

Maximizing Internet Explorer in Windows Embedded Compact 7

Douglas Boling
Boling Consulting Inc.

About Douglas Boling

- Independent consultant specializing in Windows Mobile and Windows Embedded Compact (Windows CE)
 - On-Site Instruction
 - Consulting and Development
- Author
 - Programming Embedded Windows CE
 - Fourth Edition

Agenda

- Internet Explorer for Embedded Basics
- Tuning IE for Embedded
- Skinning IE for Embedded
- Embedding IE for Embedded

Internet Explorer for Embedded

- New Internet Explorer
 - Based on IE 7
 - Some performance updates from IE 8 added
 - JScript engine from IE 8 400% faster
- Flash 10.1 renderer shipped with OS
- Gesture support
 - Pinch to zoom
 - Swipe to pan

Internet Explorer for Embedded

- Extensive performance work on page display
 - Quicker rendering
 - Quick gesture response
 - Significantly faster JScript engine
- Two sample browser applications
 - Classic IESample
 - XAML skin version

Configuring the Browser

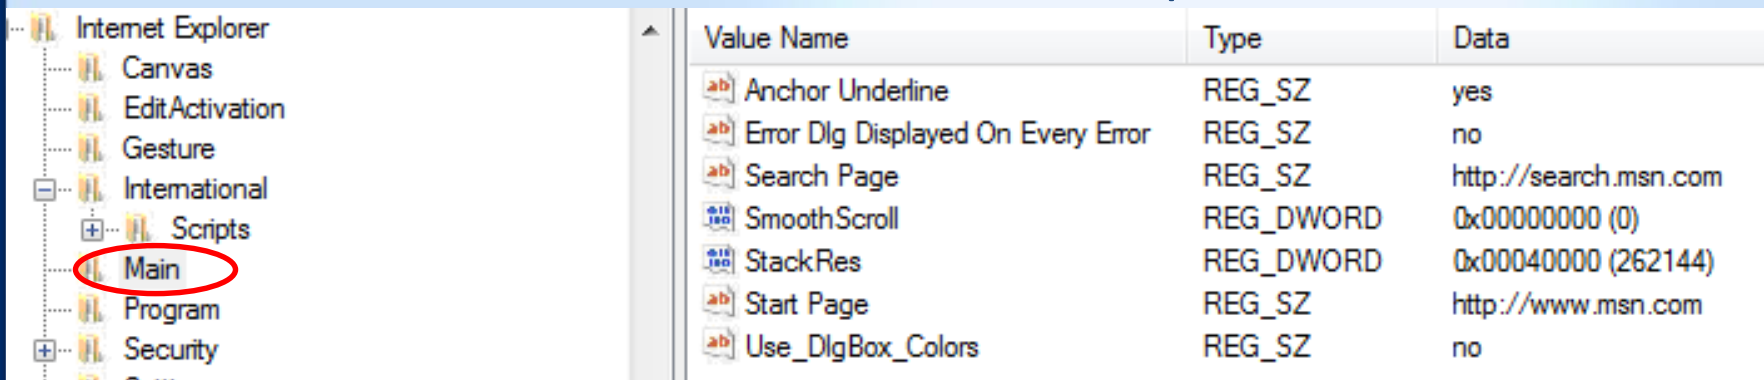

- Most of the browser functionality provided by rendering engine
- Can be configured in a variety of ways
 - Registry
 - Huge number of settings in the registry
 - Extension DLLs
 - Help with performance and how controls are rendered

User Agent String

- In WEC 7 User agent string is set
 - "Platform"="Windows Phone OS 7.0; Trident/3.1; IEMobile/7.0"
- CE 6 allowed User Agent to be set in Control Panel
 - Standard Inet control panel applet doesn't allow this in WEC 7
- Need to change user agent string to avoid "Mobile" rendering
 - "Platform"="Windows NT 6.1"
- Look under key
 - [HKLM]\Software\Microsoft\Windows\CurrentVersion\Internet Settings\5.0\User Agent

Basic Configuration

- [HKLM]\Software\Microsoft\Internet Explorer\...

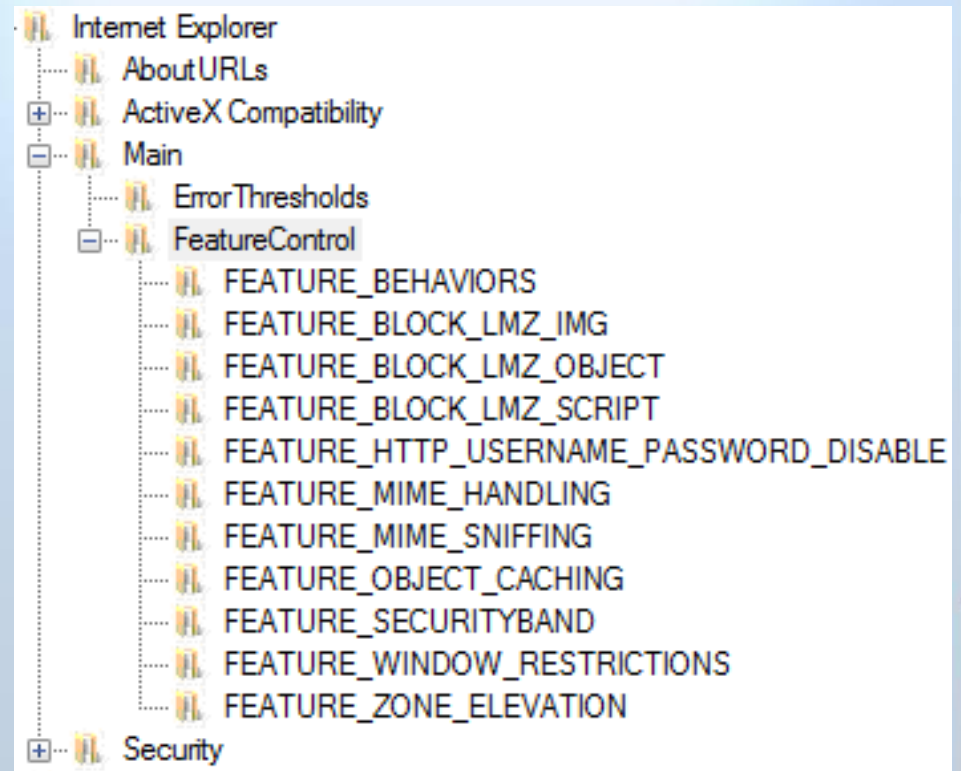

Value Name	Type	Data
Anchor Underline	REG_SZ	yes
Error Dlg Displayed On Every Error	REG_SZ	no
Search Page	REG_SZ	http://search.msn.com
SmoothScroll	REG_DWORD	0x00000000 (0)
StackRes	REG_DWORD	0x00040000 (262144)
Start Page	REG_SZ	http://www.msn.com
Use_DlgBox_Colors	REG_SZ	no

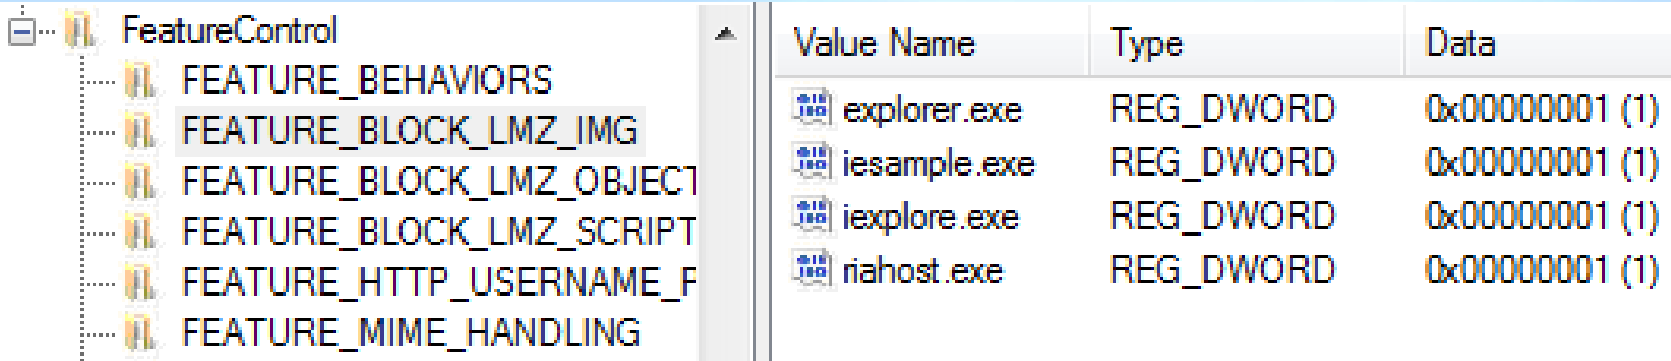

- Basic home and search page settings

IE Feature Control

- [HKLM]\Software\Microsoft\Internet Explorer\...
- Restrictions on the functionality of IE
- Restrictions are same as the desktop
- May want to disable
 - On secure web sites

IE Feature Control

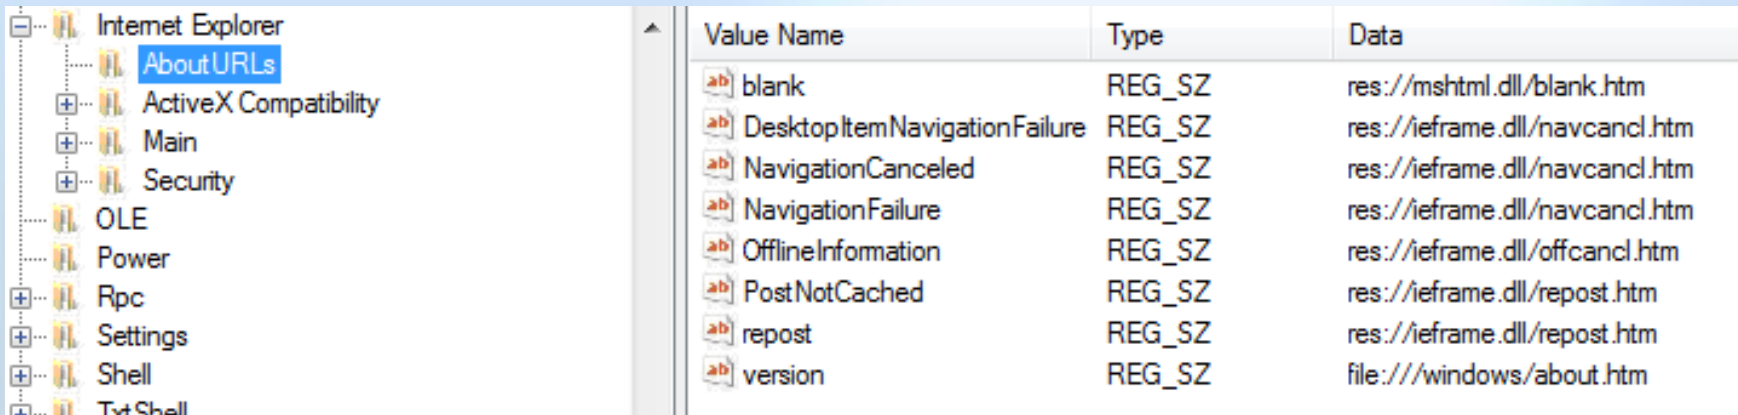

Value Name	Type	Data
explorer.exe	REG_DWORD	0x00000001 (1)
iesample.exe	REG_DWORD	0x00000001 (1)
iexplore.exe	REG_DWORD	0x00000001 (1)
riahost.exe	REG_DWORD	0x00000001 (1)

- To disable restriction, set application name value to 0
- If application name not present, security default values used

Default Pages

- [HKLM]\Software\Microsoft\Internet Explorer\...

Value Name	Type	Data
blank	REG_SZ	res://mshtml.dll/blank.htm
DesktopItemNavigationFailure	REG_SZ	res://ieframe.dll/navcancl.htm
NavigationCanceled	REG_SZ	res://ieframe.dll/navcancl.htm
NavigationFailure	REG_SZ	res://ieframe.dll/navcancl.htm
OfflineInformation	REG_SZ	res://ieframe.dll/offcancl.htm
PostNotCached	REG_SZ	res://ieframe.dll/repost.htm
repost	REG_SZ	res://ieframe.dll/repost.htm
version	REG_SZ	file:///windows/about.htm

- Currently set to resources in IEFrme and mshtml DLLs

Renderer Performance

- Internet Explorer renderer and Silverlight for Embedded use the same acceleration plug in
 - Allows hardware acceleration of rendering
- Enable in registry
 - **[HKCU]\Software\Microsoft\InternetExplorer\Gesture**
 - **ICSRenderMethod** **Set to 1 to use plug in, 0 for GDI**
 - **ICSRenderPlugin** **Set to name of plug in DLL**
 - IcsRendererDDraw.dll
 - IcsRendererOpenGL.dll
- Not set by default in registry

Learning from the Internet Explorer Examples

- There are three different examples using the browser
 - IESample Classic example
 - IEEXR XAML skinned example
 - HTMLHelp Help application that uses browser
- One was removed from WEC 7
 - IESimple HTMLHelp almost as simple
- Lots more code in `\wince700\public\ie7`
 - Know the code!

Public IE Sample Code

- `\Wince700\public\ie7\oak`
 - `Htmlhelp` Simple app that uses browser control
 - `IEexr` XAML skinned browser
 - `IESmaple` Classic browser example
 - `IETheme` Skins renderer buttons, scroll bars and such
 - `IEThmxp` Resources to skin like XP
 - `Inetcpl` IE Control panel code
 - `Inetcpl_exr` XAML skinned IE control panel
 - `UrlmonUI` Allows interception of URLMon dialogs
 - `WinInetUI` Allows interception of WinInet dialogs

IESample

- Classic IE browser sample in WE Compact
 - Standard Win UI look and feel
 - Code in C++ using Win32 and COM interfaces
- Supports
 - Autocomplete text in the navigation edit box
 - Back / Forward navigation
 - Favorites
 - Two user interfaces
 - Standard UI
 - “Pocket IE” UI

IE 7 with Silverlight

- IE browser with XAML-based chrome
 - XAML driven UI
 - Loads IE browser window and communicates via COM
- Supports
 - Back Forward navigation
 - Favorites
 - Multiple screens using ‘thumbnails’
 - Zoom

Learning from IE 7 with Silverlight

- Frankly, a better demonstration of Silverlight than using IE
- Doesn't use WEST auto generated code
- Does provide additional example code
 - For example, code that can zoom the browser control

Skimming IE

- Replacing Dialog Boxes and Message Boxes
 - URLMonUI
 - WinINETUI
- Two entry points
 - IsDialogBoxHandled Provides reason code for dialog
 - IsMessageBoxHandled Provides text for content and title
- Return code indicates action
 - ERROR_CALL_NOT_IMPLEMENTED Display default dialog/msg box

Changing Look and Feel of HTML Controls

- IETheme DLL provides controls for HTML renderer
 - Button
 - Scroll Bar
 - List Box
 - Combo Box
 - Edit Box
- Unfortunately, current implementation doesn't allow overriding of full screen list picker

Embedding IE Control in an App

Embedding IE

- The HTML renderer is an ActiveX control with COM interfaces
- It can be instantiated like any other COM control
- IESimple Example removed from WEC 7
 - HTMLHelp is simplest current example of using browser control
 - Find IESimple in Windows Embedded CE 6 if possible
- The control has a vast array of COM interfaces
 - Fortunately, same interfaces as the desktop

Things a Hosting App Must Do

- Stack size
 - The thread creating the browser window must have a larger stack
 - Proper size is in the registry
 - At least 128KB
 - In all the examples, each browser window gets its own thread
 - Beware the cross threading impacts for Win32 code
- Initializing COM
 - The browser is a COM object

Things a Hosting App Must Do

- Declare a series of GUIDs
 - There are a series of GUIDs that are not defined in the standard include files with the SDK. These can be found in the examples

```
DEFINE_GUID(CLSID_WebBrowser,  
DEFINE_GUID(IID_IWebBrowser,  
DEFINE_GUID(IID_IWebBrowser2,  
DEFINE_GUID(DIID_DWebBrowserEvents,  
DEFINE_GUID(DIID_DWebBrowserEvents2,  
DEFINE_GUID(IID_IWebBrowserApp,
```

Fielding Events

- All examples show browser window as C++ class derived from a set of classes
 - IOleContainer,
 - IOleClientSite,
 - IOleInPlaceSite,
 - IServiceProvider,
 - DWebBrowserEvents2,
 - IDocHostUIHandler,
 - IDocHostShowUI,
 - IHTMLDOMWindowServices
- Implementation very basic

Zoom

- There are two “zooms”
- Text zoom provides scaling for the fonts
 - OLECMDID_ZOOM
- Browser zoom provides pan/zoom familiar with mobile users
 - OLECMDID_OPTICAL_ZOOM
 - OLECMDID_OPTICAL_GETZOOMRANGE

Summary

- Don't be afraid to utilize the powerful Browser
- Always implement hardware acceleration if possible
 - Not enabled by default
- Tune IE
 - User Agent string
 - Security settings
 - Dialog box interception
- Use the Source!
 - The example code *is* the documentation
