort4 a,  
    NormalizedShort4 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

NormalizedShort4.op_Inequality Method

Compares the current instance of a class to another instance to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    NormalizedShort4 a,  
    NormalizedShort4 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are different; **false** otherwise.

Rg32 Members

The following tables list the members exposed by the Rg32 type.

Public Constructors

	Name	Description
	Rg32	Overloaded. Initializes a new instance of the Rg32 class.

Public Properties

	Name	Description
	PackedValue	Directly gets or sets the packed representation of the value.

Public Methods

	Name	Description
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code for the current instance.
	GetType	(Inherited from Object .)
	Op_Equality	Compares the current instance of a class to another instance to determine whether they are the same.
	Op_Inequality	Compares the current instance of a class to another instance to determine whether they are different.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a string representation of the current instance.
	ToVector2	Expands the packed vector representation into a Vector2 .

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4	Sets the packed representation from a Vector4
	Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.ToVector4	Expands the packed representation into a Vector4 .

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Rgba32 Structure

Packed vector type containing four 8-bit unsigned normalized values, ranging from 0 to 1.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public struct Rgba32 : IPackedVector<uint>, IEquatable<Rgba32>
```

Rgba32 Members

The following tables list the members exposed by the Rgba32 type.

Public Constructors

	Name	Description
	Rgba32	Overloaded. Initializes a new instance of the Rgba32 class.

Public Properties

	Name	Description
	PackedValue	Directly gets or sets the packed representation of the value.

Public Methods

	Name	Description
	Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
	GetHashCode	Gets the hash code for the current instance.
	GetType	(Inherited from Object .)
	Op_Equality	Compares the current instance of a class to another instance to determine whether they are the same.
	Op_Inequality	Compares the current instance of a class to another instance to determine whether they are different.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a string representation of the current instance.
	ToVector4	Expands the packed representation into a Vector4 .

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	Microsoft.Xna.Framework.Graphics.PackedVector.IPackedVector.PackFromVector4	Sets the packed representation from a Vector4 .

Initializes a new instance of the [Rgba32](#) class.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Rgba32 (  
    float x,  
    float y,  
    float z,  
    float w  
)
```

Parameters

x

Initial value for the x component.

y

Initial value for the y component.

z

Initial value for the z component.

w

Initial value for the w component.

Rgba32.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

The object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Rgba32.op_Equality Method

Compares the current instance of a class to another instance to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Rgba32 a,  
    Rgba32 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

Compares the current instance of a class to another instance to determine whether they are different.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    Rgba32 a,  
    Rgba32 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are different; **false** otherwise.

Short2.Equals Method (Short2)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    Short2 other  
)
```

Parameters

other

The object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Short2.GetHashCode Method

Gets the hash code for the current instance.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override int GetHashCode ()
```

Return Value

Hash code for the instance.

Short2.op_Equality Method

Compares the current instance of a class to another instance to determine whether they are the same.

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Short2 a,  
    Short2 b  
)
```

Parameters

a

The object to the left of the equality operator.

b

The object to the right of the equality operator.

Return Value

true if the objects are the same; **false** otherwise.

UInt101010.ToVector3 Method

Expands the packed representation into a [Vector3](#).

Namespace: Microsoft.Xna.Framework.Graphics.PackedVector

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector3 ToVector3 ()
```

Return Value

The expanded vector.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Microsoft.Xna.Framework.Input Namespace

Contains classes to receive input from keyboard, mouse, and Xbox 360 Controller devices.

Classes

Name	Description
 Accelerometer	Provides methods for interacting with the 3-axis accelerometer of a Zune device.
 GamePad	Allows retrieval of user interaction with an Xbox 360 Controller and setting of controller vibration motors.
 Keyboard	Allows retrieval of keystrokes from a keyboard input device.
 Mouse	Allows retrieval of position and button clicks from a mouse input device.
 TouchPanel	Provides methods for retrieving touch panel device information.

Structures

Name	Description
 AccelerometerCapabilities	Provides properties for accessing the capabilities of an accelerometer.
 AccelerometerState	Provides information on the current state of the accelerometer device and a helper function for rotational computation.
 GamePadButtons	Identifies whether the buttons on an Xbox 360 Controller are pressed or released.
 GamePadCapabilities	Describes the capabilities of an Xbox 360 Controller, including controller type and whether the controller supports voice.
 GamePadDPad	Identifies which directions on the directional pad of an Xbox 360 Controller are being pressed.
 GamePadState	Represents specific information about the state of an Xbox 360 Controller, including the current state of buttons and sticks.
 GamePadThumbSticks	Structure that represents the position of left and right sticks (thumbsticks) on an Xbox 360 Controller.
 GamePadTriggers	Structure that defines the position of the left and right triggers on an Xbox 360 controller.
 KeyboardState	Represents a state of keystrokes recorded by a keyboard input device.
 MouseState	Represents the state of a mouse input device, including mouse cursor position and buttons pressed.
 TouchCollection	Provides methods and properties for accessing state information for the touch screen of a Zune device.
 TouchCollection.Enumerator	Provides the ability to iterate through the touch locations in a TouchCollection .
 TouchLocation	Provides methods and properties for interacting with a touch location on a touch screen device.
 TouchPanelCapabilities	Provides access to information about the touch pad device.

Enumerations

Name	Description
 Buttons	Enumerates input device buttons.
 ButtonState	Identifies the state of a controller button.
 GamePadDeadZone	Specifies a type of dead zone processing to apply to Xbox 360 controller analog sticks when calling GetState .
 GamePadType	Describes the type of a specified Xbox 360 controller.
 Keys	Identifies a particular key on a keyboard.
 KeyState	Identifies the state of a keyboard key.
 TouchLocationState	Defines the possible states for a touch location.

Accelerometer Class

Note

This class is available only when developing for Zune.

Provides methods for interacting with the 3-axis accelerometer of a Zune device.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static class Accelerometer
```

AccelerometerState Members

The following tables list the members exposed by the AccelerometerState type.

Public Constructors

	Name	Description
	AccelerometerState	Overloaded. Initializes a new instance of AccelerometerState .
	AccelerometerState	Initializes a new instance of the AccelerometerState structure with the specified acceleration.

Public Properties

	Name	Description
	Acceleration	Current acceleration, in G-force (g), of the accelerometer device.
	IsConnected	Indicates if an accelerometer device is available for use.

Public Methods

	Name	Description
	Equals	(Inherited from Object .)
	GetRotation	Gets the current rotation matrix for the device from the current acceleration data.
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

AccelerometerState Constructor

Note

This constructor is available only when developing for Zune.

Initializes a new instance of the [AccelerometerState](#) structure with the specified acceleration.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public AccelerometerState (  
    Vector3 acceleration  
)
```

Parameters

acceleration

Acceleration, in G-force (g), of the new object.

See Also

Reference

[AccelerometerState Structure](#)

See Also

Reference

[AccelerometerState Structure](#)

[Microsoft.Xna.Framework.Input Namespace](#)

AccelerometerState.GetRotation Method

Note

This method is available only when developing for Zune.

Gets the current rotation matrix for the device from the current acceleration data.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Matrix GetRotation ()
```

Return Value

Matrix representing the current rotation of the accelerometer device.

Remarks

A common usage of this property is to rotate a 3D model to match the tilt of the device in the real world. For instance, the following line of code sets the basic effect's world matrix to the current rotation matrix of the device:

```
basicEffect.World = accState.GetRotation();
```

GamePad.GetCapabilities Method

Retrieves the capabilities of an Xbox 360 Controller.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static GamePadCapabilities GetCapabilities (  
    PlayerIndex playerIndex  
)
```

Parameters

playerIndex

Index of the controller to query.

Return Value

The capabilities of the controller.

Exceptions

Exception type	Condition
InvalidOperationException	An unknown error has occurred. Verify that the correct <i>playerIndex</i> is being requested.

See Also

Reference

[GamePad Class](#)

[GamePad Members](#)

[Microsoft.Xna.Framework.Input Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GamePad.GetState Method

Gets the current state of a game pad controller. As an option, it specifies a dead zone processing method for the analog sticks.

Overload List

Name	Description
GamePad.GetState (PlayerIndex)	Gets the current state of a game pad controller.
GamePad.GetState (PlayerIndex, GamePad DeadZone)	Gets the current state of a game pad controller, using a specified dead zone on an analog stick positions.

Remarks When you call [GetState](#), check the returned structure's **IsConnected** property value. If the controller has been disconnected, this value will be **false**. When a controller is disconnected, values for its state will not be valid. Also, the controller will not receive any new vibration settings.

GamePad.GetState Method (PlayerIndex)

Gets the current state of a game pad controller.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static GamePadState GetState (
    PlayerIndex playerIndex
)
```

Parameters

playerIndex

Player index for the controller you want to query.

Return Value

The current state of the controller.

Exceptions

Exception type	Condition
InvalidOperationException	An unknown error has occurred. Verify that the correct <i>playerIndex</i> is being requested.

Remarks

★ Best Practice

- On the first menu presented by the game, consider asking the player to sign in by pressing **A** or **Start**. This enables the game to detect the correct controller in use for each player in the game.
- When processing player input, you can examine [SignedInGamer.GameDefaults](#) to determine a player's preferences for how the Xbox 360 controller is used to send input to the game.

When you call [GetState](#), check the returned structure's **IsConnected** property value. If the controller has been disconnected, this value will be **false**. When a controller is disconnected, values for its state will not be valid. Also, the controller will not receive any new vibration settings.

This method uses the [GamePadDeadZone.IndependentAxes](#) dead zone to smooth the values of the analog sticks. To specify a different dead zone type, or to specify no-dead-zone processing, pass a [GamePadDeadZone](#) value to this method.

GamePad.GetState Method (PlayerIndex, GamePadDeadZone)

Gets the current state of a game pad controller, using a specified dead zone on analog stick positions.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static GamePadState GetState (
    PlayerIndex playerIndex,
    GamePadDeadZone deadZoneMode
)
```

Parameters

playerIndex

Player index for the controller you want to query.

deadZoneMode

Enumerated value that specifies what dead zone type to use.

Return Value

The current state of the controller.

Exceptions

Exception type	Condition
InvalidOperationException	An unknown error has occurred. Verify that the correct <i>playerIndex</i> is being requested.

Remarks

★ Best Practice

- On the first menu presented by the game, consider asking the player to sign in by pressing **A** or **Start**. This enables the game to detect the correct controller in use for each player in the game.
- When processing player input, you can examine [SignedInGamer.GameDefaults](#) to determine a player's preferences for how the Xbox 360 controller is used to send input to the game.

When you call [GetState](#), check the returned structure's **IsConnected** property value. If the controller has been disconnected, this value will be **false**. When a controller is disconnected, values for its state will not be valid. Also, the controller will not receive any new vibration settings.

The *deadZoneMode* parameter specifies the type of dead-zone processing to apply to the analog sticks on the controller. By applying a dead zone, controller inputs will report values near the center and edges of their ranges more accurately. If you wish to do your own dead-zone processing, use **GamePadDeadZone.None**.

On Zune, the default is "no dead zone." Dead zones are not necessary on Zune. You can specify a dead zone if you want, but you need to remember this setting will reduce the available input in a simple device.

GamePad.SetVibration Method

Sets the vibration motor speeds on an Xbox 360 Controller.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool SetVibration (
    PlayerIndex playerIndex,
    float leftMotor,
    float rightMotor
)
```

Parameters

playerIndex

Player index that identifies the controller to set.

leftMotor

The speed of the left motor, between 0.0 and 1.0. This motor is a low-frequency motor.

rightMotor

The speed of the right motor, between 0.0 and 1.0. This motor is a high-frequency motor.

Return Value

true if the vibration motors were successfully set; **false** if the controller was unable to process the request.

Exceptions

Exception type	Condition
InvalidOperationException	An unknown error has occurred. Verify that the correct <i>playerIndex</i> is being requested.

Remarks

If this method returns **false**, it means that the controller is either disconnected or too busy to accept the new vibration settings. It is not advisable to loop in wait for this method to return **true**.

GamePadButtons Structure

Identifies whether the buttons on an Xbox 360 Controller are pressed or released.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public struct GamePadButtons
```

Remarks

★ Best Practice

- If your game allows the player to control acceleration using the Xbox 360 controller, you may check [GameDefaults.AccelerateWithButtons](#) to determine if the player prefers using the gamepad buttons or triggers to control acceleration.
- If your game allows the player to control braking using the Xbox 360 controller, you may check [GameDefaults.BrakeWithButtons](#) to determine if the player prefers using the gamepad buttons or triggers to control braking.

GamePadButtons Members

The following tables list the members exposed by the GamePadButtons type.

Public Constructors

Name	Description
 GamePadButtons	Initializes a new instance of the GamePadButtons class, setting the specified buttons to pressed.

Public Properties

Name	Description
 A	Identifies whether the A button on the Xbox 360 Controller is pressed.
 B	Identifies whether the B button on the Xbox 360 Controller is pressed.
 Back	Identifies whether the BACK button on the Xbox 360 Controller is pressed.
 BigButton	Identifies whether the BigButton button is pressed.
 LeftShoulder	Identifies whether the left shoulder (bumper) button on the Xbox 360 Controller is pressed.
 LeftStick	Identifies whether the left stick button on the Xbox 360 Controller is pressed (the stick is "clicked" in).
 RightShoulder	Identifies whether the right shoulder (bumper) button on the Xbox 360 Controller is pressed.
 RightStick	Identifies whether the right stick button on the Xbox 360 Controller is pressed (the stick is "clicked" in).
 Start	Identifies whether the START button on the Xbox 360 Controller is pressed.
 X	Identifies whether the X button on the Xbox 360 Controller is pressed.
 Y	Identifies whether the Y button on the Xbox 360 Controller is pressed.

Public Methods

Name	Description
 Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
 GetHashCode	Gets the hash code for this instance.
 GetType	(Inherited from Object .)
 Sop_Equality	Determines whether two GamePadButtons instances are equal.
 Sop_Inequality	Determines whether two GamePadButtons instances are not equal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Concepts

[Input Overview](#)

Reference

[GamePadButtons Structure](#)

[Microsoft.Xna.Framework.Input Namespace](#)

GamePadButtons Constructor

Initializes a new instance of the [GamePadButtons](#) class, setting the specified buttons to pressed.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamePadButtons (  
    Buttons buttons  
)
```

Parameters

buttons

Buttons to initialize as pressed. Specify a single button, or combine multiple buttons using a bitwise OR operation.

Remarks

Note that [GamePadButtons](#) only stores the state of digital buttons (buttons that are pressed or unpressed, such as **A** or right bumper). Trigger or stick values specified in the *buttons* argument are ignored.

Games normally use [GetState](#) to get the true gamepad state. This constructor is used to instead simulate gamepad input for passing within the game's own input subsystem.

GamePadButtons.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

Object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

GamePadButtons.GetHashCode Method

Gets the hash code for this instance.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override int GetHashCode ()
```

Return Value

Hash code for this object.

GamePadButtons.op_Equality Method

Determines whether two [GamePadButtons](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    GamePadButtons left,  
    GamePadButtons right  
)
```

Parameters

left

Object on the left of the equal sign.

right

Object on the right of the equal sign.

Return Value

true if the instances are equal; **false** otherwise.

GamePadButtons.op_Inequality Method

Determines whether two [GamePadButtons](#) instances are not equal.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    GamePadButtons left,  
    GamePadButtons right  
)
```

Parameters

left

Object on the left of the equal sign.

right

Object on the right of the equal sign.

Return Value

true if the objects are not equal; **false** otherwise.

GamePadButtons.ToString Method

Retrieves a string representation of this object.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override string ToString ()
```

Return Value

String representation of this object.

GamePadButtons.A Property

Identifies whether the **A** button on the Xbox 360 Controller is pressed.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ButtonState A { get; }
```

Property Value

[ButtonState.Pressed](#) if the button is pressed; [ButtonState.Released](#) otherwise.

Remarks

★ Best Practice

The **A** button is usually used to confirm the selection of an item.

GamePadButtons.B Property

Identifies whether the **B** button on the Xbox 360 Controller is pressed.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ButtonState B { get; }
```

Property Value

[ButtonState.Pressed](#) if the button is pressed; [ButtonState.Released](#) otherwise.

Remarks

★ Best Practice

The **B** button is usually used to cancel or back out of a menu in a game.

GamePadButtons.Back Property

Identifies whether the **BACK** button on the Xbox 360 Controller is pressed.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ButtonState Back { get; }
```

Property Value

[ButtonState.Pressed](#) if the button is pressed; [ButtonState.Released](#) otherwise.

Remarks

★ Best Practice

During gameplay, the **Back** button might be used to bring up a scoreboard or other contextual information such as a map.

GamePadCapabilities Members

The following tables list the members exposed by the GamePadCapabilities type.

Public Properties

Name	Description
 GamePadType	Gets the type of controller.
 HasAButton	Indicates whether the controller has an A button.
 HasBackButton	Indicates whether the controller has a BACK button.
 HasBButton	Indicates whether the controller has a B button.
 HasBigButton	Indicates whether the controller has a BigButton button.
 HasDPadDownButton	Indicates whether the controller has a directional pad DOWN button.
 HasDPadLeftButton	Indicates whether the controller has a directional pad LEFT button.
 HasDPadRightButton	Indicates whether the controller has a directional pad RIGHT button.
 HasDPadUpButton	Indicates whether the controller has a directional pad UP button.
 HasLeftShoulderButton	Indicates whether the controller has a left bumper button.
 HasLeftStickButton	Indicates whether the controller has a digital button control on the left analog stick.
 HasLeftTrigger	Indicates whether the controller has a left analog trigger.
 HasLeftVibrationMotor	Indicates whether the controller has a low-frequency vibration motor.
 HasLeftXThumbStick	Indicates whether the controller supports a left analog control with horizontal movement.
 HasLeftYThumbStick	Indicates whether the controller supports a left analog control with vertical movement.
 HasRightShoulderButton	Indicates whether the controller has a right bumper button.
 HasRightStickButton	Indicates whether the controller has a digital button control on the right analog stick.
 HasRightTrigger	Indicates whether the controller has a right analog trigger.
 HasRightVibrationMotor	Indicates whether the controller has a high-frequency vibration motor.
 HasRightXThumbStick	Indicates whether the controller supports a right analog control with horizontal movement.
 HasRightYThumbStick	Indicates whether the controller supports a right analog control with vertical movement.
 HasStartButton	Indicates whether the controller has a START button.
 HasVoiceSupport	Indicates whether the controller supports voice.
 HasXButton	Indicates whether the controller has an X button.
 HasYButton	Indicates whether the controller has a Y button.
 IsConnected	Indicates whether the Xbox 360 Controller is connected.

GamePadCapabilities.HasLeftYThumbStick Property

Indicates whether the controller supports a left analog control with vertical movement.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool HasLeftYThumbStick { get; }
```

Property Value

true if the controller has this capability; **false** otherwise.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GamePadCapabilities.HasRightShoulderButton Property

Indicates whether the controller has a right bumper button.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool HasRightShoulderButton { get; }
```

Property Value

true if the controller has this capability; **false** otherwise.

GamePadCapabilities.HasRightStickButton Property

Indicates whether the controller has a digital button control on the right analog stick.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool HasRightStickButton { get; }
```

Property Value

true if the controller has this capability; **false** otherwise.

GamePadCapabilities.HasRightTrigger Property

Indicates whether the controller has a right analog trigger.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool HasRightTrigger { get; }
```

Property Value

true if the controller has this capability; **false** otherwise.

GamePadCapabilities.HasRightVibrationMotor Property

Indicates whether the controller has a high-frequency vibration motor.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool HasRightVibrationMotor { get; }
```

Property Value

true if the controller has this capability; **false** otherwise.

GamePadCapabilities.HasYButton Property

Indicates whether the controller has a **Y** button.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool HasYButton { get; }
```

Property Value

true if the controller has this capability; **false** otherwise.

See Also

Reference

[GamePadCapabilities Structure](#)

[GamePadCapabilities Members](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GamePadCapabilities.IsConnected Property

Indicates whether the Xbox 360 Controller is connected.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsConnected { get; }
```

Property Value

true if the controller is connected; **false** otherwise.

Remarks When calling [GetState](#) or [GetCapabilities](#), check the returned structure's **IsConnected** property value. If the controller has been disconnected, this value will be **false**. When a controller is disconnected, values for its state and/or capabilities will not be valid. The controller will also not be able to receive new vibration settings.

GamePadDeadZone Enumeration

Specifies a type of dead zone processing to apply to Xbox 360 controller analog sticks when calling [GetState](#).

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum GamePadDeadZone
```

Members

Member name	Description
Circular	The combined X and Y position of each stick is compared against the dead zone. This provides better control than IndependentAxes when the stick is used as a two-dimensional control surface, such as when controlling a character's view in a first-person game.
IndependentAxes	The X and Y positions of each stick are compared against the dead zone independently. This setting is the default when calling GetState .
None	The values of each stick are not processed and are returned by GetState as "raw" values. This is best if you intend to implement your own dead zone processing.

See Also

Reference

[Microsoft.Xna.Framework.Input Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GamePadDPad Structure

Identifies which directions on the directional pad of an Xbox 360 Controller are being pressed.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public struct GamePadDPad
```

Remarks

★ Best Practice

Many games allow movement to be controlled with either the left thumbstick or the directional pad (d-pad). The left thumbstick may be accessed with [ThumbSticks](#), and the directional pad is available through [DPad](#).

GamePadDPad Members

The following tables list the members exposed by the GamePadDPad type.

Public Constructors

Name	Description
 GamePadDPad	Initializes a new instance of the GamePadDPad class.

Public Properties

Name	Description
 Down	Identifies whether the Down direction on the Xbox 360 Controller directional pad is pressed.
 Left	Identifies whether the Left direction on the Xbox 360 Controller directional pad is pressed.
 Right	Identifies whether the Right direction on the Xbox 360 Controller directional pad is pressed.
 Up	Identifies whether the Up direction on the Xbox 360 Controller directional pad is pressed.

Public Methods

Name	Description
 Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
 GetHashCode	Gets the hash code for this instance.
 GetType	(Inherited from Object .)
 Op_Equality	Determines whether two GamePadDPad instances are equal.
 Op_Inequality	Determines whether two GamePadDPad instances are not equal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Reference

[GamePadDPad Structure](#)

[Microsoft.Xna.Framework.Input Namespace](#)

GamePadDPad Constructor

Initializes a new instance of the [GamePadDPad](#) class.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamePadDPad (  
    ButtonState upValue,  
    ButtonState downValue,  
    ButtonState leftValue,  
    ButtonState rightValue  
)
```

Parameters

upValue

Directional pad up button state.

downValue

Directional pad down button state.

leftValue

Directional pad left button state.

rightValue

Directional pad right button state.

Remarks

Games normally use [GetState](#) to get the true gamepad state. This constructor is used to instead simulate gamepad input for passing within the game's own input subsystem.

GamePadDPad.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

Object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Determines whether two [GamePadDPad](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    GamePadDPad left,  
    GamePadDPad right  
)
```

Parameters

left

Object on the left of the equal sign.

right

Object on the right of the equal sign.

Return Value

true if the instances are equal; **false** otherwise.

Determines whether two [GamePadDPad](#) instances are not equal.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    GamePadDPad left,  
    GamePadDPad right  
)
```

Parameters

left

Object on the left of the equal sign.

right

Object on the right of the equal sign.

Return Value

true if the objects are not equal; **false** otherwise.

GamePadState Members

The following tables list the members exposed by the GamePadState type.

Public Constructors

Name	Description
 GamePadState	Overloaded. Initializes a new instance of the GamePadState class.

Public Properties

Name	Description
 Buttons	Returns a structure that identifies what buttons on the Xbox 360 controller are pressed.
 DPad	Returns a structure that identifies what directions of the directional pad on the Xbox 360 Controller are pressed.
 IsConnected	Indicates whether the Xbox 360 Controller is connected.
 PacketNumber	Gets the packet number associated with this state.
 ThumbSticks	Returns a structure that indicates the position of the Xbox 360 Controller sticks (thumbsticks).
 Triggers	Returns a structure that identifies the position of triggers on the Xbox 360 controller.

Public Methods

Name	Description
 Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
 GetHashCode	Gets the hash code for this instance.
 GetType	(Inherited from Object .)
 IsButtonDown	Determines whether specified input device buttons are pressed in this GamePadState .
 IsButtonUp	Determines whether specified input device buttons are up (not pressed) in this GamePadState .
 IsOp_Equality	Determines whether two GamePadState instances are equal.
 IsOp_Inequality	Determines whether two GamePadState instances are not equal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Reference

[GamePadState Structure](#)

[Microsoft.Xna.Framework.Input Namespace](#)

GamePadState Constructor

Initializes a new instance of the [GamePadState](#) class.

Overload List

Name	Description
GamePadState (GamePadThumbSticks, GamePadTriggers, GamePadButtons, GamePadDPad)	Initializes a new instance of the GamePadState class using the specified GamePadThumbSticks , GamePadTriggers , GamePadButtons , and GamePadDPad .
GamePadState (Vector2, Vector2, Single, Single, Buttons[])	Initializes a new instance of the GamePadState class with the specified stick, trigger, and button values.

See Also

Reference

[GamePadState Structure](#)

[GamePadState Members](#)

[Microsoft.Xna.Framework.Input Namespace](#)

GamePadState Constructor (GamePadThumbSticks, GamePadTriggers, GamePadButtons, GamePadDPad)

Initializes a new instance of the [GamePadState](#) class using the specified [GamePadThumbSticks](#), [GamePadTriggers](#), [GamePadButtons](#), and [GamePadDPad](#).

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamePadState (  
    GamePadThumbSticks thumbSticks,  
    GamePadTriggers triggers,  
    GamePadButtons buttons,  
    GamePadDPad dPad  
)
```

Parameters

thumbSticks

Initial thumbstick state.

triggers

Initial trigger state.

buttons

Initial button state.

dPad

Initial directional pad state.

Remarks

Games normally use [GetState](#) to get the true gamepad state. This constructor is used to instead simulate gamepad input for passing within the game's own input subsystem.

Thumbstick state is different from the state indicated by the [GamePadButtons.LeftStick Property](#) or the [GamePadButtons.RightStick Property](#). Thumbstick state refers to the position of the thumbstick, while the **LeftStick** or **RightStick** properties indicate whether the stick is "clicked" in.

[Microsoft.Xna.Framework.Input Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GamePadState Constructor (Vector2, Vector2, Single, Single, Buttons[])

Initializes a new instance of the [GamePadState](#) class with the specified stick, trigger, and button values.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamePadState (  
    Vector2 leftThumbStick,  
    Vector2 rightThumbStick,  
    float leftTrigger,  
    float rightTrigger,  
    Buttons[] buttons  
)
```

Parameters

leftThumbStick

Left stick value. Each axis is clamped between -1.0 and 1.0.

rightThumbStick

Right stick value. Each axis is clamped between -1.0 and 1.0.

leftTrigger

Left trigger value. This value is clamped between 0.0 and 1.0.

rightTrigger

Right trigger value. This value is clamped between 0.0 and 1.0.

buttons

Array or parameter list of [Buttons](#) to initialize as pressed.

Remarks

Games normally use [GetState](#) to get the true gamepad state. This constructor is used to instead simulate gamepad input for passing within the game's own input subsystem.

GamePadState.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

Object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GamePadState.IsButtonDown Method

Determines whether specified input device buttons are pressed in this [GamePadState](#).

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsButtonDown (  
    Buttons button  
)
```

Parameters

button

Buttons to query. Specify a single button, or combine multiple buttons using a bitwise OR operation.

Return Value

true if all specified buttons are pressed; **false** otherwise.

Remarks

For digital buttons (such as **A**, **START**, and right bumper) the return value indicates whether the button is pressed.

For analog inputs (triggers and thumbsticks), the return value indicates whether the input exceeds dead zone values. For example, a trigger will not be reported as pressed until it is pulled about 12% of its full range. **IsButtonDown** always uses the default dead zone processing mode, [GamePadDeadZone.IndependentAxes](#).

If multiple buttons are specified (by combining them using the bitwise OR operator), then *all* must be pressed (or exceed dead zone values) in order for **IsButtonDown** to return **true**.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GamePadState.IsButtonUp Method

Determines whether specified input device buttons are up (not pressed) in this [GamePadState](#).

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsButtonUp (  
    Buttons button  
)
```

Parameters

button

Buttons to query. Specify a single button, or combine multiple buttons using a bitwise OR operation.

Return Value

true if any specified buttons are up; **false** otherwise.

Remarks

For digital buttons (such as **A**, **START**, and right bumper) the return value indicates whether the button is up (not pressed).

For analog inputs (triggers and thumbsticks), the return value indicates whether the input exceeds dead zone values. For example, a trigger will be reported as not pressed until it is pulled about 12% of its full range. **IsButtonUp** always uses the default dead zone processing mode, [GamePadDeadZone.IndependentAxes](#).

If multiple buttons are specified (by combining them using the bitwise OR operator), **IsButtonUp** returns **true** if *any* of the specified buttons are not pressed (or do not exceed dead zone values).

GamePadState.op_Equality Method

Determines whether two [GamePadState](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    GamePadState left,  
    GamePadState right  
)
```

Parameters

left

Object on the left of the equal sign.

right

Object on the right of the equal sign.

Return Value

true if the instances are equal; **false** otherwise.

GamePadState.op_Inequality Method

Determines whether two [GamePadState](#) instances are not equal.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    GamePadState left,  
    GamePadState right  
)
```

Parameters

left

Object on the left of the equal sign.

right

Object on the right of the equal sign.

Return Value

true if the objects are not equal; **false** otherwise.

GamePadState.ToString Method

Retrieves a string representation of this object.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override string ToString ()
```

Return Value

String representation of this object.

GamePadState Properties

Public Properties

	Name	Description
	Buttons	Returns a structure that identifies what buttons on the Xbox 360 controller are pressed.
	DPad	Returns a structure that identifies what directions of the directional pad on the Xbox 360 Controller are pressed.
	IsConnected	Indicates whether the Xbox 360 Controller is connected.
	PacketNumber	Gets the packet number associated with this state.
	ThumbSticks	Returns a structure that indicates the position of the Xbox 360 Controller sticks (thumbsticks).
	Triggers	Returns a structure that identifies the position of triggers on the Xbox 360 controller.

See Also

Reference

[GamePadState Structure](#)

[Microsoft.Xna.Framework.Input Namespace](#)

GamePadState.Buttons Property

Returns a structure that identifies what buttons on the Xbox 360 controller are pressed.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamePadButtons Buttons { get; }
```

Property Value

A structure that identifies buttons pressed on the controller.

Remarks

★ Best Practice

- If your game allows the player to control acceleration using the Xbox 360 controller, you may check [GameDefaults.AccelerateWithButtons](#) to determine if the player prefers using the gamepad buttons or triggers to control acceleration.
- If your game allows the player to control braking using the Xbox 360 controller, you may check [GameDefaults.BrakeWithButtons](#) to determine if the player prefers using the gamepad buttons or triggers to control braking.

GamePadState.DPad Property

Returns a structure that identifies what directions of the directional pad on the Xbox 360 Controller are pressed.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamePadDPad DPad { get; }
```

Property Value

Structure that identifies what directional pad directions are pressed.

Remarks

★ Best Practice

Many games allow movement to be controlled with either the left thumbstick or the directional pad (d-pad). The left thumbstick may be accessed with [GamePadState.ThumbSticks](#).

See Also

Reference

[GamePadState Structure](#)

[GamePadState Members](#)

[Microsoft.Xna.Framework.Input Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GamePadState.IsConnected Property

Indicates whether the Xbox 360 Controller is connected.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsConnected { get; }
```

Property Value

true if the controller is connected; **false** otherwise.

Remarks When calling [GetState](#) or [GetCapabilities](#), check the returned structure's **IsConnected** property value. If the controller has been disconnected, this value will be **false**. When a controller is disconnected, values for its state and/or capabilities will not be valid. The controller will also not be able to receive new vibration settings.

GamePadState.PacketNumber Property

Gets the packet number associated with this state.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int PacketNumber { get; }
```

Property Value

The packet number associated with this state.

Remarks You can use [PacketNumber](#) to determine whether input state has changed. If the value of [PacketNumber](#) remains the same between two sequential calls to [GetState](#), then there has been no change in input.

GamePadState.ThumbSticks Property

Returns a structure that indicates the position of the Xbox 360 Controller sticks (thumbsticks).

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamePadThumbSticks ThumbSticks { get; }
```

Property Value

Structure that indicates the position of the sticks.

Remarks

★ Best Practice

You can check [GameDefaults.MoveWithRightThumbStick](#) to determine if the player prefers using the right or left thumbstick to control movement.

Many games allow movement to be controlled with either the left thumbstick or the directional pad (d-pad). The directional pad is available through [GamePadState.DPad](#).

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamePadTriggers Triggers { get; }
```

Property Value

Structure that identifies the position of the triggers.

Remarks

★ Best Practice

- If your game allows the player to control acceleration using the Xbox 360 controller, you may check [GameDefaults.AccelerateWithButtons](#) to determine if the player prefers using the gamepad buttons or triggers to control acceleration.
- If your game allows the player to control braking using the Xbox 360 controller, you may check [GameDefaults.BrakeWithButtons](#) to determine if the player prefers using the gamepad buttons or triggers to control braking.

GamePadThumbSticks Members

The following tables list the members exposed by the GamePadThumbSticks type.

Public Constructors

Name	Description
 GamePadThumbSticks	Initializes a new instance of the GamePadThumbSticks class.

Public Properties

Name	Description
 Left	Returns the position of the left Xbox 360 Controller stick (thumbstick) as a 2D vector.
 Right	Returns the position of the right Xbox 360 Controller stick (thumbstick) as a 2D vector.

Public Methods

Name	Description
 Equals	Overloaded. Returns a value that indicates whether the current instance is equal to a specified object.
 GetHashCode	Gets the hash code for this instance.
 GetType	(Inherited from Object .)
 op_Equality	Determines whether two GamePadThumbSticks instances are equal.
 op_Inequality	Determines whether two GamePadThumbSticks instances are not equal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Retrieves a string representation of this object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

See Also

Reference

[GamePadThumbSticks Structure](#)

[Microsoft.Xna.Framework.Input Namespace](#)

GamePadThumbSticks Constructor

Initializes a new instance of the [GamePadThumbSticks](#) class.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamePadThumbSticks (  
    Vector2 leftThumbstick,  
    Vector2 rightThumbstick  
)
```

Parameters

leftThumbstick

Left stick value. Each axis is clamped between -1.0 and 1.0.

rightThumbstick

Right stick value. Each axis is clamped between -1.0 and 1.0.

Remarks

Games normally use [GetState](#) to get the true gamepad state. This constructor is used to instead simulate gamepad input for passing within the game's own input subsystem.

GamePadThumbSticks.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

Object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

GamePadThumbSticks Properties

Public Properties

	Name	Description
	Left	Returns the position of the left Xbox 360 Controller stick (thumbstick) as a 2D vector.
	Right	Returns the position of the right Xbox 360 Controller stick (thumbstick) as a 2D vector.

See Also

Reference

[GamePadThumbSticks Structure](#)

[Microsoft.Xna.Framework.Input Namespace](#)

GamePadThumbSticks.Left Property

Returns the position of the left Xbox 360 Controller stick (thumbstick) as a 2D vector.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector2 Left { get; }
```

Property Value

Two-dimensional vector that identifies the position of the left stick. Each axis is represented as a floating-point value from -1.0 to 1.0 .

Remarks

★Best Practice

You can check [GameDefaults.MoveWithRightThumbStick](#) to determine if the player prefers using the right or left thumbstick to control movement.

Each of the thumbstick axis members is a signed value describing the position of the thumbstick. A value of 0 is centered. Negative values signify down or to the left. Positive values signify up or to the right. The controller typically does not generate thumbstick values within a dead zone, or marginal input region around the center position.

Example

```
if (GamePad.GetState( PlayerIndex.One ).ThumbSticks.Left.Y == 1.0f)
{
    // Player one has pressed the left thumbstick up.
}
```

GamePadThumbSticks.Right Property

Returns the position of the right Xbox 360 Controller stick (thumbstick) as a 2D vector.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Vector2 Right { get; }
```

Property Value

Two-dimensional vector that identifies the position of the right stick. Each axis is represented as a floating-point value from -1.0 to 1.0.

Remarks

★ Best Practice

You can check [GameDefaults.MoveWithRightThumbStick](#) to determine if the player prefers using the right or left thumbstick to control movement.

See Also

Reference

Keyboard.GetState Method ()

Returns the current keyboard state.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static KeyboardState GetState ()
```

Return Value

Current keyboard state.

Exceptions

Exception type	Condition
InvalidOperationException	An invalid operation occurred when querying the keyboard state.

Remarks

This method queries an attached USB keyboard. To query a Chatpad instead, use [Keyboard.GetState \(PlayerIndex\)](#).

Reference

[Keyboard Class](#)

[Keyboard Members](#)

[Microsoft.Xna.Framework.Input Namespace](#)

[Keyboard.GetState Method](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Keyboard.GetState Method (PlayerIndex)

Returns the current Chatpad state for the specified player.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static KeyboardState GetState (  
    PlayerIndex playerIndex  
)
```

Parameters

playerIndex

Player index of the Chatpad to query.

Return Value

Current Chatpad state.

Exceptions

Exception type	Condition
InvalidOperationException	An invalid operation occurred when querying the Chatpad state.

Remarks

Each player can have his or her own Chatpad, which is queried as a keyboard. To query an attached USB keyboard instead, use the [GetState](#) method that does not require a player index.

This method works on Xbox 360 platforms only. Windows does not include driver support for the ChatPad.

This method is included in the assemblies for Windows, but it is effectively a null function on that platform. Calls to `Keyboard.GetState(playerIndex)` from a Windows application are accepted, but will never return a ChatPad state change (key press or release).

Mouse.SetPosition Method

Sets the position of the mouse cursor relative to the upper-left corner of the window.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void SetPosition (  
    int x,  
    int y  
)
```

Parameters

x
The horizontal position of the mouse cursor, relative to the left edge of the game window.

y
The vertical position of the mouse cursor, relative to the upper edge of the game window.

Remarks

When using this method to take relative input, such as in a first-person game, set the position of the mouse to the center of your game window each frame. This will allow you to read mouse movement on both axes with the greatest amount of granularity.

Mouse.WindowHandle Property

Gets or sets the window used for mouse processing. Mouse coordinates returned by [GetState](#) are relative to the upper-left corner of this window.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IntPtr WindowHandle { get; set; }
```

Property Value

Handle to a window.

Remarks

By default, this property is set to the game window ([Game.Window Property](#)). To select a different window as the coordinate reference, set **WindowHandle** to that window.

If the mouse is above or to the left of the reference window, the returned coordinates are negative. If the mouse is below or to the right of the reference window, the returned coordinates are greater than the window's client area.

MouseState.Equals Method

Returns a value that indicates whether the current instance is equal to a specified object.

Overload List

Name	Description
MouseState.Equals (Object)	Returns a value that indicates whether the current instance is equal to a specified object.
MouseState.Equals (Object, Object)	(Inherited from Object .)

MouseState.Equals Method (Object)

Returns a value that indicates whether the current instance is equal to a specified object.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

Object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; **false** otherwise.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

MouseState.GetHashCode Method

Gets the hash code for this instance.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override int GetHashCode ()
```

Return Value

Hash code for this object.

MouseState.op_Equality Method

Determines whether two [MouseState](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    MouseState left,  
    MouseState right  
)
```

Parameters

left

Object on the left of the equal sign.

right

Object on the right of the equal sign.

Return Value

true if the instances are equal; **false** otherwise.

MouseState.op_Inequality Method

Determines whether two [MouseState](#) instances are not equal.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    MouseState left,  
    MouseState right  
)
```

Parameters

left

Object on the left of the equal sign.

right

Object on the right of the equal sign.

Return Value

true if the objects are not equal; **false** otherwise.

MouseState.ToString Method

Retrieves a string representation of this object.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override string ToString ()
```

Return Value

String representation of this object.

MouseState Properties

Public Properties

	Name	Description
	LeftButton	Returns the state of the left mouse button.
	MiddleButton	Returns the state of the middle mouse button.
	RightButton	Returns the state of the right mouse button.
	ScrollWheelValue	Gets the cumulative mouse scroll wheel value since the game was started.
	X	Specifies the horizontal position of the mouse cursor.
	XButton1	Returns the state of XBUTTON1.
	XButton2	Returns the state of XBUTTON2.
	Y	Specifies the vertical position of the mouse cursor.

MouseState.LeftButton Property

Returns the state of the left mouse button.

Xbox 360 Specific Information

The value of this property is always [ButtonState.Released](#).

Zune Specific Information

The value of this property is always [ButtonState.Released](#).

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ButtonState LeftButton { get; }
```

Property Value

State of the left mouse button.

See Also

Reference

MouseState.RightButton Property

Returns the state of the right mouse button.

Xbox 360 Specific Information

The value of this property is always [ButtonState.Released](#).

Zune Specific Information

The value of this property is always [ButtonState.Released](#).

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ButtonState RightButton { get; }
```

Property Value

State of the right mouse button.

See Also

Reference

[MouseState Structure](#)

[MouseState Members](#)

[Microsoft.Xna.Framework.Input Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

MouseState.ScrollWheelValue Property

Gets the cumulative mouse scroll wheel value since the game was started.

Xbox 360 Specific Information

The value of this property is always 0.

Zune Specific Information

The value of this property is always 0.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int ScrollWheelValue { get; }
```

Property Value

The scroll wheel value.

Remarks

Unlike standard Windows and WinForms mouse messages, which report a relative value for the scroll wheel, XNA reports the total scroll wheel value accumulated over the length of a game's execution. To process a wheel movement, you must compare the previous frame's wheel value to the current wheel value.

See Also

Reference

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

MouseState.X Property

Specifies the horizontal position of the mouse cursor.

Xbox 360 Specific Information

The value of this property is always 0.

Zune Specific Information

The value of this property is always 0.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int X { get; }
```

Property Value

Horizontal position of the mouse cursor in relation to the upper-left corner of the game window.

Remarks

If the mouse is to the left of the client area (the inside portion of the game window, excluding the borders), the returned coordinate is negative. If the mouse is to the right of the client area, the returned coordinate is greater than the window's client area width.

MouseState.Y Property

Specifies the vertical position of the mouse cursor.

Xbox 360 Specific Information

The value of this property is always 0.

Zune Specific Information

The value of this property is always 0.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Y { get; }
```

Property Value

Vertical position of the mouse cursor in relation to the upper-left corner of the game window.

Remarks

If the mouse is above the client area (the inside portion of the game window, excluding the borders), the returned coordinate is negative. If the mouse is below the client area, the returned coordinate is greater than the window's client area height.

TouchCollection Structure

Note

This structure is available only when developing for Zune.

Provides methods and properties for accessing state information for the touch screen of a Zune device.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public struct TouchCollection : IList<TouchLocation>, ICollection<TouchLocation>, IEnumerable<TouchLocation>, IEnumerableable
```

Remarks

This structure contains information on the current state of all touch locations detected by the touch device. This information consists of:

- Positions of up to 8 touch locations.
- Amount of pressure for each touch location.
- Previous position, if any, of the current touch locations.

TouchCollection Members

The following tables list the members exposed by the TouchCollection type.

Public Constructors

Name	Description
 TouchCollection	Initializes a new instance of the TouchCollection structure with a set of touch locations.

Public Properties

Name	Description
 Count	Gets the current number of touch locations for the touch screen.
 IsConnected	Indicates if the touch screen is available for use.
 IsReadOnly	Determines if the touch location array is read-only.
 Item	Gets or sets the information of the specified touch location.

Public Methods

Name	Description
 Add	Adds a TouchLocation to the collection.
 Clear	Removes all TouchLocation objects from the collection.
 Contains	Checks whether the current touch collection contains the specified touch location.
 CopyTo	Copies the touch location to the collection, at the specified index.
 Equals	(Inherited from Object .)
 FindById	Retrieves the touch location whose ID matches the specified ID.
 GetEnumerator	Returns an enumerator that iterates through the TouchCollection .
 GetType	(Inherited from Object .)
 IndexOf	Determines the index of a TouchLocation in the TouchCollection .
 Insert	Inserts a new TouchLocation into the TouchCollection .
 ReferenceEquals	(Inherited from Object .)
 Remove	Removes the specified TouchLocation from the TouchCollection .
 RemoveAt	Removes the TouchLocation item found at the specified location from the TouchCollection .

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

Name	Description
 System.Collections.IEnumerable.GetEnumerator	Returns an enumerator that iterates through the TouchCollection .

TouchCollection.Contains Method

Note

This method is available only when developing for Zune.

Checks whether the current touch collection contains the specified touch location.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Contains (  
    TouchLocation item  
)
```

Parameters

item

The touch location to be checked against the current collection.

Return Value

true if the item is present in the collection; otherwise **false**.

TouchCollection.CopyTo Method

Note

This method is available only when developing for Zune.

Copies the touch location to the collection, at the specified index.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void CopyTo (  
    TouchLocation[] array,  
    int arrayIndex  
)
```

Parameters

array

Array receiving the copied touch location.

arrayIndex

Target index of the collection.

TouchCollection.FindById Method

Note

This method is available only when developing for Zune.

Retrieves the touch location whose ID matches the specified ID.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool FindById (
    int id,
    out TouchLocation touchLocation
)
```

Parameters

id

ID of touch location sought.

touchLocation

[[OutAttribute](#)] Touch location item whose ID matches the specified ID.

Return Value

true if the item was found; otherwise **false**.

TouchCollection.IndexOf Method

Note

This method is available only when developing for Zune.

Determines the index of a [TouchLocation](#) in the [TouchCollection](#).

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int IndexOf (  
    TouchLocation item  
)
```

Parameters

item

[TouchLocation](#) to be located in the collection.

Return Value

The index of the specified [TouchLocation](#) if found; otherwise –1.

TouchLocation Structure

Note

This structure is available only when developing for Zune.

Provides methods and properties for interacting with a touch location on a touch screen device.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public struct TouchLocation : IEquatable<TouchLocation>
```

Remarks

The **TouchLocation** structure contains information, such as screen location, current state, and amount of pressure, for a registered touch location item. A collection of current touch locations is stored in the [TouchCollection](#) object of the touch screen device.

TouchLocation Members

The following tables list the members exposed by the TouchLocation type.

Public Constructors

Name	Description
 TouchLocation	Overloaded. Initializes a new instance of the TouchLocation structure.

Public Properties

Name	Description
 Id	Gets the ID of the touch location object.
 Position	Gets the position of the touch location object.
 Pressure	Gets the recorded pressure, in G-force (g), of the touch location.
 State	Gets the state of the touch location.

Public Methods

Name	Description
 Equals	Overloaded. Determines whether the current instance is equal to a specified object.
 GetHashCode	gets the hash code for this instance.
 GetType	(Inherited from Object .)
 Op_Equality	Determines whether two TouchLocation instances are equal.
 Op_Inequality	Determines whether two TouchLocation instances are not equal.
 ReferenceEquals	(Inherited from Object .)
 ToString	Gets a string representation of this object.
 TryGetPreviousLocation	Attempts to get the previous location for the touch location object.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

TouchLocation Constructor (Int32, TouchLocationState, Vector2, Single)

Note

This constructor is available only when developing for Zune.

Initializes a new instance of the **TouchLocation** structure with the specified values.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TouchLocation (  
    int id,  
    TouchLocationState state,  
    Vector2 position,  
    float pressure  
)
```

Parameters

id

ID of the new touch location.

state

State of the new touch location.

position

Position, in screen coordinates, of the new touch location.

pressure

Pressure value, measured in G-force (g), of the new touch location.

TouchLocation Constructor (Int32, TouchLocationState, Vector2, Single, TouchLocationState, Vector2, Single)

Note

This constructor is available only when developing for Zune.

Initializes a new instance of the **TouchLocation** structure with the specified values.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TouchLocation (  
    int id,  
    TouchLocationState state,  
    Vector2 position,  
    float pressure,  
    TouchLocationState previousState,  
    Vector2 previousPosition,  
    float previousPressure  
)
```

Parameters

id

ID of the new touch location.

state

State of the new touch location.

position

Position, in screen coordinates, of the new touch location.

pressure

Pressure value, measured in G-force (g), of the new touch location.

previousState

Previous state for the new touch location.

previousPosition

Previous position for the new touch location.

previousPressure

Previous pressure, in g, for the new touch location.

TouchLocation.Equals Method (Object)

Note

This method is available only when developing for Zune.

Determines whether the current instance is equal to the specified object.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

Object with which to make the comparison.

Return Value

true if the current instance is equal to the specified object; otherwise **false**.

TouchLocation.Equals Method (TouchLocation)

Note

This method is available only when developing for Zune.

Determines whether the current instance is equal to the specified touch location.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    TouchLocation other  
)
```

Parameters

other

Touch location with which to make the comparison.

Return Value

true if the current instance is equal to the specified touch location; otherwise **false**.

TouchLocation.op_Equality Method

Note

This method is available only when developing for Zune.

Determines whether two [TouchLocation](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    TouchLocation value1,  
    TouchLocation value2  
)
```

Parameters

value1

[TouchLocation](#) on the left side of the equal sign.

value2

[TouchLocation](#) on the right side of the equal sign.

Return Value

true if the [TouchLocation](#) instances are equal; otherwise **false**.

TouchLocation.op_Inequality Method

Note

This method is available only when developing for Zune.

Determines whether two [TouchLocation](#) instances are not equal.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    TouchLocation value1,  
    TouchLocation value2  
)
```

Parameters

value1

[TouchLocation](#) on the left side of the equal sign.

value2

[TouchLocation](#) on the right side of the equal sign.

Return Value

true if the [TouchLocation](#) instances are equal; otherwise **false**.

TouchLocationState Enumeration

Note

This enumeration is available only when developing for Zune.

Defines the possible states for a touch location.

Namespace: Microsoft.Xna.Framework.Input

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum TouchLocationState
```

Members

Member name	Description
Invalid	This touch location position is invalid. Typically, you will encounter this state when a new touch location attempts to get the previous state of itself.
Moved	This touch location position was updated or pressed at same position.
Pressed	This touch location position is new.
Released	This touch location position was released.

Microsoft.Xna.Framework.Media Namespace

Contains classes to enumerate, play, and view songs, albums, playlists, and pictures.

Classes

Name	Description
 Album	Provides access to an album in the media library.
 AlbumCollection	A collection of albums in the media library.
 Artist	Provides access to artist information in the media library.
 ArtistCollection	The collection of all artists in the media library.
 Genre	Provides access to genre information in the media library.
 GenreCollection	The collection of all genres in the media library.
 MediaLibrary	Provides access to songs, playlists, and pictures in the device's media library.
 MediaPlayer	Provides methods and properties to play, pause, resume, and stop songs. MediaPlayer also exposes shuffle, repeat, volume, play position, and visualization capabilities.
 MediaQueue	Provides methods and properties to access and control the queue of playing songs.
 MediaSource	Provides methods and properties to access the source or sources from which the media will be read.
 Picture	Provides access to a picture in the media library.
 PictureAlbum	Provides access to a picture album in the media library.
 PictureAlbumCollection	A collection of picture albums in the media library.
 PictureCollection	A collection of pictures in the media library.
 Playlist	Provides access to a playlist in the media library.
 PlaylistCollection	A collection of playlists in the media library.
 Song	Provides access to a song in the song library.
 SongCollection	A collection of songs in the song library.
 Video	Represents a video.
 VideoPlayer	Provides methods and properties to playback, pause, resume, and stop video. VideoPlayer also exposes repeat, volume, and play position information.
 VisualizationData	Encapsulates visualization (frequency and sample) data for the currently-playing song.

Enumerations

Name	Description
 MediaSourceType	Type of the media source.
 MediaState	Media playback state (playing, paused, or stopped).
 VideoSoundtrackType	Type of sounds in a video

Album Class

Provides access to an album in the media library.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class Album : IEquatable<Album>
```

Remarks

The [Album](#) class provides information about an album, including the album's [Name](#), [Artist](#), and [Songs](#).

You can obtain an **Album** object through the [AlbumCollection.Item](#) indexer and the [Song.Album](#) property.

See Also

Reference

Album Members

The following tables list the members exposed by the Album type.

Public Properties

	Name	Description
	Artist	Gets the Artist of the Album.
	Duration	Gets the duration of the Album.
	Genre	Gets the Genre of the Album.
	HasArt	Gets a value indicating whether the Album has associated album art.
	Name	Gets the name of the Album.
	Songs	Gets a SongCollection that contains the songs on the album.

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	Overloaded. Determines whether two instances of Album are equal.
	GetAlbumArt	Gets the album art as a texture.
	GetHashCode	Gets the hash code for this instance.
	GetThumbnail	Gets the album art thumbnail as a texture.
	GetType	(Inherited from Object .)
	Op_Equality	Determines whether the specified Album instances are equal.
	Op_Inequality	Determines whether the specified Album instances are not equal.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a String representation of this Album.

Protected Methods

	Name	Description
	Finalize	Releases unmanaged resources and performs other cleanup operations before the Album is reclaimed by garbage collection.
	MemberwiseClone	(Inherited from Object .)

	MemberwiseClone	(Inherited from Object .)

See Also

Reference

[Album Class](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Album.Dispose Method

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[Album Class](#)

[Album Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Album.Equals Method

Determines whether two instances of [Album](#) are equal.

Overload List

Name	Description
Album.Equals (Album)	Determines whether the specified Album is equal to this Album .
Album.Equals (Object)	Determines whether the specified Object is equal to this Album .
Album.Equals (Object, Object)	(Inherited from Object .)

See Also

Reference

[Album Class](#)

[Album Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Album.Equals Method (Album)

Determines whether the specified [Album](#) is equal to this **Album**.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    Album other  
)
```

Parameters

other

Album to compare with this instance.

Return Value

true if the objects are equal; **false** otherwise.

See Also

Reference

[Album Class](#)

[Album Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Album.Equals Method (Object)

Determines whether the specified [Object](#) is equal to this [Album](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

[Object](#) to compare with this instance.

Return Value

true if the objects are equal; **false** otherwise.

See Also

Reference

[Album Class](#)

[Album Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Album.Finalize Method

Releases unmanaged resources and performs other cleanup operations before the [Album](#) is reclaimed by garbage collection.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [FinalizeSystem.Object.Finalize](#). Application code should not call this method. The object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

For more information, see [Finalize Methods and Destructors, Cleaning Up Unmanaged Resources](#), and [Overriding the Finalize Method](#).

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Album.op_Equality Method

Determines whether the specified [Album](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    Album first,  
    Album second  
)
```

Parameters

first

Object to the left of the equality operator.

second

Object to the right of the equality operator.

Return Value

true if the objects are equal; **false** otherwise.

Album.op_Inequality Method

Determines whether the specified [Album](#) instances are not equal.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    Album first,  
    Album second  
)
```

Parameters

first

Object to the left of the inequality operator.

second

Object to the right of the inequality operator.

Return Value

true if the objects are not equal; **false** otherwise.

Album.ToString Method

Returns a [String](#) representation of this [Album](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override string ToString ()
```

Return Value

[String](#) representation of this object.

Album.Artist Property

Gets the [Artist](#) of the [Album](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Artist Artist { get; }
```

Property Value

[Artist](#) of this [Album](#).

See Also

Reference

[Album Class](#)

[Album Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Album.Duration Property

Gets the duration of the [Album](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TimeSpan Duration { get; }
```

Property Value

Duration of the album, as a [TimeSpan](#) structure.

Remarks

The duration is the total duration of all of the album's songs that are present on the device. This may be less than the duration attributed to the entire album.

AlbumCollection Class

A collection of albums in the media library.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class AlbumCollection : IEnumerable<Album>, IEnumerable
```

Remarks

The [AlbumCollection](#) class provides access to albums in the device's media library.

Use the [MediaLibrary.Albums](#) property to obtain a collection of all albums in the media library, the [Artist.Albums](#) property to obtain a collection of albums associated with a particular artist, and the [Genre.Albums](#) property to obtain a collection of albums associated with a particular genre.

The **AlbumCollection** does not immediately instantiate instances of all albums in the collection. Instead, individual [Album](#) objects are created each time an album is accessed through the collection's [Item](#) indexer. See the [Remarks](#) section of [Item](#) for the resource implications of maintaining references to multiple [Album](#) objects.

AlbumCollection Members

The following tables list the members exposed by the AlbumCollection type.

Public Properties

	Name	Description
	Count	Gets the number of Album objects in the AlbumCollection.
	Item	Gets the Album at the specified index in the AlbumCollection.

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
	GetEnumerator	Returns an enumerator that iterates through the AlbumCollection.
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	Releases unmanaged resources and performs other cleanup operations before garbage collection reclaims the AlbumCollection.
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	System.Collections.IEnumerable.GetEnumerator	Returns an enumerator that iterates through the collection.

Reference

[AlbumCollection Class](#)

[Microsoft.Xna.Framework.Media Namespace](#)

AlbumCollection.Dispose Method

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[AlbumCollection Class](#)

[AlbumCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AlbumCollection.Finalize Method

Releases unmanaged resources and performs other cleanup operations before garbage collection reclaims the [AlbumCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [FinalizeSystem.Object.Finalize](#). Application code should not call this method. The object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

For more information, see [Finalize Methods and Destructors, Cleaning Up Unmanaged Resources](#), and [Overriding the Finalize Method](#).

See Also

Reference

[AlbumCollection Class](#)

[AlbumCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AlbumCollection.GetEnumerator Method

Returns an enumerator that iterates through the [AlbumCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IEnumerator<Album> GetEnumerator ()
```

Return Value

[IEnumerator](#) for the **AlbumCollection**.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until **MoveNext** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. You cannot set **Current** to the first element of the collection again; you must create a new enumerator instance instead.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

[AlbumCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

System.Collections.IEnumerable.GetEnumerator Method

Returns an enumerator that iterates through the collection.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private IEnumerator System.Collections.IEnumerable.GetEnumerator ()
```

Return Value

[IEnumerator](#) that iterates through the collection.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. [Reset](#) also brings the enumerator back to this position. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until either **MoveNext** or **Reset** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. To set **Current** to the first element of the collection again, you can call **Reset** followed by **MoveNext**.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

[AlbumCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AlbumCollection.Item Property

Gets the [Album](#) at the specified index in the [AlbumCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Album this [
    int index
] { get; }
```

Property Value

A new [Album](#) representing the album at the specified index in this **AlbumCollection**.

Remarks

Each call returns a new [Album](#) instance.

Album resources such as art and thumbnails are cached in each **Album** instance. Retrieving and maintaining references to multiple instances of the same album, and accessing art or thumbnails on each of those instances, creates multiple copies of the art or thumbnails. Because large numbers of album art textures can consume considerable memory, it is not advisable to hold a large number of **Album** objects on which [GetAlbumArt](#) has been called.

ArtistCollection.GetEnumerator Method

Returns an enumerator that iterates through the [ArtistCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IEnumerator<Artist> GetEnumerator ()
```

Return Value

[IEnumerator](#) for the **ArtistCollection**.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until **MoveNext** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. You cannot set **Current** to the first element of the collection again; you must create a new enumerator instance instead.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

System.Collections.IEnumerable.GetEnumerator Method

Returns an enumerator that iterates through the collection.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private IEnumerator System.Collections.IEnumerable.GetEnumerator ()
```

Return Value

[IEnumerator](#) that iterates through the collection.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. [Reset](#) also brings the enumerator back to this position. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until either **MoveNext** or **Reset** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. To set **Current** to the first element of the collection again, you can call **Reset** followed by **MoveNext**.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

GenreCollection.GetEnumerator Method

Returns an enumerator that iterates through the [GenreCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IEnumerator<Genre> GetEnumerator ()
```

Return Value

[IEnumerator](#) for the **GenreCollection**.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until **MoveNext** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. You cannot set **Current** to the first element of the collection again; you must create a new enumerator instance instead.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

MediaLibrary Class

Provides access to songs, playlists, and pictures in the device's media library.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class MediaLibrary
```

Remarks

[MediaLibrary](#) provides the following properties that return media collections: [Albums](#), [Artists](#), [Genres](#), [Pictures](#), [Playlists](#), and [Songs](#). Each property returns a collection object that can be enumerated and indexed. The collection object represents all media of that type in the device's media library.

The media collections do not retrieve or instantiate all media objects immediately. Instead, when needed, you can use the collections later to retrieve individual media objects, such as [Song](#) and [Artist](#) objects.

On Windows, **MediaLibrary** cannot find any songs unless the Windows Media Player previously found songs on the system. That means that Windows Media Player must first search the system for music before any songs can be accessed through **MediaLibrary**.

Example

The following sample fragment demonstrates how to use **MediaLibrary** to retrieve and play a song.

C#

```
using System;
using Microsoft.Xna.Framework;
using Microsoft.Xna.Framework.Input;
using Microsoft.Xna.Framework.Media;

namespace ZuneSimpleSongPlay
{
    static class Program
    {
        static void Main(string[] args)
        {
            MediaLibrary library = new MediaLibrary();
            SongCollection songs = library.Songs;
            Song song = songs[0];
            MediaPlayer.Play(song);

            while (!GamePad.GetState(PlayerIndex.One).IsButtonDown(Buttons.Back))
            {
                ;
            }
        }
    }
}
```

Note

You may get an exception when you try to play DRM protected music.

Overload List

Name	Description
MediaLibrary ()	Initializes a new instance of the MediaLibrary class.
MediaLibrary (MediaSource)	Initializes a new instance of the MediaLibrary class, using a specific media source to create the new media library.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

MediaLibrary Constructor (MediaSource)

Initializes a new instance of the [MediaLibrary](#) class, using a specific media source to create the new media library.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public MediaLibrary (  
    MediaSource mediaSource  
)
```

Parameters

mediaSource

A media source that will be the source for the media library.

Example

The following example demonstrates creating a new [MediaLibrary](#) class using a [MediaSource](#).

C#

```
GraphicsDevice.Clear(Color.CornflowerBlue);  
Vector2 pos = Vector2.Zero;  
SpriteFont font = Content.Load<SpriteFont>("Font");  
  
spriteBatch.Begin();  
spriteBatch.DrawString(font, "media library stats:",  
    pos, Color.White);  
  
ICollection<MediaSource> mediaSources =  
    MediaSource.GetAvailableMediaSources();  
foreach (MediaSource source in mediaSources)  
{  
    MediaLibrary ml = new MediaLibrary(source);  
  
    // display some data about this media library  
    pos.Y += font.LineSpacing;  
    spriteBatch.DrawString(font, "Album count: " + ml.Albums.Count,  
        pos, Color.White);  
}  
  
spriteBatch.End();
```

MediaLibrary Methods

Public Methods

	Name	Description
	Dispose	Releases the resources used by the MediaLibrary .
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	Releases unmanaged resources and performs other cleanup operations before the MediaLibrary is reclaimed by garbage collection.
	MemberwiseClone	(Inherited from Object .)

See Also

Reference

[MediaLibrary Class](#)

[Microsoft.Xna.Framework.Media Namespace](#)

MediaLibrary.Dispose Method

Releases the resources used by the [MediaLibrary](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

Call **Dispose** only when you are finished using the **MediaLibrary**. The **Dispose** method leaves the **MediaLibrary** in an unusable state. After calling **Dispose**, you must release all references to the **MediaLibrary** in order for the garbage collector to reclaim the memory that the **MediaLibrary** was occupying. For more information, see [Cleaning Up Unmanaged Resources](#) and [Implementing a Dispose Method](#).

See Also

Reference

MediaLibrary.Finalize Method

Releases unmanaged resources and performs other cleanup operations before the [MediaLibrary](#) is reclaimed by garbage collection.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [FinalizeSystem.Object.Finalize](#). Application code should not call this method. The object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

For more information, see [Finalize Methods and Destructors, Cleaning Up Unmanaged Resources](#), and [Overriding the Finalize Method](#).

MediaPlayer Class

Provides methods and properties to play, pause, resume, and stop songs. [MediaPlayer](#) also exposes shuffle, repeat, volume, play position, and visualization capabilities.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static class MediaPlayer
```

Remarks

MediaPlayer provides methods and properties for playing songs in the media library.

To control song playback, use the [Play](#), [Pause](#), [Stop](#), and [Resume](#) methods. The [MoveNext](#) and [MovePrevious](#) methods move to the next or previous song in the queue. They operate as if the queue was circular. That is, [MoveNext](#), when the last song is playing, moves to the first song. [MovePrevious](#), when the first song is playing, moves to the last song.

To get and set playback options, use the [IsMuted](#), [IsRepeating](#), [IsShuffled](#), [PlayPosition](#), and [Volume](#) properties.

To obtain visualization data for the currently playing song, call [GetVisualizationData](#).

MediaPlayer is a static class, so you do not have to use [new](#) to instantiate an instance of the class. Instead, call methods and properties directly on the class.

MediaPlayer Members

The following tables list the members exposed by the MediaPlayer type.

Public Properties

	Name	Description
	GameHasControl	Determines whether the game has control of the background music.
	IsMuted	Gets or set the muted setting for the media player.
	IsRepeating	Gets or sets the repeat setting for the media player.
	IsShuffled	Gets or sets the shuffle setting for the media player.
	IsVisualizationEnabled	Gets or sets the visualization enabled setting for the media player.
	PlayPosition	Gets the play position within the currently playing song.
	Queue	Gets the media playback queue, MediaQueue .
	State	Gets the media playback state, MediaState .
	Volume	Gets or sets the media player volume.

Public Methods

	Name	Description
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	 GetVisualizationData	Retrieves visualization (frequency and sample) data for the currently-playing song.
	 MoveNext	Moves to the next song in the queue of playing songs.
	 MovePrevious	Moves to the previous song in the queue of playing songs.
	 Pause	Pauses the currently playing song.
	 Play	Overloaded. Plays a song or collection of songs.
	ReferenceEquals	(Inherited from Object .)
	 Resume	Resumes a paused song.
	 Stop	Stops playing a song.
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

Public Events

	Name	Description
	 ActiveSongChanged	Raised when the active song changes due to active playback or due to explicit calls to the MoveNext or MovePrevious methods.
	 MediaStateChanged	Raised when the media player play state changes.

MediaPlayer.GetVisualizationData Method

Retrieves visualization (frequency and sample) data for the currently-playing song.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void GetVisualizationData (
    VisualizationData visualizationData
)
```

Parameters

visualizationData

Visualization (frequency and sample) data for the currently playing song.

Remarks

Visualization data can be used to create *visualizers*, which are graphical representations of sound. For example, a simple visualizer might be an equalizer spectrum display that shows the current power level for each frequency band.

The frequency data is a collection of float values. Each element corresponds to a frequency band, ranging from 20Hz to 20KHz. In the collection, the distribution of bands from 20Hz to 20KHz is logarithmic, not linear. This means that elements at the lower end of the spectrum represent a smaller frequency range than those at the upper end of the spectrum.

Each value in the frequency collection is a normalized float value from 0.0f to 1.0f, and is the logarithmic scaled power level for that frequency band. Frequency is perceived as pitch.

Information returned from the **GetVisualizationData** method can determine if a sound is more of a higher pitch, or more of a lower pitch. This information can be useful when determining how the sounds might drive game play.

The Complete Sample

The code in the topic shows you the technique. You can download a complete code sample for this topic, including full source code and any additional supporting files required by the sample.

[Download Spectrum.zip](#).

Example

The following example demonstrates using frequency and sample data to display the frequency power spectrum and waveform of the currently playing song. The program display is in landscape mode.

C#

```
    if (MediaPlayer.State == MediaState.Playing)
    {
        MediaPlayer.GetVisualizationData(visData);
    }
    ...
    spriteBatch.Begin();
    for (int y = 0; y < arraySize; y++)
    {
        // Draw frequency spectrum display.
        spriteBatch.Draw(
            line,
            new Vector2((float)((-1.0 + visData.Frequencies[y]) * width + 1), y),
            Color.White);

        // Draw waveform from samples.
        spriteBatch.Draw(
            line,
            new Vector2((float)(visData.Samples[y] * width / 4 + width * 3 / 4), y),
            sampleLine,
            Color.White);
    }
```

```
spriteBatch.End();
```

MediaPlayer.MoveNext Method

Moves to the next song in the queue of playing songs.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void MoveNext ()
```

Remarks

If the current song is the last song in the queue, **MoveNext** moves to the first song in the queue.

MoveNext does not alter the current media state (playing, paused, or stopped).

See Also

MediaPlayer.MovePrevious Method

Moves to the previous song in the queue of playing songs.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void MovePrevious ()
```

Remarks

If the current song is the first song in the queue, **MovePrevious** moves to the last song in the queue.

MovePrevious does not alter the current media state (playing, paused, or stopped).

MediaPlayer.Play Method (Song)

Plays a [Song](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Play (  
    Song song  
)
```

Parameters

song

[Song](#) to play.

Exceptions

Exception type	Condition
ArgumentNullException	<i>song</i> is null .

Remarks

Play clears the current playback queue, and then queues up the specified song for playback. Playback starts immediately at the beginning of the song.

MediaPlayer.Play Method (SongCollection)

Plays a [SongCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Play (  
    SongCollection songs  
)
```

Parameters

songs

[SongCollection](#) to play.

Exceptions

Exception type	Condition
ArgumentException	Play cannot be used when the song collection count is zero.
ArgumentNullException	<i>songs</i> is null .

Remarks

Play clears the current playback queue, and then queues up the specified song collection for playback. It begins with the first song in the collection. Playback starts immediately at the beginning of the song.

Plays a [SongCollection](#), starting with the [Song](#) at the specified index.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static void Play (  
    SongCollection songs,  
    int index  
)
```

Parameters

songs

[SongCollection](#) to play.

index

Index of the song in the collection at which playback should begin.

Exceptions

Exception type	Condition
ArgumentException	Play cannot be used when the song collection count is zero.
ArgumentNullException	<i>songs</i> is null .
ArgumentOutOfRangeException	<i>index</i> must be valid for the current collection.

Remarks

Play clears the current playback queue, and then queues up the specified song collection for playback. It begins with the song at the specified index in the collection. Playback starts immediately at the beginning of the song.

MediaPlayer.GameHasControl Property

Determines whether the game has control of the background music.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool GameHasControl { get; }
```

Property Value

true if the game has control of the background music; otherwise, **false**.

Remarks

A gamer can play his or her own music as the background to your game by using the Xbox 360 dashboard. If the game is currently playing custom background music (specified by the gamer using the Xbox 360 dashboard), calls to [Play](#), [Stop](#), [Pause](#), [Resume](#), [MoveNext](#), and [MovePrevious](#) have no effect.

MediaPlayer.Volume Property

Gets or sets the media player volume.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static float Volume { get; set; }
```

Property Value

Media player volume, from 0.0f (silence) to 1.0f (full volume relative to the current device volume).

Remarks

Volume adjustment is based on a decibel, not multiplicative, scale. For example, when the device volume is half of maximum (about **7** in the Zune user interface), setting **Volume** to 0.6f or less is silent or nearly so, not volume **4** as you would expect from a multiplicative adjustment.

Setting **Volume** to 0.0 subtracts 96 dB from the volume. Setting **Volume** to 1.0 subtracts 0 dB from the volume. Values in between 0.0f and 1.0f subtract dB from the volume proportionally.

MediaQueue Class

Provides methods and properties to access and control the queue of playing songs.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class MediaQueue
```

Remarks

[MediaQueue](#) provides properties and methods that query and control the queue of playing songs. The [ActiveSong](#) property returns the currently playing [Song](#). [ActiveSongIndex](#) gets or set the queue index of the currently playing song. [Count](#) returns the number of songs in the queue. The [Item](#) indexer returns the [Song](#) at the specified index in the queue.

MediaQueue is a read-only queue of songs. With **MediaQueue**, you can control which song is playing in the queue, but you cannot add or remove songs from the queue. Either [MediaPlayer.Play](#) or the songs already queued up when the game starts determine the songs that are in the queue of playing songs.

Note

All of the collections, playlists, and queues returned by methods and properties in the [Microsoft.Xna.Framework.Media](#) name space are immutable. You cannot add or remove objects from those collections or playlists. To create a custom 'playlist' of songs, games must maintain their own list of songs to play, and play those songs one at a time by calling [MediaPlayer.Play](#).

MediaQueue.ActiveSong Property

Gets the current [Song](#) in the queue of playing songs.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Song ActiveSong { get; }
```

Property Value

Current [Song](#) in the queue of playing songs.

Remarks

Retrieving this property is expensive on Xbox, so it should not be called every frame.

MediaQueue.ActiveSongIndex Property

Gets or sets the index of the current (active) song in the queue of playing songs.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int ActiveSongIndex { get; set; }
```

Property Value

Index of the current song in the queue of playing songs.

Remarks

Changing the active song index does not alter the current media state (playing, paused, or stopped).

MediaQueue.Count Property

Gets the count of songs in the [MediaQueue](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Count { get; }
```

Property Value

Count of songs in this **MediaQueue**.

MediaQueue.Item Property

Gets the [Song](#) at the specified index in the [MediaQueue](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Song this [
    int index
] { get; }
```

Property Value

A new [Song](#) representing the song at the specified index in this **MediaQueue**.

Remarks

Each call returns a new [Song](#) instance.

MediaSource Class

Provides methods and properties to access the source or sources from which the media will be read.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class MediaSource
```

Remarks

[MediaSource](#) provides access to the source or sources from which the media will be read. A source can be either the local device, or a device connected through Windows Media Connect. On Windows and Zune, the only available **MediaSource** is the local device. On Xbox 360, a **MediaSource** can either be the local device or a device connected through Windows Media Connect. Windows Media Connect is software that lets you connect your Xbox 360 console to a computer running Microsoft Windows. Connecting this way enables you to view media on the connected computer in the Xbox 360 dashboard.

[MediaSource Class](#)

[Microsoft.Xna.Framework.Media Namespace](#)

MediaSource.GetAvailableMediaSources Method

Gets the available media sources.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IList<MediaSource> GetAvailableMediaSources ()
```

Return Value

The available media sources.

Remarks Gets the available media sources with which a media library can be constructed. On Zune and Windows, this method will always return a single media source: the local device. On Xbox 360, this method can return multiple sources, depending on how many computers are connected to the Xbox 360 through Windows Media Connect.

Example

The following example demonstrates how the **GetAvailableMediaSources** method gets and displays the current media sources.

C#

```
GraphicsDevice.Clear(Color.CornflowerBlue);
Vector2 pos = Vector2.Zero;
SpriteFont font = Content.Load<SpriteFont>("Font");

spriteBatch.Begin();
spriteBatch.DrawString(font, "media source(s):", pos, Color.White);

ICollection<MediaSource> mediaSources =
    MediaSource.GetAvailableMediaSources();
foreach (MediaSource source in mediaSources)
{
    pos.Y += font.LineSpacing;
    spriteBatch.DrawString(font, source.Name, pos, Color.White);
}

spriteBatch.End();
```

MediaSourceType Enumeration

Type of the media source.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum MediaSourceType
```

Members

Member name	Description
LocalDevice	A local device.
WindowsMediaConnect	A Windows Media Connect device.

Remarks

Indicates the type of the current media source. The type can be either a local device, or a device connected through Windows Media Connect. On Windows and Zune, the only available media source type is the local device. On Xbox 360, a media source can be either the local device or a device connected through Windows Media Connect.

The [MediaSource.MediaSourceType](#) property returns a **MediaSourceType** value.

MediaState Enumeration

Media playback state (playing, paused, or stopped).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum MediaState
```

Members

Member name	Description
Paused	Media playback is paused.
Playing	Media is currently playing.
Stopped	Media playback is stopped.

Remarks

The [MediaPlayer.State](#) property returns a **MediaState** value.

Picture Class

Provides access to a picture in the media library.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class Picture : IEquatable<Picture>
```

Remarks

The [Picture](#) class provides information about a picture, including the picture's graphic ([GetTexture](#)), thumbnail ([GetThumbnail](#)), [Name](#), [Date](#), and [Height](#) and [Width](#).

You can obtain a **Picture** object through the [PictureCollection.Item](#) indexer.

Picture Members

The following tables list the members exposed by the Picture type.

Public Properties

	Name	Description
	Album	Gets the picture album that contains the picture.
	Date	Gets the picture's date.
	Height	Gets the picture's height.
	Name	Gets the name of the Picture.
	Width	Gets the picture's width.

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	Overloaded. Determines whether two instances of Picture are equal.
	GetHashCode	Gets the hash code for this instance.
	GetTexture	Gets the picture as a texture.
	GetThumbnail	Gets a thumbnail of the picture as a texture.
	GetType	(Inherited from Object .)
	op_Equality	Determines whether the specified Picture instances are equal.
	op_Inequality	Determines whether the specified Picture instances are not equal.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a String representation of the Picture.

Protected Methods

	Name	Description
	Finalize	Releases unmanaged resources and performs other cleanup operations before the Picture is reclaimed by garbage collection.
	MemberwiseClone	(Inherited from Object .)

Picture.Equals Method (Object)

Determines whether the specified [Object](#) is equal to this [Picture](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

[Object](#) to compare with this instance.

Return Value

true if the objects are equal; **false** otherwise.

See Also

Reference

[Picture Class](#)

[Picture Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Picture.Equals Method (Picture)

Determines whether the specified [Picture](#) is equal to this **Picture**.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    Picture other  
)
```

Parameters

other

Picture to compare with this instance.

Return Value

true if the objects are equal; **false** otherwise.

Gets the picture as a texture.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Texture2D GetTexture (  
    IServiceProvider serviceProvider  
)
```

Parameters

serviceProvider

Game service provider, obtained from the [Game.Services](#) property.

Return Value

Texture with the graphical content of the picture.

Remarks

[GameServiceContainer Class](#) implements [IServiceProvider](#), so you can pass the value of the [Game.Services](#) property as the *serviceProvider* parameter.

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	Overloaded. Determines whether two instances of PictureAlbum are equal.
	GetHashCode	Gets the hash code for this instance.
	GetType	(Inherited from Object .)
	 Op_Equality	Determines whether the specified PictureAlbum instances are equal.
	 Op_Inequality	Determines whether the specified PictureAlbum instances are not equal.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a String representation of the PictureAlbum.

Protected Methods

	Name	Description
	Finalize	Releases unmanaged resources and performs other cleanup operations before the PictureAlbum is reclaimed by garbage collection.
	MemberwiseClone	(Inherited from Object .)

PictureAlbum.Equals Method (Object)

Determines whether the specified [Object](#) is equal to this [PictureAlbum](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

[Object](#) to compare with this instance.

Return Value

true if the objects are equal; **false** otherwise.

See Also

Reference

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

PictureAlbum.Equals Method (PictureAlbum)

Determines whether the specified [PictureAlbum](#) is equal to this **PictureAlbum**.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool Equals (  
    PictureAlbum other  
)
```

Parameters

other

PictureAlbum to compare with this instance.

Return Value

true if the objects are equal; **false** otherwise.

PictureAlbum.Finalize Method

Releases unmanaged resources and performs other cleanup operations before the [PictureAlbum](#) is reclaimed by garbage collection.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [FinalizeSystem.Object.Finalize](#). Application code should not call this method. The object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

For more information, see [Finalize Methods and Destructors, Cleaning Up Unmanaged Resources](#), and [Overriding the Finalize Method](#).

Determines whether the specified [PictureAlbum](#) instances are equal.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Equality (  
    PictureAlbum first,  
    PictureAlbum second  
)
```

Parameters

first

Object to the left of the equality operator.

second

Object to the right of the equality operator.

Return Value

true if the objects are equal; **false** otherwise.

Determines whether the specified [PictureAlbum](#) instances are not equal.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static bool op_Inequality (  
    PictureAlbum first,  
    PictureAlbum second  
)
```

Parameters

first

Object to the left of the inequality operator.

second

Object to the right of the inequality operator.

Return Value

true if the objects are not equal; **false** otherwise.

PictureAlbum.Albums Property

Gets the collection of picture albums that are contained within the picture album (that is, picture albums that are children of the picture album).

Windows Specific Information

Picture albums are not supported. This property always returns an empty collection.

Xbox 360 Specific Information

Picture albums are not supported. This property always returns an empty collection.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public PictureAlbumCollection Albums { get; }
```

Property Value

[PictureAlbumCollection](#) that contains the picture albums that are children of this picture album.

Remarks

A [PictureAlbum](#) can contain pictures as well as other picture albums. This property returns the collection of picture albums that are contained within this picture album, if any. If this picture album has no child picture albums, an empty collection is returned.

PictureAlbumCollection Class

A collection of picture albums in the media library.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class PictureAlbumCollection : IEnumerable<PictureAlbum>, IEnumerable
```

Remarks

The [PictureAlbumCollection](#) class provides access to picture albums in the device's media library.

Use the [PictureAlbum.Albums](#) property to obtain a collection of picture albums that are contained within (that is, children of) a particular picture album. Use the [MediaLibrary.RootPictureAlbum](#) property to obtain the root (top-most) picture album, which contains both pictures and other picture albums.

The **PictureAlbumCollection** does not immediately instantiate instances of all picture albums in the collection. Instead, individual [PictureAlbum](#) objects are created each time a picture album is accessed through the collection's [Item](#) indexer.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [FinalizeSystem.Object.Finalize](#). Application code should not call this method. The object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

For more information, see [Finalize Methods and Destructors, Cleaning Up Unmanaged Resources](#), and [Overriding the Finalize Method](#).

See Also

Reference

[PictureAlbumCollection Class](#)

[PictureAlbumCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

PictureAlbumCollection.GetEnumerator Method

Returns an enumerator that iterates through the [PictureAlbumCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IEnumerator<PictureAlbum> GetEnumerator ()
```

Return Value

[IEnumerator](#) for the **PictureAlbumCollection**.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until **MoveNext** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. You cannot set **Current** to the first element of the collection again; you must create a new enumerator instance instead.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

System.Collections.IEnumerable.GetEnumerator Method

Returns an enumerator that iterates through the collection.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private IEnumerator System.Collections.IEnumerable.GetEnumerator ()
```

Return Value

[IEnumerator](#) that iterates through the collection.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. [Reset](#) also brings the enumerator back to this position. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until either **MoveNext** or **Reset** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. To set **Current** to the first element of the collection again, you can call **Reset** followed by **MoveNext**.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

PictureAlbumCollection.Count Property

Gets the number of [PictureAlbum](#) objects in the [PictureAlbumCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Count { get; }
```

Property Value

Number of [PictureAlbum](#) objects in this **PictureAlbumCollection**.

See Also

Reference

[PictureAlbumCollection Class](#)

[PictureAlbumCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

PictureAlbumCollection.Item Property

Gets the [PictureAlbum](#) at the specified index in the [PictureAlbumCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public PictureAlbum this [
    int index
] { get; }
```

Property Value

A new [PictureAlbum](#) representing the picture album at the specified index in this **PictureAlbumCollection**.

Remarks

Each call returns a new [PictureAlbum](#) instance.

PictureAlbum resources such as the picture collection and children picture albums collection are cached in each **PictureAlbum** instance. Retrieving and maintaining references to multiple instances of the same picture album, and then accessing the picture collection ([PictureAlbum.Pictures](#)) or children picture albums collection ([PictureAlbum.Albums](#)) on each of those instances, creates multiple copies of the resources.

PictureCollection.Count Property

Gets the number of [Picture](#) objects in the [PictureCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Count { get; }
```

Property Value

Number of [Picture](#) objects in this **PictureCollection**.

See Also

Reference

[PictureCollection Class](#)

[PictureCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

PictureCollection.Item Property

Gets the [Picture](#) at the specified index in the [PictureCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Picture this [
    int index
] { get; }
```

Property Value

A new [Picture](#) representing the picture at the specified index in this **PictureCollection**.

Remarks

Each call returns a new [Picture](#) instance.

Picture resources such as the picture texture and thumbnail are cached in each **Picture** instance. Retrieving and maintaining references to multiple instances of the same picture, and then accessing the picture texture or thumbnail on each of those instances, creates multiple copies of the texture or thumbnail. Large numbers of picture textures can consume considerable memory, so it is not advisable to hold a large number of **Picture** objects on which [GetTexture](#) has been called.

Playlist Class

Provides access to a playlist in the media library.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class Playlist : IEquatable<Playlist>
```

Remarks

The [Playlist](#) class provides information about a playlist, including the playlist's [Name](#), [Duration](#), and [Songs](#).

Obtain **Playlist** objects through the [PlaylistCollection.Item](#) indexer.

Playlist Members

The following tables list the members exposed by the Playlist type.

Public Properties

	Name	Description
	Duration	Gets the duration of the Playlist.
	Name	Gets the name of the Playlist.
	Songs	Gets a SongCollection that contains the songs in the playlist.

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	Overloaded. Determines whether two instances of Playlist are equal.
	GetHashCode	Gets the hash code for this instance.
	GetType	(Inherited from Object .)
 	op_Equality	Determines whether the specified Playlist instances are equal.
 	op_Inequality	Determines whether the specified Playlist instances are not equal.
	ReferenceEquals	(Inherited from Object .)
	ToString	Returns a String representation of the Playlist.

Protected Methods

	Name	Description
	Finalize	Releases unmanaged resources and performs other cleanup operations before the Playlist is reclaimed by garbage collection.
	MemberwiseClone	(Inherited from Object .)

Playlist.Equals Method (Object)

Determines whether the specified [Object](#) is equal to this [Playlist](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override bool Equals (  
    Object obj  
)
```

Parameters

obj

[Object](#) to compare with this instance.

Return Value

true if the objects are equal; **false** otherwise.

See Also

PlaylistCollection Class

A collection of playlists in the media library.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class PlaylistCollection : IEnumerable<Playlist>, IEnumerable
```

Remarks

The [PlaylistCollection](#) class provides access to playlists in the device's media library.

Use the [MediaLibrary.Playlists](#) property to obtain a collection of all playlists in the media library.

The **PlaylistCollection** does not immediately instantiate instances of all playlists in the collection. Instead, individual [Playlist](#) objects are created each time a playlist is accessed through the collection's [Item](#) indexer.

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [FinalizeSystem.Object.Finalize](#). Application code should not call this method. The object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

For more information, see [Finalize Methods and Destructors, Cleaning Up Unmanaged Resources](#), and [Overriding the Finalize Method](#).

See Also

Reference

[PlaylistCollection Class](#)

[PlaylistCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

PlaylistCollection.GetEnumerator Method

Returns an enumerator that iterates through the [PlaylistCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IEnumerator<Playlist> GetEnumerator ()
```

Return Value

[IEnumerator](#) for the **PlaylistCollection**.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until **MoveNext** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. You cannot set **Current** to the first element of the collection again; you must create a new enumerator instance instead.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

Reference

[PlaylistCollection Class](#)

[PlaylistCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

System.Collections.IEnumerable.GetEnumerator Method

Returns an enumerator that iterates through the collection.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private IEnumerator System.Collections.IEnumerable.GetEnumerator ()
```

Return Value

[IEnumerator](#) that iterates through the collection.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. [Reset](#) also brings the enumerator back to this position. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until either **MoveNext** or **Reset** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. To set **Current** to the first element of the collection again, you can call **Reset** followed by **MoveNext**.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

PlaylistCollection.Count Property

Gets the number of [Playlist](#) objects in the [PlaylistCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Count { get; }
```

Property Value

Number of [Playlist](#) objects in this **PlaylistCollection**.

See Also

Reference

[PlaylistCollection Class](#)

[PlaylistCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

PlaylistCollection.Item Property

Gets the [Playlist](#) at the specified index in the [PlaylistCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Playlist this [
    int index
] { get; }
```

Property Value

A new [Playlist](#) representing the playlist at the specified index in this **PlaylistCollection**.

Remarks

Each call returns a new [Playlist](#) instance.

The [SongCollection](#) returned by [Songs](#) is allocated and cached by each **Playlist** instance. Retrieving and maintaining references to multiple instances of the same playlist, and then accessing the song collection on each of those instances, creates multiple copies of the song collection.

Gets the duration of the [Song](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TimeSpan Duration { get; }
```

Property Value

Duration of the song, as a [TimeSpan](#) structure.

See Also

Reference

[Song Class](#)

[Song Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Song.Genre Property

Gets the [Genre](#) of the [Song](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Genre Genre { get; }
```

Property Value

[Genre](#) of this [Song](#).

See Also

Reference

[Song Class](#)

[Song Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Song.IsProtected Property

Gets a value that indicates whether the song is DRM protected content.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsProtected { get; }
```

Property Value

true if this [Song](#) is DRM protected; **false** otherwise.

See Also

Reference

[Song Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Song.IsRated Property

Gets a value that indicates whether the song has been rated by the user.

Xbox 360 Specific Information

Song information is not supported. This property is always set to **false**.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsRated { get; }
```

Property Value

true if this [Song](#) has been rated by the user; **false** otherwise.

See Also

Reference

[Song.Rating Property](#)

Song.Name Property

Gets the name of the [Song](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Name { get; }
```

Property Value

The name of this **Song**.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Song.PlayCount Property

Gets the song play count.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int PlayCount { get; }
```

Property Value

Song play count.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

Song.Rating Property

Gets the user's rating for the [Song](#).

Xbox 360 Specific Information

Album information is not supported. This value is always 0.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int Rating { get; }
```

Property Value

User's rating for this **Song**, or 0 if the song is unrated.

Ratings range from 1 (dislike the most) to 10 (like the most).

When the user rates songs using the Zune device or Zune software, the rating is set to 8 for liked songs (shown as a heart) and to 2 or 3 for disliked songs (shown as a broken heart).

Song.TrackNumber Property

Gets the track number of the song on the song's [Album](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int TrackNumber { get; }
```

Property Value

Track number of this [Song](#) on the song's [Album](#).

SongCollection Class

A collection of songs in the song library.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class SongCollection : IEnumerable<Song>, IEnumerable
```

Remarks

The [SongCollection](#) class provides access to songs in the device's song library.

Use the [MediaLibrary.Songs](#) property to obtain the following collections:

- All songs in the media library.
- Songs on a particular album.
- Songs associated with a particular artist.
- Songs associated with a particular genre.

The **SongCollection** does not immediately instantiate instances of all songs in the collection. Instead, individual [Song](#) objects are created each time a user accesses a song through the collection's [Item](#) indexer. See the [Remarks](#) section of [Item](#) for the resource implications of maintaining references to multiple [Song](#) objects.

Note

All of the collections, playlists, and queues returned by methods and properties in the [Microsoft.Xna.Framework.Media](#) name space are immutable. You cannot add or remove objects from those collections or playlists. To create a custom 'playlist' of songs, games must maintain their own list of songs to play, and play those songs one at a time by calling [MediaPlayer.Play](#).

SongCollection Members

The following tables list the members exposed by the SongCollection type.

Public Properties

	Name	Description
	Count	Gets the number of Song objects in the SongCollection.
	Item	Gets the Song at the specified index in the SongCollection.

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
	GetEnumerator	Returns an enumerator that iterates through the SongCollection.
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	Releases unmanaged resources and performs other cleanup operations before garbage collection reclaims the SongCollection.
	MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

	Name	Description
	System.Collections.IEnumerable.GetEnumerator	Returns an enumerator that iterates through the collection.

Reference

[SongCollection Class](#)

[Microsoft.Xna.Framework.Media Namespace](#)

SongCollection.Dispose Method

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

See Also

Reference

[SongCollection Class](#)

[SongCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

SongCollection.Finalize Method

Releases unmanaged resources and performs other cleanup operations before garbage collection reclaims the [SongCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [FinalizeSystem.Object.Finalize](#). Application code should not call this method. The object's **Finalize** method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

For more information, see [Finalize Methods and Destructors, Cleaning Up Unmanaged Resources](#), and [Overriding the Finalize Method](#).

See Also

Reference

[SongCollection Class](#)

[SongCollection Members](#)

SongCollection.GetEnumerator Method

Returns an enumerator that iterates through the [SongCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public IEnumerator<Song> GetEnumerator ()
```

Return Value

[IEnumerator](#) for the **SongCollection**.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until **MoveNext** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. You cannot set **Current** to the first element of the collection again; you must create a new enumerator instance instead.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

Reference

[SongCollection Class](#)

[SongCollection Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

System.Collections.IEnumerable.GetEnumerator Method

Returns an enumerator that iterates through the collection.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private IEnumerator System.Collections.IEnumerable.GetEnumerator ()
```

Return Value

[IEnumerator](#) that iterates through the collection.

Remarks

The **foreach** statement of the C# language (**for each** in C++, **For Each** in Visual Basic) hides the complexity of enumerators. Therefore, using **foreach** instead of directly manipulating the enumerator is recommended.

Enumerators can be used to read the data in the collection, but they cannot be used to modify the underlying collection.

Initially, the enumerator is positioned before the first element in the collection. [Reset](#) also brings the enumerator back to this position. At this position, [Current](#) is undefined. You must call [MoveNext](#) to advance the enumerator to the first element of the collection before reading the value of **Current**.

Current returns the same object until either **MoveNext** or **Reset** is called. **MoveNext** sets **Current** to the next element.

If **MoveNext** passes the end of the collection, the enumerator is positioned after the last element in the collection and **MoveNext** returns false. When the enumerator is at this position, subsequent calls to **MoveNext** also return false. If the last call to **MoveNext** returned false, **Current** is undefined. To set **Current** to the first element of the collection again, you can call **Reset** followed by **MoveNext**.

An enumerator remains valid as long as the collection remains unchanged. If changes are made to the collection, such as adding, modifying, or deleting elements, the enumerator is irrecoverably invalidated and its behavior is undefined.

The enumerator does not have exclusive access to the collection; enumerating through a collection is intrinsically not a thread-safe procedure. To guarantee thread safety during enumeration, you can lock the collection during the entire enumeration. To allow the collection to be accessed by multiple threads for reading and writing, you must implement your own synchronization.

This method is an O(1) operation.

SongCollection.Item Property

Gets the [Song](#) at the specified index in the [SongCollection](#).

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public Song this [
    int index
] { get; }
```

Property Value

A new [Song](#) representing the song at the specified index in this **SongCollection**.

Remarks

Each call returns a new [Song](#) instance.

Song resources such as the album, artist, and genre are cached in each **Song** instance. Retrieving and maintaining references to multiple instances of the same song, and then accessing the album, artist, or genre on each of those instances, creates multiple copies of the album, artist, or genre. Because large numbers of album art textures can consume considerable memory, it is not advisable to hold a large number of **Song** objects on which [Song.Album.GetAlbumArt](#) has been called.

VideoPlayer Members

The following tables list the members exposed by the VideoPlayer type.

Public Constructors

Name	Description
 VideoPlayer	Initializes a new instance of this class.

Public Properties

Name	Description
 IsDisposed	Gets a value that indicates whether the object is disposed.
 IsLooped	Gets a value that indicates whether the player is playing video in a loop.
 IsMuted	Gets or sets the muted setting for the video player.
 PlayPosition	Gets the play position within the currently playing video.
 State	Gets the media playback state, MediaState .
 Video	Gets the Video that is currently playing.
 Volume	Gets or sets the video player volume.

Public Methods

Name	Description
 Dispose	Immediately releases the unmanaged resources used by this object.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetTexture	Retrieves a Texture2D containing the current frame of video being played.
 GetType	(Inherited from Object .)
 Pause	Pauses the currently playing video.
 Play	Plays a Video .
 ReferenceEquals	(Inherited from Object .)
 Resume	Resumes a paused video.
 Stop	Stops playing a video.
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
 MemberwiseClone	(Inherited from Object .)

```

Property Value

The currently playing [Video](#).

See Also

Reference

[VideoPlayer Class](#)

[VideoPlayer Members](#)

[Microsoft.Xna.Framework.Media Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista

VideoPlayer.Volume Property

Gets or sets the video player volume.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float Volume { get; set; }
```

Property Value

Video player volume, from 0.0f (silence) to 1.0f (full volume relative to the current device volume).

Remarks

Volume adjustment is based on a decibel, not multiplicative, scale. For example, when the device volume is half of maximum (about **7** in the Zune user interface), setting **Volume** to 0.6f or less is silent or nearly so, not volume **4** as you would expect from a multiplicative adjustment.

Setting **Volume** to 0.0 subtracts 96 dB from the volume. Setting **Volume** to 1.0 subtracts 0 dB from the volume. Values in between 0.0f and 1.0f subtract dB from the volume proportionally.

VideoSoundtrackType Enumeration

Type of sounds in a video

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum VideoSoundtrackType
```

Members

Member name	Description
Dialog	This video contains only dialog.
Music	This video contains only music.
MusicAndDialog	This video contains music and dialog.

Xbox 360 Specific Information

This setting has no effect on Windows. On the Xbox 360, videos with the *Dialog* type will have their sound mixed in with the dashboard player's playback. Videos with the *Music* type will be muted if the dashboard player is playing. Videos with the *MusicAndDialog* type will override the dashboard playback.

Remarks

A video that only contains music will be muted on playback if the [MediaPlayer](#) is playing back music.

VisualizationData.Frequencies Property

Returns a collection of floats that contain frequency data.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ReadOnlyCollection<float> Frequencies { get; }
```

Property Value

A collection of floats that contain frequency data.

RemarksEach value in the collection is a float value from 0.0f to 1.0f, and is the logarithmic scaled power level for that frequency band.

VisualizationData.Samples Property

Returns a collection of floats that contain sample data.

Sample floats are in the range -1.0f to 1.0f, which approximate the wave form of the sound. The sample data equates to the volume of the sound.

Namespace: Microsoft.Xna.Framework.Media

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public ReadOnlyCollection<float> Samples { get; }
```

Property Value

A collection of floats that contain sample data.

Microsoft.Xna.Framework.Net Namespace

Contains classes that implement support for Xbox LIVE, multiplayer, and networking for XNA Framework games.

Classes

Name	Description
 AvailableNetworkSession	Describes a multiplayer session that can be joined.
 AvailableNetworkSessionCollection	Represents a collection of sessions available for joining.
 GameEndedEventArgs	Represents the arguments passed to a GameEnded event.
 GamerJoinedEventArgs	Represents the arguments passed to a GamerJoined event.
 GamerLeftEventArgs	Represents the arguments passed to a GamerLeft event.
 GameStartedEventArgs	Represents the arguments passed to a GameStarted event.
 HostChangedEventArgs	Represents the arguments passed to a HostChanged event.
 InviteAcceptedEventArgs	Represents the arguments passed to a InviteAccepted event.
 LocalNetworkGamer	Represents a local player in a network session.
 NetworkException	Thrown if there is a network communication failure.
 NetworkGamer	Represents a player in a network session.
 NetworkMachine	Represents a physical machine (such as single Xbox 360 console or Windows-based computer) that is participating in a multiplayer session. It can be used to detect when more than one NetworkGamer is playing on the same actual machine.
 NetworkNotAvailableException	Exception thrown if no network is available.
 NetworkSession	Represents a multiplayer game session.
 NetworkSessionEndedEventArgs	Represents the arguments passed to a SessionEnded event. These arguments are passed to event handlers when a session ends.
 NetworkSessionJoinException	Thrown if an error was encountered while joining a session.
 NetworkSessionProperties	Describes custom, game-specific information about a NetworkSession object.
 PacketReader	Provides common functionality for efficiently reading incoming network packets.
 PacketWriter	Provides common functionality for efficiently formatting outgoing network packets.
 QualityOfService	Describes the quality of the network connection between this machine and the host of a multiplayer session that was discovered with a matchmaking query.

Enumerations

Name	Description
 NetworkSessionEndReason	Defines the reason a session ended.
 NetworkSessionJoinError	Contains additional data about a NetworkSessionJoinException .
 NetworkSessionState	Defines the different states of a multiplayer session.
 NetworkSessionType	Defines the different types of a multiplayer session.
 SendDataOptions	Defines options for network packet transmission.

Remarks

 **Important**

Games for Windows - LIVE is not available to finished games. This functionality is not included in the redistributable version of the XNA Framework. A game that attempts to use these components without XNA Game Studio installed will result in a [GameServicesNotAvailableException](#).

See Also

Concepts

[Getting Started With Networked Games](#)

[Networking Content Catalog at XNA Creators Club Online](#)

AvailableNetworkSession Class

Describes a multiplayer session that can be joined.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public sealed class AvailableNetworkSession
```

Remarks

Use the [NetworkSession](#) class to get a list of **AvailableNetworkSession** instances. Typically, the results populate some type of user interface, displayed by the game. The user then chooses a session, and the game adds the player to the chosen session with a call to [Join](#).

Reference

[AvailableNetworkSession Class](#)

[Microsoft.Xna.Framework.Net Namespace](#)

AvailableNetworkSession.CurrentGamerCount Property

Gets the number of gamers in the session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int CurrentGamerCount { get; }
```

Property Value

Number of gamers currently in the session.

See Also

Reference

[AvailableNetworkSession Class](#)

[AvailableNetworkSession Members](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AvailableNetworkSession.HostGamertag Property

Gets the gamertag of the session host.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string HostGamertag { get; }
```

Property Value

Name of the gamertag.

[Microsoft.Xna.Framework.Net Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AvailableNetworkSession.OpenPrivateGamerSlots Property

Gets the number of private player slots. These slots are reserved for people joining by invitation or friend presence.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int OpenPrivateGamerSlots { get; }
```

Property Value

Number of reserved private slots.

See Also

Reference

[AvailableNetworkSession Class](#)

[AvailableNetworkSession Members](#)

[Microsoft.Xna.Framework.Net Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AvailableNetworkSession.OpenPublicGamerSlots Property

Gets the number of public player slots. These slots are reserved for people joining by a matchmaking service.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int OpenPublicGamerSlots { get; }
```

Property Value

Number of public slots.

See Also

Reference

[AvailableNetworkSession Class](#)

[AvailableNetworkSession Members](#)

[Microsoft.Xna.Framework.Net Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

AvailableNetworkSession.QualityOfService Property

Gets an estimate of the quality of network service between this local machine and the remote session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public QualityOfService QualityOfService { get; }
```

Property Value

An estimate of the quality of network service between this local machine and the remote session. Initially the [IsAvailable](#) property will be set to false, and all the other properties of the returned [QualityOfService](#) instance will be zero, but after the probing finishes this will become true and the other properties will be filled in with some actual data.

Remarks This measurement can take some time to complete, so the data may not be available when the search result is first returned to you.

HostChangedEventArgs Constructor

Creates an instance of [HostChangedEventArgs](#).

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public HostChangedEventArgs (
    NetworkGamer oldHost,
    NetworkGamer newHost
)
```

Parameters

oldHost

The player who was the previous session host.

newHost

The player who is the new host of the multiplayer session.

Reference

[InviteAcceptedEventArgs Class](#)

[Microsoft.Xna.Framework.Net Namespace](#)

InviteAcceptedEventArgs.Gamer Property

Gets the gamer who accepted the game invitation.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SignedInGamer Gamer { get; }
```

Property Value

The gamer accepting the game invitation.

See Also

Reference

[InviteAcceptedEventArgs Class](#)

[InviteAcceptedEventArgs Members](#)

[Microsoft.Xna.Framework.Net Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

InviteAcceptedEventArgs.IsCurrentSession Property

Represents whether this invitation is for a `NetworkSession` that is already joined by other local gamers.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsCurrentSession { get; }
```

Property Value

true if this invitation is for a pre-existing session with other local players on the current machine; **false**, otherwise.

Remarks

If `IsCurrentSession` is **false**, indicating that the invitation is from a session that hasn't already been joined, call `NetworkSession.JoinInvited` to allow the gamer to join the remote session. If `IsCurrentSession` is **true**, indicating that another local gamer has already joined the session, call `NetworkSession.AddLocalGamer` to add additional gamers to the session.

Reference

[LocalNetworkGamer Class](#)

[Microsoft.Xna.Framework.Net Namespace](#)

LocalNetworkGamer.EnableSendVoice Method

Specifies whether voice data should be sent to, or received from, the specified remote gamer.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void EnableSendVoice (
    NetworkGamer remoteGamer,
    bool enable
)
```

Parameters

remoteGamer

A remote gamer in the session.

enable

true if voice is enabled; **false** otherwise.

Exceptions

Exception type	Condition
ArgumentException	This NetworkGamer belongs to a different network session.
ArgumentNullException	<i>remoteGamer</i> is null .
ObjectDisposedException	This NetworkGamer is no longer valid. The gamer may have left the session.

Remarks

Call this method for local gamer instances only.

By default, voice is enabled for all gamers. However, you can selectively turn it off to enable features such as team chat. Also, you can dynamically turn it on or off, depending on the player's location in the game world, to achieve a proximity voice effect.

LocalNetworkGamer.ReceiveData Method

Reads the next incoming packet.

Overload List

Name	Description
LocalNetworkGamer.ReceiveData (Byte[], Int32, NetworkGamer)	Reads the next incoming packet using the specified values.
LocalNetworkGamer.ReceiveData (Byte[], NetworkGamer)	Reads the next incoming packet using the specified values.
LocalNetworkGamer.ReceiveData (PacketReader, NetworkGamer)	Reads the next incoming packet and copies the packet data into the specified reader object.

Example

Be sure to call **ReceiveData** for all incoming data for all local gamers, even if the data is to be discarded. Any time data is sent to a local network gamer, the incoming data queue will grow until the data is read. If the data is not read using **ReceiveData** the performance of the application will degrade as the data queue grows in size.

C#

```
foreach (LocalNetworkGamer gamer in session.LocalGamers)
{
    // Keep reading while packets are available.
    while (gamer.IsDataAvailable)
    {
        NetworkGamer sender;

        // Read a single packet.
        gamer.ReceiveData(packetReader, out sender);
        // Discard the data, or use packetReader.Read* to process the data.
    }
    gamer.SendData(packetWriter, SendDataOptions.None);
}
```

[How To: Receive Data](#)

Reference

[LocalNetworkGamer Class](#)

[LocalNetworkGamer Members](#)

[Microsoft.Xna.Framework.Net Namespace](#)

LocalNetworkGamer.ReceiveData Method (Byte[], Int32, NetworkGamer)

Reads the next incoming packet using the specified values.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int ReceiveData (
    byte[] data,
    int offset,
    out NetworkGamer sender
)
```

Parameters

data

Storage for the network packet data.

offset

Offset, in bytes, to begin reading data.

sender

[[OutAttribute](#)] Gamer who sent this packet.

Return Value

Number of bytes read from the network packet. Returns 0 if no packet is available.

Exceptions

Exception type	Condition
ArgumentException	The specified array is too small to receive the incoming network packet.
ArgumentNullException	<i>data</i> is null .
ArgumentOutOfRangeException	<i>offset</i> cannot be larger than the amount of data available for storage.

Example

Be sure to call **ReceiveData** for all incoming data for all local gamers, even if the data is to be discarded. Any time data is sent to a local network gamer, the incoming data queue will grow until the data is read. If the data is not read using **ReceiveData** the performance of the application will degrade as the data queue grows in size.

C#

```
foreach (LocalNetworkGamer gamer in session.LocalGamers)
{
    // Keep reading while packets are available.
    while (gamer.IsDataAvailable)
    {
        NetworkGamer sender;

        // Read a single packet.
        gamer.ReceiveData(packetReader, out sender);
        // Discard the data, or use packetReader.Read* to process the data.
    }
    gamer.SendData(packetWriter, SendDataOptions.None);
}
```

Remarks

ReceiveData copies the packet data into the array specified by *data*, returning the number of bytes read. If several independent packets are available, only one is returned for each **ReceiveData** call.

LocalNetworkGamer.IsDataAvailable Property

Determines if there is incoming packet data for this player.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsDataAvailable { get; }
```

Property Value

true if there are one or more packets waiting; otherwise **false**.

LocalNetworkGamer.SignedInGamer Property

Gets the [SignedInGamer](#) instance for this **SignedInGamer** object.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public SignedInGamer SignedInGamer { get; }
```

Property Value

The related [SignedInGamer](#) instance.

Note

This constructor is available only when developing for Windows.

Initializes a new instance of [NetworkException](#) with the specified streaming context.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected NetworkException (  
    SerializationInfo info,  
    StreamingContext context  
)
```

Parameters

info

Describes the network data being sent or received when the exception occurred.

context

Describes the stream where the exception occurred.

NetworkGamer Members

The following tables list the members exposed by the NetworkGamer type.

Public Properties

Name	Description
 Gamertag	(Inherited from Gamer .)
 HasLeftSession	Indicates whether this gamer has left the session.
 HasVoice	Determines if the player has a voice headset.
 Id	Gets a unique identifier that can be used to refer to this gamer in network packets.
 IsDisposed	(Inherited from Gamer .)
 IsGuest	Determines whether this gamer is logged in as a guest profile.
 IsHost	Determines if the player is the host of the multiplayer session.
 IsLocal	Determines if the player is playing on a local machine.
 IsMutedByLocalUser	Determines if the player is muted by one or more local users.
 IsPrivateSlot	Determines if the player occupies a reserved private session slot.
 IsReady	Determines whether the gamer is ready to leave the lobby screen and begin gameplay.
 IsTalking	Determines whether the gamer is currently sending voice data.
 Machine	Gets an object representing the physical gaming machine this NetworkGamer is playing on.
 RoundtripTime	Gets an estimate of the network latency involved in sending a packet round trip from the local machine to this gamer and back again.
 Session	Gets the multiplayer session of the gamer.
 SignedInGamers	(Inherited from Gamer .)
 Tag	(Inherited from Gamer .)

Public Methods

Name	Description

Reference

[NetworkGamer Class](#)

[Microsoft.Xna.Framework.Net Namespace](#)

NetworkGamer.HasLeftSession Property

Indicates whether this gamer has left the session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool HasLeftSession { get; }
```

Property Value

true if the player has left the session; **false**, otherwise.

See Also

Reference

[Microsoft.Xna.Framework.Net Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

NetworkGamer.HasVoice Property

Determines if the player has a voice headset.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool HasVoice { get; }
```

Property Value

true if a headset is present; **false** otherwise.

See Also

Reference

NetworkGamer.Id Property

Gets a unique identifier that can be used to refer to this gamer in network packets.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public byte Id { get; }
```

Property Value

A unique identifier that can be used to refer to this gamer in network packets.

Remarks This value is synchronized across all the machines in the session, so it can be used in situations where gamer A wants to send a packet to B, and the contents of this packet must refer to gamer C. Using the identifier is preferable to sending the index of the gamer within the session, because indices could change if gamers join or leave in mid session, but this id will always remain constant. To look up a gamer once you know their id, use [FindGamerById](#).

NetworkGamer.IsReady Property

Determines whether the gamer is ready to leave the lobby screen and begin gameplay.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsReady { get; set; }
```

Property Value

true if the gamer is ready to start playing; **false** otherwise.

Exceptions

Exception type	Condition
InvalidOperationException	<ul style="list-style-type: none"> This operation is only valid when the session state is NetworkSessionState.Lobby. This method cannot be called on remote gamer instances. It is only valid when NetworkGamer.IsLocal is true. If you are looping over the contents of the NetworkSession.AllGamers collection, consider using NetworkSession.LocalGamers instead.
ObjectDisposedException	This NetworkGamer is no longer valid. The gamer may have left the session.

Remarks

The host of a multiplayer session can use the [IsEveryoneReady](#) property to detect when all players have marked themselves ready, and then call [StartGame](#) to kick off the game.

NetworkGamer.Machine Property

Gets an object representing the physical gaming machine this [NetworkGamer](#) is playing on.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public NetworkMachine Machine { get; set; }
```

Property Value

An object representing the physical gaming machine this [NetworkGamer](#) is playing on.

Remarks If there are several gamers all playing on the same gaming machine, they will all share a single value for the

Machine property.

Gets an estimate of the network latency involved in sending a packet round trip from the local machine to this gamer and back again.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TimeSpan RoundtripTime { get; }
```

Property Value

An estimate of the network latency involved in sending a packet round trip from the local machine to this gamer and back again.

Remarks This value does not include latency introduced via the [NetworkSession.SimulatedLatency](#) property.

NetworkSession Members

The following tables list the members exposed by the NetworkSession type.

Public Fields

Name	Description
 MaxPreviousGamers	Represents the maximum number of gamers that can be held in the PreviousGamers property.
 MaxSupportedGamers	Maximum number of gamers supported in a session.

Public Properties

Name	Description
 AllGamers	Gets the collection of gamers currently in the session.
 AllowHostMigration	Gets or sets whether host migration is allowed. This can be read by any machine in the session, but can only be changed by the host. The default value is false indicating that host migration is disabled.
 AllowJoinInProgress	Gets or sets whether join-in-progress is allowed. If the host enables this setting, new machines will be able to join at any time. The default value is false, indicating that join-in-progress is disabled. AllowJoinInProgress can be read by any machine in the session, but can only be changed by the host.
 BytesPerSecondReceived	Gets a performance counter recording the amount of data being received from the network.
 BytesPerSecondSent	Gets a performance counter recording the amount of data being sent over the network.
 Host	Gets the current host of the multiplayer session.
 IsDisposed	Gets a value that indicates whether the object is disposed.
 IsEveryoneReady	Determines whether all gamers are ready to enter the session.
 IsHost	Determines whether this machine is the session host.
 LocalGamers	Get the collection of local gamers for a multiplayer session.
 MaxGamers	Gets or sets the maximum number of players able to join this multiplayer session.
 PreviousGamers	A collection of previous gamers in the network session.
 PrivateGamerSlots	Gets or sets the number of private slots reserved for gamers who join using an invitation.
 RemoteGamers	Gets the collection of remote gamers for a multiplayer session.
 SessionProperties	Gets any custom properties that have been attached to the session.
 SessionState	Gets the current state of a multiplayer session.
 SessionType	Gets the current multiplayer session type.
 SimulatedLatency	Gets or sets the amount of simulated network latency.
 SimulatedPacketLoss	Gets or sets the amount of simulated packet loss.

Public Methods

Name	Description
 AddLocalGamer	Adds the specified local gamer profile to the network session.

 	BeginCreate	Overloaded. Starts hosting a new multiplayer session.
 	BeginFind	Overloaded. Starts a matchmaking query to search for available multiplayer sessions.
 	BeginJoin	Starts a join operation for the specified multiplayer session.
 	BeginJoinInvited	Overloaded. Starts joining an existing network session in response to an InviteAccepted notification event. Call EndJoinInvited to access the asynchronous method results.
 	Create	Overloaded. Hosts a new multiplayer session.
	Dispose	Ends the current multiplayer session.
 	EndCreate	Gets the result from a BeginCreate asynchronous call.
 	EndFind	Gets the result from a BeginFind asynchronous call.
	EndGame	Changes the session state from NetworkSessionState.Playing to NetworkSessionState.Lobby .
 	EndJoin	Gets the result from a BeginJoin asynchronous call.
 	EndJoinInvited	Gets the result from a BeginJoinInvited asynchronous call.
	Equals	(Inherited from Object .)
 	Find	Overloaded. Issues a matchmaking query, searching for available multiplayer sessions.
	FindGamerById	Looks up the network gamer with the specified ID.
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
 	Join	Joins an existing multiplayer session.
 	JoinInvited	Overloaded. Joins the specified local gamers, along with the local machine, to an existing network session in response to an InviteAccepted notification event from a non-local session.
	ReferenceEquals	(Inherited from Object .)
	ResetReady	Resets the IsReady property of all session gamers.
	StartGame	Changes the session state from NetworkSessionState.Lobby to NetworkSessionState.Playing .
	ToString	(Inherited from Object .)
	Update	Updates the state of the multiplayer session.

Protected Methods

	Name	Description
	Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
	MemberwiseClone	(Inherited from Object .)

Public Events

	Name	Description
	GameEnded	Occurs when the game moves from gameplay to the lobby.
	GamerJoined	Occurs when a new player joins a multiplayer session.
	GamerLeft	Occurs when a player leaves the multiplayer session.
	GameStarted	Occurs when the game moves from the lobby into actual gameplay.
	HostChanged	Occurs when the session host has changed.
 	InviteAccepted	Event that occurs when a user has accepted an invitation to join a network session.
	SessionEnded	Occurs when the multiplayer session ends.

[Microsoft.Xna.Framework.Net Namespace](#)

NetworkSession.BeginCreate Method (NetworkSessionType, Generic IEnumerable, Int32, Int32, NetworkSessionProperties, AsyncCallback, Object)

Starts hosting a new multiplayer session. The creation operation is performed asynchronously.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IAsyncResult BeginCreate (
    NetworkSessionType sessionType,
    IEnumerable<SignedInGamer> localGamers,
    int maxGamers,
    int privateGamerSlots,
    NetworkSessionProperties sessionProperties,
    AsyncCallback callback,
    Object asyncState
)
```

Parameters

sessionType

Type of session being created.

localGamers

A collection of local gamers to add to the network session. The first gamer in the collection becomes the host; the others are added to the session.

maxGamers

Maximum number of players allowed in this network session. For Windows- or Xbox 360-based games, this value must be between 2 and 31; 31 is the maximum number of players supported in a session. For Zune-based games, this value must be between 2 and 8; 8 is the maximum number of players supported in the session.

privateGamerSlots

Number of reserved private session slots created for the session. This value must be less than *maximumGamers*.

sessionProperties

Properties of the session being created.

callback

The method to be called once the asynchronous operation has finished.

asyncState

State of the asynchronous operation.

Return Value

An [IAsyncResult](#) used to track the progress of the method.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<p>One of the following conditions is true:</p> <ul style="list-style-type: none"> <i>maxGamers</i> is not in range of gamers that are supported in a network session. NetworkSession.BeginFind Method (NetworkSessionType, Generic IEnumerable, NetworkSessionProperties, AsyncCallback, Object)

Starts a matchmaking query to search for available multiplayer sessions, specifying a collection of local gamers to add to the network session. Call [EndFind](#) to access the results of this asynchronous call.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IAsyncResult BeginFind (
    NetworkSessionType sessionType,
    IEnumerable<SignedInGamer> localGamers,
    NetworkSessionProperties searchProperties,
    AsyncCallback callback,
    Object asyncState
)
```

Parameters

sessionType

Type of session sought.

localGamers

A collection of local gamers to add to the network session.

searchProperties

Optional session properties to match during the search. If this argument is **null**, the query results will not be filtered based on the session properties of available sessions. If any of the search property values in *searchProperties* are specified, only sessions with matching properties will be returned by the query. **null** items in the *searchProperties* collection will match to any value for that session property.

callback

Method to be called once the asynchronous operation has finished.

asyncState

State of the asynchronous operation.

Return Value

An [IAsyncResult](#) used to track the progress of the method.

Exceptions

Exception type	Condition
ArgumentException	BeginFind cannot be used from NetworkSession objects of session type NetworkSessionType.Local .
ArgumentOutOfRangeException	<i>maxLocalGamers</i> must be between 1 and 4.

RemarksThe collection of gamers provided in *localGamers* are not added to a session until [NetworkSession.Join](#) is called with one of the sessions returned from the search. The gamers are provided here for matchmaking purposes.

    NetworkSessionType sessionType,
    int maxLocalGamers,
    NetworkSessionProperties searchProperties,
    AsyncCallback callback,
    Object asyncState
)
```

Parameters

sessionType

Type of session sought.

maxLocalGamers

Maximum number of local players on the same gaming machine in this network session.

searchProperties

Optional session properties to match during the search. If this argument is **null**, the query results will not be filtered based on the session properties of available sessions. If any of the search property values in *searchProperties* are specified, only sessions with matching properties will be returned by the query. **null** items in the *searchProperties* collection will match to any value for that session property.

NetworkSession.BeginJoin Method

Starts a join operation for the specified multiplayer session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IAsyncResult BeginJoin (  
    AvailableNetworkSession availableSession,  
    AsyncCallback callback,  
    Object asyncState  
)
```

Parameters

availableSession

Session the gamer is attempting to join.

callback

The method to be called once the asynchronous operation has finished.

asyncState

State of the asynchronous operation.

Return Value

An [IAsyncResult](#) used to track the progress of the method. Call [EndJoin](#) to access these results.

Exceptions

Exception type	Condition
ArgumentNullException	<i>availableSession</i> is null .
ObjectDisposedException	<i>availableSession</i> is disposed.

NetworkSession.BeginJoinInvited Method (Generic IEnumerable, AsyncCallback, Object)

Starts joining an existing network session in response to an [InviteAccepted](#) notification event with the specified collection of local gamers. Call [EndJoinInvited](#) to access the asynchronous method results.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IAsyncResult BeginJoinInvited (  
    IEnumerable<SignedInGamer> localGamers,  
    AsyncCallback callback,  
    Object asyncState  
)
```

Parameters

localGamers

A collection of local signed-in gamers to add to the network session.

callback

Method to be called at the conclusion of the asynchronous operation.

asyncState

State of the asynchronous operation.

Return Value

An [IAsyncResult](#) used to track the progress of the method.

Remarks

See [How To: Add Support for Game Invitations](#) for more information about adding game invitation support to your title.

NetworkSession.BeginJoinInvited Method (Int32, AsyncCallback, Object)

Starts joining an existing network session in response to an [InviteAccepted](#) notification event. Call [EndJoinInvited](#) to access the asynchronous method results.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static IAsyncResult BeginJoinInvited (
    int maxLocalGamers,
    AsyncCallback callback,
    Object asyncState
)
```

Parameters

maxLocalGamers

The number of local signed-in gamers to add to the network session when accepting the invite. This must be at least one, and can be as high as the limit imposed by either the title or platform. On Windows, this value must always be set to one.

callback

Method to be called at the conclusion of the asynchronous operation.

asyncState

State of the asynchronous operation.

Return Value

An [IAsyncResult](#) used to track the progress of the method.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<i>maxLocalGamers</i> must be between 1 and 4.

Remarks

If there are fewer signed-in gamers than the number specified in *maxLocalGamers*, all currently-available signed-in gamers will be added. This method does not allow specifying particular signed-in gamers in the event that there are more local signed-in gamers than the number to add.

See [How To: Add Support for Game Invitations](#) for more information about adding game invitation support to your title.

NetworkSession.Create Method (NetworkSessionType, Generic IEnumerable, Int32, Int32, NetworkSessionProperties)

Starts hosting a new multiplayer session. This method blocks until the operation has completed.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static NetworkSession Create (
    NetworkSessionType sessionType,
    IEnumerable<SignedInGamer> localGamers,
    int maxGamers,
    int privateGamerSlots,
    NetworkSessionProperties sessionProperties
)
```

Parameters

sessionType

Type of session being hosted.

localGamers

A collection of local gamers to add to the network session. The first gamer in the collection becomes the host; the others are added to the session.

maxGamers

Maximum number of players allowed in this network session. For Windows- or Xbox 360-based games, this value must be between 2 and 31; 31 is the maximum number of players supported in a session. For Zune-based games, this value must be between 2 and 8; 8 is the maximum number of players supported in the session.

privateGamerSlots

Number of reserved private session slots created for the session. This value must be less than *maxGamers*.

sessionProperties

Properties of the session being created.

Return Value

The newly hosted session.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<p>One of the following conditions is true:</p> <ul style="list-style-type: none"> <i>maxGamers</i> is not in range of gamers that are supported in a network session. The XNA Framework supports multiplayer sessions between 2 and 31 players in a session for a Windows- or an Xbox 360-based game. InvalidOperationException	<p>One of the following conditions is true:</p> <ul style="list-style-type: none"> • A different session already exists. There can only be one <code>NetworkSession</code> or <code>AvailableNetworkSessionCollection</code> in use at a time. You must dispose any previous session before you create a new one. • One of the following methods has been called, but has not yet returned results: <ul style="list-style-type: none"> • NetworkSession.Create • NetworkSession.BeginCreate • NetworkSession.Find • NetworkSession.BeginFind • NetworkSession.Join • NetworkSession.BeginJoin <p>Note that you must wait for any of these methods to return before you can create a new network session. To support this, you may use the asynchronous methods BeginCreate, BeginFind, BeginJoin, and the corresponding EndCreate, EndFind, EndJoin methods to detect when the operation is complete.</p>
ObjectDisposedException	This <code>NetworkSession</code> is disposed.

Remarks

Zune Specific Information

For Zune-based games, *maxGamers* must be between 2 and 8; 8 is the maximum number of players supported in the session.

Windows Specific Information

For Windows-based games, *maxGamers* must be between 2 and 31; 31 is the maximum number of players supported in a session.

Xbox 360 Specific Information

For Xbox 360-based games, *maxGamers* must be between 2 and 31; 31 is the maximum number of players supported in a session.

Behavior of Local Sessions

XNA Game Studio 3.0 introduces a change in the behavior of network sessions when local profiles sign out in the middle of a session. In previous versions of XNA Game Studio, a session ended whenever a player signed out. Now the session continues even if one or more profiles sign out. Signed-out players are removed from the session, but the session ends only if no suitable players remain in the session.

NetworkSession.Find Method (NetworkSessionType, Generic IEnumerable, NetworkSessionProperties)

Issues a matchmaking query, searching for available multiplayer sessions. This method blocks until the operation has completed.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static AvailableNetworkSessionCollection Find (
    NetworkSessionType sessionType,
    IEnumerable<SignedInGamer> localGamers,
    NetworkSessionProperties searchProperties
)
```

Parameters

sessionType

Type of session sought.

localGamers

A collection of local gamers to add to the network session.

searchProperties

Optional session properties to match during the search. If this argument is **null**, the query results will not be filtered based on the session properties of available sessions. If any of the search property values in *searchProperties* are specified, only sessions with matching properties will be returned by the query. **null** items in the *searchProperties* collection will match to any value for that session property.

Return Value

Collection of available network multiplayer sessions.

Exceptions

Exception type	Condition
ArgumentException	Find cannot be used from NetworkSession objects of session type NetworkSessionType.Local .
ArgumentOutOfRangeException	<i>maxLocalGamers</i> must be between 1 and 4.

RemarksThe collection of gamers provided in *localGamers* are not added to a session until [NetworkSession.Join](#) is called with one of the sessions returned from the search. The gamers are provided here for matchmaking purposes.

NetworkSession.Join Method

Joins an existing multiplayer session. This method blocks until the operation has completed.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static NetworkSession Join (
    AvailableNetworkSession availableSession
)
```

Parameters

availableSession

An existing multiplayer session.

Return Value

Session joined by the gamer.

Exceptions

Exception type	Condition
ArgumentNullException	<i>availableSession</i> is null .
ObjectDisposedException	<i>availableSession</i> is disposed.
NetworkSessionJoinException	The session either is full, is not joinable, or cannot be found. <ul style="list-style-type: none"> • If the session is full, the specified session does not have enough open slots for all the local gamers signed in to this machine. • If it is not joinable, you must wait for the host to return to the lobby before joining. • If it cannot be found, the session may have ended, or there may be no network connectivity between the local machine and session host.

Remarks

Use the [Find](#) or [BeginFind](#) methods to search for available sessions.

Behavior of Local Sessions

XNA Game Studio 3.0 introduces a change in the behavior of network sessions when local profiles sign out in the middle of a session. In previous versions of XNA Game Studio, a session ended whenever a player signed out. Now the session continues even if one or more profiles sign out. Signed-out players are removed from the session, but the session ends only if no suitable players remain in the session.

NetworkSession.JoinInvited Method (Int32)

Joins the local machine to an existing network session in response to an [InviteAccepted](#) notification event from a non-local session.

Note

Use the [NetworkSession.AddLocalGamer](#) method to join players to a session in response to an [InviteAccepted](#) notification event for a session that already exists locally, as indicated by [IsCurrentSession](#).

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static NetworkSession JoinInvited (
    int maxLocalGamers
)
```

Parameters

maxLocalGamers

The number of local signed-in gamers to add to the network session when accepting the invite. This must be at least one, and can be as high as the limit imposed by either the title or platform. On Windows, this value must always be set to one.

Return Value

The network session.

Exceptions

Exception type	Condition
NetworkSessionJoinException	<p>The session either is full, is not joinable, or cannot be found.</p> <ul style="list-style-type: none"> If the session is full, the specified session does not have enough open slots for all the local gamers signed in to this machine. If it is not joinable, you must wait for the host to return to the lobby before joining. If it cannot be found, the session may have ended, or there may be no network connectivity between the local machine and session host.

Remarks

If there are fewer signed-in gamers than the number specified in *maxLocalGamers*, all currently-available signed-in gamers will be added. This method does not allow specifying particular signed-in gamers in the event that there are more local signed-in gamers than the number to add.

This method blocks until the operation has completed. For an asynchronous version of this method, see [BeginJoinInvited](#).

NetworkSession.Update Method

Updates the state of the multiplayer session. Call this method at regular intervals—for example, from the [Game.Update](#) method.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Update ()
```

Exceptions

Exception type	Condition
ObjectDisposedException	This object has already been disposed.

NetworkSession Properties

Public Properties

	Name	Description
	AllGamers	Gets the collection of gamers currently in the session.
	AllowHostMigration	Gets or sets whether host migration is allowed. This can be read by any machine in the session, but can only be changed by the host. The default value is false indicating that host migration is disabled.
	AllowJoinInProgress	Gets or sets whether join-in-progress is allowed. If the host enables this setting, new machines will be able to join at any time. The default value is false, indicating that join-in-progress is disabled. AllowJoinInProgress can be read by any machine in the session, but can only be changed by the host.
	BytesPerSecondReceived	Gets a performance counter recording the amount of data being received from the network.
	BytesPerSecondSent	Gets a performance counter recording the amount of data being sent over the network.
	Host	Gets the current host of the multiplayer session.
	IsDisposed	Gets a value that indicates whether the object is disposed.
	IsEveryoneReady	Determines whether all gamers are ready to enter the session.
	IsHost	Determines whether this machine is the session host.
	LocalGamers	Get the collection of local gamers for a multiplayer session.
	MaxGamers	Gets or sets the maximum number of players able to join this multiplayer session.
	PreviousGamers	A collection of previous gamers in the network session.
	PrivateGamerSlots	Gets or sets the number of private slots reserved for gamers who join using an invitation.
	RemoteGamers	Gets the collection of remote gamers for a multiplayer session.
	SessionProperties	Gets any custom properties that have been attached to the session.
	SessionState	Gets the current state of a multiplayer session.
	SessionType	Gets the current multiplayer session type.
	SimulatedLatency	Gets or sets the amount of simulated network latency.
	SimulatedPacketLoss	Gets or sets the amount of simulated packet loss.

Reference

[NetworkSession Class](#)

[Microsoft.Xna.Framework.Net Namespace](#)

NetworkSession.AllGamers Property

Gets the collection of gamers currently in the session. This is the union of everything in [LocalGamers](#) and [RemoteGamers](#).

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerCollection<NetworkGamer> AllGamers { get; }
```

Property Value

Collection of gamers in the session.

See Also

Reference

[NetworkSession Class](#)

[NetworkSession Members](#)

[Microsoft.Xna.Framework.Net Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

NetworkSession.AllowHostMigration Property

Gets or sets whether host migration is allowed. This can be read by any machine in the session, but can only be changed by the host. The default value is **false** indicating that host migration is disabled.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool AllowHostMigration { get; set; }
```

Property Value

true to enable host migration; **false** to disable host migration. The default value is **false**.

Exceptions

Exception type	Condition
InvalidOperationException	This session is not the host, and cannot change the value of AllowHostMigration .
ObjectDisposedException	The session has been disposed.

RemarksWhen host migration is disabled (the default state), the session will be ended if the host leaves the game or there is a network disconnect. If the host enables this setting, after they leave or disconnect a new host will automatically be selected from the machines remaining in the session, and the HostChanged event will be raised to notify you of the change. Note that game simulation state is not automatically transferred during the migration process. It is usually relatively easy for peer-to-peer games to support host migration, but rather more difficult to make this work in a client/server architecture.

NetworkSession.AllowJoinInProgress Property

Gets or sets whether join-in-progress is allowed. If the host enables this setting, new machines will be able to join at any time. The default value is **false**, indicating that join-in-progress is disabled. **AllowJoinInProgress** can be read by any machine in the session, but can only be changed by the host.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool AllowJoinInProgress { get; set; }
```

Property Value

true to enable join-in-progress, **false** otherwise. The default value is **false**.

Exceptions

Exception type	Condition
NotSupportedException	Join-in-progress is not supported for multiplayer sessions of type NetworkSessionType.Ranked .
InvalidOperationException	This session is not the host, and cannot change the value of AllowJoinInProgress .
ObjectDisposedException	The session has been disposed.

Remarks When join-in-progress is disabled (the default state), new machines are only able to join while the session is in the lobby. The session will not be visible to matchmaking queries while in the actual gameplay state.

Determines whether all gamers are ready to enter the session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsEveryoneReady { get; }
```

Property Value

true if all gamers are ready to leave the lobby screen and begin gameplay. This state is indicated by a setting of **true** for the [IsReady](#) property.

NetworkSession.LocalGamers Property

Get the collection of local gamers for a multiplayer session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerCollection<LocalNetworkGamer> LocalGamers { get; }
```

Property Value

Collection of local gamers of a network session. For a complete collection of gamers, access the [AllGamers](#) property.

See Also

Reference

[NetworkSession Class](#)

[NetworkSession Members](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

NetworkSession.MaxGamers Property

Gets or sets the maximum number of players able to join this multiplayer session. The Zune platform supports up to eight players. All other platforms support up to 31 players.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int MaxGamers { get; set; }
```

Property Value

Maximum number of players supported by the multiplayer session. Only the host can modify this value.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<code>MaxGamers</code> must be between 2 and 31 players for Windows-based and Xbox 360–based games, and between 2 and 8 for Zune-based games.
ObjectDisposedException	This NetworkSession is disposed.
InvalidOperationException	This NetworkSession is not the host; therefore, it cannot set the property MaxGamers .

Remarks

Zune Specific Information

For Zune-based games, **MaxGamers** must be between 2 and 8, where 8 is the maximum number of players supported in the session.

Windows Specific Information

For Windows-based games, **MaxGamers** must be between 2 and 31, where 31 is the maximum number of players supported in a session.

Xbox 360 Specific Information

For Xbox 360–based games, **MaxGamers** must be between 2 and 31, where 31 is the maximum number of players supported in a session.

NetworkSession.PreviousGamers Property

A collection of previous gamers in the network session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerCollection<NetworkGamer> PreviousGamers { get; }
```

Property Value

A collection of gamers who once belonged to the current network session, but have since left.

RemarksThe number of gamers in the **PreviousGamers** collection will be equal to or less than the value of [MaxPreviousGamers](#). You can use this collection to include previous gamers in Guide calls that take a [Gamer](#) parameter.

NetworkSession.PrivateGamerSlots Property

Gets or sets the number of private slots reserved for gamers who join using an invitation.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int PrivateGamerSlots { get; set; }
```

Property Value

Number of private slots.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	There are not enough slots available to support this new value.
ObjectDisposedException	This NetworkSession is disposed.
InvalidOperationException	This NetworkSession is not the host, therefore it cannot set the property PrivateGamerSlots .

NetworkSession.RemoteGamers Property

Gets the collection of remote gamers for a multiplayer session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public GamerCollection<NetworkGamer> RemoteGamers { get; }
```

Property Value

Collection of remote gamers of a network session. For a complete collection of gamers, access the [AllGamers](#) property.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public NetworkSessionProperties SessionProperties { get; }
```

Property Value

Any custom properties that have been attached to the session.

RemarksThis [NetworkSessionProperties](#) is automatically synchronized across all the machines in the session, and can only be modified by the host. It can be used to filter sessions during matchmaking operations by passing in a set of required property values to [Find](#) or [BeginFind](#).

NetworkSession.SimulatedLatency Property

Gets or sets the amount of simulated network latency.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TimeSpan SimulatedLatency { get; set; }
```

Property Value

The amount of simulated network latency, in milliseconds. The default value is 0.

Remarks

SimulatedLatency is useful if you are testing a system link game on a fast local network and want to make sure it will also work correctly over the Internet. Xbox games are typically expected to work with up to 200 milliseconds of latency.

The latency simulation is applied on the sending machine, so if you set this property differently on each machine, only outgoing packets will be affected by the local value of the property. Latency introduced through this setting is not included in the [RoundtripTime](#) property, which always just reports the physical network latency.

Packets sent without any ordering guarantee will be given a random latency normally distributed around the specified value, introducing packet reordering as well as raw latency. Packets sent using [SendDataOptions.InOrder](#) will be delayed without reordering.

⚠ Caution

The packet loss and latency simulation in the XNA Framework applies to messages that are sent to all players, including local players. In game designs where data to local players is sent and received using the network session [SendData](#) methods, local players will experience the set values for simulated packet loss and latency. To work around this issue, avoid broadcasting messages to all users and set [SimulatedPacketLoss](#) and [SimulatedLatency](#) on a per-send basis.

NetworkSession.SimulatedPacketLoss Property

Gets or sets the amount of simulated packet loss.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public float SimulatedPacketLoss { get; set; }
```

Property Value

The amount of simulated packet loss, expressed as any fractional probability in the range 0 to 1, with 1 causing 100% packet loss. The default value is zero.

Remarks

SimulatedPacketLoss is useful if you are testing a system link game on a fast local network and want to make sure it will also work correctly over the Internet. Xbox games are typically expected to work with up to 0.1 (10%) packet loss.

The packet loss simulation is applied on the sending machine, so if you set this property differently on each machine, only outgoing packets will be affected by the local value of the property.

Packets sent using [SendDataOptions.Reliable](#) are not affected by this setting.

⚠ Caution

The packet loss and latency simulation in the XNA Framework applies to messages that are sent to all players, including local players. In game designs where data to local players is sent and received using the network session [SendData](#) methods, local players will experience the set values for simulated packet loss and latency. To work around this issue, avoid broadcasting messages to all users and set [SimulatedPacketLoss](#) and [SimulatedLatency](#) on a per-send basis.

NetworkSession.InviteAccepted Event

Event that occurs when a user has accepted an invitation to join a network session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static event EventHandler<InviteAcceptedEventArgs> InviteAccepted
```

Remarks

In addition to being sent if a player responds to a game invitation, this event is also sent to a title when a gamer requests to join an in-progress session by selecting **Join Session In Progress** from the gamer's friends list on the LIVE Guide.

Important

If your title does not register for the [InviteAccepted](#) event, its sessions will always show up as non-joinable.

Notification of this event may be delivered at any time. However, if the game has been launched in response to a cross-title invite, it will arrive as soon as the game starts. In this case, the event will be delivered as soon as the managed client subscribes to it.

In response to this event, games should end any existing network session and call [JoinInvited](#). There is no need to display any user interface before this. The system will already have prompted the user to confirm acceptance of the game invitation.

For more information, see [How To: Add Support for Game Invitations](#).

NetworkSessionJoinException Constructor

Creates an instance of **NetworkSessionJoinException**.

Overload List

Name	Description
NetworkSessionJoinException ()	Creates an empty instance of NetworkSessionJoinException .
NetworkSessionJoinException (SerializationInfo, StreamingContext)	Creates an instance of NetworkSessionJoinException with the specified streaming context.
NetworkSessionJoinException (String)	Creates an instance of NetworkSessionJoinException with the specified error message.
NetworkSessionJoinException (String, Exception)	Creates an instance of NetworkSessionJoinException with the specified error message and inner exception.
NetworkSessionJoinException (String, NetworkSessionJoinError)	Creates an instance of NetworkSessionJoinException with the specified error and additional information on the exception.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

NetworkSessionJoinException Constructor (SerializationInfo, StreamingContext)

Note

This constructor is available only when developing for Windows.

Creates an instance of **NetworkSessionJoinException** with the specified streaming context.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected NetworkSessionJoinException (  
    SerializationInfo info,  
    StreamingContext context  
)
```

Parameters

info

Describes information related to the session being joined when the exception occurred.

context

Describes the stream where the exception occurred.

NetworkSessionJoinException.GetObjectData Method

When overridden in a derived class, returns information about the exception. In addition to the base behavior, this method provides serialization functionality.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public override void GetObjectData (  
    SerializationInfo info,  
    StreamingContext context  
)
```

Parameters

info

Information necessary for serialization and deserialization of the session item.

context

Information necessary for the source and destination of a given serialized stream. Also provides an additional caller-defined context.

NetworkSessionProperties Members

The following tables list the members exposed by the NetworkSessionProperties type.

Public Constructors

Name	Description
 NetworkSessionProperties	Creates an empty instance of NetworkSessionProperties.

Public Properties

Name	Description
 Count	Gets the number of custom session properties.
 Item	Gets or sets a custom session property value at the specified index

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetEnumerator	Gets an enumerator for iterating over the custom property values.
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

Name	Description
 System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.IsReadOnly	Gets a value indicating whether the collection is read-only.
 System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.Add	The System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.Add interface method is not supported by NetworkSessionProperties .
 System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.Clear	The System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.Clear interface method is not supported by NetworkSessionProperties .
 System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.Contains	Checks whether the collection contains the specified value.
 System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.CopyTo	Copies the contents of the collection to an array.
 System.Collections.IEnumerable.GetEnumerator	Gets an enumerator for iterating over the custom property values.
 System.Collections.Generic.IList<System.Nullable<System.Int32>>.IndexOf	Gets the index of the specified value.
 System.Collections.Generic.IList<System.Nullable<System.Int32>>.Insert	The System.Collections.Generic.IList<System.Nullable<System.Int32>>.Insert interface method is not supported by NetworkSessionProperties .
 System.Collections.Generic.IList<System.Nullable<System.Int32>>.RemoveAt	The System.Collections.Generic.IList<System.Nullable<System.Int32>>.RemoveAt interface method is not supported by NetworkSessionProperties .
 System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.Remove	The System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.Remove interface method is not supported by NetworkSessionProperties .

Checks whether the collection contains the specified value.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private bool System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.Contains (
    Nullable<int> item
)
```

Parameters

item

The value to search for.

Return Value

true if the collection contains the specified value; **false** otherwise.

Copies the contents of the collection to an array.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
private void System.Collections.Generic.ICollection<System.Nullable<System.Int32>>.CopyTo (
    Nullable<int>[] array,
    int arrayIndex
)
```

Parameters

array

The array to receive the contents of the collection.

arrayIndex

Starting index for the copy operation.

NetworkSessionState Enumeration

Defines the different states of a multiplayer session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum NetworkSessionState
```

Members

Member name	Description
Lobby	The local machine joins the session, waiting in the pregame lobby. The GameStarted event is raised when gameplay begins.
Playing	The local machine joins the session, currently in the middle of gameplay. The GameEnded event is raised when the session returns to the lobby.
Ended	The local machine has left the current session or the session has ended. The SessionEnded event is raised at this time. The event's arguments describe the reason for the session ending.

NetworkSessionType Enumeration

Defines the different types of a multiplayer session.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public enum NetworkSessionType
```

Members

Member name	Description
Local	Does not involve any networking traffic, but can be used for split-screen gaming on a single Xbox 360 console. Creating a local network session may also make it easier to share code between local and online game modes.
SystemLink	Connect multiple Xbox 360 consoles or computers over a local subnet. These machines do not require a connection to Xbox LIVE or any LIVE accounts. However, connection to machines on different subnets is not allowed. If you are a Creators Club developer testing your game, you can use this type to connect an Xbox 360 console to a computer. However, cross-platform networking is not supported in games distributed to non-Creators Club community players.
PlayMatch	Uses the Xbox LIVE servers. This enables connection to other machines over the Internet. It requires a LIVE Silver Membership for Windows-based games or a LIVE Gold membership for Xbox 360 games. Games in development will also require an XNA Creators Club premium membership. While in trial mode, Indie games downloaded from Xbox LIVE Marketplace will not have access to LIVE matchmaking.
Ranked	All session matches are ranked. This option is available only for commercial games that have passed Xbox LIVE certification. Due to the competitive nature of the gameplay, this session type does not support join-in-progress.

PacketReader Class

Provides common functionality for efficiently reading incoming network packets.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public class PacketReader : BinaryReader
```

Remarks

Commonly, your multiplayer game should create a single **PacketReader** instance at startup and then reuse it whenever a packet needs to be read. To read the packet, pass the **PacketReader** instance to [ReceiveData](#) and then use various Read methods to extract the data.

QualityOfService Members

The following tables list the members exposed by the QualityOfService type.

Public Properties

Name	Description
 AverageRoundtripTime	Gets the average (median) round trip time of all the network packets that were sent during the quality of service measurement process.
 BytesPerSecondDownstream	Gets an estimate of the available downstream network bandwidth from the session host to this machine, measured in bytes per second.
 BytesPerSecondUpstream	Gets an estimate of the available upstream network bandwidth from this machine to the session host, measured in bytes per second.
 IsAvailable	Checks whether this quality of service operation has completed.
 MinimumRoundtripTime	Gets the minimum round trip time of any network packet that was sent during the quality of service measurement process.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Reference

[QualityOfService Class](#)

[Microsoft.Xna.Framework.Net Namespace](#)

QualityOfService.AverageRoundtripTime Property

Gets the average (median) round trip time of all the network packets that were sent during the quality of service measurement process.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public TimeSpan AverageRoundtripTime { get; }
```

Property Value

The average (median) round trip time of all the network packets that were sent during the quality of service measurement process. Will return zero if the query has not yet completed. You can check if the query is complete using [IsAvailable](#).

See Also

Reference

[QualityOfService Class](#)

[QualityOfService Members](#)

[Microsoft.Xna.Framework.Net Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

QualityOfService.BytesPerSecondDownstream Property

Gets an estimate of the available downstream network bandwidth from the session host to this machine, measured in bytes per second.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int BytesPerSecondDownstream { get; }
```

Property Value

An estimate of the available downstream network bandwidth from the session host to this machine, measured in bytes per second. Will return zero if the query has not yet completed. You can check if the query is complete using [IsAvailable](#).

Remarks

The bandwidth algorithm used for [BytesPerSecondUpstream](#) and [BytesPerSecondDownstream](#) gives only an estimate of bandwidth and there is a possibility it may not accurately reflect the true bandwidth provided by the player's internet service provider. To avoid inaccurately representing the true bandwidth to the player, games should avoid displaying [BytesPerSecondUpstream](#) and [BytesPerSecondDownstream](#).

Even though the results of these properties provide only rough estimates, the values can be useful for relative comparisons or host stack ranking. For instance, these properties might be used for choosing a host gaming machine with a bandwidth twice as large as another gaming machine or sorting a list based on bandwidth.

[Microsoft.Xna.Framework.Net Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

QualityOfService.BytesPerSecondUpstream Property

Gets an estimate of the available upstream network bandwidth from this machine to the session host, measured in bytes per second.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public int BytesPerSecondUpstream { get; }
```

Property Value

An estimate of the available upstream network bandwidth from this machine to the session host, measured in bytes per second. Will return zero if the query has not yet completed. You can check if the query is complete using [IsAvailable](#).

Remarks

The bandwidth algorithm used for [BytesPerSecondUpstream](#) and [BytesPerSecondDownstream](#) gives only an estimate of bandwidth and there is a possibility it may not accurately reflect the true bandwidth provided by the player's internet service provider. To avoid inaccurately representing the true bandwidth to the player, games should avoid displaying [BytesPerSecondUpstream](#) and [BytesPerSecondDownstream](#).

Even though the results of these properties provide only rough estimates, the values can be useful for relative comparisons or host stack ranking. For instance, these properties might be used for choosing a host gaming machine with a bandwidth twice as large as another gaming machine or sorting a list based on bandwidth.

QualityOfService.IsAvailable Property

Checks whether this quality of service operation has completed.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsAvailable { get; }
```

Property Value

true if quality of service data is available; **false** otherwise.

Remarks Matchmaking search results are returned before the quality of service probing has finished, so as to avoid an excessive delay before you can display the list of sessions to the user, but the quality of service checks continue in the background even after the search results are available. Initially the **IsAvailable** property will be set to **false**, and all the other properties will be zero, but after the probing finishes this will become true and the other properties will be filled in with some actual data.

SendDataOptions Enumeration

Defines options for network packet transmission.

Namespace: Microsoft.Xna.Framework.Net

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
[FlagsAttribute]
public enum SendDataOptions
```

Members

Member name	Description
None	<p>Sends the data with no guarantees.</p> <p>Packets of this type may be delivered in any order, with occasional packet loss.</p> <p>This is the most efficient option in terms of network bandwidth and machine resource usage. However, it is recommended only in situations where your game can recover from occasional packet loss.</p>
Reliable	<p>Sends the data with reliable delivery, but no special ordering.</p> <p>Packets of this type are resent until arrival at the destination. They may arrive out of order.</p>
InOrder	<p>Sends the data with guaranteed ordering, but without reliable delivery.</p> <p>Occasionally, packets of this type are not delivered. However, any delivered packets always arrive in the order in which they are sent.</p> <p>Use this option in situations where the transmitted value changes constantly. Old versions never arrive after a more recent version.</p>
ReliableInOrder	<p>Sends the data with reliability and arrival in the order originally sent.</p> <p>Packets of this type are resent until arrival and ordered internally. This means they arrive in the same order in which they were sent.</p> <p>In terms of network bandwidth usage, this is the strongest and most expensive option. Use this only when arrival and ordering are essential. Commonly, a game uses this option for a small percentage of packets. The majority of gameplay data is sent using <i>None</i> or <i>Reliable</i>.</p>
Chat	<p>Mark that this packet contains chat data, such as a player-to-player message string entered using the keyboard. To comply with international regulations, you must send such data without packet encryption. Therefore, you must use this flag to mark it. To maintain security, other game data should not use this flag. It is acceptable and efficient to mix encrypted and unencrypted data.</p> <p>If you send packets both with and without this flag within a single frame, both the encrypted and unencrypted data streams will be merged into a single wire packet. This option can be combined with either or both of the <i>Reliable</i> and <i>InOrder</i> flags. When you request in-order delivery for chat packets, they will be ordered relative to other chat packets, but they may arrive out of order with respect to other non-chat data.</p>

StorageContainer Members

The following tables list the members exposed by the StorageContainer type.

Public Properties

	Name	Description
	IsDisposed	Gets a value that indicates whether the object is disposed.
	Path	Gets the file path to the location of the user's save game files.
	StorageDevice	Gets the StorageDevice that holds the files in this container.
	TitleLocation	Gets the file path to the location of the title storage space.
	TitleName	Gets the name of the title.

Public Methods

	Name	Description
	Dispose	Immediately releases the unmanaged resources used by this object.
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description
	Finalize	Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.
	MemberwiseClone	(Inherited from Object .)

Public Events

	Name	Description
	Disposing	Occurs when Dispose is called or when this object is finalized and collected by the garbage collector of the Microsoft .NET common language runtime.

Reference

[StorageContainer Class](#)

[Microsoft.Xna.Framework.Storage Namespace](#)

StorageContainer.Dispose Method

Immediately releases the unmanaged resources used by this object.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void Dispose ()
```

Remarks

After the [StorageContainer](#) has been opened on a [StorageDevice](#), changes to the files within the container are cached until the container is disposed. If the storage device is removed or the Xbox 360 is powered down before the container is disposed, any changes are lost.

See Also

Reference

[StorageContainer Class](#)

[StorageContainer Members](#)

[OpenContainer](#)

[Microsoft.Xna.Framework.Storage Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

StorageContainer.Finalize Method

Allows this object to attempt to free resources and perform other cleanup operations before garbage collection reclaims the object.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected override void Finalize ()
```

Remarks

This method overrides [System.Object.Finalize](#). Application code should not call this method. An object's [Finalize](#) method is automatically invoked during garbage collection, unless a call to the [GC.SuppressFinalize](#) method has disabled finalization by the garbage collector.

StorageContainer Properties

Public Properties

	Name	Description
	IsDisposed	Gets a value that indicates whether the object is disposed.
	Path	Gets the file path to the location of the user's save game files.
	StorageDevice	Gets the StorageDevice that holds the files in this container.
 S	TitleLocation	Gets the file path to the location of the title storage space.
	TitleName	Gets the name of the title.

See Also

Reference

[StorageContainer Class](#)

[Microsoft.Xna.Framework.Storage Namespace](#)

StorageContainer.IsDisposed Property

Gets a value that indicates whether the object is disposed.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public bool IsDisposed { get; }
```

Property Value

true if the object is disposed; **false** otherwise.

See Also

Reference

[StorageContainer Class](#)

[StorageContainer Members](#)

[Microsoft.Xna.Framework.Storage Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

StorageContainer.Path Property

Gets the file path to the location of the user's save game files.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string Path { get; }
```

Property Value

The file path to the location of the user's save game files.

See Also

Reference

[StorageContainer Class](#)

[StorageContainer Members](#)

[Microsoft.Xna.Framework.Storage Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

StorageContainer.StorageDevice Property

Gets the [StorageDevice](#) that holds the files in this container.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public StorageDevice StorageDevice { get; }
```

Property Value

The [StorageDevice](#) that holds the files in this container.

See Also

Reference

[StorageContainer Class](#)

[StorageContainer Members](#)

[Microsoft.Xna.Framework.Storage Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

StorageContainer.TitleLocation Property

Gets the file path to the location of the title storage space.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public static string TitleLocation { get; }
```

Property Value

The title's install location based on the current platform.

Remarks

Use this member to create full paths to files in the same location as the game executable. For example:

C#

```
using System;
using System.Collections.Generic;
using Microsoft.Xna.Framework;
using Microsoft.Xna.Framework.GamerServices;
using Microsoft.Xna.Framework.Graphics;
using Microsoft.Xna.Framework.Input;
using Microsoft.Xna.Framework.Storage;
using System.IO;
using System.Xml.Serialization;
using System.Diagnostics;
/// <summary>
/// This method opens a file using System.IO classes and the
/// TitleLocation property. It presumes that a file named
/// ship.dds has been deployed alongside the game.
/// </summary>
private static void DoOpenFile()
{
    FileStream file = OpenTitleFile(
        "ship.dds", FileMode.Open, FileAccess.Read);
    Console.WriteLine("File Size: " + file.Length);
    file.Close();
}
private static FileStream OpenTitleFile(
    string filename, FileMode mode, FileAccess access)
{
    string fullpath = Path.Combine(StorageContainer.TitleLocation, filename);
    return File.Open(fullpath, mode, access);
}
```

StorageContainer.TitleName Property

Gets the name of the title.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public string TitleName { get; }
```

Property Value

The name of the title.

Remarks

This is the same as the *titleName* passed to [OpenContainer](#).

Reference

[StorageDevice Class](#)

[Microsoft.Xna.Framework.Storage Namespace](#)

StorageDevice.DeleteContainer Method

Deletes a storage container without opening it. You can do this even if the container is corrupted.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public void DeleteContainer (
    string titleName
)
```

Parameters

titleName

The name of the storage container to delete.

Exceptions

Exception type	Condition
ArgumentNullException	<i>titleName</i> is null .
InvalidOperationException	The container is currently open. A container cannot be deleted if it is open.  Note No exception will be thrown if the container does not exist.

Remarks

The string passed to *titleName* must be the same string used with [StorageDevice.OpenContainer](#).

Usually a storage container is closed with [StorageContainer.Dispose](#) so that it can be re-opened with its data intact. Use [DeleteContainer](#) only when you want to delete the data permanently or when you determine the storage container has been corrupted.

See the [Storage Overview](#) for more information about using storage containers in your title.

See Also

Reference

[StorageDevice Class](#)

[StorageDevice Members](#)

[Microsoft.Xna.Framework.Storage Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

StorageDevice.OpenContainer Method

Opens a [StorageContainer](#) containing any files for the specified title.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public StorageContainer OpenContainer (
    string titleName
)
```

Parameters

titleName

The name of the XNA Framework title.

Return Value

A [StorageContainer](#) containing any files for the title.

Exceptions

Exception type	Condition
ArgumentNullException	<i>titleName</i> is null .
InvalidOperationException	A container is already open for the PlayerIndex set in BeginShowStorageDeviceSelector . A new container cannot be opened until all previous containers used by this PlayerIndex have been disposed.

Remarks

titleName should be a constant human readable string used to identify your title and generate a title-unique storage location.

After the container has been opened, changes to the files within the container are cached until the container is disposed. For this reason, only one container per profile can be opened at the same time on the same device.

If the storage device is removed or the Xbox 360 console is powered down before the container is disposed, any changes are lost.

Call the [Dispose](#) method to dispose a [StorageContainer](#).

StorageDeviceNotConnectedException Constructor

Initializes a new instance of this class.

Overload List

Name	Description
StorageDeviceNotConnectedException ()	Initializes a new instance of this class.
StorageDeviceNotConnectedException (SerializationInfo, StreamingContext)	Initializes a new instance of this class during deserialization.
StorageDeviceNotConnectedException (String)	Initializes a new instance of this class with a specified error message.
StorageDeviceNotConnectedException (String, Exception)	Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

See Also

Reference

[StorageDeviceNotConnectedException Class](#)

[StorageDeviceNotConnectedException Members](#)

[Microsoft.Xna.Framework.Storage Namespace](#)

StorageDeviceNotConnectedException Constructor ()

Initializes a new instance of this class.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public StorageDeviceNotConnectedException ()
```

Remarks

This constructor initializes the [Message](#) property of the new instance to a system-supplied message that describes the error, such as "A file read or write operation failed." This message takes into account the current system culture.

The following table shows the initial property values for an instance of [StorageDeviceNotConnectedException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

[Microsoft.Xna.Framework.Storage Namespace](#)

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

StorageDeviceNotConnectedException Constructor (SerializationInfo, StreamingContext)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of this class during deserialization.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
protected StorageDeviceNotConnectedException (  
    SerializationInfo info,  
    StreamingContext context  
)
```

Parameters

info

The information needed to serialize an object.

context

The source or destination for the serialization stream.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

An exception that is thrown as a direct result of a previous exception should include a reference to the previous exception in the [InnerException](#) property. The [InnerException](#) property returns the same value that is passed into the constructor, or a null reference if the [InnerException](#) property does not supply the inner exception value to the constructor.

[StorageDeviceNotConnectedException Members](#)

[Microsoft.Xna.Framework.Storage Namespace](#)

PlatformsWindows XP SP2, Windows Vista

StorageDeviceNotConnectedException Constructor (String)

Initializes a new instance of this class with a specified error message.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public StorageDeviceNotConnectedException (  
    string message  
)
```

Parameters

message

A message that describes the error.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

The following table shows the initial property values for an instance of [StorageDeviceNotConnectedException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

Platforms Xbox 360, Windows XP SP2, Windows Vista, Zune

StorageDeviceNotConnectedException Constructor (String, Exception)

Initializes a new instance of this class with a specified error message and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework.Storage

Assembly: Microsoft.Xna.Framework (in microsoft.xna.framework.dll)

Syntax

C#

```
public StorageDeviceNotConnectedException (  
    string message,  
    Exception innerException  
)
```

Parameters

message

A message that describes the error.

innerException

The exception that is the cause of the current exception. If the *innerException* parameter is not a null reference, the current exception is raised in a catch block that handles the inner exception.

Remarks

The content of the message parameter is intended to be understood by humans. The caller of this constructor is required to ensure that this string has been localized for the current system culture.

An exception that is thrown as a direct result of a previous exception should include a reference to the previous exception in the [InnerException](#) property. The [InnerException](#) property returns the same value that is passed into the constructor, or a null reference if the [InnerException](#) property does not supply the inner exception value to the constructor.

The following table shows the initial property values for an instance of [StorageDeviceNotConnectedException](#).

Property	Value
InnerException	A null reference.
Message	The localized error message string.

Content Pipeline Class Library

The Content Pipeline class library is a library of classes, interfaces, and value types that are included in XNA Game Studio. This library provides access to XNA Framework Content Pipeline functionality and is designed to be the foundation on which Content Pipeline–related applications, components, and controls are built.

Namespaces

[Microsoft.Xna.Framework.Content.Pipeline](#)

Provides classes representing base types and building block functionality for use by more specialized object models, such as the Graphics DOM.

[Microsoft.Xna.Framework.Content.Pipeline.Audio](#)

Provides intermediate classes and types for representing and manipulating graphics audio data.

[Microsoft.Xna.Framework.Content.Pipeline.Graphics](#)

Provides intermediate classes and types for representing and manipulating graphics data.

[Microsoft.Xna.Framework.Content.Pipeline.Processors](#)

Provides base classes that represent processors used by the XNA Framework Content Pipeline when processing specific game asset types.

[Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler](#)

Provides base classes that represent compilers and writers used by the XNA Framework Content Pipeline when processing specific game asset types.

[Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate](#)

Provides base classes that represent the creation and writing of intermediate content for game asset types processed by the XNA Framework Content Pipeline.

[Microsoft.Xna.Framework.Content.Pipeline.Tasks](#)

Provides support for importing and processing game assets into the binary format that is used by the content loader of a game project.

Microsoft.Xna.Framework.Content.Pipeline Namespace

Note

This namespace is available only when developing for Windows.

Provides classes representing base types and building block functionality for use by more specialized object models, such as the Graphics DOM.

Classes

Name	Description
ChildCollection	Provides a collection of child objects for a content item.
ContentBuildLogger	Provides methods for reporting informational messages or warnings from content importers and processors.
ContentIdentity	Provides properties describing the origin of the game asset, such as the original source file and creation tool. This information is used for error reporting, and by processors that need to determine from what directory the asset was originally loaded.
ContentImporter	Implements a file format importer for use with game assets.
ContentImporterAttribute	Provides properties that identify and provide metadata about the importer, such as supported file extensions and caching information.
ContentImporterContext	Provides properties that define logging behavior for the importer.
ContentItem	Provides properties that define various aspects of content stored using the intermediate file format of the XNA Framework.
ContentProcessor	Provides a base class to use when developing custom processor components. All processors must derive from this class.
ContentProcessorAttribute	Gets any existing content processor components.
ContentProcessorContext	Provides access to custom processor parameters, methods for converting member data, and triggering nested builds.
ExternalReference	Specifies external references to a data file for the content item.
FontDescriptionImporter	Provides methods for reading .spritefont files for use in the Content Pipeline.
InvalidContentException	Thrown when errors are encountered in content during processing.
NamedValueDictionary	Base class for dictionaries that map string identifiers to data values.
OpaqueDataDictionary	Provides properties that define opaque data for a game asset.
PipelineComponentScanner	Implements a scanner object containing the available importers and processors for an application.
PipelineException	Thrown when errors are encountered during a content pipeline build.
ProcessorParameter	Represents a processor parameter.
ProcessorParameterCollection	Represents a collection of processor parameters , usually for a single processor.
VideoContent	Provides a base class for all video objects.
XmlImporter	Implements an importer for reading intermediate XML files.

Interfaces

Name	Description
------	-------------

 IContentImporter	Accesses a statically typed ContentImporter instance from generic code using dynamic typing.
 IContentProcessor	Provides methods and properties for accessing a statically typed ContentProcessor subclass, using dynamically typed object data.

ChildCollection Generic Class

Note

This generic class is available only when developing for Windows.

Provides a collection of child objects for a content item.

Links from a child object to its parent are maintained as the collection contents are modified.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract class ChildCollection<TParent,TChild> : Collection<TChild>
```

See Also

Reference

Note

This method is available only when developing for Windows.

Gets the parent of a child object.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected abstract TParent GetParent (  
    TChild child  
)
```

Parameters

child

The child of the parent being retrieved.

Return Value

The parent of the child object.

ContentBuildLogger.GetCurrentFilename Method

Note

This method is available only when developing for Windows.

Gets the filename currently being processed, for use in warning and error messages.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected string GetCurrentFilename (  
    ContentIdentity contentIdentity  
)
```

Parameters

contentIdentity

Identity of a content item. If specified, **GetCurrentFilename** uses this value to refine the search. If no value is specified, the current [PushFile](#) state is used.

Return Value

Name of the file being processed.

ContentBuildLogger.LogImportantMessage Method

Note

This method is available only when developing for Windows.

Outputs a high-priority status message from a content importer or processor.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract void LogImportantMessage (
    string message,
    Object[] messageArgs
)
```

Parameters

message

Message being reported.

messageArgs

[[ParamArrayAttribute](#)] Arguments for the reported message.

Remarks

Use **LogImportantMessage** only for important information, because these messages appear in the **Output** window of Visual Studio. Importers and processors should use this functionality only for unusual or unexpected situations.

ContentBuildLogger.LogMessage Method

Note

This method is available only when developing for Windows.

Outputs a low priority status message from a content importer or processor.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract void LogMessage (
    string message,
    Object[] messageArgs
)
```

Parameters

message

Message being reported.

messageArgs

[[ParamArrayAttribute](#)] Arguments for the reported message.

Remarks

This message will not usually appear in the **Build Output** window of Visual Studio, but it can be viewed if the content pipeline is called directly from an MSBuild task.

ContentBuildLogger.LogWarning Method

Note

This method is available only when developing for Windows.

Outputs a warning message from a content importer or processor.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract void LogWarning (
    string helpLink,
    ContentIdentity contentIdentity,
    string message,
    Object[] messageArgs
)
```

Parameters

helpLink

Link to an existing online help topic containing related information.

contentIdentity

Identity of the content item that generated the message.

message

Message being reported.

messageArgs

[[ParamArrayAttribute](#)] Arguments for the reported message.

Remarks

Use **LogWarning** only for important information, because these messages appear in the **Error List** window of Visual Studio. The message text should indicate what steps need to be taken to correct the problem.

ContentBuildLogger Properties

Public Properties

	Name	Description
	LoggerRootDirectory	Gets or sets the base reference path used when reporting errors during the content build process.

See Also

Reference

[ContentBuildLogger Class](#)

[Microsoft.Xna.Framework.Content.Pipeline Namespace](#)

ContentBuildLogger.LoggerRootDirectory Property

Note

This property is available only when developing for Windows.

Gets or sets the base reference path used when reporting errors during the content build process.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public string LoggerRootDirectory { get; set; }
```

Property Value

Current name of the base directory or the value to be set.

Remarks

When building XNA content, all errors are displayed in the Error List Window of Visual Studio. Along with the data that triggered the error, the Error List displays the path and filename where the offending data was encountered.

By default, the path of the offending file that is reported in the Error List is always expressed as it relates to the location of the project file that references it.

When set, the **LoggerRootDirectory** property specifies an explicit base path for error reporting that overrides the default operation. All offending files reported in the Error List will be expressed as they relate to the base path set in **LoggerRootDirectory**.

ContentImporter Generic Class

Note

This generic class is available only when developing for Windows.

Implements a file format importer for use with game assets.

Importers, either provided by the framework or written by a developer, must derive from **ContentImporter**, as well as being marked with a [ContentImporterAttribute](#).

An importer should produce results in the standard intermediate object model. If an asset has information not supported by the object model, the importer should output it as opaque data (key/value attributes attached to the relevant object). By following this procedure, a content pipeline can access specialized digital content creation (DCC) tool information, even when that information has not been fully standardized into the official object model.

You can also design custom importers that accept and import types containing specific third-party extensions to the object model.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract class ContentImporter<T> : IContentImporter
```

ContentImporter.Import Method

Note

This method is available only when developing for Windows.

Called by the framework when importing a game asset. This is the method called by XNA when an asset is to be imported into an object that can be recognized by the Content Pipeline.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract T Import (  
    string filename,  
    ContentImporterContext context  
)
```

Parameters

filename

Name of a game asset file.

context

Contains information for importing a game asset, such as a logger interface.

Return Value

Resulting game asset.

ContentImporterAttribute Constructor (String)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of [ContentImporterAttribute](#) and sets the file name extension supported by the importer.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public ContentImporterAttribute (  
    string fileExtension  
)
```

Parameters

fileExtension

The list of file name extensions supported by the importer. Prefix each extension with a '.'.

Reference

[ContentImporterAttribute Class](#)

[Microsoft.Xna.Framework.Content.Pipeline Namespace](#)

ContentImporterAttribute.CacheImportedData Property

Note

This property is available only when developing for Windows.

Gets and sets the caching of the content during importation.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool CacheImportedData { get; set; }
```

Property Value

If **true**, imported content is cached in an intermediate file (managed by XNA). By default, caching is not enabled.

Caching provides significantly faster iteration times when changing the processing code for a file format. A good example would be a third-party digital content creation (DCC) tool that needs to execute before importation can occur. However, caching is not appropriate for all importers—for example, caching bulky content that is quick to import, such as bitmap images.

ContentImporterContext.AddDependency Method

Note

This method is available only when developing for Windows.

Adds a dependency to the specified file. This causes a rebuild of the file, when modified, on subsequent incremental builds.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void AddDependency (  
    string filename  
)
```

Parameters

filename

Name of an asset file.

RemarksDo not call this method for the main file passed to the [Import](#) method. It is only required for additional files needing to be read by the importer.

C#

```
public void AddDependency (  
    string filename  
)
```

Parameters

filename

Name of an asset file.

Remarks Do not call this method for data that has already been loaded by an importer or passed to the [BuildAndLoadAsset](#) method. It is only required for additional files needing to be read by the processor.

ContentProcessorContext.AddOutputFile Method

Note

This method is available only when developing for Windows.

Add a file name to the list of related output files maintained by the build item. This allows tracking build items that build multiple output files.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void AddOutputFile (  
    string filename  
)
```

Parameters

filename

The name of the file.

ContentProcessorContext.BuildAndLoadAsset Generic Method (Generic ExternalReference, String)

Note

This generic method is available only when developing for Windows.

Initiates a nested build of the specified asset and then loads the result into memory.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public TOutput BuildAndLoadAsset<TInput,TOutput> (  
    ExternalReference<TInput> sourceAsset,  
    string processorName  
)
```

Type Parameters

TInput

Type of the input.

TOutput

Type of the converted output.

Parameters

sourceAsset

Reference to the source asset.

processorName

Optional processor for this content.

Return Value

Copy of the final converted content.

Remarks

An example of usage would be a mesh processor calling **BuildAndLoadAsset** to build any associated textures and replace the original .tga file references with an embedded copy of the converted texture.

ContentProcessorContext.BuildAndLoadAsset Generic Method (Generic ExternalReference, String, OpaqueDataDictionary, String)

Note

This generic method is available only when developing for Windows.

Initiates a nested build of the specified asset and then loads the result into memory.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public TOutput BuildAndLoadAsset<TInput,TOutput> (  
    ExternalReference<TInput> sourceAsset,  
    string processorName,  
    OpaqueDataDictionary processorParameters,  
    string importerName  
)
```

Type Parameters

TInput

Type of the input.

TOutput

Type of the converted output.

Parameters

sourceAsset

Reference to the source asset.

processorName

Optional processor for this content.

processorParameters

Optional collection of named values available as input to the content processor.

importerName

Optional importer for this content.

Return Value

Copy of the final converted content.

Remarks

An example of usage would be a mesh processor calling **BuildAndLoadAsset** to build any associated textures and replace the original .tga file references with an embedded copy of the converted texture.

ContentProcessorContext.BuildAsset Generic Method (Generic ExternalReference, String)

Note

This generic method is available only when developing for Windows.

Initiates a nested build of an additional asset.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public ExternalReference<TOutput> BuildAsset<TInput,TOutput> (  
    ExternalReference<TInput> sourceAsset,  
    string processorName  
)
```

Type Parameters

TInput

Type of the input.

TOutput

Type of the output.

Parameters

sourceAsset

Reference to the source asset.

processorName

Optional processor for this content.

Return Value

Reference to the final compiled content. The build work is not required to complete before returning. Therefore, this file may not be up to date when **BuildAsset** returns but it will be available for loading by the game at runtime.

Remarks

An example of usage for **BuildAsset** is being called by a mesh processor to request that any related textures used are also built, replacing the original TGA file references with new references to the converted texture files.

ExternalReference Generic Class

Note

This generic class is available only when developing for Windows.

Specifies external references to a data file for the content item.

While the object model is instantiated, reference file names are absolute. When the file containing the external reference is serialized to disk, file names are relative to the file. This allows movement of the content tree to a different location without breaking internal links.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public sealed class ExternalReference<T> : ContentItem
```

Initializes a new instance of [ExternalReference](#).

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public ExternalReference (  
    string filename  
)
```

Parameters

filename

The name of the referenced file.

See Also

Reference

[ExternalReference Generic Class](#)

[ExternalReference Members](#)

[Microsoft.Xna.Framework.Content.Pipeline Namespace](#)

PlatformsWindows XP SP2, Windows Vista

ExternalReference Constructor (String, ContentIdentity)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of [ExternalReference](#), specifying the file path relative to another content item.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public ExternalReference (
    string filename,
    ContentIdentity relativeToContent
)
```

Parameters

filename

The name of the referenced file.

relativeToContent

The content that the path specified in *filename* is relative to.

Exceptions

Exception type	Condition
ArgumentNullException	<i>filename</i> , <i>relativeToContent</i> , or the SourceFilename property of <i>relativeToContent</i> is null .

Remarks

This method constructs a reference to the specified file. If the file name contains a relative path, it is made absolute based on the [SourceFilename](#) property of *relativeToContent*. This can be useful in a custom content processor for constructing references to texture or effect files relative to the [Identity](#) property of the mesh being processed.

FontDescriptionImporter Class

Note

This class is available only when developing for Windows.

Provides methods for reading .spritefont files for use in the Content Pipeline.

Note

As with most types of software, font files are licensed rather than sold. Font licenses vary from vendor to vendor, but most don't allow redistribution of the fonts, and that includes redistribution of reproductions such as bitmaps containing the rasterized character set. This is even true of many of the licenses covering fonts that Microsoft supplies with applications and Windows. Be careful, therefore, to ensure that you have the required license rights to redistribute any font you include as a bitmap containing the rasterized character set in your game!

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[ContentImporterAttribute(".spritefont")]  
public class FontDescriptionImporter : ContentImporter<FontDescription>
```

FontDescriptionImporter.Import Method

Note

This method is available only when developing for Windows.

Called by the XNA Framework when importing a .spritefont file to be used as a game asset. This is the method called by the XNA Framework when an asset is to be imported into an object that can be recognized by the Content Pipeline.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override FontDescription Import (
    string filename,
    ContentImporterContext context
)
```

Parameters

filename

Name of a game asset file.

context

Contains information for importing a game asset, such as a logger interface.

Return Value

Resulting game asset.

Exceptions

Exception type	Condition
ArgumentNullException	<i>filename</i> is null .
SecurityException	Sufficient permissions are not available to access <i>filename</i> .
FileNotFoundException	The file identified by the <i>filename</i> does not exist.
UriFormatException	The format of <i>filename</i> is not correct.
InvalidContentException	The XML in <i>filename</i> is either badly formed or does not represent a FontDescription object.

IContentProcessor.OutputType Property

Note

This property is available only when developing for Windows.

Gets the object type returned by [IContentProcessor.Process](#).

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract Type OutputType { get; }
```

Property Value

Type of object returned by the processor.

InvalidContentException Class

Note

This class is available only when developing for Windows.

Thrown when errors are encountered in content during processing.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[SerializableAttribute]  
public class InvalidContentException : Exception
```

Remarks

InvalidContentException is an exception that any importer or content processor can throw to indicate a problem with the current content file. Exceptions of this type are presented differently from all other exceptions the pipeline throws. Exceptions of this type indicate a problem in the content. Other exceptions the content pipeline throws indicate a problem with the pipeline code itself. The **InvalidContentException** class has properties that identify the content file with the problem, if available.

InvalidContentException Constructor (SerializationInfo, StreamingContext)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of the [InvalidContentException](#) class with information on serialization and streaming context for the related content item.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected InvalidContentException (  
    SerializationInfo serializationInfo,  
    StreamingContext streamingContext  
)
```

Parameters

serializationInfo

Information necessary for serialization and deserialization of the content item.

streamingContext

Information necessary for the source and destination of a given serialized stream. Also provides an additional caller-defined context.

InvalidContentException Constructor (String, ContentIdentity)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of the [InvalidContentException](#) class with the specified error message and the identity of the content throwing the exception.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public InvalidContentException (  
    string message,  
    ContentIdentity contentIdentity  
)
```

Parameters

message

A message that describes the error.

contentIdentity

Information about the content item that caused this error, including the file name. In some cases, a location within the file (of the problem) is specified.

InvalidContentException Constructor (String, ContentIdentity, Exception)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of the [InvalidContentException](#) class with the specified error message, the identity of the content throwing the exception, and a reference to the inner exception that is the cause of this exception.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public InvalidContentException (
    string message,
    ContentIdentity contentIdentity,
    Exception innerException
)
```

Parameters

message

A message that describes the error.

contentIdentity

Information about the content item that caused this error, including the file name. In some cases, a location within the file (of the problem) is specified.

innerException

The exception that is the cause of the current exception. If *innerException* is not a null reference, the current exception is raised in a catch block that handles the inner exception.

InvalidContentException.GetObjectData Method

Note

This method is available only when developing for Windows.

When overridden in a derived class, returns information about the exception.

In addition to the base behavior, this method provides serialization functionality.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override void GetObjectData (  
    SerializationInfo info,  
    StreamingContext context  
)
```

Parameters

info

Information necessary for serialization and deserialization of the content item.

context

Information necessary for the source and destination of a given serialized stream. Also provides an additional caller-defined context.

NamedValueDictionary Members

The following tables list the members exposed by the NamedValueDictionary type.

Public Constructors

Name	Description
NamedValueDictionary	Initializes an instance of NamedValueDictionary .

Public Properties

Name	Description
Count	Gets the number of items in the dictionary.
Item	Gets or sets the specified item.
Keys	Gets all keys contained in the dictionary.
Values	Gets all values contained in the dictionary.

Protected Properties

Name	Description
DefaultSerializerType	Specifies the type hint for the intermediate serializer.

Public Methods

Name	Description
Add	Adds the specified key and value to the dictionary.
Clear	Removes all keys and values from the dictionary.
ContainsKey	Determines whether the specified key is present in the dictionary.
Equals	(Inherited from Object .)
GetEnumerator	Gets an enumerator that iterates through items in a dictionary.
GetHashCode	(Inherited from Object .)
GetType	(Inherited from Object .)
ReferenceEquals	(Inherited from Object .)
Remove	Removes the specified key and value from the dictionary.
ToString	(Inherited from Object .)
TryGetValue	Gets the value associated with the specified key.

Protected Methods

Name	Description
AddItem	Adds an element to the dictionary.
ClearItems	Removes all elements from the dictionary.
Finalize	(Inherited from Object .)
MemberwiseClone	(Inherited from Object .)
RemoveItem	Removes the specified element from the dictionary.
SetItem	Modifies the value of an existing element.

Explicit Interface Implementations

Name	Description
System.Collections.Generic.ICollection<System.Collections.Generic.KeyValuePair<System.String,T>>.IsReadOnly	Gets a value indicating if this object is read-only.
System.Collections.Generic.ICollection<System.Collections.Generic.KeyValuePair<System.String,T>>.Add	Adds an item to the collection.
System.Collections.Generic.ICollection<System.Collections.Generic.KeyValuePair<System.String,T>>.Contains	Determines whether the collection contains a specific value.
System.Collections.Generic.ICollection<System.Collections.Generic.KeyValuePair<System.String,T>>.CopyTo	Copies the elements of the collection to an array, starting at a specified index.
System.Collections.IEnumerable.GetEnumerator	Returns an enumerator that can iterate through this collection.
System.Collections.Generic.ICollection<System.Collections.Generic.KeyValuePair<System.String,T>>.Remove	Removes the first occurrence of the specified object from the collection.

NamedValueDictionary.TryGetValue Method

Note

This method is available only when developing for Windows.

Gets the value associated with the specified key.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool TryGetValue (  
    string key,  
    out T value  
)
```

Parameters

key

Identity of the key of the element whose value is to be retrieved.

value

[[OutAttribute](#)] The current value of the element.

Return Value

true if the value is present; **false** otherwise.

Remarks

If the key was not found, *value* gets the appropriate default value for the type **T**. For example, 0 (zero) for integer types, **false** for Boolean types, and a **null** reference for reference types.

Note

This property is available only when developing for Windows.

Gets or sets the specified item.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public T this [
    string key
] { get; set; }
```

Property Value

Identity of a key.

OpaqueDataDictionary Class

Note

This class is available only when developing for Windows.

Provides properties that define opaque data for a game asset.

Opaque data is any data that is not explicitly supported by the XNA object model. In addition, the opaque data can be of any managed data type.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public sealed class OpaqueDataDictionary : NamedValueDictionary<Object>
```

OpaqueDataDictionary Members

The following tables list the members exposed by the OpaqueDataDictionary type.

Public Constructors

Name	Description
 OpaqueDataDictionary	Initializes a new instance of OpaqueDataDictionary .

Public Properties

Name	Description
 Count	(Inherited from NamedValueDictionary .)
 Item	(Inherited from NamedValueDictionary .)
 Keys	(Inherited from NamedValueDictionary .)
 Values	(Inherited from NamedValueDictionary .)

Protected Properties

Name	Description
 DefaultSerializerType	Specifies the type hint for the intermediate serializer.

Public Methods

Name	Description
 Add	(Inherited from NamedValueDictionary .)
 AddItem	Overloaded. Adds an element to the dictionary.
 Clear	(Inherited from NamedValueDictionary .)
 ContainsKey	(Inherited from NamedValueDictionary .)
 Equals	(Inherited from Object .)
 GetContentAsXml	Gets the data contents and returns it as a single XML string.
 GetEnumerator	(Inherited from NamedValueDictionary .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 GetValue	Gets the value of the specified key/value pair of the asset.
 ReferenceEquals	(Inherited from Object .)
 Remove	(Inherited from NamedValueDictionary .)
 SetItem	Overloaded. Modifies the value of an existing element.
 ToString	(Inherited from Object .)
 TryGetValue	(Inherited from NamedValueDictionary .)

Protected Methods

Name	Description
 ClearItems	Removes all elements from the dictionary.
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)
 RemoveItem	Removes the specified element from the dictionary.

OpaqueDataDictionary.AddItem Method (String, Object)

Note

This method is available only when developing for Windows.

Adds an element to the dictionary.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected override void AddItem (  
    string key,  
    Object value  
)
```

Parameters

key

Identity of the key of the new element.

value

The value of the new element.

OpaqueDataDictionary.GetContentAsXml Method

Note

This method is available only when developing for Windows.

Gets the data contents and returns it as a single XML string. This format is useful for doing deep equality comparison or object hashing.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public string GetContentAsXml ()
```

Return Value

Data contents of the entry.

OpaqueDataDictionary.GetValue Generic Method

Note

This generic method is available only when developing for Windows.

Gets the value of the specified key/value pair of the asset.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public T GetValue<T> (  
    string key,  
    T defaultValue  
)
```

Type Parameters

T

Parameters

key

The name of the key.

defaultValue

The value to return if the key cannot be found. This can be **null** for reference types, 0 for primitive types, and a zero-filled structure for structure types.

Return Value

The value of the retrieved opaque data.

Remarks

GetValue looks only for values of a specific type. If the entry is of a different type, the *defaultvalue* is returned.

OpaqueDataDictionary.RemoveItem Method

Note

This method is available only when developing for Windows.

Removes the specified element from the dictionary.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected override bool RemoveItem (  
    string key  
)
```

Parameters

key

Identity of the key of the data pair to be removed.

Return Value

true if the value is present; **false** otherwise.

PipelineComponentScanner.Update Method

Updates the scanner object with the latest available assembly states.

Overload List

Name	Description
PipelineComponentScanner.Update (Generic IEnumerable)	Updates the scanner object with the latest available assembly states.
PipelineComponentScanner.Update (Generic IEnumerable, Generic IEnumerable)	Updates the scanner object with the latest available assembly states.

See Also

Reference

[PipelineComponentScanner Class](#)

[PipelineComponentScanner Members](#)

[Microsoft.Xna.Framework.Content.Pipeline Namespace](#)

PipelineComponentScanner.Update Method (Generic IEnumerable)

Note

This method is available only when developing for Windows.

Updates the scanner object with the latest available assembly states.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool Update (  
    IEnumerable<string> pipelineAssemblies  
)
```

Parameters

pipelineAssemblies

Enumerated list of available assemblies.

Return Value

true if an actual scan was required, indicating the collection contents may have changed. **false** if no assembly changes were detected since the previous call.

Remarks

After **Update** is called, the [Importer*](#) and [Processor*](#) properties contain any new information. If any errors occurred during the scan, they are stored in the [Errors](#) property.

Since **Update** uses assembly file time stamps, trivial reject situations (where nothing has changed) are detected. Therefore, **Update** can be called frequently.

Updates the scanner object with the latest available assembly states.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool Update (  
    IEnumerable<string> pipelineAssemblies,  
    IEnumerable<string> pipelineAssemblyDependencies  
)
```

Parameters

pipelineAssemblies

Enumerated list of available assemblies.

pipelineAssemblyDependencies

Enumerated list of dependent assemblies.

Return Value

true if an actual scan was required, indicating the collection contents may have changed. **false** if no assembly changes were detected since the previous call.

Creates an instance of [PipelineException](#) with information on serialization and streaming context for the related content item.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected PipelineException (  
    SerializationInfo serializationInfo,  
    StreamingContext streamingContext  
)
```

Parameters

serializationInfo

Information necessary for serialization and deserialization of the content item.

streamingContext

Information necessary for the source and destination of a given serialized stream. Also provides an additional caller-defined context.

)
```

Parameters

message

A message that describes the error.

innerException

The exception that is the cause of the current exception. If *innerException* is not a null reference, the current exception is raised in a catch block that handles the inner exception.

PipelineException Constructor (String, Object[])

Note

This constructor is available only when developing for Windows.

Initializes a new instance of the [PipelineException](#) class with the specified error message.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public PipelineException (  
    string message,  
    Object[] messageArgs  
)
```

Parameters

message

A message that describes the error.

messageArgs

[[ParamArrayAttribute](#)] Array of strings specifying message-related arguments.

ProcessorParameter Class

Note

This class is available only when developing for Windows.

Represents a processor parameter. Processor parameters are automatically discovered by the content pipeline. Therefore, only custom processor developers should use this class directly.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[SerializableAttribute]  
public sealed class ProcessorParameter
```

See Also

Reference

PlatformsWindows XP SP2, Windows Vista

ProcessorParameter Members

The following tables list the members exposed by the ProcessorParameter type.

Public Properties

Name	Description
 DefaultValue	Default value of the parameter, as specified by the [DefaultValue] attribute.
 Description	Description of the parameter, as specified by the [Description] attribute.
 DisplayName	Name of the parameter displayed in the designer, as specified by the [DisplayName] attribute.
 IsEnum	Gets a value indicating whether the parameter is an enumeration.
 PossibleEnumValues	Available options for enumerated type parameters.
 PropertyName	Name of the property, as defined in the C# code.
 PropertyType	Type of the parameter.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

ProcessorParameter.DefaultValue Property

Note

This property is available only when developing for Windows.

Default value of the parameter, as specified by the [DefaultValue] attribute.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public Object DefaultValue { get; set; }
```

Property Value

Default value of the processor parameter.

Remarks

Not all types are supported. For a complete list of supported values, see [Parameterized Processors](#).

DefaultValue is treated as a suggestion to the designer UI and is not enforced by the content pipeline. This value may be **null**.

ProcessorParameter.Description Property

Note

This property is available only when developing for Windows.

Description of the parameter, as specified by the [Description] attribute.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public string Description { get; set; }
```

Property Value

Parameter description.

Remarks

The description appears as a tooltip, displayed by the designer UI. This value may be **null**.

ProcessorParameter.IsEnum Property

Note

This property is available only when developing for Windows.

Gets a value indicating whether the parameter is an enumeration.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool IsEnum { get; }
```

Property Value

true if the parameter is an enumeration; **false** otherwise.

ProcessorParameter.PropertyName Property

Note

This property is available only when developing for Windows.

Name of the property, as defined in the C# code.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public string PropertyName { get; }
```

Property Value

Name of the property used to identify a specific processor parameter.

RemarksCorresponds to the property name, as defined in the C# code. This differs from the friendly parameter name, stored in the [DisplayName](#) property.

Note

This method is available only when developing for Windows.

Called by the framework when importing an intermediate file containing a game asset.

Namespace: Microsoft.Xna.Framework.Content.Pipeline

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override Object Import (  
    string filename,  
    ContentImporterContext context  
)
```

Parameters

filename

Name of the intermediate file.

context

Contains information for importing the intermediate file, such as a logger interface.

Return Value

Object representing the game asset contained by the intermediate file.

Microsoft.Xna.Framework.Content.Pipeline.Audio Namespace

Note

This namespace is available only when developing for Windows.

Provides intermediate classes and types for representing and manipulating graphics audio data.

Classes

	Name	Description
	AudioContent	Encapsulates and provides operations, such as format conversions, on the source audio. This type is produced by the audio importers and used by audio processors to produce compiled audio assets.
	AudioFormat	Encapsulates the native audio format (WAVEFORMATEX) information of the audio content.

Enumerations

	Name	Description
	AudioFileType	Type of the audio file.
	ConversionFormat	Target formats supported for audio source conversions.
	ConversionQuality	Compression quality of the audio content.

AudioContent Class

Note

This class is available only when developing for Windows.

Encapsulates and provides operations, such as format conversions, on the source audio. This type is produced by the audio importers and used by audio processors to produce compiled audio assets.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Audio

Assembly: (in)

Syntax

C#

```
public class AudioContent : ContentItem, IDisposable
```

AudioContent.ConvertFormat Method

Note

This method is available only when developing for Windows.

Transcodes the source audio to the target format and quality.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Audio

Assembly: (in)

Syntax

C#

```
public void ConvertFormat (  
    ConversionFormat formatType,  
    ConversionQuality quality,  
    string targetFileName  
)
```

Parameters

formatType

Format of the processed source audio: WAV, MP3 or WMA.

quality

Quality of the processed source audio. It can be one of the following:

- Low (96 kbps)
- Medium (128 kbps)
- Best (192 kbps)

targetFileName

Name of the file containing the processed source audio.

AudioContent.Data Property

Note

This property is available only when developing for Windows.

Gets the raw audio data.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Audio

Assembly: (in)

Syntax

C#

```
public ReadOnlyCollection<byte> Data { get; }
```

Property Value

If unprocessed, the source data; otherwise, the processed data.

AudioFormat Members

The following tables list the members exposed by the AudioFormat type.

Public Properties

Name	Description
 AverageBytesPerSecond	Gets the average bytes processed per second.
 BitsPerSample	Gets the bit depth of the audio content.
 BlockAlign	Gets the number of bytes per sample block, taking channels into consideration.
 ChannelCount	Gets the number of channels.
 Format	Gets the format of the audio content.
 NativeWaveFormat	Gets the raw byte buffer for the format.
 SampleRate	Gets the sample rate of the audio content.

Public Methods

Name	Description

AudioFormat.BlockAlign Property

Note

This property is available only when developing for Windows.

Gets the number of bytes per sample block, taking channels into consideration. For example, for 16-bit stereo audio (PCM format), the size of each sample block is 4 bytes.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Audio

Assembly: (in)

Syntax

C#

```
public int BlockAlign { get; }
```

Property Value

Number of bytes, per sample block.

[Microsoft.Xna.Framework.Content.Pipeline.Audio Namespace](#)

Platforms Windows XP SP2, Windows Vista

Microsoft.Xna.Framework.Content.Pipeline.Graphics Namespace

Note

This namespace is available only when developing for Windows.

Provides intermediate classes and types for representing and manipulating graphics data.

Classes

Name	Description
AnimationChannel	Provides methods and properties for maintaining an animation channel.
AnimationChannelDictionary	Collection of animation data channels, one per bone or rigid object.
AnimationContent	Provides properties for maintaining an animation.
AnimationContentDictionary	Collection of named animations.
AnimationKeyframe	Provides methods and properties for managing a keyframe.
BasicMaterialContent	Provides properties for modifying a traditional fixed-function-style material, as supported by most 3D modeling packages.
BitmapContent	Provides properties and methods for creating and maintaining a bitmap resource.
BoneContent	Represents an animation skeleton.
BoneWeightCollection	Collection of bone weights of a vertex.
Dxt1BitmapContent	Provides methods and properties for managing compressed textures (DXT1).
Dxt3BitmapContent	Provides methods and properties for managing compressed textures (DXT3).
Dxt5BitmapContent	Provides methods and properties for managing compressed textures (DXT5).
DxtBitmapContent	Provides methods and properties for managing compressed textures (DXT1, DXT3, DXT5).
EffectContent	Contains the source code for a DirectX Effect, loaded from a .fx file.
EffectMaterialContent	Provides support for representing DirectX Effect materials.
FontDescription	Provides information to the FontDescriptionProcessor describing which font to rasterize, which font size to utilize, and which Unicode characters to include in the processor output.
GeometryContent	Provides properties that define various aspects of a geometry batch.
GeometryContentCollection	Provides methods for maintaining a collection of geometry batches that make up a mesh.
IndexCollection	Provides methods for maintaining a list of index values.
IndirectPositionCollection	Provides methods for maintaining a list of vertex positions.
MaterialContent	Provides methods and properties for maintaining a collection of named texture references.
MeshBuilder	Provides support for writing a custom importer for mesh objects.
MeshContent	Provides properties and methods that define various aspects of a mesh.
MeshHelper	Provides methods for manipulating mesh data.
MipmapChain	Provides methods for accessing a mipmap chain.
MipmapChainCollection	Provides methods for maintaining a mipmap chain.
NodeContent	Provides a base class for graphics types that define local coordinate systems.
NodeContentCollection	Provides a collection of all NodeContent objects in a spatial hierarchy.

 PixelBitmapContent	Provides methods for maintaining a 2D array of pixel values.
 PositionCollection	Provides a collection of vertex position values.
 Texture2DContent	Represents a regular two-dimensional texture.
 Texture3DContent	Represents a three-dimensional volume texture.
 TextureContent	Provides a base class for all texture objects.
 TextureCubeContent	Provides validation for a cube map texture, which contains an array of six image faces.
 TextureReferenceDictionary	Provides a collection of named references to texture files.
 VectorConverter	Provides methods for converting data between different packed vector representations.
 VertexChannel	Provides methods and properties for maintaining a vertex channel.
 VertexChannel	Provides methods and properties for maintaining a vertex channel.
 VertexChannelCollection	Provides methods and properties for managing a list of vertex data channels.
 VertexChannelNames	Provides properties for managing a collection of vertex channel names.
 VertexContent	Provides methods and properties for maintaining the vertex data of a GeometryContent .

Structures

Name	Description
 BoneWeight	Provides properties for managing a bone weight.

Enumerations

Name	Description
 FontDescriptionStyle	Flags that describe style information to be applied to text.

AnimationChannel Class

Note

This class is available only when developing for Windows.

Provides methods and properties for maintaining an animation channel. An animation channel is a collection of keyframes describing the movement of a single bone or rigid object.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public sealed class AnimationChannel : ICollection<AnimationKeyframe>, IEnumerable<AnimationKeyframe>, IEnumerable
```

See Also

Reference

AnimationChannel Members

The following tables list the members exposed by the AnimationChannel type.

Public Constructors

Name	Description
 AnimationChannel	Initializes a new instance of AnimationChannel.

Public Properties

Name	Description
 Count	Gets the number of keyframes in the collection.
 Item	Gets the keyframe at the specified index position.

Public Methods

Name	Description
 Add	Adds a new keyframe to the collection, automatically sorting the contents according to keyframe times.
 Clear	Removes all keyframes from the collection.
 Contains	Searches the collection for the specified keyframe.
 Equals	(Inherited from Object .)
 GetEnumerator	Returns an enumerator that iterates through the keyframes.
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 IndexOf	Determines the index for the specified keyframe.
 ReferenceEquals	(Inherited from Object .)
 Remove	Removes the specified keyframe from the collection.
 RemoveAt	Removes the keyframe at the specified index position.
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

Name	Description
 System.Collections.Generic.ICollection<Microsoft.Xna.Framework.Content.Pipeline.Graphics.AnimationKeyframe>.IsReadOnly	Returns a value indicating whether the object is read-only.
 System.Collections.Generic.ICollection<Microsoft.Xna.Framework.Content.Pipeline.Graphics.AnimationKeyframe>.Add	Adds a new keyframe to the collection, automatically sorting the contents according to keyframe times.
 System.Collections.Generic.ICollection<Microsoft.Xna.Framework.Content.Pipeline.Graphics.AnimationKeyframe>.CopyTo	Copies the elements of the animation channel to an array, starting at the specified index.
 System.Collections.IEnumerable.GetEnumerator	Gets an enumerator that iterates through the keyframes of an animation channel.

AnimationContent Class

Note

This class is available only when developing for Windows.

Provides properties for maintaining an animation.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public class AnimationContent : ContentItem
```

Remarks

An animation contains a collection of data channels, describing a complete set of movement for any number of bones or rigid objects. The channels are stored in the [Animations](#) dictionary. For character skinning, the animation data is usually attached to the root of a bone hierarchy. However, it can potentially belong to any node. For example, when used for rigid body animation.

Note

This property is available only when developing for Windows.

Gets or sets the vertex color property.

This is a shortcut for accessing **Textures[VertexColorEnabledKey]**.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public Nullable<bool> VertexColorEnabled { get; set; }
```

Property Value

Current vertex color or the value to be set.

BitmapContent Class

Note

This class is available only when developing for Windows.

Provides properties and methods for creating and maintaining a bitmap resource.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract class BitmapContent : ContentItem
```

Remarks

The **BitmapContent** class represents a single two-dimensional image with a fixed size and fixed format. Various pixel encodings are supported by subclasses of the bitmap type. Higher level constructs such as textures that may contain multiple mipmap images or cube map faces are stored as collections of multiple bitmaps.

BitmapContent Members

The following tables list the members exposed by the BitmapContent type.

Public Constructors

Name	Description
 BitmapContent	Overloaded. Initializes a new instance of BitmapContent .

Public Properties

Name	Description
 Height	Gets or sets the height of the bitmap, in pixels.
 Identity	(Inherited from ContentItem .)
 Name	(Inherited from ContentItem .)
 OpaqueData	(Inherited from ContentItem .)
 Width	Gets or sets the width of the bitmap, in pixels.

Public Methods

Name	Description
  Copy	Overloaded. Copies one bitmap to another.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetPixelData	Reads encoded bitmap content.
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 SetPixelData	Writes encoded bitmap content.
 ToString	Returns a string description of the bitmap resource.
 TryGetFormat	Gets the corresponding GPU texture format for the specified bitmap type.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)
 TryCopyFrom	Attempts to copy a region from a specified bitmap.
 TryCopyTo	Attempts to copy a region of the specified bitmap onto another.
  ValidateCopyArguments	Validates the arguments to the Copy function.

Note

This method is available only when developing for Windows.

Copies one bitmap into another.

The destination bitmap can be in any format and size. If the destination is larger or smaller, the source bitmap is scaled accordingly.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static void Copy (  
    BitmapContent sourceBitmap,  
    Rectangle sourceRegion,  
    BitmapContent destinationBitmap,  
    Rectangle destinationRegion  
)
```

Parameters

sourceBitmap

[BitmapContent](#) being copied.

sourceRegion

Region of *sourceBitmap*.

destinationBitmap

[BitmapContent](#) being overwritten.

destinationRegion

Region of bitmap to be overwritten.

BitmapContent.SetPixelData Method

Note

This method is available only when developing for Windows.

Writes encoded bitmap content.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract void SetPixelData (  
    byte[] sourceData  
)
```

Parameters

sourceData

Array containing encoded bitmap data to be set.

BitmapContent.TryCopyFrom Method

Note

This method is available only when developing for Windows.

Attempts to copy a region from a specified bitmap.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected abstract bool TryCopyFrom (  
    BitmapContent sourceBitmap,  
    Rectangle sourceRegion,  
    Rectangle destinationRegion  
)
```

Parameters

sourceBitmap

[BitmapContent](#) being copied.

sourceRegion

Location of *sourceBitmap*.

destinationRegion

Region of destination bitmap to be overwritten.

Return Value

true if region copy is supported; **false** otherwise.

Remarks

This operation succeeds if the source is a [PixelBitmapContent](#) object and the copy region covers all of both bitmaps. Some bitmap subclasses may support subregion copies and/or a wider range of formats than just [Vector4](#), but this is not required. Copy functionality is accessible using the [Copy](#) methods.

BitmapContent.TryCopyTo Method

Note

This method is available only when developing for Windows.

Attempts to copy a region of the specified bitmap onto another.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected abstract bool TryCopyTo (  
    BitmapContent destinationBitmap,  
    Rectangle sourceRegion,  
    Rectangle destinationRegion  
)
```

Parameters

destinationBitmap

[BitmapContent](#) being overwritten.

sourceRegion

Location of the source bitmap.

destinationRegion

Region of destination bitmap to be overwritten.

Return Value

true if region copy is supported; **false** otherwise.

BitmapContent.TryGetFormat Method

Note

This method is available only when developing for Windows.

Gets the corresponding GPU texture format for the specified bitmap type.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract bool TryGetFormat (  
    out SurfaceFormat format  
)
```

Parameters

format

[[OutAttribute](#)] Format being compared.

Return Value

true if the bitmap matches *format*; **false** otherwise.

BitmapContent.ValidateCopyArguments Method

Note

This method is available only when developing for Windows.

Validates the arguments to the [Copy](#) function.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected static void ValidateCopyArguments (  
    BitmapContent sourceBitmap,  
    Rectangle sourceRegion,  
    BitmapContent destinationBitmap,  
    Rectangle destinationRegion  
)
```

Parameters

sourceBitmap

[BitmapContent](#) being copied.

sourceRegion

Location of *sourceBitmap*.

destinationBitmap

[BitmapContent](#) being overwritten.

destinationRegion

Region of bitmap to be overwritten.

Remarks

Override this method to verify arguments from custom implementations of [TryCopyFrom](#) and [TryCopyTo](#) for your derived type.

BoneContent Class

Note

This class is available only when developing for Windows.

Represents an animation skeleton.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public class BoneContent : NodeContent
```

Remarks

Animation skeletons are represented as a tree of **BoneContent** objects with the bind pose stored in their [Transform](#) properties. Animation data for the entire skeleton is stored in the [Animations](#) property of the root bone (represented by a **BoneContent** object); typically a sibling of the mesh being skinned.

BoneWeight Structure

Note

This structure is available only when developing for Windows.

Provides properties for managing a bone weight.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public struct BoneWeight
```

Remarks

A bone weight describes the influence of a single bone on the position of a vertex. These are grouped into [BoneWeightCollection](#) objects, which are stored in a vertex data channel.

BoneWeightCollection.NormalizeWeights Method ()

Note

This method is available only when developing for Windows.

Normalizes the contents of the weights list.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void NormalizeWeights ()
```

Remarks

Normalization does the following:

- Sorts weights such that the most significant weight is first.
- Removes zero-value entries.
- Adjusts values so the sum equals one.

Throws [InvalidContentException](#) if all weights are zero.

BoneWeightCollection.NormalizeWeights Method (Int32)

Note

This method is available only when developing for Windows.

Normalizes the contents of the bone weights list.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void NormalizeWeights (  
    int maxWeights  
)
```

Parameters

maxWeights

Maximum number of weights allowed.

Remarks

Normalization does the following:

- Sorts weights such that the most significant weight is first.
- Removes zero-value entries.
- Discards weights with the smallest value until there are *maxWeights* or less in the list.
- Adjusts values so the sum equals one.

Throws [InvalidContentException](#) if all weights are zero.

Dxt1BitmapContent Constructor

Note

This constructor is available only when developing for Windows.

Initializes a new instance of **Dxt1BitmapContent** with the specified width and height.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public Dxt1BitmapContent (  
    int width,  
    int height  
)
```

Parameters

width

Width of the bitmap, in pixels.

height

Height of the bitmap, in pixels.

Dxt1BitmapContent.TryGetFormat Method

Note

This method is available only when developing for Windows.

Attempts to get the GPU texture format of this bitmap type.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override bool TryGetFormat (  
    out SurfaceFormat format  
)
```

Parameters

format

[[OutAttribute](#)] Matching GPU format.

Return Value

true if the bitmap matches a GPU format; **false** otherwise.

FontDescription Class

Note

This class is available only when developing for Windows.

Provides information to the [FontDescriptionProcessor](#) describing which font to rasterize, which font size to utilize, and which Unicode characters to include in the processor output.

Note

As with most types of software, font files are licensed rather than sold. Font licenses vary from vendor to vendor, but most don't allow redistribution of the fonts, and that includes redistribution of reproductions such as bitmaps containing the rasterized character set. This is even true of many of the licenses covering fonts that Microsoft supplies with applications and Windows. Be careful, therefore, to ensure that you have the required license rights to redistribute any font you include as a bitmap containing the rasterized character set in your game!

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public class FontDescription : ContentItem
```

FontDescription Members

The following tables list the members exposed by the FontDescription type.

Public Constructors

Name	Description
 FontDescription	Overloaded. Initializes a new instance of FontDescription.

Public Properties

Name	Description
 Characters	Gets the collection of characters provided by this FontDescription .
 DefaultCharacter	Gets or sets the default character for the font.
 FontName	Gets or sets the name of the font, such as "Times New Roman" or "Arial". This value cannot be null or empty.
 Identity	(Inherited from ContentItem .)
 Name	(Inherited from ContentItem .)
 OpaqueData	(Inherited from ContentItem .)
 Size	Gets or sets the size, in points, of the font.
 Spacing	Gets or sets the amount of space, in pixels, to insert between letters in a string.
 Style	Gets or sets the style of the font, expressed as a combination of one or more FontDescriptionStyle flags.
 UseKerning	Indicates if kerning information is used when drawing characters.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

FontDescription Constructor

Initializes a new instance of **FontDescription**.

Overload List

Name	Description
FontDescription (String, Single, Single)	Initializes a new instance of FontDescription and initializes its members to the specified font, size, and spacing, using FontDescriptionStyle.Regular as the default value for Style .
FontDescription (String, Single, Single, FontDescriptionStyle)	Initializes a new instance of FontDescription and initializes its members to the specified font, size, spacing, and style.
FontDescription (String, Single, Single, FontDescriptionStyle, Boolean)	Initializes a new instance of FontDescription using the specified values.

FontDescription Constructor (String, Single, Single)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of **FontDescription** and initializes its members to the specified font, size, and spacing, using [FontDescriptionStyle.Regular](#) as the default value for *Style*.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public FontDescription (
    string fontName,
    float size,
    float spacing
)
```

Parameters

fontName

The name of the font, such as *Times New Roman*.

size

The size, in points, of the font.

spacing

The amount of space, in pixels, to insert between letters in a string.

Exceptions

Exception type	Condition
ArgumentNullException	<i>fontName</i> is null or an empty string.
ArgumentOutOfRangeException	<i>size</i> is less than or equal to zero. Specify a value for this parameter that is greater than zero.

FontDescription Constructor (String, Single, Single, FontStyle)

Note

This constructor is available only when developing for Windows.

Initializes a new instance of **FontDescription** and initializes its members to the specified font, size, spacing, and style.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public FontDescription (  
    string fontName,  
    float size,  
    float spacing,  
    FontStyle fontStyle  
)
```

Parameters

fontName

The name of the font, such as *Times New Roman*.

size

The size, in points, of the font.

spacing

The amount of space, in pixels, to insert between letters in a string.

fontStyle

The font style for the font.

Exceptions

Exception type	Condition
ArgumentNullException	<i>fontName</i> is null or an empty string.
ArgumentOutOfRangeException	<i>size</i> is less than or equal to zero. Specify a value for this parameter that is greater than zero.

Initializes a new instance of **FontDescription** using the specified values.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public FontDescription (  
    string fontName,  
    float size,  
    float spacing,  
    FontDescriptionStyle fontStyle,  
    bool useKerning  
)
```

Parameters

fontName

The name of the font, such as *Times New Roman*.

size

The size, in points, of the font.

spacing

The amount of space, in pixels, to insert between letters in a string.

fontStyle

The font style for the font.

useKerning

true if kerning information is used when drawing characters; **false** otherwise.

FontDescription.Characters Property

Note

This property is available only when developing for Windows.

Gets the collection of characters provided by this [FontDescription](#).

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[ContentSerializerIgnoreAttribute]  
public ICollection<char> Characters { get; }
```

Property Value

The collection of characters.

Remarks

Characters can be used to change the characters provided by this [FontDescription](#).

The **Characters** collection keeps track of duplicates automatically. It is not necessary for the user to make sure that each letter is added only once. The **Characters** collection will contain only one instance of each character, no matter how many times you call **Add**.

This collection of characters can be used to implement processing for a message file. A custom processor could read the message file, which would contain all of the text that the game will need to print, and add each character it finds to **Characters**.

FontDescription.DefaultCharacter Property

Note

This property is available only when developing for Windows.

Gets or sets the default character for the font.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[ContentSerializerAttribute]  
public Nullable<char> DefaultCharacter { get; set; }
```

Property Value

The default character for this font.

Remarks

If set to anything other than null, this character will be automatically substituted any time an attempt is made to draw or measure characters that are not in the font.

If set to null, missing characters will produce an exception.

GeometryContent Class

Note

This class is available only when developing for Windows.

Provides properties that define various aspects of a geometry batch.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public class GeometryContent : ContentItem
```

Remarks

A geometry batch is a subcomponent of a mesh, representing a single piece of homogeneous geometry that can be submitted to the GPU in a single draw call. It contains an indexed triangle list (using a single material) where all vertices share the same set of data channels. Vertices are made unique if there are differences in any of their data channels. Coordinates that require unique vertices on either side of a join create unique vertices.

IndirectPositionCollection Members

The following tables list the members exposed by the IndirectPositionCollection type.

Public Properties

Name	Description
 Count	Number of positions in the collection.
 Item	Gets or sets the position at the specified index.

Public Methods

Name	Description
 Contains	Determines whether the specified position is in the collection.
 CopyTo	Copies the specified positions to an array, starting at the specified index.
 Equals	(Inherited from Object .)
 GetEnumerator	Gets an enumerator interface for reading the position values.
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 IndexOf	Gets the index of the specified position in a collection.
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

Name	Description
 System.Collections.Generic.ICollection<Microsoft.Xna.Framework.Vector3>.IsReadOnly	Gets a value indicating whether this object is read-only.
 System.Collections.Generic.ICollection<Microsoft.Xna.Framework.Vector3>.Add	Adds a new element to the end of the collection.
 System.Collections.Generic.ICollection<Microsoft.Xna.Framework.Vector3>.Clear	Removes all elements from the collection.
 System.Collections.IEnumerable.GetEnumerator	Returns an enumerator that can iterate through the collection.
 System.Collections.Generic.ICollection<Microsoft.Xna.Framework.Vector3>.Insert	Inserts a new element into the collection.
 System.Collections.Generic.ICollection<Microsoft.Xna.Framework.Vector3>.RemoveAt	Removes the element at the specified index position.
 System.Collections.Generic.ICollection<Microsoft.Xna.Framework.Vector3>.Remove	Removes the specified element from the collection.

IndirectPositionCollection.Contains Method

Note

This method is available only when developing for Windows.

Determines whether the specified position is in the collection.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool Contains (  
    Vector3 item  
)
```

Parameters

item

Position being searched for in the collection.

Return Value

true if the position was found; **false** otherwise.

Copies the specified positions to an array, starting at the specified index.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void CopyTo (  
    Vector3[] array,  
    int arrayIndex  
)
```

Parameters

array

Array of positions to be copied.

arrayIndex

Index of the first copied position.

Gets a reference type from the [OpaqueDataDictionary](#) collection.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected T GetReferenceTypeProperty<T> (  
    string key  
)
```

Type Parameters

T

Parameters

key

Key of the property being retrieved.

Return Value

Type of the related opaque data.

MaterialContent.SetProperty Generic Method

Note

This generic method is available only when developing for Windows.

Sets a value in the contained [OpaqueDataDictionary](#) object.

If **null** is passed, the value is removed.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected void SetProperty<T> (  
    string key,  
    T value  
)
```

Type Parameters

T

Type of the element being set.

Parameters

key

Name of the key being modified.

value

Value being set.

See Also

Reference

[Microsoft.Xna.Framework.Content.Pipeline.Graphics Namespace](#)

PlatformsWindows XP SP2, Windows Vista

MaterialContent.SetTexture Method

Note

This method is available only when developing for Windows.

Sets a value in the contained [TextureReferenceDictionary](#) object.

If **null** is passed, the value is removed.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected void SetTexture (  
    string key,  
    ExternalReference<TextureContent> value  
)
```

Parameters

key

Name of the key being modified.

value

Value being set.

Remarks

The *key* value differs depending on the type of attached dictionary.

If attached to a [BasicMaterialContent](#) dictionary (which becomes a [BasicEffect](#) object at run time), the value for the Texture key is used as the texture for the [BasicEffect](#) runtime object. Other keys are ignored.

If attached to a [EffectMaterialContent](#) dictionary, key names are the texture names used by the effect. These names are dependent upon the author of the effect object.

MeshBuilder Class

Note

This class is available only when developing for Windows.

Provides support for writing a custom importer for mesh objects.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public sealed class MeshBuilder
```

Remarks

MeshBuilder is designed to make it easier to write importers. It creates an abstraction of the internal workings of the [MeshContent](#) and [GeometryContent](#) classes and provides a simple way to create a mesh object.

There are three steps to creating a mesh.

1. Call [StartMesh](#) to get a [MeshBuilder](#) object. To initialize this object, fill the positions buffer with data by using the [CreatePosition](#) function. After retrieving the positions data, call the [CreateVertexChannel](#) generic function to specify the types of vertex channels needed—for example, normals, UVs, and color channels.

Note

The [PositionCollection](#) property of a [MeshContent](#) object is created automatically. Therefore, there is no need to explicitly declare a [VertexChannel](#) object for positions.

2. After setting up the position and vertex data channel buffers, begin creating triangles. Use [SetMaterial](#) and [SetOpaqueData](#) to set the data of each triangle, and use [SetVertexChannelData](#) to set the individual vertex data of each triangle. After setting this data, call [AddTriangleVertex](#) for each vertex of each triangle.

Note

If you call [CreatePosition](#) or [CreateVertexChannel](#) after calling [AddTriangleVertex](#), an [InvalidOperationException](#) exception is thrown.

3. In the final step, call [FinishMesh](#). After this call, the mesh is optimized automatically with calls to [MergeDuplicateVertices](#) and [CalculateNormals](#).

For a complete example of this procedure, download the [Generated Geometry Sample](#) from the Creators Club Online website and load the solution. Open the TerrainProcessor.cs file and examine the `Process` method. This method implements the steps listed above.

MeshBuilder Members

The following tables list the members exposed by the MeshBuilder type.

Public Properties

	Name	Description
	MergeDuplicatePositions	Gets or sets the current value for position merging of the mesh.
	MergePositionTolerance	Gets or sets the tolerance for MergeDuplicatePositions .
	Name	Gets or sets the name of the current MeshContent object being processed.
	SwapWindingOrder	Reverses the triangle winding order of the specified mesh.

Public Methods

	Name	Description
	AddTriangleVertex	Adds a vertex into the index collection.
	CreatePosition	Overloaded. Inserts the specified vertex position into the vertex channel.
	CreateVertexChannel	Creates a vertex data channel for use by the mesh.
	Equals	(Inherited from Object .)
	FinishMesh	Ends the creation of a mesh.
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	ReferenceEquals	(Inherited from Object .)
	SetMaterial	Specifies the material used by the current mesh.
	SetOpaqueData	Initializes the opaque data for a specific mesh object.
	SetVertexChannelData	Sets the specified vertex data with new data.
 	StartMesh	Initializes the creation of a mesh.
	ToString	(Inherited from Object .)

Protected Methods

	Name	Description

Reference

[MeshBuilder Class](#)

[Microsoft.Xna.Framework.Content.Pipeline.Graphics Namespace](#)

MeshBuilder.AddTriangleVertex Method

Note

This method is available only when developing for Windows.

Adds a vertex into the index collection.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void AddTriangleVertex (  
    int indexIntoVertexCollection  
)
```

Parameters

indexIntoVertexCollection

Index of the inserted vertex, in the collection. This corresponds to the value returned by [CreatePosition](#).

Remarks

[MeshBuilder](#) supports triangle lists only. Therefore, calls to **AddTriangleVertex** must occur in groups of three. In addition, [MeshBuilder](#) automatically determines which [GeometryContent](#) object receives the current triangle based on the state data. This data is set by the last calls to [SetMaterial](#) and [SetOpaqueData](#).

This means that per-vertex material and opaque data are not supported. Therefore, do not call [SetMaterial](#) or [SetOpaqueData](#) when defining a triangle. For an example of the proper method, see the [MeshBuilder](#) class overview.

See Also

Reference

[MeshBuilder Class](#)

[MeshBuilder Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Graphics Namespace](#)

PlatformsWindows XP SP2, Windows Vista

MeshBuilder.CreatePosition Method

Inserts the specified vertex position into the vertex channel.

Overload List

Name	Description
MeshBuilder.CreatePosition (Single, Single, Single)	Inserts the specified vertex position into the vertex channel.
MeshBuilder.CreatePosition (Vector3)	Inserts the specified vertex position into the vertex channel at the specified index.

Remarks

These vertices are shared between the mesh's geometry objects, preserving the topology information. For example, two different geometries could reference the same position, but have a different material, texture coordinates, and normals.

In most cases, the index returned by **CreatePosition** is based on the number of times this function has been called. For example, **CreatePosition** returns 0 on the first call, 1 on the second call, and so forth. Therefore, if you call **CreatePosition** for each vertex in your vertex collection, your vertex collection and the [Positions](#) collection of the finished [MeshContent](#) object are parallel, assuming [MergeDuplicatePositions](#) doesn't find anything to merge.

MeshBuilder.CreatePosition Method (Single, Single, Single)

Note

This method is available only when developing for Windows.

Inserts the specified vertex position into the vertex channel.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public int CreatePosition (  
    float x,  
    float y,  
    float z  
)
```

Parameters

x

Value of the x component of the vector.

y

Value of the y component of the vector.

z

Value of the z component of the vector.

Return Value

Index of the inserted vertex.

Note

This generic method is available only when developing for Windows.

Creates a vertex data channel for use by the mesh. Typically, the data channel holds texture coordinates, normals, and other per-vertex data.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public int CreateVertexChannel<T> (  
    string usage  
)
```

Type Parameters

T

Type of the data channel.

Parameters

usage

Describes how the channel is used. Use this parameter as a look-up into a [VertexChannelCollection](#). It is strongly recommended that you choose a *usage* from the following list.

- Binormal
- Color
- Normal
- Tangent
- TextureCoordinate
- Weights

For more information, see [VertexChannelNames](#).

Return Value

Index identifying the new data channel. Use this as a parameter when calling [SetVertexChannelData](#).

MeshBuilder.FinishMesh Method

Note

This method is available only when developing for Windows.

Ends the creation of a mesh.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public MeshContent FinishMesh ()
```

Return Value

Resultant mesh.

Remarks

Once called, **FinishMesh** optimizes the related mesh by calling [MergeDuplicateVertices](#). In addition, mesh normals are generated (by calling [CalculateNormals](#)) if none currently exist.

Note

The related [MeshBuilder](#) object can no longer be used after this function is called.

MeshBuilder.SetMaterial Method

Note

This method is available only when developing for Windows.

Specifies the material used by the current mesh.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void SetMaterial (  
    MaterialContent material  
)
```

Parameters

material

The material to be used by the mesh.

Remarks

Sets the material used by the triangle being defined next. This material, in conjunction with [SetOpaqueData](#), determines the [GeometryContent](#) object containing the next triangle. [MeshBuilder](#) maintains the material value for all future triangles. Therefore, if multiple triangles share the same material, you need only one call to [SetMaterial](#).

MeshBuilder.SetOpaqueData Method

Note

This method is available only when developing for Windows.

Initializes the opaque data for a specific mesh object.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void SetOpaqueData (  
    OpaqueDataDictionary opaqueData  
)
```

Parameters

opaqueData

Opaque data to be applied to the [GeometryContent](#) object of the next triangle.

Remarks

The opaque data is used in conjunction with the current material (set with a call to [SetMaterial](#)) to determine the [GeometryContent](#) object that will contain the next triangle. [MeshBuilder](#) maintains the material value for all future triangles. Therefore, if multiple triangles share the same material, you need only one call to [SetMaterial](#).

SetOpaqueData can be called only on [GeometryContent](#) and [MeshContent](#) objects.

MeshBuilder.SetVertexChannelData Method

Note

This method is available only when developing for Windows.

Sets the specified vertex data with new data.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void SetVertexChannelData (
    int vertexDataIndex,
    Object channelData
)
```

Parameters

vertexDataIndex

Index of the vertex data channel being set. This should match the index returned by [CreateVertexChannel](#).

channelData

New data values for the vertex data. The data type being set must match the data type for the vertex channel specified by *vertexDataIndex*.

Remarks

The following table lists the exceptions that can be thrown by this method:

Exception	Cause
KeyNotFoundException	If <i>vertexDataIndex</i> does not correspond to an actual vertex data channel created using CreateVertexChannel .
InvalidOperationException	If the type of <i>channelData</i> does not match the data type for the vertex channel specified by <i>vertexDataIndex</i> .

MeshBuilder.StartMesh Method

Note

This method is available only when developing for Windows.

Initializes the creation of a mesh.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static MeshBuilder StartMesh (  
    string name  
)
```

Parameters

name

Name of the mesh.

Return Value

Object used when building the mesh.

MeshBuilder.MergeDuplicatePositions Property

Note

This property is available only when developing for Windows.

Gets or sets the current value for position merging of the mesh.

This can be used to preserve topology of unique vertices.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool MergeDuplicatePositions { get; set; }
```

Property Value

Current value of the property.

Remarks

If this property is enabled, every call to [MeshBuilder.CreatePosition \(Vector3\)](#) will check to see whether a position exists for which each component of that position varies no more than the current value of [MergePositionTolerance](#) from the new position. If one is found, the original position is used.

This property should be used in conjunction with [MergePositionTolerance](#). The following code demonstrates this:

C#

```
MeshBuilder b = MeshBuilder.StartMesh( "bill" );  
b.MergeDuplicatePositions = true;  
b.MergePositionTolerance = 1.0f;  
  
// Additional mesh building code here.  
  
MeshContent mesh = b.FinishMesh();
```

MeshBuilder.MergePositionTolerance Property

Note

This property is available only when developing for Windows.

Gets or sets the tolerance for [MergeDuplicatePositions](#). The default value is 0.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public float MergePositionTolerance { get; set; }
```

Property Value

Tolerance value used by the mesh.

Remarks

When [MergeDuplicatePositions](#) is enabled, each call to [MeshBuilder.CreatePosition \(Vector3\)](#) checks to see whether a position exists for which each component of that position varies no more than the current value of **MergePositionTolerance** from the new position. If one is found, the original position will be reused.

Note

Setting **MergePositionTolerance** does not also enable position merging. This must be enabled explicitly by calling [MergeDuplicatePositions](#).

MeshBuilder.Name Property

Note

This property is available only when developing for Windows.

Gets or sets the name of the current [MeshContent](#) object being processed. This is the same name as was passed in to [StartMesh](#).

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public string Name { get; set; }
```

Property Value

Name of the [MeshContent](#) object.

See Also

Reference

[MeshBuilder Class](#)

[MeshBuilder Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Graphics Namespace](#)

PlatformsWindows XP SP2, Windows Vista

MeshBuilder.SwapWindingOrder Property

Note

This property is available only when developing for Windows.

Reverses the triangle winding order of the specified mesh.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool SwapWindingOrder { get; set; }
```

Property Value

Current value of the winding order.

Remarks

If enabled, the triangles of the finished mesh are in the opposite order that they were given to the mesh builder. For example, if the vertices of two triangles were given as 123 456, they would be changed to 321 654. This can be useful if the source data was constructed with back-face culling set to something other than what the destination game engine expects.

The winding order is swapped when [FinishMesh](#) is called. Therefore, it is not necessary to modify the indices returned by [CreatePosition](#).

See Also

Reference

[MeshBuilder Class](#)

[MeshBuilder Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Graphics Namespace](#)

PlatformsWindows XP SP2, Windows Vista

MeshContent Class

Note

This class is available only when developing for Windows.

Provides properties and methods that define various aspects of a mesh.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public class MeshContent : NodeContent
```

Remarks

A mesh has the following characteristics:

- It is not jointed. For example, the wheels of a car are separate meshes from the body mesh of the same car.
- It may contain multiple materials. For example, the car body can be a single mesh even if the windshield component uses a different texture and shader as compared to the leather seat component of the car body.
- Vertices containing different channels may be mixed in a single mesh. For example, the seat geometry includes tangent vectors but the windshield does not. However, using a single mesh preserves topological continuity (shared vertex identities) across material and vertex format boundaries.

MeshHelper.CalculateNormals Method

Note

This method is available only when developing for Windows.

Computes new normals for the specified mesh.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static void CalculateNormals (  
    MeshContent mesh,  
    bool overwriteExistingNormals  
)
```

Parameters

mesh

Mesh containing the normals being computed.

overwriteExistingNormals

true if existing normals are to be discarded; **false** otherwise. Existing normals are searched for as if they are a vertex data channel (of type [Vector3 Structure](#)) with the name [VertexChannelNames.Normal](#).

Remarks

The new normals are stored in vertex data channels (of type [Vector3 Structure](#)) with the name [VertexChannelNames.Normal](#).

MeshHelper.CalculateTangentFrames Method

Note

This method is available only when developing for Windows.

Compute tangent frames for the given mesh.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static void CalculateTangentFrames (
    MeshContent mesh,
    string textureCoordinateChannelName,
    string tangentChannelName,
    string binormalChannelName
)
```

Parameters

mesh

The target mesh used to create the tangent frame. All geometries in this mesh must have normal vertex channels stored in [Normal](#), and must contain [Vector3](#) data.

textureCoordinateChannelName

The texture coordinate channel used for computing the tangent frame. This channel must contain [Vector2](#) data.

tangentChannelName

Target channel name used to store calculated tangents. A tangent channel is not generated if **null** or an empty string is specified.

binormalChannelName

Target channel name used to store calculated binormals. A tangent channel is not generated if **null** or an empty string is specified.

Remarks

This method computes and adds tangent and binormal vertex channels to the given mesh.

An [InvalidContentException](#) is thrown if:

- The mesh does not contain a normal channel (stored in [Normal](#)).
- The data specified in the normal channel is not a [Vector3](#) type.
- The vertex channel of the mesh does not have the name specified by *textureCoordinateChannelName*.
- The data specified in the texture coordinate channel is not a [Vector2](#) type.
- The channel specified by *tangentChannelName* already exists.
- The channel specified by *binormalChannelName* already exists.

MeshHelper.FindSkeleton Method

Note

This method is available only when developing for Windows.

Searches for the root bone of the contained skeleton. This node is used to animate the skeleton.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static BoneContent FindSkeleton (  
    NodeContent node  
)
```

Parameters

node

Mesh that possibly contains the skeleton.

Return Value

Root of the contained skeleton; otherwise **null** if no skeleton is found.

MeshHelper.FlattenSkeleton Method

Note

This method is available only when developing for Windows.

Gets a flattened list of all bones contained by the specified skeleton.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static IList<BoneContent> FlattenSkeleton (  
    BoneContent skeleton  
)
```

Parameters

skeleton

Skeleton to be traversed.

Return Value

List of bones for the animation skeleton.

Remarks

The tree is calculated using a depth-first traversal. The bones are returned in the same order used by [ModelProcessor](#) to convert [BoneWeight](#) vertex channels into the [BlendIndices](#) format.

MeshHelper.MergeDuplicatePositions Method

Note

This method is available only when developing for Windows.

Processes the [PositionCollection](#) collection of the specified mesh, merging any values that are closer together than the specified tolerance threshold.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static void MergeDuplicatePositions (  
    MeshContent mesh,  
    float tolerance  
)
```

Parameters

mesh

Mesh to be processed.

tolerance

Tolerance to be used when determining duplicate positions. Pass a value of 0 to merge only those values that are exactly identical.

Remarks

This method also updates the [PositionIndices](#) data to match the modified position table. This should generally be followed by a call to [MergeDuplicateVertices](#).

MeshHelper.SwapWindingOrder Method

Note

This method is available only when developing for Windows.

Reverses the triangle winding order of the specified mesh.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static void SwapWindingOrder (  
    MeshContent mesh  
)
```

Parameters

mesh

The mesh to be modified.

Remarks

Call this method when moving data between right-handed and left-handed coordinate systems, or when changing the direction of the back-face culling.

MeshHelper.TransformScene Method

Note

This method is available only when developing for Windows.

Applies a transformation to the contents of a scene hierarchy.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static void TransformScene (  
    NodeContent scene,  
    Matrix transform  
)
```

Parameters

scene

Scene hierarchy being transformed.

transform

Matrix used in the transformation

Remarks

The resulting world space positions are similar to the results obtained from applying the specified transform to the [Transform](#) property of the scene object. However, this method performs the transformation by cascading down through the scene hierarchy and modifying the actual underlying vertex positions. This does not introduce unwanted artifacts into the node transforms. For instance, this method can be used to mirror a scene without leaving mirroring in the transform matrices.

Typically, you would convert a scene from a left-handed to a right-handed coordinate system and then transform it with the following matrix ((1, 0, 0), (0, 1, 0), (0, 0, -1)).

MipmapChain Class

Note

This class is available only when developing for Windows.

Provides methods for accessing a mipmap chain.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public sealed class MipmapChain : Collection<BitmapContent>
```

Remarks

A mipmap chain consists of one or more individual 2D bitmaps, holding scaled versions of the same underlying image. For example, if the first entry was sized 256×128, the second would be 128×64, and the third 64×32.

NodeContent.AbsoluteTransform Property

Note

This property is available only when developing for Windows.

Gets the value of the local [Transform](#) property, multiplied by the [AbsoluteTransform](#) of the parent.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public Matrix AbsoluteTransform { get; }
```

Property Value

Matrix of the [NodeContent](#) object.

See Also

Reference

[NodeContent Class](#)

[NodeContent Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Graphics Namespace](#)

PlatformsWindows XP SP2, Windows Vista

NodeContent.Animations Property

Note

This property is available only when developing for Windows.

Gets the set of animations belonging to this node.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public AnimationContentDictionary Animations { get; }
```

Property Value

Collection of animations for this content item.

Remarks

Note

The XNA Framework provides only partial support for animation. In the [NodeContent](#) class an intermediate object model for storing animation data inside the Content Pipeline is defined, which exposes data into that has been extracted from Autodesk FBX (.fbx) and DirectX X file (.x) formats. The built-in [ModelProcessor](#) also converts vertex channels of [BoneWeightCollection](#) data into sets of [VertexElementUsage.BlendIndices](#) and [VertexElementUsage.BlendWeight](#) channels suitable for skinned rendering on the GPU. However, the framework does not include any runtime animation classes at this time.

There can be any number of animations, which are looked up by name. For character skinning, the animation data is usually attached to the root of a bone hierarchy. However, it can potentially belong to any node. For example, when used for rigid body animation.

PixelBitmapContent Generic Class

Note

This generic class is available only when developing for Windows.

Provides methods for maintaining a 2D array of pixel values.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public class PixelBitmapContent<T> : BitmapContent where T : ValueType, IEquatable
```

Remarks

Pixel bitmaps are represented as a 2D array of independent pixel values. The pixel type will often be from the [Graphics.PackedVector](#) namespace, but can also be [System.Single](#), [Vector2](#), [Vector3](#), or [Vector4](#). A pixel bitmap of [Vector4](#) values is commonly used as an intermediate format for image manipulation operations.

 PixelBitmapContent	Overloaded. Initializes a new instance of PixelBitmapContent.

Public Properties

Name	Description
 Height	(Inherited from BitmapContent .)
 Identity	(Inherited from ContentItem .)
 Name	(Inherited from ContentItem .)
 OpaqueData	(Inherited from ContentItem .)
 Width	(Inherited from BitmapContent .)

Public Methods

Name	Description
 Copy	(Inherited from BitmapContent .)
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetPixel	Gets the pixel value at the specified location in the bitmap.
 GetPixelData	Gets the bitmap content as an array of encoded bytes.
 GetRow	Gets an array containing a single row of bitmap data.
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ReplaceColor	Searches for all pixels matching the specified color and replaces them with a new value.
 SetPixel	Sets the pixel value at the specified location in the bitmap.
 SetPixelData	Sets the bitmap content using the specified encoded byte array.
 ToString	Gets a string description of the bitmap.
 TryGetFormat	Gets the GPU texture format that corresponds to the specified bitmap type.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)
 TryCopyFrom	Attempts to copy a region from the specified bitmap.
 TryCopyTo	Attempts to copy a region to the specified bitmap.
 ValidateCopyArguments	(Inherited from BitmapContent .)

Initializes a new instance of **PixelBitmapContent** with the specified width and height.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public PixelBitmapContent (  
    int width,  
    int height  
)
```

Parameters

width

Width, in pixels, of the blank pixel bitmap.

height

Height, in pixels, of the blank pixel bitmap.

PixelBitmapContent Methods

Public Methods

Name	Description
 Copy	(Inherited from BitmapContent .)
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetPixel	Gets the pixel value at the specified location in the bitmap.
 GetPixelData	Gets the bitmap content as an array of encoded bytes.
 GetRow	Gets an array containing a single row of bitmap data.
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ReplaceColor	Searches for all pixels matching the specified color and replaces them with a new value.
 SetPixel	Sets the pixel value at the specified location in the bitmap.
 SetPixelData	Sets the bitmap content using the specified encoded byte array.
 ToString	Gets a string description of the bitmap.
 TryGetFormat	Gets the GPU texture format that corresponds to the specified bitmap type.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)
 TryCopyFrom	Attempts to copy a region from the specified bitmap.
 TryCopyTo	Attempts to copy a region to the specified bitmap.
 ValidateCopyArguments	(Inherited from BitmapContent .)

PixelBitmapContent.GetPixel Method

Note

This method is available only when developing for Windows.

Gets the pixel value at the specified location in the bitmap.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public T GetPixel (  
    int x,  
    int y  
)
```

Parameters

x

The x component of a bitmap pixel.

y

The y component of a bitmap pixel.

Return Value

Value of the pixel.

PixelBitmapContent.GetPixelData Method

Note

This method is available only when developing for Windows.

Gets the bitmap content as an array of encoded bytes.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override byte[] GetPixelData ()
```

Return Value

Contents of the bitmap.

See Also

PixelBitmapContent.GetRow Method

Note

This method is available only when developing for Windows.

Gets an array containing a single row of bitmap data.

This method can be used both to read and modify the bitmap contents.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public T[] GetRow (  
    int y  
)
```

Parameters

y

The y component of the bitmap row.

Return Value

Array containing the bitmap row data.

PixelBitmapContent.ReplaceColor Method

Note

This method is available only when developing for Windows.

Searches for all pixels matching the specified color and replaces them with a new value.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void ReplaceColor (  
    T originalColor,  
    T newColor  
)
```

Parameters

originalColor

Color being searched for.

newColor

Color used to replace *originalColor*.

Remarks

Use this method to implement color keying. For instance, replace [Magenta](#) with [TransparentBlack](#).

PixelBitmapContent.SetPixel Method

Note

This method is available only when developing for Windows.

Sets the pixel value at the specified location in the bitmap.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void SetPixel (  
    int x,  
    int y,  
    T value  
)
```

Parameters

x

The x component of a bitmap pixel.

y

The y component of a bitmap pixel.

value

New pixel value.

PixelBitmapContent.TryCopyFrom Method

Note

This method is available only when developing for Windows.

Attempts to copy a region from the specified bitmap.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected override bool TryCopyFrom (  
    BitmapContent sourceBitmap,  
    Rectangle sourceRegion,  
    Rectangle destinationRegion  
)
```

Parameters

sourceBitmap

Bitmap content being copied.

sourceRegion

Location of the upper-left region of *sourceBitmap* being copied from.

destinationRegion

Region of destination bitmap to be overwritten.

Return Value

true if region copy is supported; **false** otherwise.

TextureContent Members

The following tables list the members exposed by the TextureContent type.

Protected Constructors

Name	Description
 TextureContent	Initializes a new instance of TextureContent with the specified face collection.

Public Properties

Name	Description
 Faces	Collection of image faces that hold a single mipmap chain for a regular 2D texture, six chains for a cube map, or an arbitrary number for volume and array textures.
 Identity	(Inherited from ContentItem .)
 Name	(Inherited from ContentItem .)
 OpaqueData	(Inherited from ContentItem .)

Public Methods

Name	Description
 ConvertBitmapType	Converts all bitmaps for this texture to a different format.
 Equals	(Inherited from Object .)
 GenerateMipmaps	Generates a full set of mipmaps for the texture.
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)
 Validate	Overloaded. Verifies that all contents of this texture are present and correct.

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

[TextureContent Class](#)

[Microsoft.Xna.Framework.Content.Pipeline.Graphics Namespace](#)

TextureContent Constructor

Note

This constructor is available only when developing for Windows.

Initializes a new instance of **TextureContent** with the specified face collection.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected TextureContent (  
    MipmapChainCollection faces  
)
```

Parameters

faces

Mipmap chain containing the face collection.

Remarks

Override this constructor to provide support for specialized face collections. For example, the [cube map](#) class provides a fixed-size collection of six faces, while the [Texture2DContent](#) class provides a variable-size collection.

TextureContent.ConvertBitmapType Method

Note

This method is available only when developing for Windows.

Converts all bitmaps for this texture to a different format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void ConvertBitmapType (
    Type newBitmapType
)
```

Parameters

newBitmapType

Type being converted to. The new type must be a subclass of [BitmapContent](#), such as [PixelBitmapContent](#) or [DxtBitmapContent](#).

Exceptions

Exception type	Condition
ArgumentException	<ul style="list-style-type: none"> ConvertBitmapType cannot convert to <i>newBitmapType</i>. The target type must be derived from BitmapContent. ConvertBitmapType cannot convert to <i>newBitmapType</i>. The target must be a concrete type with a public constructor taking integer width and height parameters.
ArgumentNullException	<i>newBitmapType</i> is null .

TextureContent.Validate Method (Boolean)

Note

This method is available only when developing for Windows.

Verifies that all contents of this texture are present and correct.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected void Validate (  
    bool facesMustHaveSameMipCount  
)
```

Parameters

facesMustHaveSameMipCount

Result of the validation.

Remarks

Validation is based on the following rules.

- One image face must be present.
- The mipmap chain for each face contains at least one bitmap.
- All bitmaps share the same type.
- Each face is the same size.
- Each face contains the same number of mipmaps.
- Each mipmap must be half the size of the previous. If the root bitmap is not square, the smaller axis is rounded up to 1 for the last few mipmaps before both dimensions reach zero.

Derived validation methods could add more validation rules. For example, cube maps must be square.

Exceptions

Exception type	Condition
InvalidContentException	The texture is not a valid one.

TextureContent.Faces Property

Note

This property is available only when developing for Windows.

Collection of image faces that hold a single mipmap chain for a regular 2D texture, six chains for a cube map, or an arbitrary number for volume and array textures.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public MipmapChainCollection Faces { get; }
```

Property Value

Collection of object faces.

VectorConverter.GetConverter Generic Method

Note

This generic method is available only when developing for Windows.

Gets a [Converter](#) delegate that can convert one packed vector representation to another.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static Converter<TInput, TOutput> GetConverter<TInput,TOutput> ()
```

Type Parameters

TInput

Source type for the conversion.

TOutput

Output type for the conversion.

Return Value

A [Converter](#) delegate that encodes or decodes *TInput* to *TOutput*.

Remarks

The input and output types must be either a value type that implements [IPackedVector](#) or one of [Single](#), [Vector2](#), [Vector3](#), or [Vector4](#).

VectorConverter.TryGetSurfaceFormat Method

Note

This method is available only when developing for Windows.

Gets the GPU texture format that corresponds to a managed vector type.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static bool TryGetSurfaceFormat (  
    Type vectorType,  
    out SurfaceFormat surfaceFormat  
)
```

Parameters

vectorType

Can be one of the following:

- [IPackedVector](#)
- [Single](#)
- [Vector2](#)
- [Vector3](#)
- [Vector4](#)

surfaceFormat

[[OutAttribute](#)] Surface format being compared.

Return Value

true if a match is found; **false** otherwise.

Note

This method is available only when developing for Windows.

Searches for a managed vector type that corresponds to a GPU texture format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static bool TryGetVectorType (  
    SurfaceFormat surfaceFormat,  
    out Type vectorType  
)
```

Parameters

surfaceFormat

Surface format being compared.

vectorType

[[OutAttribute](#)] Corresponding managed vector type.

Return Value

true if a match is found; **false** otherwise.

Note

This method is available only when developing for Windows.

Searches for a managed vector type that corresponds to a GPU vertex format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static bool TryGetVectorType (  
    VertexElementFormat vertexElementFormat,  
    out Type vectorType  
)
```

Parameters

vertexElementFormat

Texture format being matched.

vectorType

[[OutAttribute](#)] Corresponding managed vector type.

Return Value

true if a match is found; **false** otherwise.

VertexChannel Class

Note

This class is available only when developing for Windows.

Provides methods and properties for maintaining a vertex channel.

A vertex channel is a list of arbitrary data with one value for each vertex. Channels are stored inside a [GeometryContent](#) and identified by name.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract class VertexChannel : IList, ICollection, IEnumerable
```

[VertexChannelNames](#)

PlatformsWindows XP SP2, Windows Vista

VertexChannel Members

The following tables list the members exposed by the VertexChannel type.

Public Properties

Name	Description
 Count	Gets the number of elements in the vertex channel.
 ElementType	Gets the type of data contained in this channel.
 Item	Gets or sets the element at the specified index.
 Name	Gets the name of the vertex channel.

Public Methods

Name	Description
 Contains	Determines whether the specified element is in the channel.
 CopyTo	Copies the elements of the channel to an array, starting at the specified index.
 Equals	(Inherited from Object .)
 GetEnumerator	Gets an enumerator interface for reading channel content.
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 IndexOf	Gets the index of the specified item.
 ReadConvertedContent	Reads channel content and automatically converts it to the specified vector format.
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

Name	Description
 System.Collections.IList.IsFixedSize	Gets a value indicating whether this list has a fixed size.
 System.Collections.IList.IsReadOnly	Gets a value indicating whether this object is read-only.
 System.Collections.ICollection.IsSynchronized	Gets a value indicating whether access to the collection is synchronized (thread safe).
 System.Collections.ICollection.SyncRoot	Gets an object that can be used to synchronize access to the collection.
 System.Collections.IList.Add	Adds a new element to the end of the collection.
 System.Collections.IList.Clear	Removes all elements from the collection.
 System.Collections.IList.Insert	Inserts an element into the collection at the specified position.
 System.Collections.IList.RemoveAt	Removes the element at the specified index position.
 System.Collections.IList.Remove	Removes a specified element from the collection.

VertexChannel.Contains Method

Note

This method is available only when developing for Windows.

Determines whether the specified element is in the channel.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool Contains (  
    Object value  
)
```

Parameters

value

Element being searched for.

Return Value

true if the element is present; **false** otherwise.

Platforms Windows XP SP2, Windows Vista

VertexChannel.CopyTo Method

Note

This method is available only when developing for Windows.

Copies the elements of the channel to an array, starting at the specified index.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void CopyTo (  
    Array array,  
    int index  
)
```

Parameters

array

Array that will receive the copied channel elements.

index

Starting index for copy operation.

VertexChannel.GetEnumerator Method

Note

This method is available only when developing for Windows.

Gets an enumerator interface for reading channel content.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public IEnumerator GetEnumerator ()
```

Return Value

Enumeration of the channel content.

Remarks

To access strongly typed content data, cast the [VertexChannel](#) object to a [VertexChannel<T>](#) before calling **GetEnumerator**. This causes a generic enumerator interface to be returned.

VertexChannel.ReadConvertedContent Generic Method

Note

This generic method is available only when developing for Windows.

Reads channel content and automatically converts it to the specified vector format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract IEnumerable<TargetType> ReadConvertedContent<TargetType> ()
```

Type Parameters

TargetType

Return Value

Vector format to convert returned data to.

Remarks

The following formats are supported:

- [Single](#)
- [Vector2 Structure](#)
- [Vector3 Structure](#)
- [Vector4 Structure](#)
- Any implementation of [IPackedVector Interface](#).

Platforms Windows XP SP2, Windows Vista

VertexChannel.Item Property

Note

This property is available only when developing for Windows.

Gets or sets the element at the specified index.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public Object this [
    int index
] { get; set; }
```

Property Value

Element at the specified index.

VertexChannel.Name Property

Note

This property is available only when developing for Windows.

Gets the name of the vertex channel.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public string Name { get; }
```

Property Value

Name of the channel.

VertexChannel.System.Collections.ICollection.IsSynchronized Property

Note

This property is available only when developing for Windows.

Gets a value indicating whether access to the collection is synchronized (thread safe).

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
private bool System.Collections.ICollection.IsSynchronized { get; }
```

Property Value

true if access to the collection is synchronized (thread safe); **false** otherwise.

VertexChannel.System.Collections.ICollection.SyncRoot Property

Note

This property is available only when developing for Windows.

Gets an object that can be used to synchronize access to the collection.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
private Object System.Collections.ICollection.SyncRoot { get; }
```

Property Value

An object that can be used to synchronize access to the collection.

VertexChannel Generic Class

Note

This generic class is available only when developing for Windows.

Provides methods and properties for maintaining a vertex channel.

This is a generic implementation of [VertexChannel](#) and, therefore, can handle strongly typed content data.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public sealed class VertexChannel<T> : VertexChannel, IList<T>, ICollection<T>, IEnumerable<T>, IEnumerable
```

VertexChannel Members

The following tables list the members exposed by the VertexChannel type.

Public Properties

Name	Description
 Count	(Inherited from VertexChannel .)
 ElementType	Gets the type of data contained in this channel.
 Item	Gets or sets the element at the specified index.
 Name	(Inherited from VertexChannel .)

Public Methods

Name	Description
 Contains	Overloaded. Determines whether the specified element is in the channel.
 CopyTo	Overloaded. Copies the elements of the channel to an array.
 Equals	(Inherited from Object .)
 GetEnumerator	Gets an enumerator interface for reading channel content.
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 IndexOf	Overloaded. Gets the index of the specified item.
 ReadConvertedContent	Reads channel content and automatically converts it to the specified vector format.
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

Explicit Interface Implementations

Name	Description
 System.Collections.Generic.ICollection<T>.IsReadOnly	Gets a value indicating whether this object is read-only.
 System.Collections.Generic.ICollection<T>.Add	Adds a new element to the end of the collection.
 System.Collections.Generic.ICollection<T>.Clear	Removes all elements from the collection.
 System.Collections.Generic.IList<T>.Insert	Inserts an element into the collection at the specified position.
 System.Collections.Generic.IList<T>.RemoveAt	Removes the element at the specified index position.
 System.Collections.Generic.ICollection<T>.Remove	Removes a specified element from the collection.

VertexChannel.Contains Method (T)

Note

This method is available only when developing for Windows.

Determines whether the specified element is in the channel.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool Contains (  
    T item  
)
```

Parameters

item

Element being searched for.

Return Value

true if the element is present; **false** otherwise.

VertexChannel.CopyTo Method (T[], Int32)

Note

This method is available only when developing for Windows.

Copies the elements of the channel to an array, starting at the specified index.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void CopyTo (  
    T[] array,  
    int arrayIndex  
)
```

Parameters

array

Array that will receive the copied channel elements.

arrayIndex

Starting index for copy operation.

Note

This method is available only when developing for Windows.

Gets the index of the specified item.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public int IndexOf (  
    T item  
)
```

Parameters

item

Item whose index is to be retrieved.

Return Value

Index of specified item.

VertexChannel.ReadConvertedContent Generic Method

Note

This generic method is available only when developing for Windows.

Reads channel content and automatically converts it to the specified vector format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override IEnumerable<TargetType> ReadConvertedContent<TargetType> ()
```

Type Parameters

TargetType

Return Value

Enumeration of retrieved channel data.

Remarks

The following formats are supported:

- [Single](#)
- [Vector2 Structure](#)
- [Vector3 Structure](#)
- [Vector4 Structure](#)
- Any implementation of [IPackedVector Interface](#).

VertexChannelCollection.Add Generic Method (String, Generic IEnumerable)

Note

This generic method is available only when developing for Windows.

Adds a new vertex channel to the end of the collection.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public VertexChannel<ElementType> Add<ElementType> (  
    string name,  
    IEnumerable<ElementType> channelData  
)
```

Type Parameters

ElementType

Type of the channel.

Parameters

name

Name of the new channel.

channelData

Initial data for the new channel. If null, the channel is filled with the default value for that type.

Return Value

The newly added vertex channel.

Note

This method is available only when developing for Windows.

Adds a new vertex channel to the end of the collection.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public VertexChannel Add (  
    string name,  
    Type elementType,  
    IEnumerable channelData  
)
```

Parameters

name

Name of the new channel.

elementType

Type of data to be contained in the new channel.

channelData

Initial data for the new channel. If null, the channel is filled with the default value for that type.

Return Value

The newly added vertex channel.

TargetType

Type of the target format. Can be one of the following:

- [Single](#)
- [Vector2](#)
- [Vector3](#)
- [Vector4](#)
- [IPackedVector](#)

Parameters

name

Name of the channel to be converted.

Return Value

New channel in the specified format.

VertexChannelCollection.Get Generic Method (Int32)

Note

This generic method is available only when developing for Windows.

Gets the vertex channel with the specified index and content type.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public VertexChannel<T> Get<T> (  
    int index  
)
```

Type Parameters

T

Parameters

index

Index of a vertex channel.

Return Value

Type of a vertex channel.

VertexChannelCollection.Get Generic Method (String)

Note

This generic method is available only when developing for Windows.

Gets the vertex channel with the specified name and content type.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public VertexChannel<T> Get<T> (  
    string name  
)
```

Type Parameters

T

Type of the content.

Parameters

name

Name of a vertex channel.

Return Value

Type of a vertex channel.

Inserts a new vertex channel at the specified position.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public VertexChannel Insert (  
    int index,  
    string name,  
    Type elementType,  
    IEnumerable channelData  
)
```

Parameters

index

Index for channel insertion.

name

Name of the new channel.

elementType

Type of the new channel.

channelData

Initial data for the new channel. If null, it is filled with the default value.

Return Value

The inserted vertex channel.

VertexChannelNames Members

The following tables list the members exposed by the VertexChannelNames type.

Public Methods

	Name	Description
	Binormal	Gets the name of a binormal vector channel with the specified index.
	Color	Gets the name of a color channel with the specified index.
	DecodeBaseName	Gets a channel base name stub from the encoded string format.
	DecodeUsageIndex	Gets a channel usage index from the encoded format.
	EncodeName	Overloaded. Combines a vertex string and usage index into an encoded string.
	Equals	(Inherited from Object .)
	GetHashCode	(Inherited from Object .)
	GetType	(Inherited from Object .)
	Normal	Overloaded. Gets the name of a normal channel.
	ReferenceEquals	(Inherited from Object .)
	Tangent	Gets the name of the tangent vector channel with the specified index.
	TextureCoordinate	Gets the name of the texture coordinate channel with the specified index.
	ToString	(Inherited from Object .)
	TryDecodeUsage	Gets a vertex declaration usage enumeration from the encoded string format.
	Weights	Overloaded. Gets the name of an animation weights channel.

Protected Methods

	Name	Description
	Finalize	(Inherited from Object .)
	MemberwiseClone	(Inherited from Object .)

VertexChannelNames.Binormal Method

Note

This method is available only when developing for Windows.

Gets the name of a binormal vector channel with the specified index.

This will typically contain [Vector3](#) data.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static string Binormal (  
    int usageIndex  
)
```

Parameters

usageIndex

Zero-based index of the vector channel being retrieved.

Return Value

Name of the retrieved vector channel.

This method is available only when developing for Windows.

Gets the name of the primary animation weights channel.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static string Weights ()
```

Return Value

Name of the primary animation weights channel.

See Also

VertexChannelNames.Weights Method (Int32)

Note

This method is available only when developing for Windows.

Gets the name of an animation weights channel at the specified index.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static string Weights (  
    int usageIndex  
)
```

Parameters

usageIndex

Index of the animation weight channel to be retrieved.

Return Value

Name of the retrieved animation weights channel.

VertexContent Class

Note

This class is available only when developing for Windows.

Provides methods and properties for maintaining the vertex data of a [GeometryContent](#).

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public sealed class VertexContent
```

Remarks

This class combines a collection of arbitrarily named data channels with a list of position indices that reference the [Positions](#) collection of the parent [MeshContent](#).

VertexContent Members

The following tables list the members exposed by the VertexContent type.

Public Properties

Name	Description
 Channels	Gets the list of named vertex data channels in the VertexContent .
 PositionIndices	Gets the list of position indices.
 Positions	Gets position data from the parent mesh object.
 VertexCount	Number of vertices for the content.

Public Methods

Name	Description
 Add	Appends a new vertex index to the end of the PositionIndices collection.
 AddRange	Appends multiple vertex indices to the end of the PositionIndices collection.
 CreateVertexBuffer	Converts design-time vertex position and channel data into a vertex buffer format that a graphics device can recognize.
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 Insert	Inserts a new vertex index to the PositionIndices collection.
 InsertRange	Inserts multiple vertex indices to the PositionIndices collection.
 ReferenceEquals	(Inherited from Object .)
 RemoveAt	Removes a vertex index from the specified location in both PositionIndices and VertexChannel<T> .
 RemoveRange	Removes a range of vertex indices from the specified location in both PositionIndices and VertexChannel<T> .
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

VertexContent.Add Method

Note

This method is available only when developing for Windows.

Appends a new vertex index to the end of the [PositionIndices](#) collection.

Other vertex channels will automatically be extended and the new indices populated with default values.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public int Add (  
    int positionIndex  
)
```

Parameters

positionIndex

Index into the [MeshContent.Positions](#) member of the parent.

Return Value

Index of the new entry. This can be added to the [Indices](#) member of the parent.

VertexContent.AddRange Method

Note

This method is available only when developing for Windows.

Appends multiple vertex indices to the end of the [PositionIndices](#) collection.

Other vertex channels will automatically be extended and the new indices populated with default values.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void AddRange (  
    IEnumerable<int> positionIndexCollection  
)
```

Parameters

positionIndexCollection

Index into the [Positions](#) member of the parent.

VertexContent.CreateVertexBuffer Method

Note

This method is available only when developing for Windows.

Converts design-time vertex position and channel data into a vertex buffer format that a graphics device can recognize.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void CreateVertexBuffer (  
    out VertexBufferContent vertexBuffer,  
    out VertexElement[] vertexElements,  
    TargetPlatform targetPlatform  
)
```

Parameters

vertexBuffer

[[OutAttribute](#)] A packed vertex buffer.

vertexElements

[[OutAttribute](#)] Description of the vertex format.

targetPlatform

Target platform of the content build.

Remarks

This method returns both a packed vertex buffer and a description of the vertex format.

Exceptions

Exception type	Condition
InvalidContentException	One or more of the vertex channel types are invalid or an unrecognized name was passed to VertexElementUsage .

Note

This property is available only when developing for Windows.

Gets the list of named vertex data channels in the [VertexContent](#).

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public VertexChannelCollection Channels { get; }
```

Property Value

Collection of vertex data channels.

See Also

Reference

[VertexContent Class](#)

[VertexContent Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Graphics Namespace](#)

PlatformsWindows XP SP2, Windows Vista

VertexContent.PositionIndices Property

Note

This property is available only when developing for Windows.

Gets the list of position indices.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public VertexChannel<int> PositionIndices { get; }
```

Property Value

Position of the position index being retrieved.

Remarks

This list adds a level of indirection between the actual triangle indices and the [Positions](#) member of the parent. This indirection preserves the topological vertex identity in cases where a single vertex position is used by triangles that straddle a discontinuity in some other data channel.

For example, the following code gets the position of the first vertex of the first triangle in a [GeometryContent](#) object:

```
parent.Positions[Vertices.PositionIndices[Indices[0]]]
```

See Also

Reference

[VertexContent Class](#)

[VertexContent Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Graphics Namespace](#)

PlatformsWindows XP SP2, Windows Vista

VertexContent.Positions Property

Note

This property is available only when developing for Windows.

Gets position data from the parent mesh object.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Graphics

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public IndirectPositionCollection Positions { get; }
```

Property Value

Collection of vertex positions for the mesh.

Remarks

The collection returned from this call provides a virtualized view of the vertex positions for this batch. The collection uses the contents of the [PositionIndices](#) property to index into the parent [Positions](#). This collection is read-only. If you need to modify any contained values, edit the [PositionIndices](#) or [Positions](#) members directly.

Microsoft.Xna.Framework.Content.Pipeline.Processors

Namespace

Note

This namespace is available only when developing for Windows.

Provides base classes that represent processors used by the XNA Framework Content Pipeline when processing specific game asset types.

Classes

Name	Description
 EffectProcessor	Processes a string representation to a platform-specific compiled effect.
 FontDescriptionProcessor	Provides methods to convert a font description class containing the name and size of a font into SpriteFontContent .
 FontTextureProcessor	Provides methods to convert a specially marked 2D bitmap into SpriteFontContent .
 MaterialProcessor	Builds the effects and textures of a MaterialContent object.
 ModelBoneContent	Stores design-time data for a ModelBone asset.
 ModelBoneContentCollection	A collection of ModelBoneContent objects.
 ModelContent	Stores design-time data for a Model asset.
 ModelMeshContent	Stores design-time data for a ModelMesh asset.
 ModelMeshContentCollection	A collection of ModelMeshContent objects.
 ModelMeshPartContent	Stores design-time data for a ModelMeshPart asset.
 ModelMeshPartContentCollection	Collection of ModelMeshPartContent objects.
 ModelProcessor	Processes a game asset mesh to a model content that is optimal for runtime.
 ModelTextureProcessor	Processes textures for 3D models.
 PassThroughProcessor	Provides an implementation of a no-operation processor that returns an unmodified copy of the input data.
 SongContent	Represents a processed Song object.
 SongProcessor	A custom song processor that processes an intermediate AudioContent type.
 SoundEffectContent	Represents a processed sound effect.
 SoundEffectProcessor	Provides a custom sound effect processor that processes an intermediate AudioContent type.
 SpriteFontContent	Provides methods and properties for managing a design-time SpriteFont Class holding packed font data.
 SpriteTextureProcessor	Processes textures for use as 2D sprites or user interface components.
 TextureProcessor	Provides methods for processing textures.
 VertexBufferContent	Provides methods and properties for managing a design-time vertex buffer that holds packed vertex data.
 VideoProcessor	Processes videos for playback within a game.

Enumerations

Name	Description
 TextureProcessorOutputFormat	Specifies the target output (of type SurfaceFormat) of the texture processor.

EffectProcessor Class

Note

This class is available only when developing for Windows.

Processes a string representation to a platform-specific compiled effect.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[ContentProcessorAttribute]  
public class EffectProcessor : ContentProcessor<EffectContent, CompiledEffect>
```

EffectProcessor.Process Method

Note

This method is available only when developing for Windows.

Processes the string representation of the specified effect into a platform-specific binary format using the specified context.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override CompiledEffect Process (
    EffectContent input,
    ContentProcessorContext context
)
```

Parameters

input

The effect string to be processed.

context

Context for the specified processor.

Return Value

A platform-specific compiled binary effect.

Remarks

If you get an error during processing, compilation stops immediately. The effect processor displays an error message. Once you fix the current error, it is possible you may get more errors on subsequent compilation attempts.

Note

When processing effects for the Xbox 360 platform, the following conditional compilation symbols are defined: XBOX and XBOX360. For more information, see [Cross-Platform Conditional Compilation Symbols](#).

FontTextureProcessor Class

Note

This class is available only when developing for Windows.

Provides methods to convert a specially marked 2D bitmap into [SpriteFontContent](#).

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[ContentProcessorAttribute]
public class FontTextureProcessor : ContentProcessor<Texture2DContent, SpriteFontContent>
```

Remarks

The [FontTextureProcessor](#) class transforms a specially formatted bitmap-font texture into a [SpriteFontContent](#) object that can be loaded at run time as a standard [SpriteFont](#) object.

A bitmap-font texture must not contain more than one glyph for any given character code point; otherwise, it would not be clear which to use.

You can create a bitmap-font texture in the appropriate format using almost any raster drawing program. Place all the characters of the font in order on the bitmap as follows:

Each character should be arranged on the bitmap in a grid ordered from upper left to lower right. Monochrome characters should use white for solid areas and black for transparent areas. To include multicolored characters, add an alpha channel to the bitmap and use that to control which parts of the character are solid. Fill the spaces between each character and around the edges of the grid with a specific magenta color having the value Red:255 Green:0 Blue:255 Alpha:255. The processor packs the characters together as tightly as possible, eliminating any wasted space in the original grid.

The following figure shows an example of this kind of font texture.

The default behavior of [FontTextureProcessor](#) is to expect the first character at the upper left corner of the grid to be a space character (ASCII and Unicode code 32), and the one beside it to be an exclamation point (ASCII and Unicode code 33), and the succeeding characters to appear in Unicode order for all the characters that the font contains.

You can support a different range and order of characters by writing a custom processor that extends [FontTextureProcessor](#) by overriding the [GetCharacterForIndex](#) method. For example, the code below creates a processor class that you could use to load a bitmap font texture containing the numeric digits from 1 to 9:

C#

```
[ContentProcessor]
public class MyFontTextureProcessor : FontTextureProcessor
{
    protected override char GetCharacterForIndex( int index )
    {
        return (char)('1' + index);
    }
}
```

Be sure to include the `[ContentProcessor]` attribute before the class declaration, as shown in this example.

Reference

[FontTextureProcessor Class](#)

[Microsoft.Xna.Framework.Content.Pipeline.Processors Namespace](#)

FontTextureProcessor.GetCharacterForIndex Method

Note

This method is available only when developing for Windows.

Maps a glyph index to a character.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected virtual char GetCharacterForIndex (
    int index
)
```

Parameters

index

The glyph index. This is a zero-based index that corresponds to the position of the glyph in the original character. This value begins at the upper-left corner of the texture and increases when moving to the right and down.

Return Value

The character represented by the specified glyph index.

Exceptions

Exception type	Condition
ArgumentOutOfRangeException	<i>index</i> is out of the range of available characters.

Remarks

This method is designed to be overridden by a subclass of this processor. For example, if the original texture contains the characters A, B, and C, in that order, this method should return "A" when passed 0, "B" when passed 1, and "C" when passed 2. Subclasses of this processor may override this method to control which characters a bitmap font represents.

If not overridden, the default implementation of this function assumes a Unicode order of character code points starting at code point 32—the space character. In other words, it assumes that a character index of zero corresponds to a space character, a character index of 1 corresponds to an exclamation point ("!"), and so on.

A font texture must not contain more than one instance of any given character code point. For example, it must not contain two uppercase "A" characters. As a result, any implementation of this function should ensure that it cannot return the same character for two different indices.

FontTextureProcessor.Process Method

Note

This method is available only when developing for Windows.

Creates [SpriteFontContent](#) from a bitmap.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override SpriteFontContent Process (
    Texture2DContent input,
    ContentProcessorContext context
)
```

Parameters

input

The bitmap data to convert to a font.

context

Context for the specified processor.

Return Value

The font data.

Exceptions

Exception type	Condition
ArgumentNullException	<i>input</i> is null .
InvalidOperationException	A character cannot be mapped to a glyph index: it is already mapped to a glyph index.

Remarks

Each character should be arranged on the bitmap in a grid ordered from upper left to lower right. Monochrome characters should use white for solid areas and black for transparent areas. To include multicolored characters, add an alpha channel to the bitmap and use that to control which parts of the character are solid. Fill the spaces between each character and around the edges of the grid with a specific magenta color having the value Red:255 Green:0 Blue:255 Alpha:255. The processor packs the characters together as tightly as possible, eliminating any wasted space in the original grid.

PlatformsWindows XP SP2, Windows Vista

FontTextureProcessor Properties

Public Properties

	Name	Description
	FirstCharacter	Gets or sets the value of the First Character processor parameter.
	TextureFormat	Gets or sets the output SurfaceFormat of textures.

FontTextureProcessor.FirstCharacter Property

Note

This property is available only when developing for Windows.

Gets or sets the value of the First Character processor parameter.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual char FirstCharacter { get; set; }
```

Property Value

The start character of the font texture being processed.

FontTextureProcessor.TextureFormat Property

Note

This property is available only when developing for Windows.

Gets or sets the output [SurfaceFormat](#) of textures.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual TextureProcessorOutputFormat TextureFormat { get; set; }
```

Property Value

The output [SurfaceFormat](#) of textures.

Remarks

Textures can be left unchanged from the source asset, converted to the [Color](#) format, or DXT compressed.

MaterialProcessor Class

Note

This class is available only when developing for Windows.

Builds the effects and textures of a [MaterialContent](#) object.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[ContentProcessorAttribute]  
public class MaterialProcessor : ContentProcessor<MaterialContent, MaterialContent>
```

MaterialProcessor Members

The following tables list the members exposed by the MaterialProcessor type.

Public Constructors

Name	Description
 MaterialProcessor	Initializes a new instance of the MaterialProcessor class.

Public Properties

Name	Description
 ColorKeyColor	Gets or sets the color value to replace with transparent black.
 ColorKeyEnabled	Specifies whether color keying of a texture is enabled.
 GenerateMipmaps	Specifies if a full chain of mipmaps are generated from the source material. Existing mipmaps of the material are not replaced.
 ResizeTexturesToPowerOfTwo	Specifies whether resizing of a material is enabled.
 TextureFormat	Specifies the texture format of output materials.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 Process	Builds the texture and effect content for the material.
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 BuildEffect	Builds effect content.
 BuildTexture	Builds texture content.
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

See Also

Reference

[MaterialProcessor Class](#)

[Microsoft.Xna.Framework.Content.Pipeline.Processors Namespace](#)

MaterialProcessor.BuildEffect Method

Note

This method is available only when developing for Windows.

Builds effect content.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected virtual ExternalReference<CompiledEffect> BuildEffect (  
    ExternalReference<EffectContent> effect,  
    ContentProcessorContext context  
)
```

Parameters

effect

An external reference to the effect content.

context

Context for the specified processor.

Return Value

A platform-specific compiled binary effect.

RemarksIf the input to process is of type [EffectMaterialContent](#), this function will be called to request that the [EffectContent](#) be built. The [EffectProcessor](#) is used to process the [EffectContent](#). Subclasses of [MaterialProcessor](#) can override this function to modify the parameters used to build [EffectContent](#). For example, a different version of this function could request a different processor for the [EffectContent](#).

MaterialProcessor.BuildTexture Method

Note

This method is available only when developing for Windows.

Builds texture content.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected virtual ExternalReference<TextureContent> BuildTexture (  
    string textureName,  
    ExternalReference<TextureContent> texture,  
    ContentProcessorContext context  
)
```

Parameters

textureName

The name of the texture. This should correspond to the key used to store the texture in [Textures](#).

texture

The asset to build. This should be a member of [Textures](#).

context

Context for the specified processor.

Return Value

The built texture content.

Remarks *textureName* can be used to determine which processor to use. For example, if a texture is being used as a normal map, the user may not want to use the [ModelTextureProcessor](#) on it, which compresses textures.

[MaterialProcessor Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Processors Namespace](#)

PlatformsWindows XP SP2, Windows Vista

MaterialProcessor.Process Method

Note

This method is available only when developing for Windows.

Builds the texture and effect content for the material.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override MaterialContent Process (  
    MaterialContent input,  
    ContentProcessorContext context  
)
```

Parameters

input

The material content to build.

context

Context for the specified processor.

Return Value

The built material.

RemarksIf the [MaterialContent](#) is of type [EffectMaterialContent](#), a build is requested for [Effect](#), and validation will be performed on the [OpaqueData](#) to ensure that all parameters are valid input to [SetValue](#) or [SetValueTranspose](#). If the [MaterialContent](#) is a [BasicMaterialContent](#), no validation will be performed on [OpaqueData](#). **Process** requests builds for all textures in [Textures](#), unless the [MaterialContent](#) is of type [BasicMaterialContent](#), in which case a build will only be requested for [DiffuseColor](#). The textures in [Textures](#) will be ignored.

MaterialProcessor.ColorKeyColor Property

Note

This property is available only when developing for Windows.

Gets or sets the color value to replace with transparent black.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual Color ColorKeyColor { get; set; }
```

Property Value

Color value of the material to replace with transparent black.

PlatformsWindows XP SP2, Windows Vista

MaterialProcessor.ColorKeyEnabled Property

Note

This property is available only when developing for Windows.

Specifies whether color keying of a texture is enabled.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual bool ColorKeyEnabled { get; set; }
```

Property Value

true if color keying is enabled; **false** otherwise.

PlatformsWindows XP SP2, Windows Vista

MaterialProcessor.ResizeTexturesToPowerOfTwo Property

Note

This property is available only when developing for Windows.

Specifies whether resizing of a material is enabled. Typically used to maximize compatibility with a graphics card because many graphics cards do not support a material size that is not a power of two. If **ResizeTexturesToPowerOfTwo** is enabled, the material is resized to the next largest power of two.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual bool ResizeTexturesToPowerOfTwo { get; set; }
```

Property Value

true if resizing is enabled; **false** otherwise.

MaterialProcessor.TextureFormat Property

Note

This property is available only when developing for Windows.

Specifies the texture format of output materials. Materials can either be left unchanged from the source asset, converted to a corresponding [Color](#), or compressed using the appropriate **DXTCompressed** format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual TextureProcessorOutputFormat TextureFormat { get; set; }
```

Property Value

The texture format of the output.

ModelMeshPartContent Members

The following tables list the members exposed by the ModelMeshPartContent type.

Public Properties

Name	Description
 BaseVertex	Gets the offset from the start of the index buffer to the first vertex index.
 Material	Gets the material of this mesh part.
 NumVertices	Gets the number of vertices used in this mesh part.
 PrimitiveCount	Gets the number of primitives to render for this mesh part.
 StartIndex	Gets the location in the index buffer at which to start reading vertices.
 StreamOffset	Gets the offset, in bytes, from the first index of the of vertex buffer for this mesh part.
 Tag	Gets a user-defined tag object.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 GetVertexDeclaration	Gets the vertex declaration for this mesh part.
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

ModelProcessor Members

The following tables list the members exposed by the ModelProcessor type.

Public Constructors

Name	Description
 ModelProcessor	Initializes a new instance of ModelProcessor.

Public Properties

Name	Description
 ColorKeyColor	Specifies the color used when color keying for a texture is enabled.
 ColorKeyEnabled	Specifies whether color keying of a model is enabled.
 GenerateMipmaps	Specifies whether a full chain of mipmaps is generated from the source material.
 GenerateTangentFrames	Gets or sets the value of the Generate Tangent Frames processor parameter.
 ResizeTexturesToPowerOfTwo	Specifies whether resizing of textures are enabled.
 RotationX	Gets or sets the value of the X Axis Rotation processor parameter.
 RotationY	Gets or sets the value of the Y Axis Rotation processor parameter.
 RotationZ	Gets or sets the value of the Z Axis Rotation processor parameter.
 Scale	Gets or sets the value of the Scale processor parameter.
 SwapWindingOrder	Gets or sets the value of the Swap Winding Order processor parameter.
 TextureFormat	Specifies the texture format of output materials.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 Process	Converts mesh content to model content.
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 ConvertMaterial	Called by the framework when the MaterialContent property of a GeometryContent object is encountered in the input node collection.
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)
 ProcessGeometryUsingMaterial	Processes all geometry using a specified material.
 ProcessVertexChannel	Processes geometry content vertex channels at the specified index.

ModelProcessor.ConvertMaterial Method

Note

This method is available only when developing for Windows.

Called by the framework when the [MaterialContent](#) property of a [GeometryContent](#) object is encountered in the input node collection.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected virtual MaterialContent ConvertMaterial (  
    MaterialContent material,  
    ContentProcessorContext context  
)
```

Parameters

material

The input material content.

context

Context for the specified processor.

Return Value

The converted material content.

See Also

Reference

[Microsoft.Xna.Framework.Content.Pipeline.Processors Namespace](#)

PlatformsWindows XP SP2, Windows Vista

ModelProcessor.Process Method

Note

This method is available only when developing for Windows.

Converts mesh content to model content.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override ModelContent Process (
    NodeContent input,
    ContentProcessorContext context
)
```

Parameters

input

The root node content.

context

Context for the specified processor.

Return Value

The model content.

[ModelProcessor Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Processors Namespace](#)

Platforms Windows XP SP2, Windows Vista

ModelProcessor.ProcessGeometryUsingMaterial Method

Note

This method is available only when developing for Windows.

Processes all geometry using a specified material.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected virtual void ProcessGeometryUsingMaterial (
    MaterialContent material,
    IEnumerable<GeometryContent> geometryCollection,
    ContentProcessorContext context
)
```

Parameters

material

A material used in the scene.

geometryCollection

A collection of all the geometry using the specified material.

context

Context for the specified processor.

Remarks

This function will be called for each material used by geometry in the input mesh, passing in a collection of all the geometry that is using the specified material. The default implementation replaces **null** materials with a default [BasicMaterialContent](#), validates that the geometry contains texture coordinates if a [BasicMaterialContent](#) has a texture, and sets the [VertexColorEnabled](#) property depending on whether the geometry contains vertex color data.

PlatformsWindows XP SP2, Windows Vista

ModelProcessor.ProcessVertexChannel Method

Note

This method is available only when developing for Windows.

Processes geometry content vertex channels at the specified index.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected virtual void ProcessVertexChannel (
    GeometryContent geometry,
    int vertexChannelIndex,
    ContentProcessorContext context
)
```

Parameters

geometry

The geometry content to process.

vertexChannelIndex

Index of the vertex channel to process.

context

Context for the specified processor.

Remarks This function will be called for each [VertexChannel](#) of [Vertices](#) found in the input mesh. Subclasses of [ModelProcessor](#) can override **ProcessVertexChannel** to control how vertex data is processed. The default implementation converts [VertexElementUsage.Color](#) channels to [Color](#) format, and replaces [Weights](#) channels with a pair of [VertexElementUsage.BlendIndices](#) and [VertexElementUsage.BlendIndices](#) channels (using [Byte4](#) format for the [VertexElementUsage.BlendWeight](#), Color for the [VertexElementUsage.BlendWeight](#), and discarding excess weights if there are more than four per vertex).

ModelProcessor.ColorKeyColor Property

Note

This property is available only when developing for Windows.

Specifies the color used when color keying for a texture is enabled. When color keying, all pixels of a specified color are replaced with transparent black.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual Color ColorKeyColor { get; set; }
```

Property Value

Color value of the material to replace with transparent black.

ModelProcessor.ColorKeyEnabled Property

Note

This property is available only when developing for Windows.

Specifies whether color keying of a model is enabled.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual bool ColorKeyEnabled { get; set; }
```

Property Value

true if color keying is enabled; **false** otherwise.

ModelProcessor.ResizeTexturesToPowerOfTwo Property

Note

This property is available only when developing for Windows.

Specifies whether resizing of textures are enabled. Typically used to maximize compatability with a graphics card because many graphics cards do not support a material size that is not a power of two. If **ResizeTexturesToPowerOfTwo** is enabled, textures are resized to the next largest power of two.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual bool ResizeTexturesToPowerOfTwo { get; set; }
```

Property Value

true if resizing is enabled; **false** otherwise.

Gets or sets the value of the Z Axis Rotation processor parameter.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual float RotationZ { get; set; }
```

Property Value

The amount of rotation, in degrees, around the Z axis.

ModelProcessor.Scale Property

Note

This property is available only when developing for Windows.

Gets or sets the value of the Scale processor parameter.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual float Scale { get; set; }
```

Property Value

The scaling factor to be applied.

ModelProcessor.SwapWindingOrder Property

Note

This property is available only when developing for Windows.

Gets or sets the value of the Swap Winding Order processor parameter.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual bool SwapWindingOrder { get; set; }
```

Property Value

true if the winding order of the model should be swapped; otherwise **false**. This is useful for models that appear to be drawn inside-out.

ModelTextureProcessor Members

The following tables list the members exposed by the ModelTextureProcessor type.

Public Constructors

Name	Description
 ModelTextureProcessor	Initializes a new instance of the ModelTextureProcessor class.

Public Properties

Name	Description
 ColorKeyColor	Specifies the color used when color keying for a texture is enabled.
 ColorKeyEnabled	Specifies whether color keying of the texture is enabled.
 GenerateMipmaps	Specifies if a full chain of mipmaps are generated from the source material.
 ResizeToPowerOfTwo	Specifies whether resizing of textures are enabled.
 TextureFormat	Specifies the texture format of output materials.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

ModelTextureProcessor.GenerateMipmaps Property

Note

This property is available only when developing for Windows.

Specifies if a full chain of mipmaps are generated from the source material. Existing mipmaps of the material are not replaced.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override bool GenerateMipmaps { get; }
```

Property Value

true if mipmap generation is enabled; **false** otherwise.

[Microsoft.Xna.Framework.Content.Pipeline.Processors Namespace](#)

PlatformsWindows XP SP2, Windows Vista

ModelTextureProcessor.ResizeToPowerOfTwo Property

Note

This property is available only when developing for Windows.

Specifies whether resizing of textures are enabled. Typically used to maximize compatability with a graphics card because many graphics cards do not support a material size that is not a power of two. If **ResizeToPowerOfTwo** is enabled, textures are resized to the next largest power of two.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override bool ResizeToPowerOfTwo { get; }
```

Property Value

true if resizing is enabled; **false** otherwise.

[ModelTextureProcessor Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Processors Namespace](#)

PlatformsWindows XP SP2, Windows Vista

PassThroughProcessor Class

Note

This class is available only when developing for Windows.

Provides an implementation of a no-operation processor that returns an unmodified copy of the input data.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[ContentProcessorAttribute]
public class PassThroughProcessor : ContentProcessor<Object, Object>
```

Remarks **PassThroughProcessor** is useful when the importer is already producing data in a game ready format. This can occur after importing textures from DDS files that have been formatted using an external tool, or when deserializing game logic data from XML using the intermediate XML importer.

Specifies whether color keying of the texture is enabled.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override bool ColorKeyEnabled { get; }
```

Property Value

true if color keying is enabled; **false** otherwise.

TextureProcessor Members

The following tables list the members exposed by the TextureProcessor type.

Public Constructors

Name	Description
 TextureProcessor	Initializes a new instance of the TextureProcessor class.

Public Properties

Name	Description
 ColorKeyColor	Specifies the color used when color keying for a texture is enabled.
 ColorKeyEnabled	Specifies whether color keying of a texture is enabled.
 GenerateMipmaps	Specifies if a full chain of mipmaps are generated from the source texture.
 ResizeToPowerOfTwo	Specifies whether resizing of a texture is enabled.
 TextureFormat	Specifies the texture format of outputmaterials.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 Process	Processes a texture.
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 MemberwiseClone	(Inherited from Object .)

TextureProcessor.Process Method

Note

This method is available only when developing for Windows.

Processes a texture.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override TextureContent Process (  
    TextureContent input,  
    ContentProcessorContext context  
)
```

Parameters

input

The texture content to process.

context

Context for the specified processor.

Return Value

The converted texture content.

Remarks **Process** generates mipmaps if they are not already present, but leaves the texture in the same format as the input data. This is suitable for use with DDS files that have already been converted to an appropriate format.

TextureProcessorOutputFormat Enumeration

Note

This enumeration is available only when developing for Windows.

Specifies the target output (of type [SurfaceFormat](#)) of the texture processor. Used by [TextureProcessor.TextureFormat](#).

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public enum TextureProcessorOutputFormat
```

Members

Member name	Description
Color	The SurfaceFormat value, of the input TextureContent object, is converted to Color by the processor. Typically used for 2D graphics and overlays.
DxtCompressed	The SurfaceFormat value, of the input TextureContent object, is converted to an appropriate DXT compression by the processor. If the input texture contains fractional alpha values, it is converted to DXT5 format (8 bits per texel); otherwise it is converted to DXT1 (4 bits per texel). This conversion reduces the resource's size on the graphics card. Typically used for 3D textures such as 3D model textures.
NoChange	The SurfaceFormat value, of the input TextureContent object, is not changed by the processor. Typically used for textures processed by an external tool.

VertexBufferContent Class

Note

This class is available only when developing for Windows.

Provides methods and properties for managing a design-time vertex buffer that holds packed vertex data.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public class VertexBufferContent : ContentItem
```

Remarks

This type directly corresponds to the runtime [VertexBuffer](#) class, and when a **VertexBufferContent** object is passed to the content compiler, the vertex data deserializes directly into a [VertexBuffer](#) at runtime. **VertexBufferContent** objects are not directly created by importers. The preferred method is to store vertex data in the more flexible [VertexContent](#) class.

VertexBufferContent.SizeOf Method

Note

This method is available only when developing for Windows.

Gets the size of the specified type, in bytes.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static int SizeOf (  
    Type type  
)
```

Parameters

type

The type.

Return Value

The size of the specified type, in bytes.

Remarks

Call this method to compute offset parameters for the [Write](#) method. If the specified data type cannot be packed into a vertex buffer—for example, if *type* is not a valid value type—a [NotSupportedException](#) is thrown.

[VertexBufferContent Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Processors Namespace](#)

VertexBufferContent.Write Generic Method (Int32, Int32, Generic IEnumerable)

Note

This generic method is available only when developing for Windows.

Writes additional data into the vertex buffer. Writing begins at the specified byte offset, and each value is spaced according to the specified stride value (in bytes).

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void Write<T> (  
    int offset,  
    int stride,  
    IEnumerable<T> data  
)
```

Type Parameters

T

Type being written.

Parameters

offset

Offset to begin writing at.

stride

Stride of the data being written, in bytes.

data

Enumerated collection of data.

Remarks

This method automatically grows the vertex buffer if an attempt is made to write past the buffer end. **Write** throws [NotSupportedException](#) if the specified data type cannot be packed into a vertex buffer. For example, if *data* is not a valid value type.

Use this method to interleave vertex data channels into a single buffer. This can be done by passing the total vertex size as the *stride* and suitable smaller offsets for each channel. You can also concatenate entire vertex buffers by passing the length of the vertex as the *offset*, 1 as the *stride*, and the vertex data as the *data* parameter.

Note

This method is available only when developing for Windows.

Writes additional data into the vertex buffer. Writing begins at the specified byte offset, and each value is spaced according to the specified stride value (in bytes).

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Processors

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void Write (  
    int offset,  
    int stride,  
    Type dataType,  
    IEnumerable data  
)
```

Parameters

offset

Offset at which to begin writing.

stride

Stride of the data being written, in bytes.

dataType

The type of data to be written.

data

The data to write.

Remarks

This method automatically grows the vertex buffer if an attempt is made to write past the buffer end. **Write** throws [NotSupportedException](#) if the specified data type cannot be packed into a vertex buffer. For example, if *data* is not a valid value type.

Use this method to interleave vertex data channels into a single buffer. This can be done by passing the total vertex size as the *stride* and suitable smaller offsets for each channel. Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler Namespace

Note

This namespace is available only when developing for Windows.

Provides base classes that represent compilers and writers used by the XNA Framework Content Pipeline when processing specific game asset types.

Classes

	Name	Description
	ContentCompiler	Provides methods for writing compiled binary format.
	ContentTypeWriter	Provides a generic implementation of ContentTypeWriter methods and properties for compiling a specific managed type into a binary format.
	ContentTypeWriter	Provides methods and properties for compiling a specific managed type into a binary format.
	ContentTypeWriterAttribute	Identifies the components of a type writer.
	ContentWriter	Provides an implementation for many of the ContentCompiler methods including compilation, state tracking for or shared resources and creation of the header type manifest.

ContentCompiler Class

Note

This class is available only when developing for Windows.

Provides methods for writing compiled binary format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public sealed class ContentCompiler
```

ContentCompiler.GetTypeWriter Method

Note

This method is available only when developing for Windows.

Retrieves the worker writer for the specified type.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public ContentTypeWriter GetTypeWriter (  
    Type type  
)
```

Parameters

type

The type.

Return Value

The worker writer.

Remarks This should be called from the [ContentTypeWriter.Initialize](#) method.

ContentTypeWriter Members

The following tables list the members exposed by the ContentTypeWriter type.

Protected Constructors

Name	Description
 ContentTypeWriter	Initializes a new instance of the ContentTypeWriter class.

Public Properties

Name	Description
 CanDeserializeIntoExistingObject	Determines if deserialization into an existing object is possible.
 TargetType	Gets the type handled by this compiler component.
 TypeVersion	Gets a format version number for this type.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetRuntimeReader	Gets the assembly qualified name of the runtime loader for this type.
 GetRuntimeType	Gets the assembly qualified name of the runtime target type.
 GetType	(Inherited from Object .)
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Finalize	(Inherited from Object .)
 Initialize	Retrieves and caches nested type writers and allows for reflection over the target data type.
 MemberwiseClone	(Inherited from Object .)
 ShouldCompressContent	Indicates whether a given type of content should be compressed.
 Write	Compiles an object into binary format.

ContentTypeWriter Constructor

Note

This constructor is available only when developing for Windows.

Initializes a new instance of the [ContentTypeWriter](#) class.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected ContentTypeWriter (  
    Type targetType  
)
```

Parameters

targetType

The target type the [ContentTypeWriter](#).

Exceptions

Exception type	Condition
ArgumentException	<ul style="list-style-type: none">Cannot serialize type <i>targetType</i>. Pointers and references are not supported.<i>targetType</i> cannot be serialized because not all the generic type parameters have been specified.
ArgumentNullException	<i>targetType</i> is null .

ContentTypeWriter.GetRuntimeReader Method

Note

This method is available only when developing for Windows.

Gets the assembly qualified name of the runtime loader for this type.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract string GetRuntimeReader (  
    TargetPlatform targetPlatform  
)
```

Parameters

targetPlatform

Name of the platform.

Return Value

Name of the runtime loader.

ContentTypeWriter.GetRuntimeType Method

Note

This method is available only when developing for Windows.

Gets the assembly qualified name of the runtime target type. The runtime target type often matches the design time type, but may differ.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public virtual string GetRuntimeType (  
    TargetPlatform targetPlatform  
)
```

Parameters

targetPlatform

The target platform.

Return Value

The qualified name.

ContentTypeWriter.Initialize Method

Note

This method is available only when developing for Windows.

Retrieves and caches nested type writers and allows for reflection over the target data type. Called by the framework at creation time.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected virtual void Initialize (  
    ContentCompiler compiler  
)
```

Parameters

compiler

The content compiler.

See Also

Reference

[ContentTypeWriter Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler Namespace](#)

PlatformsWindows XP SP2, Windows Vista

ContentTypeWriter.ShouldCompressContent Method

Note

This method is available only when developing for Windows.

Indicates whether a given type of content should be compressed.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected internal virtual bool ShouldCompressContent (
    TargetPlatform targetPlatform,
    Object value
)
```

Parameters

targetPlatform

The target platform of the content build.

value

The object about to be serialized, or **null** if a collection of objects is to be serialized.

Return Value

true if the content of the requested type should be compressed; **false** otherwise.

Remarks

This base class implementation of this method always returns **true**. It should be overridden to return **false** if there would be little or no useful reduction in size of the content type's data from a general-purpose lossless compression algorithm.

The implementations for [Song Class](#) and [SoundEffect Class](#) data return **false** because data for these content types is already in compressed form.

Name	Description
ContentWriter.WriteObject (T)	Writes a single object preceded by a type identifier to the output binary.
ContentWriter.WriteObject (T, ContentType Writer)	Writes a single object to the output binary, using the specified type hint and writer worker.

ContentWriter.WriteObject Generic Method (T)

Note

This generic method is available only when developing for Windows.

Writes a single object preceded by a type identifier to the output binary.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void WriteObject<T> (  
    T value  
)
```

Type Parameters

T

The type of *value*.

Parameters

value

The value to write.

Remarks This method can be called recursively with a **null** value.

PlatformsWindows XP SP2, Windows Vista

ContentWriter.WriteObject Generic Method (T, ContentTypeWriter)

Note

This generic method is available only when developing for Windows.

Writes a single object to the output binary, using the specified type hint and writer worker.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void WriteObject<T> (  
    T value,  
    ContentTypeWriter typeWriter  
)
```

Type Parameters

T

The type of *value*.

Parameters

value

The value to write.

typeWriter

The content type writer.

RemarksThe type hint should be retrieved from the [Initialize](#) method of the [ContentTypeWriter](#) that is calling **WriteObject**, by calling [GetTypeWriter](#) and passing it the type of the field used to hold the value being serialized. If the hint type is a sealed value type (which cannot be **null** or hold a polymorphic object instance) this method skips writing the usual type identifier.

ContentWriter.WriteRawObject Method

Writes a single object to the output binary as an instance of the specified type.

Overload List

Name	Description
ContentWriter.WriteRawObject (T)	Writes a single object to the output binary as an instance of the specified type.
ContentWriter.WriteRawObject (T, ContentTypeWriter)	Writes a single object to the output binary using the specified writer worker.

See Also

Reference

[ContentWriter Class](#)

[ContentWriter Members](#)

[Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler Namespace](#)

ContentWriter.WriteRawObject Generic Method (T)

Note

This generic method is available only when developing for Windows.

Writes a single object to the output binary as an instance of the specified type.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void WriteRawObject<T> (  
    T value  
)
```

Type Parameters

T

The type of *value*.

Parameters

value

The value to write.

RemarksIf you specify a base class of the actual object value only data from this base type will be written. This method does not write any type identifier so it cannot support **null** or polymorphic values, and the reader must specify an identical type while loading the compiled data.

ContentWriter.WriteRawObject Generic Method (T, ContentTypeWriter)

Note

This generic method is available only when developing for Windows.

Writes a single object to the output binary using the specified writer worker.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void WriteRawObject<T> (  
    T value,  
    ContentTypeWriter typeWriter  
)
```

Type Parameters

T

The type of *value*.

Parameters

value

The value to write.

typeWriter

The writer worker. This should be looked up from the [Initialize](#) method of the [ContentTypeWriter](#) that is calling **WriteRawObject**, by calling [GetTypeWriter](#).

Remarks **WriteRawObject** does not write any type identifier, so it cannot support **null** or polymorphic values, and the reader must specify an identical type while loading the compiled data.

ContentWriter.WriteSharedResource Generic Method

Note

This generic method is available only when developing for Windows.

Adds a shared reference to the output binary and records the object to be serialized later.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Compiler

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void WriteSharedResource<T> (  
    T value  
)
```

Type Parameters

T

The type of *value*.

Parameters

value

The object to record.

Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate Namespace

Note

This namespace is available only when developing for Windows.

Provides base classes that represent the creation and writing of intermediate content for game asset types processed by the XNA Framework Content Pipeline.

Classes

Name	Description
 ContentTypeSerializer	Provides a generic implementation of ContentTypeSerializer methods and properties for serializing and deserializing a specific managed type.
 ContentTypeSerializer	Provides methods for serializing and deserializing a specific managed type.
 ContentTypeSerializerAttribute	Identifies type serializer components.
 IntermediateReader	Provides an implementation of many of the methods of IntermediateSerializer . Deserializes and tracks state for shared resources and external references.
 IntermediateSerializer	Provides methods for reading and writing XNA intermediate XML format.
 IntermediateWriter	Provides an implementation of many of the methods of IntermediateSerializer including serialization and state tracking for shared resources and external references.

Delegates

Name	Description
 ContentTypeSerializer.ChildCallback	Callback delegate for the ScanChildren method.

ContentTypeSerializer Class

Note

This class is available only when developing for Windows.

Provides methods for serializing and deserializing a specific managed type.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public abstract class ContentTypeSerializer
```

ContentTypeSerializer Members

The following tables list the members exposed by the ContentTypeSerializer type.

Public Constructors

Name	Description
 ContentTypeSerializer	Overloaded. Initializes a new instance of the ContentTypeSerializer class.

Public Properties

Name	Description
 CanDeserializeIntoExistingObject	Gets a value indicating whether this component may load data into an existing object or if it must construct a new instance of the object before loading the data.
 TargetType	Gets the type handled by this serializer component.
 XmlTypeName	Gets a short-form XML name for the target type, or null if there is none.

Public Methods

Name	Description
 Equals	(Inherited from Object .)
 GetHashCode	(Inherited from Object .)
 GetType	(Inherited from Object .)
 ObjectsIsEmpty	Queries whether an object contains data to be serialized.
 ReferenceEquals	(Inherited from Object .)
 ToString	(Inherited from Object .)

Protected Methods

Name	Description
 Deserialize	Deserializes an object from intermediate XML format.
 Finalize	(Inherited from Object .)
 Initialize	Retrieves and caches any nested type serializers and allows reflection over the target data type.
 MemberwiseClone	(Inherited from Object .)
 ScanChildren	Examines the children of the specified object, passing each to a callback delegate.
 Serialize	Serializes an object to intermediate XML format.

ContentTypeSerializer.Deserialize Method

Note

This method is available only when developing for Windows.

Deserializes an object from intermediate XML format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected internal abstract Object Deserialize (  
    IntermediateReader input,  
    ContentTypeSerializerAttribute format,  
    Object existingInstance  
)
```

Parameters

input

Location of the intermediate XML and various deserialization helpers.

format

Specifies the intermediate source XML format.

existingInstance

The object containing the received data, or **null** if the deserializer should construct a new instance.

Return Value

The resultant object.

ContentTypeSerializer.ScanChildren Method

Note

This method is available only when developing for Windows.

Examines the children of the specified object, passing each to a callback delegate.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected internal virtual void ScanChildren (  
    IntermediateSerializer serializer,  
    ChildCallback callback,  
    Object value  
)
```

Parameters

serializer

The content serializer.

callback

The method to be called for each examined child.

value

The object whose children are being scanned.

Serializes an object to intermediate XML format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected internal abstract void Serialize (  
    IntermediateWriter output,  
    Object value,  
    ContentTypeSerializerAttribute format  
)
```

Parameters

output

Specifies the intermediate XML location, and provides various serialization helpers.

value

The object to be serialized.

format

Specifies the content format for this object.

ContentTypeSerializer.Serialize Method (IntermediateWriter, Object, ContentSerializerAttribute)

Note

This method is available only when developing for Windows.

Serializes an object to intermediate XML format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected internal override void Serialize (  
    IntermediateWriter output,  
    Object value,  
    ContentSerializerAttribute format  
)
```

Parameters

output

Specifies the intermediate XML location, and provides various serialization helpers.

value

The object to be serialized.

format

Specifies the content format for this object.

ContentTypeSerializer.Serialize Method (IntermediateWriter, T, ContentTypeSerializerAttribute)

Note

This method is available only when developing for Windows.

Serializes an object to intermediate XML format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected internal abstract void Serialize (  
    IntermediateWriter output,  
    T value,  
    ContentTypeSerializerAttribute format  
)
```

Parameters

output

Specifies the intermediate XML location, and provides various serialization helpers.

value

The strongly typed object to be serialized.

format

Specifies the content format for this object.

ContentTypeSerializer.ChildCallback Delegate

Note

This delegate is available only when developing for Windows.

Callback delegate for the [ScanChildren](#) method.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
protected internal delegate void ContentTypeSerializer.ChildCallback (  
    ContentTypeSerializer typeSerializer,  
    Object value  
)
```

Parameters

typeSerializer

The serializer component used to read or write the child object.

value

The child object currently being scanned.

IntermediateReader.MoveToElement Method

Note

This method is available only when developing for Windows.

Moves to the specified element if the element name exists.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool MoveToElement (  
    string elementName  
)
```

Parameters

elementName

The element name.

Return Value

true if the specified element exists and the move was successful; **false** otherwise.

IntermediateSerializer.Deserialize Generic Method

Note

This generic method is available only when developing for Windows.

Deserializes an intermediate XML file into a managed object.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static T Deserialize<T> (  
    XmlReader input,  
    string referenceRelocationPath  
)
```

Type Parameters

T

The type to deserialize.

Parameters

input

Intermediate XML file.

referenceRelocationPath

Final name of the output file used to relative encode external reference filenames.

Return Value

The deserialized type.

Serializes an object into an intermediate XML file.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public static void Serialize<T> (  
    XmlWriter output,  
    T value,  
    string referenceRelocationPath  
)
```

Type Parameters

T

The type of *value*.

Parameters

output

The output XML stream.

value

The object to be serialized.

referenceRelocationPath

Final name of the output file, used to relative encode external reference filenames.

IntermediateWriter.WriteExternalReference Generic Method

Note

This generic method is available only when developing for Windows.

Adds an external reference to the output XML, and records the filename to be serialized later.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void WriteExternalReference<T> (  
    ExternalReference<T> value  
)
```

Type Parameters

T

The type of external reference to add.

Parameters

value

The external reference to add.

IntermediateWriter.WriteObject Generic Method (T, ContentSerializerAttribute)

Note

This generic method is available only when developing for Windows.

Writes a single object to the output XML stream.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void WriteObject<T> (  
    T value,  
    ContentSerializerAttribute format  
)
```

Type Parameters

T

The type of value to write.

Parameters

value

The value to write.

format

The format of the XML.

IntermediateWriter.WriteObject Generic Method (T, ContentSerializerAttribute, ContentTypeSerializer)

Note

This generic method is available only when developing for Windows.

Writes a single object to the output XML stream, using the specified type hint.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void WriteObject<T> (  
    T value,  
    ContentSerializerAttribute format,  
    ContentTypeSerializer typeSerializer  
)
```

Type Parameters

T

The type of value to write.

Parameters

value

The value to write.

format

The format of the XML.

typeSerializer

The type serializer.

IntermediateWriter.WriteRawObject Generic Method (T, ContentSerializerAttribute)

Note

This generic method is available only when developing for Windows.

Writes a single object to the output XML stream using the specified serializer worker.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Serialization.Intermediate

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public void WriteRawObject<T> (  
    T value,  
    ContentSerializerAttribute format  
)
```

Type Parameters

T

The type of value to write.

Parameters

value

The value to write.

format

The format of the XML.

RemarksThis method does not write any type identifier, so it cannot support **null** or polymorphic values and the reader must specify an identical type while deserializing.

Microsoft.Xna.Framework.Content.Pipeline.Tasks Namespace

Note

This namespace is available only when developing for Windows.

Provides support for importing and processing game assets into the binary format that is used by the content loader of a game project.

Classes

Name	Description
 BuildContent	Provides methods and properties for importing and processing game assets into a binary format.
 BuildXact	An MSBuild task that provides incremental build capabilities for XACT projects.
 CleanContent	An MSBuild task for deleting all the intermediate and output files that were created by a previous Content Pipeline build operation.
 GetLastOutputs	Provides methods and properties for getting the names of all output content files from the content pipeline's cache file.

BuildContent Class

Note

This class is available only when developing for Windows.

Provides methods and properties for importing and processing game assets into a binary format.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public class BuildContent : Task
```

Remarks

BuildContent represents a specific [MSBuild](#) task, exposing the complete functionality of the XNA Framework Content Pipeline. This task takes a list of source asset files and the appropriate assemblies (implementing the importer and processor components) as input. After processing, the intermediate result is compiled into a binary format recognized by the game content loader.

BuildContent Members

The following tables list the members exposed by the BuildContent type.

Public Constructors

Name	Description
 BuildContent	Initializes a new instance of BuildContent.

Public Fields

Name	Description
 CancelEventNameFormat	The format specifier for the named event used to cancel the build.

Public Properties

Name	Description
 BuildConfiguration	Gets or sets the content build configuration name.
 BuildEngine	(Inherited from Task .)
 BuildEngine2	(Inherited from Task .)
 CompressContent	Gets or sets the content compression flag.
 HostObject	(Inherited from Task .)
 IntermediateDirectory	Gets or sets the directory for storing temporary build files.
 IntermediateFiles	Gets all file names produced by the build, regardless of any incremental optimizations.
 Log	(Inherited from Task .)
 LoggerRootDirectory	Gets or sets the base reference path used when reporting errors during the content build process.
 OutputContentFiles	Gets all file names produced by the build, regardless of any incremental optimizations.
 OutputDirectory	Gets or sets the output directory for the final build results.
 PipelineAssemblies	Gets or sets the names of assemblies that provide Importer<T> or ContentProcessor<T> components for use by the build.
 PipelineAssemblyDependencies	Gets or sets the dependencies of the pipeline assemblies.
 RebuildAll	Gets or sets the force rebuild flag.
 RebuiltContentFiles	Gets the list of file names modified by an incremental rebuild.
 RootDirectory	Gets or sets the base path for the entire content build process.
 SourceAssets	Gets or sets the source asset files to be built.
 TargetPlatform	Gets or sets the content build target platform.

Protected Properties

Name	Description
 HelpKeywordPrefix	(Inherited from Task .)
 TaskResources	(Inherited from Task .)

Public Methods

PlatformsWindows XP SP2, Windows Vista

BuildContent.LoggerRootDirectory Property

Note

This property is available only when developing for Windows.

Gets or sets the base reference path used when reporting errors during the content build process.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public string LoggerRootDirectory { get; set; }
```

Property Value

Current name of the base directory or the value to be set.

Remarks

When building XNA content, all errors are displayed in the Error List Window of Visual Studio. Along with the data that triggered the error, the Error List displays the path and filename where the offending data was encountered.

By default, the path of the offending file that is reported in the Error List is always expressed as relative to the location of the project file that references it.

When set, the LoggerRootDirectory property specifies an explicit base path for error reporting that overrides the default operation. All offending files reported in the Error List will be expressed as relative to the base path set in LoggerRootDirectory.

BuildContent.SourceAssets Property

Note

This property is available only when developing for Windows.

Gets or sets the source asset files to be built.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[RequiredAttribute]
public ITaskItem[] SourceAssets { get; set; }
```

Property Value

Current source asset files to be built or the values to be set.

Remarks

This task list can be decorated with the following metadata attributes.

Attribute Name	Description
Name	Final name of the compiled asset. This value is passed to the runtime content loader. If you omit this value, it defaults to the source file name with no extension.
Importer	Importer used to read the source asset. If you omit this value, the importer is deduced from the source file extension.
Processor	Content processor used to convert the asset data. If you omit this value, data passes through the pipeline with no custom processing.

Initializes a new instance of **BuildXact**.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public BuildXact ()
```

BuildXact.Execute Method

Note

This method is available only when developing for Windows.

Executes the **BuildXact** task.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public override bool Execute ()
```

Return Value

true to begin execution of the task; otherwise **false**.

BuildXact Properties

Public Properties

	Name	Description
	BuildConfiguration	Gets or sets the content build configuration name.
	BuildEngine	(Inherited from Task .)
	BuildEngine2	(Inherited from Task .)
	HostObject	(Inherited from Task .)
	IntermediateDirectory	Gets or sets the directory for storing temporary build files.
	IntermediateFiles	Gets the names of the intermediate files used internally by the build.
	Log	(Inherited from Task .)
	LoggerRootDirectory	Gets or sets the base reference path used when reporting errors during the content build process.
	OutputDirectory	Gets or sets the directory for the final build results.
	OutputXactFiles	Gets the names of all files produced by the build, regardless of any incremental optimizations.
	RebuildAll	Gets or sets the force rebuild flag.
	RebuiltXactFiles	Gets the names of files modified by an incremental rebuild.
	RootDirectory	Gets or sets the base directory for the entire content build process.
	TargetPlatform	Gets or sets the content build target platform.
	XactProjects	Gets or sets the XACT project files to be built.
	XnaFrameworkVersion	Gets or sets XNA framework version, used to determine the xactbld3.exe path.

Protected Properties

	Name	Description
	HelpKeywordPrefix	(Inherited from Task .)
	TaskResources	(Inherited from Task .)

BuildXact.BuildConfiguration Property

Note

This property is available only when developing for Windows.

Gets or sets the content build configuration name.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public string BuildConfiguration { get; set; }
```

Property Value

Current name of the build configuration or the value to be set.

BuildXact.IntermediateDirectory Property

Note

This property is available only when developing for Windows.

Gets or sets the directory for storing temporary build files.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[RequiredAttribute]  
public string IntermediateDirectory { get; set; }
```

Property Value

Current directory for temporary build files or the value to be set.

BuildXact.IntermediateFiles Property

Note

This property is available only when developing for Windows.

Gets the names of the intermediate files used internally by the build.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[OutputAttribute]  
public ITaskItem[] IntermediateFiles { get; }
```

Property Value

Intermediate file names produced by the build.

Remarks

When combined with [OutputXactFiles](#), this property gives the complete list of generated files that should be removed by a Clean build operation.

BuildXact.LoggerRootDirectory Property

Note

This property is available only when developing for Windows.

Gets or sets the base reference path used when reporting errors during the content build process.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public string LoggerRootDirectory { get; set; }
```

Property Value

Current name of the base directory or the value to be set.

Remarks

When building XACT content, all errors are displayed in the Error List Window of Visual Studio. Along with the data that triggered the error, the Error List displays the path and filename where the offending data was encountered.

By default, the path of the offending file that is reported in the Error List is always expressed as relative to the location of the project file that references it.

When set, the LoggerRootDirectory property specifies an explicit base path for error reporting that overrides the default operation. All offending files reported in the Error List will be expressed as relative to the base path set in LoggerRootDirectory.

Note

This property is available only when developing for Windows.

Gets the names of all files produced by the build, regardless of any incremental optimizations.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
[OutputAttribute]  
public ITaskItem[] OutputXactFiles { get; }
```

Property Value

File names produced by the build or the value to be set.

Remarks

Pass this property value to a subsequent packfile generator task or combine with the [IntermediateFiles](#) property to get a complete list of generated files that should be removed by a Clean build operation.

BuildXact.RebuildAll Property

Note

This property is available only when developing for Windows.

Gets or sets the force rebuild flag.

Namespace: Microsoft.Xna.Framework.Content.Pipeline.Tasks

Assembly: Microsoft.Xna.Framework.Content.Pipeline (in microsoft.xna.framework.content.pipeline.dll)

Syntax

C#

```
public bool RebuildAll { get; set; }
```

Property Value

If **true**, all XACT target files are rebuilt; otherwise only modified files are rebuilt. Default value is **false**.

White Papers

This section includes technical articles and white papers about programming for XNA Game Studio. Topics can include code migration, performance tweaking, Visual Studio integration, and a host of other subject areas.

In This Section

[API Migration Guide: Managed DirectX 1.1 to XNA Framework](#)

Facilitates the transition of Managed DirectX (MDX) 1.1 developers moving to the XNA Framework.

API Migration Guide: Managed DirectX 1.1 to XNA Framework

There are a number of differences to note when migrating to the XNA Framework. These changes are intentional, and are based on the following design principles for the XNA Framework:

- Embrace the creator community on Microsoft platforms (Windows and Xbox 360 in the initial release).
- Simplify the process of writing games.
- Provide education solutions for academia.
- Provide a positive user experience for MDX or native DirectX developers.

One major architectural difference is the overall scope of XNA Framework versus MDX. While MDX had a 1-to-1 correspondence with many of the core technologies of DirectX, the XNA Framework focuses on an intersection of core DirectX functionality with other game-development technologies.

Another key difference between MDX 1.1 and the XNA Framework is the way the interfaces are packaged. The basic run-time functionality for the XNA Framework is contained in two assemblies:

- Microsoft.Xna.Framework.dll
- Microsoft.Xna.Framework.Game.dll

It is no longer necessary, for example, to reference a separate assembly to add audio support to a project. However, a higher-level differentiation has been made between execution-time and design-time components. Microsoft.Xna.Framework.dll and Microsoft.Xna.Framework.Game.dll correspond to elements from DirectX APIs that are useful for game run times.

XNA Game Studio also contains an extensible XNA Framework Content Pipeline designed to simplify importing, processing, and building game content. A complete representation of the XNA Framework Content Pipeline is outside the scope of this document, but there are several important MDX 1.1 features that are duplicated by XNA Framework Content Pipeline features.

For some developers, porting to the XNA Framework is a less than ideal solution. For one, the XNA Framework API has a significant number of naming differences from the native DirectX APIs. Developers employing MDX tool chains to build content for native games may be more comfortable with the MDX conventions. Also, the XNA Framework does not have support for run-time processing of meshes. This may make the current XNA Framework unsuitable for tools that require run-time import or modification of mesh data.

Getting Started

There are two ways to port a game from MDX to the XNA Framework:

- Reference XNA Framework class libraries in an existing MDX-based project.
- Create a new Windows with XNA Game Studio game and port functionality piece-by-piece from MDX-based sources.

Creating a new XNA Framework game is the recommended porting path. The XNA Game Studio Windows Game template automatically sets up the required references. You can then migrate code files into the new project.

Application Model

Managed DirectX 1.1 and the MDX 2.0 Beta both have functionality for interaction with WinForms. However, the XNA Framework has been designed for an unprecedented level of platform independence. It cannot rely on WinForms for development on Windows and Xbox 360. Therefore, a common set of functionality has been provided in the form of the Application Model. It is important to note that this is not a one-for-one replacement to WinForms, MFC, or Win32; it is intended as a framework specific to game development on Windows and Xbox 360.

To include the application model in a project, you must add the XNA Framework Application Model class library as a reference. The Application Model assembly is Microsoft.Xna.Framework.Game.dll and it can be referenced in the same manner as the XNA Framework assembly.

WinForms to Game

The Game assembly is also a standard partial replacement for the DirectX Managed Utility Toolkit (DXMUT) library previously available as part of the DirectX SDK sample source code. The Application Model does not cover all facets of DXMUT, but it does provide a broad replacement for its boilerplate features.

The advantage of the XNA Framework is that it is compatible with WinForms applications, yet it does not depend on any WinForms or **System.Drawing** types. For applications that already use WinForms, converting to Game is not necessary unless

you are moving to a cross-platform architecture. Also, using the Game interface will add support for the [GraphicsDeviceManager](#), which simplifies device creation and management.

Graphics

XNA Framework Graphics has received a major API overhaul from MDX 1.1, but like MDX, XNA Framework Graphics uses core Direct3D 9 graphics technology. The key interface changes are in the device, effects, D3DX types, and resources. It is also important to note that there is no distinction now between a D3D and a D3DX class. The XNA Framework abstracts the Graphics API to omit any non-intuitive differentiation in the Graphics namespaces.

Another major difference in XNA Framework Graphics is the differentiation of "in-game" and "content creation" functions. In the native DirectX COM API, for example, there is no interface-level distinction between functions that should be used in-game versus those that should be reserved for content creation and processing. The XNA Framework concentrates only on the in-game portions of the API, so some Direct3D 9 features may appear to be missing. Functionality specific to content generation has been moved to its own API and utility set known as the XNA Framework Content Pipeline.

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3D.Light	No XNA Framework equivalent
Microsoft.DirectX.Direct3D.Material	
Microsoft.DirectX.Direct3D.VertexFormat	

Perhaps the most radical departure from Direct3D 9 is the removal of fixed-function pipeline features from the XNA Framework. The long-term trend in the real time graphics industry has been to move away from fixed-function graphics to the more flexible programmable model. The Xbox 360 does not have a fixed-function pipeline, so shader-based rendering is essential to creating cross-platform games.

The lack of fixed-function rendering in the XNA Framework requires some level of reorganization to port fixed-function rendering engines to the programmable pipeline. Keep in mind that several fixed-function-only classes have been removed altogether and that you must implement a shader-based solution.

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3D.GraphicsStream	No XNA Framework equivalent

MDX supported a variety of direct memory access operations through the custom GraphicsStream type. Direct memory access is not a feature of the XNA Framework. Data access has been restricted to specific type-safe classes, generic accessors, and arrays. The new access patterns are not only easier to implement, but in many scenarios they are much faster.

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3D.SwapChain	No XNA Framework equivalent

Swap chains do not exist in the XNA Framework. This was done to improve cross-platform compatibility in the majority of XNA Game Studio rendering scenarios.

Graphics Device Setup

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3D.Manager	Microsoft.Xna.Framework.Graphics.GraphicsAdapter

The static MDX Manager class has been largely reworked into a more organized set of interfaces based on the [GraphicsAdapter](#) class. The **GraphicsAdapter** class has an [Adapters](#) property, which is a collection of all the adapters on the current machine.

This code example shows how to check a texture format to ensure that it is valid.

C#

```
// Check whether device 0 supports A8R8G8B8 in hardware.
if ( GraphicsAdapter.Adapters[0].CheckDeviceFormat( DeviceType.Hardware,
    SurfaceFormat.Color, ResourceUsage.None, QueryUsage.None,
    ResourceType.Texture2D, Format.A8R8G8B8 ) )
{
    // A8R8G8B8 is supported in hardware.
}
else
```

```
{
    // A8R8B8G8 is not supported in this hardware.
}
```

Likewise, all of the useful **Manager** functions have a similar mapping to methods available from the MDX Manager class.

Graphics Device

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3D.Device	Microsoft.Xna.Framework.Graphics.GraphicsDevice

[GraphicsDevice](#) behaves like its MDX 1.1 counterpart, without the fixed-function features of the XNA Framework. Most of the methods have been carried over to the new [GraphicsDevice](#), but some have different parameters or overloads.

MDX 1.1	XNA Framework
Device.SetStreamSource	GraphicsDevice.Vertices[]
Device.SetStreamFrequency	
Device.GetStreamSource	
Device.GetStreamSourceFrequency	

The MDX **SetStreamSource** function was used to enable a vertex buffer on a specific stream with a specific stride. Also, the **SetStreamFrequency** method could be used on Shader Model 3.0-compliant hardware to change a specific vertex stream's frequency, enabling performance-boosting techniques such as hardware instancing.

The new access pattern makes intended functionality more discoverable. The supplied index indicates the stream being used. The [VertexStreamCollection](#) returned from this indexer contains properties for the current vertex buffer, stride size, offset, and frequency of vertices on that stream.

For example, to set an 8-byte stride size of vertex stream 0, you could use this C# code.

C#

```
// Set vertex stride for stream 0 to 8 bytes.
device.Vertices[0].VertexStride = 8;
```

MDX 1.1	XNA Framework
Device.SetTexture	GraphicsDevice.Textures[]
Device.GetTexture	

Similar to streams, textures have been abstracted into their own collection representing the different samplers available on the device. The [Textures](#) property is quite straightforward to use:

C#

```
// Set texture stage 0 to myTexture.
device.Textures[0]= myTexture;
```

MDX 1.1	XNA Framework
Device.SetSamplerState	GraphicsDevice.SamplerStates[]
Device.SamplerState[]	

This functionality was available in MDX 1.1. The only difference is that the **SetSamplerState** method has been removed. The [SamplerStates](#) property is a straightforward way of setting and reading all of the possible sampler states for a given stage. As in MDX 1.1, the usage pattern requires an indexer corresponding to the sampler being accessed.

MDX 1.1	XNA Framework
---------	---------------

Device.SetRenderState	GraphicsDevice.RenderState
Device.RenderState	

The [RenderState](#) property was already available in MDX 1.1, but the superfluous **SetRenderState** method has been removed for [GraphicsDevice](#).

MDX 1.1	XNA Framework
Device.Lights	No XNA Framework equivalent
Device.Material	
Device.Transform	
Device.VertexFormat	
Device.RenderState.Ambient	
Device.RenderState.Lighting	
Device.RenderState.LocalViewer	
Device.RenderState.EmissiveMaterialSource	
Device.RenderState.ShadeMode	
Device.RenderState.SpecularEnable	
Device.RenderState.TweenFactor	

Fixed-function pipeline methods have been removed from the XNA Framework, so many MDX **Device** methods and properties do not have an XNA Framework counterpart.

MDX 1.1	XNA Framework
Device.DrawRectanglePatch	No XNA Framework equivalent
Device.DrawTrianglePatch	
Device.NPatchMode	
Device.RenderState.AdaptiveTessellateW	
Device.RenderState.AdaptiveTessellateX	
Device.RenderState.AdaptiveTessellateY	
Device.RenderState.AdaptiveTessellateZ	
Device.RenderState.MaxTessellationValue	
Device.RenderState.MinTessellationValue	
Device.RenderState.PatchEdgeStyle	
Device.RenderState.PositionDegree	
Device.RenderState.NormalizeNormals	

Due to limited hardware support and lack of widespread adoption, patch-based drawing methods have been removed from the XNA Framework.

MDX 1.1	XNA Framework
---------	---------------

Device.ClipStatus	No XNA Framework equivalent
Device.RenderState.UseWBuffer	
Device.RenderState.UpdateSurface	
Device.RenderState.BeginScene	
Device.RenderState.EndScene	

These properties and methods have been removed from the XNA Framework due to limited hardware support, lack of widespread adoption, and Xbox 360 compatibility. **ResourceUsage.Dynamic** resources should be used for default pool textures that require surface updates. **BeginScene** and **EndScene** calls are not required by XNA Framework and have been omitted.

Formats

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3D.Format	Microsoft.Xna.Graphics.SurfaceFormat

The MDX **Format** type has been renamed [SurfaceFormat](#) for clarity.

MDX 1.1	XNA Framework
Format.Unknown	SurfaceFormat.Unknown
Format.R8G8B8	SurfaceFormat.Bgr24
Format.A8R8G8B8	SurfaceFormat.Color
Format.X8R8G8B8	SurfaceFormat.Bgr32
Format.R5G6B5	SurfaceFormat.Bgr565
Format.X1R5G5B5	SurfaceFormat.Bgr555
Format.A1R5G5B5	SurfaceFormat.Bgra5551
Format.A4R4G4B4	SurfaceFormat.Bgra4444
Format.R3G3B2	SurfaceFormat.Bgr233
Format.A8	SurfaceFormat.Alpha8
Format.A8R3G3B2	SurfaceFormat.Bgra2338
Format.X4R4G4B4	SurfaceFormat.Bgr444
Format.A2B10G10R10	SurfaceFormat.Rgba1010102
Format.A8B8G8R8	SurfaceFormat.Rgba32
Format.X8B8G8R8	SurfaceFormat.Rgb32
Format.G16R16	SurfaceFormat.Rg32
Format.A2R10G10B10	SurfaceFormat.Bgra1010102

Format.A16B16G16R16	SurfaceFormat.Rgba64
Format.A8P8	SurfaceFormat.PaletteAlpha16
Format.P8	SurfaceFormat.Palette8
Format.L8	SurfaceFormat.Luminance8
Format.A8L8	SurfaceFormat.LuminanceAlpha16
Format.A4L4	SurfaceFormat.LuminanceAlpha8
Format.V8U8	SurfaceFormat.NormalizedByte2
Format.L6V5U5	SurfaceFormat.NormalizedLuminance16
Format.X8L8V8U8	SurfaceFormat.NormalizedLuminance32
Format.Q8W8V8U8	SurfaceFormat.NormalizedByte4
Format.V16U16	SurfaceFormat.NormalizedShort2
Format.A2W10V10U10	SurfaceFormat.NormalizedAlpha1010102
Format.D16Lockable	SurfaceFormat.Depth16Lockable
Format.D32	SurfaceFormat.Depth32
Format.D15S1	SurfaceFormat.Depth15Stencil1
Format.D24S8	SurfaceFormat.Depth24Stencil8
Format.D24X8	SurfaceFormat.Depth24
Format.D24X4S4	SurfaceFormat.Depth24Stencil4
Format.D16	SurfaceFormat.Depth16
Format.L16	SurfaceFormat.Luminance16
Format.D32SingleLockable	SurfaceFormat.Depth32SingleLockable
Format.D24SingleS8	SurfaceFormat.Depth24Stencil8Single
Format.Q16W16V16U16	SurfaceFormat.NormalizedShort4
Format.R16F	SurfaceFormat.HalfSingle
Format.G16R16F	SurfaceFormat.HalfVector2
Format.A16B16G16R16F	SurfaceFormat.HalfVector4
Format.R32F	SurfaceFormat.Single

Format.G32R32F	SurfaceFormat.Vector2
Format.A32B32G32R32F	SurfaceFormat.Vector4
Format.CxV8U8	SurfaceFormat.NormalizedByte2Computed
Format.Multi2Argb8	SurfaceFormat.Multi2Bgra32
Format.Dxt1	SurfaceFormat.Dxt1
Format.Dxt2	SurfaceFormat.Dxt2
Format.Dxt3	SurfaceFormat.Dxt3
Format.Dxt4	SurfaceFormat.Dxt4
Format.Dxt5	SurfaceFormat.Dxt5
Format.Yuy2	SurfaceFormat.VideoUyVy
Format.G8R8G8B8	SurfaceFormat.VideoRgBg
Format.VertexData	No XNA Framework equivalent

The full list is included here, as this is one area where the naming convention changed dramatically. The XNA Framework formats have identical layouts to their MDX counterparts.

Effects

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3DX.Effect	Microsoft.Xna.Framework.Graphics.Effect
Microsoft.DirectX.Direct3DX.EffectCompiler	
Microsoft.DirectX.Direct3DX.BaseEffect	
Microsoft.DirectX.Direct3DX.EffectHandle	Microsoft.Xna.Framework.Graphics.EffectAnnotation Microsoft.Xna.Framework.Graphics.EffectFunction Microsoft.Xna.Framework.Graphics.EffectParameter Microsoft.Xna.Framework.Graphics.EffectPass Microsoft.Xna.Framework.Graphics.EffectTechnique

The [Effect](#) interface has changed significantly between the MDX 1.1 implementation and the XNA Framework version. One minor change is that compiled effects were originally accessed through the **GraphicsStream** type. In the XNA Framework, [CompiledEffect](#) takes the place of the MDX 1.1 **GraphicsStream**.

Another feature of XNA Framework is a complete replacement for the **EffectHandle** interface. The XNA Framework implements type-safe replacements to effect handles, which no longer have to be treated as "blobs" of formless data. Effect handles have been abstracted into the types of data or code they represent. The end result is that many potential pitfalls inherited from the native **Effect** functions are eliminated in the XNA Framework.

The new effect handles do not necessarily entail a major departure from the familiar MDX and native Direct3D 9 usage patterns. Some methods have been moved from **Effect** to its subcomponents where it was logical.

The following code is a simplistic example of how to render using a multipass effect technique.

C#

```

// Load a simple effect.
Effect myEffect = new Effect( device, "MyEffect.fx", CompilerOptions.None, null );

// Set parameters.
myEffect.Parameters["g_mWorldViewProjection"].SetValue<Matrix>( Matrix.Identity );

// Render all passes.
myEffect.CurrentTechnique = myEffect.Techniques["T0"];
myEffect.Begin( EffectStateOptions.Default );
foreach( EffectPass pass in myEffect.CurrentTechnique.Passes )
{
    pass.Begin();
    // Draw primitives here....
    pass.End();
}
myEffect.End();

```

Effects in the XNA Framework behave more like a hierarchy than a loose collection of handles into a compiled effect file. Owner relationships have been established between [Effect](#), [EffectTechnique](#), and [EffectPass](#). It follows then that the [Effect.Techniques](#) property returns a collection of techniques, which in turn define a collection of passes located in [EffectTechnique.Passes](#).

Colors and Packed Vectors

MDX 1.1	XNA Framework
System.Drawing.Color	Microsoft.Xna.Framework.Graphics.Color

[System.Drawing](#) is not an XNA Framework dependency, so the XNA Framework contains its own [Color](#) structure. The XNA Framework [Color](#) structure contains all of the colors represented in [System.Drawing.Color](#).

Sprites

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3DX.Sprite	Microsoft.Xna.Framework.Graphics.SpriteBatch

The D3DX [Sprite](#) interface has been redesigned for the XNA Framework into the [SpriteBatch](#) class. It contains functionality similar to D3DX [Sprite](#), but is designed to be more user friendly to 2D and 3D developers alike.

Some functional changes are in the order of operations and the center of Z-rotation for 2D sprites. Sprites always rotate and scale around their center using [SpriteBatch](#). Therefore, [SpriteBatch](#) transforms are applied per each [SpriteBatch.Draw\(\)](#) call instead of per group of sprites.

Shaders

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3D.VertexShader	Microsoft.Xna.Framework.Graphics.VertexShader
Microsoft.DirectX.Direct3D.PixelShader	Microsoft.Xna.Framework.Graphics.PixelShader
Microsoft.DirectX.Direct3D.VertexDeclaration	Microsoft.Xna.Framework.Graphics.VertexDeclaration
Microsoft.DirectX.Direct3D.ConstantTable Microsoft.DirectX.Direct3D.ConstantTableDescription	Microsoft.Xna.Framework.Graphics.ShaderConstantTable
Microsoft.DirectX.Direct3D.ConstantDescription	Microsoft.Xna.Framework.Graphics.ShaderConstant
Microsoft.DirectX.Direct3D.Semantic	Microsoft.Xna.Framework.Graphics.ShaderSemantic

The basic XNA Framework shader interfaces remain largely unchanged from their MDX and Direct3D 9 counterparts.

MDX 1.1	XNA Framework
---------	---------------

Microsoft.DirectX.Direct3DX.ShaderLoader	Microsoft.Xna.Framework.Graphics.ShaderCompiler Microsoft.Xna.Framework.Graphics.CompiledShader
---	--

The MDX **ShaderLoader** interface has been replaced by a run-time [ShaderCompiler](#) interface in the XNA Framework. In MDX 1.1, the **ShaderLoader** interface would return a GraphicsStream object that could be used to create a vertex or pixel shader. In the XNA Framework, the [ShaderCompiler](#) returns a type-safe [CompiledShader](#), from which you can retrieve input and output semantics.

Meshes and Animation

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3DX.Mesh	No XNA Framework equivalent
Microsoft.DirectX.Direct3DX.BaseMesh	
Microsoft.DirectX.Direct3DX.SkinMesh	
Microsoft.DirectX.Direct3DX.Frame	
Microsoft.DirectX.Direct3DX.BoneCombination	
Microsoft.DirectX.Direct3DX.BoneInfluences	
Microsoft.DirectX.Direct3DX.AttributeRange	
Microsoft.DirectX.Direct3DX.AttributeWeight	
Microsoft.DirectX.Direct3DX.AllocateHierarchy	
Microsoft.DirectX.Direct3DX.AnimationController	
Microsoft.DirectX.Direct3DX.AnimationRootFrame	

The XNA Framework specifies the type [Model](#), which is the run-time component of mesh data imported and processed by the XNA Framework Content Pipeline. The XNA Game Studio documentation includes more information about Model and importing meshes with the XNA Framework Content Pipeline.

Dynamic run-time D3DX **Mesh** loading is not available in the XNA Framework, so an MDX application using D3DX mesh functions, animation controllers, or x-file mesh loading will require game-specific implementation of this functionality.

Graphics Resources

All graphics resources have undergone a revision to their primary data-access pattern. The **Lock** and **Unlock** methods of all resources have been removed in the XNA Framework and have been replaced with **SetData** / **GetData** semantics. **SetData** and **GetData** behave quite differently from the **Lock** / **Unlock** pattern. Using **Lock** / **Unlock**, a given resource could have had read-only, write-only, or read-write properties during a lock. Those ambiguities have been completely cleared up by establishing discreet read and write operations for a resource. That does not mean that the call will always succeed. However, there shouldn't be any confusion as to whether data is being written or read during a given function call.

The **GetData** / **SetData** functions use generic method parameters to indicate the type of the elements within the array. The type provided to the generic parameter indicates the type of the individual elements in the array.

To use **SetData** or **GetData**, it is assumed that you previously allocated a data buffer for use. This is especially important for **GetData**, which, instead of returning a newly allocated array, fills an array provided as a parameter to **GetData**. You must manage the allocation of managed arrays used to read from and write to resources. Resources backed by arrays can help reduce managed heap allocation overhead, as long as the arrays are not constantly re-created.

Textures and Surfaces

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3D.BaseTexture	Microsoft.Xna.Framework.Graphics.Texture
Microsoft.DirectX.Direct3D.ImageData	
Microsoft.DirectX.Direct3D.Texture	Microsoft.Xna.Framework.Graphics.Texture2D
Microsoft.DirectX.Direct3D.VolumeTexture	Microsoft.Xna.Framework.Graphics.Texture3D

Microsoft.DirectX.Direct3D.CubeTexture	Microsoft.Xna.Framework.Graphics.TextureCube
---	--

Nearly all of the textures and surfaces have different names than they do in native Direct3D 9 and MDX 1.1. The new names are similar to the naming conventions used in Direct3D 10 and are intended to reduce ambiguity about the dimensions of a texture.

Additionally, the **ImageData** information class and other relevant texture data have been moved to the texture itself to remove ambiguities relating to its usage.

MDX 1.1	XNA Framework
Texture.Lock	Texture2D.SetData
Texture.Unlock	Texture2D.GetData
CubeTexture.Lock	TextureCube.SetData
CubeTexture.Unlock	TextureCube.GetData
VolumeTexture.Lock	Texture3D.SetData
VolumeTexture.Unlock	Texture3D.GetData

Like all resources, textures no longer have **Lock** or **Unlock** methods. Data is written and read by using the **SetData** and **GetData** functions described in the Graphics Resources section. The following code snippet is an example usage of the **SetData** and **GetData** methods with textures.

C#

```
// Create a 256 x 256 image in memory.
uint[] imageData = new uint[256 * 256];

// At this point, fill the array with data....

// Fill the texture with the image data.
Texture2D tex = new Texture2D( device, 256, 256, 1, ResourceUsage.None,
SurfaceFormat.Color, ResourceManagementMode.Automatic );
tex.SetData<uint>( imageData );

// Get the image data from the surface.
uint[] imageDataOutput = new uint[256 * 256];
tex.GetData<uint>( imageDataOutput );
```

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3DX.TextureLoader.FromFile	Texture2D.FromFile
Microsoft.DirectX.Direct3DX.TextureLoader.FromCubeFile	TextureCube.FromFile
Microsoft.DirectX.Direct3DX.TextureLoader.FromVolumeFile	Texture3D.FromFile

The XNA Framework does not contain a dedicated static texture loading interface separate from the texture classes themselves. Instead, the static **FromFile** methods are part of each texture type to simplify loading texture resources directly from an image file.

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3D.Device.GetRendertargetData	Microsoft.Xna.Framework.GraphicsDevice.GetRenderTarget/a>

No MDX equivalent	Microsoft.Xna.Framework.Graphics.RenderTarget Microsoft.Xna.Framework.Graphics.RenderTarget2D Microsoft.Xna.Framework.Graphics.RenderTargetCube
-------------------	---

Render target data is now handled through a strongly-typed object called **RenderTarget**. The **RenderTarget2D.GetTexture** function creates a texture with the render target data. This has made the **Usage.RenderTarget** type obsolete, and it has been omitted in the XNA Framework.

Buffers

MDX 1.1	XNA Framework
Microsoft.DirectX.Direct3D.VertexBuffer	Microsoft.Xna.Framework.Graphics.VertexBuffer
Microsoft.DirectX.Direct3D.IndexBuffer	Microsoft.Xna.Framework.Graphics.IndexBuffer

XNA Framework Index buffers have remained largely unchanged from their MDX counterparts. With fixed-function methods removed, there is no longer a need to provide a vertex buffer's Flexible Vertex Format (FVF) when creating the buffer.

MDX 1.1	XNA Framework
VertexBuffer.Lock	VertexBuffer.SetData
VertexBuffer.Unlock	VertexBuffer.GetData
IndexBuffer.Lock	IndexBuffer.SetData
IndexBuffer.Unlock	IndexBuffer.GetData

Like all graphics resources, the **Lock** and **Unlock** methods have been replaced by dedicated **GetData** and **SetData** calls for reading and writing data respectively.

The following code shows an example usage of the new methods to write and read from a vertex buffer.

C#

```
// Create a set of position vertices.
Vector3[] positionVerts = new Vector3[3];
positionVerts[0] = new Vector3( 0.0f, 0.0f, 0.0f );
positionVerts[1] = new Vector3( 1.0f, 0.0f, 0.0f );
positionVerts[2] = new Vector3( 1.0f, 1.0f, 0.0f );

// Create a vertex buffer and set the data to the position data
// in the positionVerts array.
VertexBuffer vb = new VertexBuffer( device, typeof( Vector3 ), 3,
    ResourceUsage.None, ResourcePool.Managed );
vb.SetData<Vector3>( positionVerts );

// Allocate a new array and fill it with data using GetData.
Vector3[] positionVertsOutput = new Vector3[3];
vb.GetData<Vector3>( positionVertsOutput );
```

MDX 1.1	XNA Framework
VertexBuffer.Description	VertexBuffer

Relevant [VertexBuffer](#) description information has been moved to the [VertexBuffer](#) class rather than a separate **Description** property.

Math

Nearly all of the basic math types familiar to the native D3DX libraries and MDX have been replicated in the XNA Framework. There have been numerous additions to the XNA Framework math types and methods to reduce the amount of boilerplate math code that you have to rewrite for each new game. The biggest breaking change has been the removal of left-handed

coordinate-system math functions in favor of unifying on a right-handed coordinate system. This simplifies the Math API and omits functionality that causes a large amount of confusion.

Vector Math

MDX 1.1	XNA Framework
Microsoft.DirectX.Vector2	Microsoft.Xna.Framework.Vector2
Microsoft.DirectX.Vector3	Microsoft.Xna.Framework.Vector3
Microsoft.DirectX.Vector4	Microsoft.Xna.Framework.Vector4

Vector math is mostly unchanged from its MDX 1.1 implementation. However, several uncommon methods from MDX 1.1 are not available in XNA Framework.

Matrix Math

MDX 1.1	XNA Framework
Microsoft.DirectX.Matrix	Microsoft.Xna.Framework.Matrix

There are several public and static name changes in the new matrix structure. The most common change is that the static **Matrix** methods that create new matrices have been prefixed with the word "**Create**." Also, matrices have a new set of properties that allow rapid access to directional vectors from an orientation matrix.

MDX 1.1	XNA Framework
Matrix.LookAtLH	No XNA Framework equivalent
Matrix.PerspectiveLH	
Matrix.PerspectiveFovLH	
Matrix.PerspectiveOffCenterLH	
Matrix.OrthoLH	
Matrix.OrthoOffCenterLH	
Matrix.LookAtRH	Matrix.CreateLookAt
Matrix.PerspectiveRH	Matrix.CreatePerspective
Matrix.PerspectiveFovRH	Matrix.CreatePerspectiveFieldOfView
Matrix.PerspectiveOffCenterRH	Matrix.CreatePerspectiveOffCenter
Matrix.OrthoRH	Matrix.CreateOrthographic
Matrix.OrthoOffCenterRH	Matrix.CreateOrthographicOffCenter

Right-handed coordinate systems are the default coordinate systems in XNA Framework matrix math. The left-handed matrix methods are not available in the XNA Framework, but you can still create your own left-handed view matrices. Ideally, all new development should be in right-handed coordinates to be compatible with documentation, XNA Framework Content Pipeline components, and XNA Framework drop-in components.

MDX 1.1	XNA Framework
Matrix.TransformCoordinate	Vector3.Transform
Matrix.LookAtRH	Matrix.CreateLookAt

Some matrix method names have been altered to be more consistent with the rest of the XNA Framework.

MDX 1.1	XNA Framework
Matrix.AfflineTransformation	No XNA Framework equivalent
Matrix.AfflineTransformation2D	

Many matrix methods were superfluous or simply elaborate overloads for functionality that can be achieved by multiplying matrices. These were removed to simplify the Math API and clarify math-intensive code.

Quaternion Math

MDX 1.1	XNA Framework
Microsoft.DirectX.Quaternion	Microsoft.Xna.Framework.Quaternion

Quaternion math is unchanged from its MDX 1.1 implementation.

Audio

Audio in XNA Framework is based on the more advanced XACT tools and functions available in the DirectX SDK. In terms of both interface and functionality, XACT is very different from the DirectSound API found in MDX. XACT is both a playback and an authoring system for game audio. It consists of two main components: the XACT API, and the Microsoft Cross-Platform Audio Creation Tool (also called XACT).

XACT is more than a replacement for DirectSound. The run-time XACT functions are easier to use than their DirectSound counterparts. XACT manages the minute details of streaming, threading, and playing individual sounds. The specifics of the audio processing are "baked in" at content creation-time, so the loading and playback of audio can be as efficient as possible.

Using the XACT audio system is a major improvement over DirectSound because it enables cross-platform content creation for audio on Xbox 360 and Windows PC. The tool used to create audio resources for XNA Game Studio (XACT) is the same tool that is used in the Xbox 360 SDK and the DirectX SDK.

The Microsoft Cross-Platform Audio Creation Tool is documented in the DirectX SDK. For more information, see <http://msdn.microsoft.com/directx/sdk/>.

Audio Playback

After you have built an audio project, audio playback is a simple matter as far as coding goes. XACT organizes audio data into a global settings file, banks of wave data, and banks of sounds. Sound banks map audio "Cues" to sounds. Cues have a "play" function that works as you might expect. The following code snippet shows how to play a cue in just a few lines of XNA Framework code.

C#

```
// Load the files built by XACT.
AudioEngine engine = new AudioEngine( "MyAudioSettings.xgs" );
WaveBank wb = new WaveBank( engine, "MyWaveBank.xwb" );
SoundBank sb = new SoundBank( engine, "MySoundBank.xsb" );

// Play the "Noisy" audio cue.
sb.GetCue( "Noisy" ).Play();
```

Input

XNA Framework input is designed around immediate state rather than buffered input events. This design fundamentally changes how input is handled between MDX and XNA Framework applications. Immediate input state polling is cleaner and more flexible than input events, but it requires some re-implementation to work in an existing game.

The key to using state-based input is a simple concept: in-game actions that are triggered on changes in controller inputs require that the game store a previous controller state. For example, to "know" that a button has been pressed during a given frame, the game would have to store the fact that the button was in the released state during the previous frame.

Mouse and Keyboard

In MDX 1.1, you can obtain mouse and keyboard input from a variety of sources. DirectInput has its own mouse and keyboard interfaces supporting both immediate and buffered inputs. It is also typical to use WinForms events or even wndproc (message pump) overrides for input handling.

MDX 1.1	XNA Framework
---------	---------------

No MDX equivalent	Microsoft.Xna.Framework.Input.Mouse
No MDX equivalent	Microsoft.Xna.Framework.Input.Keyboard

In the XNA Framework, mouse and keyboard inputs have been standardized into two interfaces. Unlike MDX or WinForms solutions, there is no setup whatsoever to be done with keyboard or mouse inputs. The following code example shows how to get inputs from a mouse and a keyboard.

C#

```

MouseState mouse = Mouse.GetState();
KeyboardState keyboard = Keyboard.GetState();

if ( mouse.LeftButton == ButtonState.Pressed )
{
    // The left mouse button is down!
}
if ( keyboard.IsKeyDown( Keys.Space ) )
{
    // The SPACEBAR is down!
}

```

Xbox 360 Controller

You can access the Xbox 360 Controller with DirectInput. However, it is highly recommended that XNA Framework-based games take advantage of the classes provided in the namespace [Microsoft.Xna.Framework.Input](#).

MDX 1.1	XNA Framework
No MDX equivalent	Microsoft.Xna.Framework.Input.GamePad

The Xbox 360 Controller for Windows uses the new XInput API, which is streamlined compared to DirectInput. It supports only state-based input. Unlike DirectInput, it does not automatically buffer input events. This means that you must poll input and update game state accordingly.

This code shows how to poll an Xbox 360 Controller for input in just a few lines of code.

C#

```

// Get the controller state using the static GetState method.
GamePadState state = GamePad.GetState( PlayerIndex.One );

// Now check whether the controller is connected.
if ( state.IsConnected )
{
    // Check to see whether Button A is down.
    if ( state.Buttons.A == ButtonState.Pressed )
    {
        // Button A is pressed!
    }
}

```

As was the case for [Keyboard](#) and [Mouse](#), there is no setup required. The first time [GetState](#) is called, the controller is set up and ready for use.

The Xbox 360 Controller also supports vibration. Unlike the complex setup required by DirectInput Force Feedback, vibration can be started or stopped in a single line of XNA Framework code!

C#

```

// Turn on maximum vibration.
GamePad.SetVibration( PlayerIndex.One, 1.0f, 1.0f );

// Turn off vibration.
GamePad.SetVibration( PlayerIndex.One, 0f, 0f );

```

DirectInput Devices

DirectInput devices such as flight sticks, wheels, and older game pads are not supported by the XNA Framework. Such devices are not compatible with the Xbox 360, and thus make poor candidates for cross-platform game support.

For games that require DirectInput device support, the MDX 1.1 DirectInput assembly is still the required means of accessing these controllers. DirectInput does not work across platforms and is not recommended for most XNA Framework projects.

Summary

While the XNA Framework may appear superficially similar to Managed DirectX or even native DirectX, the differences go beneath the surface. Some game ports may be fairly simple, requiring mostly naming changes. Other games, particularly those relying on D3DX animation, complex DirectSound processing, or deeply integrated fixed-function pipeline features may require significant modification to be functional in XNA Game Studio.

What's Inside

As a member of the XNA Creators Club, you can download:

- Educational samples and tutorials
- Technical articles
- Starter kits
- Minigames
- Utilities
- Partner offers

Content is updated regularly, so there is always something new.

Community Forums

Signing up on the XNA Creators Club Online Web site gives you access to the XNA Creators Club Online Forums, where you can interact with other creators. Find the answers to your questions, and share your knowledge with others.

Ready to Join?

The community is waiting for you at the XNA Creators Club Online Web site. Joining is free and easy, so sign up today.
